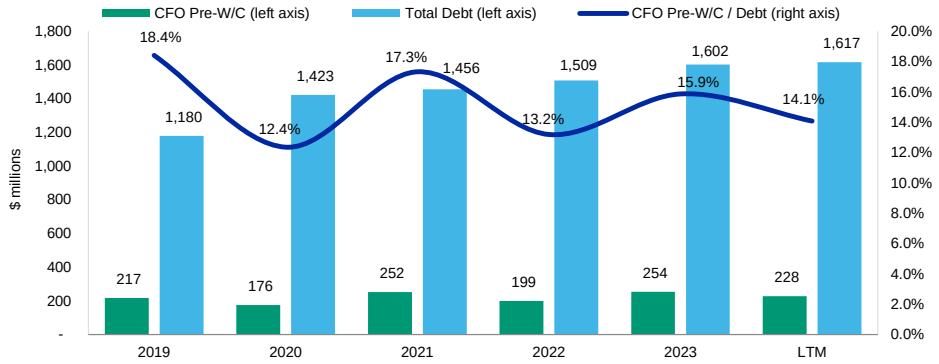
Because of its supportive regulatory outcomes, NW Natural has historically sustained credit metrics, including a cash flow from operations before changes in working capital (CFO pre-WC) to debt ratio, in the mid to high teens range over the last several years. The years of financial declines were due to one time events including the coronavirus pandemic (2020) and an increase in commodity prices that drove an increase in gas cost deferrals (2022). Favorably, the utility was authorized full recovery of these costs thereby driving the improvement in the utility's credit metrics in 2023. We expect NW Natural's financial profile to remain consistent over the next several years.

Exhibit 1
Historical CFO Pre-WC, Total Debt and CFO Pre-WC to Debt ($ MM)



Source: Moody's Financial Metrics™

Credit strengths

» Low business risk local gas distribution company

» Supportive regulatory jurisdiction, including cost tracking mechanisms and legislation that can help investment prospects

» Good stakeholder relationships and ongoing dialogue to resolve most issues

Credit challenges

» Elevated social risk due to higher scrutiny on natural gas as an energy source

» Long-term risks associated with environmental remediation costs and emission reduction requirements

Rating outlook

The stable outlook reflects our expectation that NW Natural's track record of solid financial performance and credit supportive regulatory outcomes will continue over the next several years. We see credit metrics sustaining at levels sufficient for the current credit profile including a ratio of CFO pre-WC to debt in the mid-teens percent range over the longer-term.

Factors that could lead to an upgrade

A rating upgrade could occur if NW Natural's credit metrics improve such that CFO pre-WC to debt ratio increases to 18% and CFO pre-WC less dividends to debt is consistently above 14%.

Factors that could lead to a downgrade

A rating downgrade could occur if NW Natural's regulatory environment becomes less credit supportive, including material environmental challenges where costs cannot be recovered due to state emission reduction requirements. A rating downgrade could also be considered if CFO pre-WC to debt is sustained below 14%.

Profile

Northwest Natural Gas Company (NW Natural) is a natural gas local distribution company (LDC), serving 800,000 customers in Oregon (about 88% of utility margins) and Washington (about 12% of utility margins). NW Natural is regulated by the Oregon Public Utility Commission (OPUC) and the Washington Utilities and Transportation Commission (WUTC).

NW Natural's parent, Northwest Natural Holding Company (NW Holdings), is a holding company headquartered in Portland, Oregon and owns NW Natural, NW Natural Water Company, LLC (NWN Water), NW Natural Renewables Holdings, LLC, and other businesses and activities. NW Natural is NW Holdings' largest subsidiary and an illustrative organizational chart is shown in Exhibit 3.

This publication does not announce a credit rating action. For any credit ratings referenced in this publication, please see the issuer/deal page on https://ratings.moodys.com for the most updated credit rating action information and rating history.

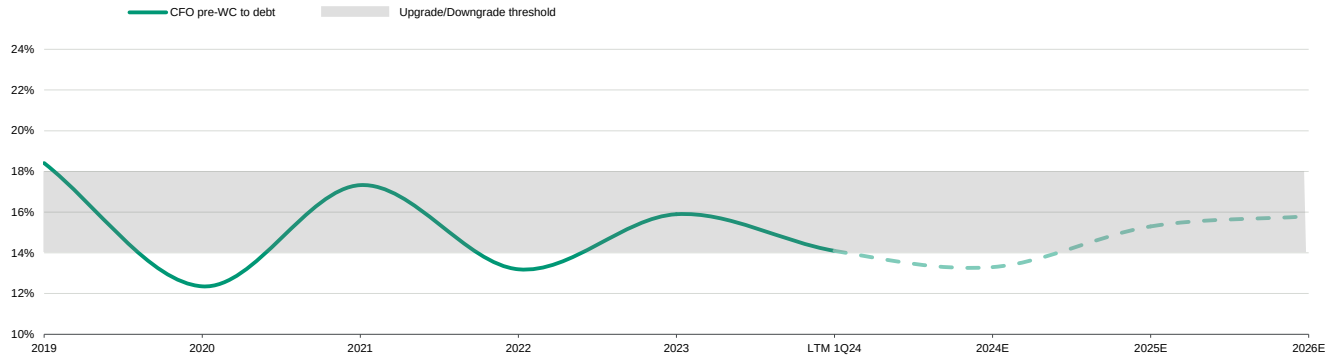
Detailed credit considerations

Consistent track record of solid financial performance expected to continue

NW Natural has a strong track record of producing solid financial performance as a result of its credit supportive regulatory framework and balanced fiscal policies. Over the last five years, the utility averaged about $220 million in cash flow from operations. This led to an average CFO pre-WC to debt ratio of about 15% from 2019 to 2023. As of the last twelve months ending 31 March 2024, the ratio was about 14%, as shown in Exhibit 4.

For 2024, credit metrics may fall to about 13% due to higher debt issued in 2023 and pressured cash flow due to higher O&M costs. NW Natural has a pending general rate case that is expected to conclude in a constructive manner with new rates effective November 2024; coupled with lower capital expenditures starting in 2025, we see credit metrics including its CFO pre-WC to debt ratio improving and sustaining in the 15% range over the next several years.

Exhibit 4
Consistent credit metrics expected over next several years
Historical and projected CFO pre-WC to debt ratio, upgrade/downgrade threshold range



The range indicated is one of several factors that could lead to an upgrade or downgrade of the ratings if the CFO pre-WC to debt ratio is above or below the level for a sustained period.
Source: Moody's Ratings

NW Natural's capital expenditures have averaged about $275 million from 2019 to 2023. In 2022 and 2023, capital spending increased to $319 million and $291 million, respectively. For 2024, NW Natural is projecting about $360 million. Capex has increased largely due to investments in technology of which much of it was related to the federal cybersecurity mandates. With the conclusion of these major projects, from 2025 to 2027, capital expenditures are projected to decrease totaling about $900 million or an average of about $225 million annually.

The utility had two years over this period where credit metrics dropped below 14% (its established downgrade threshold). In 2020, the utility's cash flow was affected by the impacts from the coronavirus pandemic as well as debt levels that increased to ensure adequate liquidity for the year amid the pandemic uncertainties. The pandemic-related debt was subsequently repaid in 2021. In 2022, the weaker metrics were due to cost inflation pressures, primarily within the materials used in field work, higher natural gas prices and related short term debt to cover the initial cost. Notably, these were pressures that plagued the industry during most of 2022. Favorably, the utility was able to recover the deferred costs within a year as reflected in its stronger credit metrics for 2023.

Supportive legislative and regulatory framework in Oregon and Washington

NW Natural's low business risk profile is supported by gas distribution operations that receive supportive regulatory treatment from the Oregon Public Utility Commission (OPUC) and Washington Utilities and Transportation Commission (WUTC), which allows for several cost recovery mechanisms that help provide stability and predictability of the utility's cash flow.

Oregon

Since 88% of the utility's margins are derived from Oregon customers, the legislative and regulatory support that NW Natural receives from the OPUC is a fundamental credit driver for the utility. In general, NW Natural has cooperative relationships with stakeholders in the state and has been able to negotiate constructive rate case outcomes and acquire tracking mechanisms for its most material costs.

The most important cost recovery mechanisms include: NW Natural's use of forward test years for capital expenditures; weather adjusted rate mechanism (WARM); conservation tariff (i.e., revenue decoupling); purchased gas adjustment (PGA); utility gas reserve investments included in rate base; and a Site Remediation and Recovery Mechanism (SRRM), primarily for the recovery of manufactured gas plant environmental expenditures. These various cost recovery mechanisms help support recovery of the most significant costs that NW Natural faces.

The utility filed its most recent Oregon general rate case on 29 December 2023 requesting $154.9 million revenue increase (16.6%), a 10.10% ROE, 50% equity layer and a $2.14 billion rate base. On 24 July 2024, NW Natural entered into an all-party settlement agreement that included a $95 million revenue increase (10.2%) and a 9.4% ROE and 50% equity layer, which remain unchanged. If approved by the OPUC, we view the settlement as credit supportive and consistent with prior rate case outcomes that have also been constructive. It also illustrates NW Natural's robust relationship with its regulatory authority. NW Natural's initial filing represented the largest base rate increase requested in recent years, underscoring the inflationary pressures the utility has been navigating. NW Natural expects new rates to take effect 1 November 2024.

From a legislative perspective, Oregon has frequently been on the forefront of progressive environmental measures, including the 2019 passage of Senate Bill 98 (SB 98), which allows utilities to acquire renewable natural gas (RNG) on behalf of customers. In July 2020, the parameters surrounding the rulemaking for RNG cost recovery were determined, which allowed for NW Natural to sign its first RNG investment in December 2020. We see this as an important step in supporting ongoing investment and growth for NW Natural in the face of the threat of electrification. The state support for RNG development can be a helpful tool for the company to maintain its place as a significant energy provider for customers, at the same time as state reduces carbon and methane emissions.

We also view the company as having low stranded asset risk given the state's policy goals of advancing renewable natural gas as a form of decarbonization and OPUC ongoing support of cost recovery for these projects. In the 2021 general rate case, the OPUC approved the recovery of costs associated with the Lexington RNG facility under Senate Bill 98 and authorized the adoption of an automatic adjustment clause that allows the utility to add costs associated with its renewable natural gas projects to rates annually on 1 November.

Washington

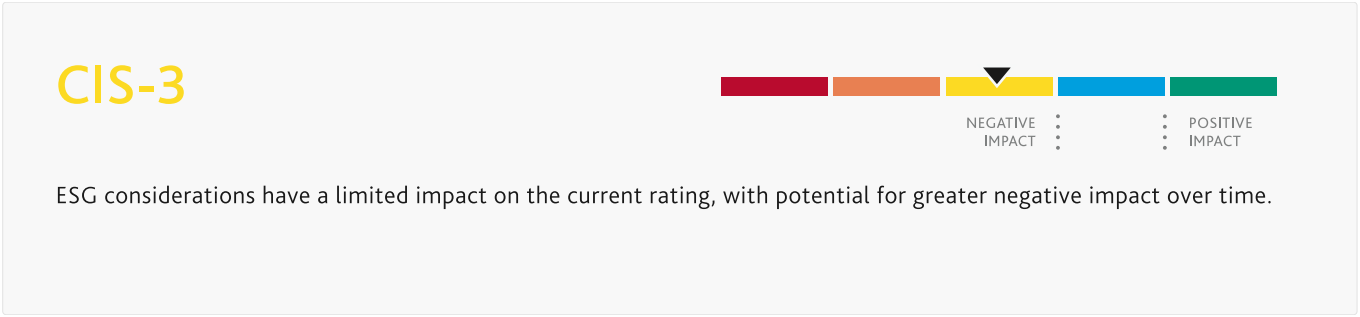
In October 2021, the WUTC issued an order authorizing an annual revenue requirement increase over two years; a 6.4% or $5 million increase in the first year, effective 1 November 2021, and up to a 3.5% or $3 million increase in the second year beginning 1 November

2022. The order was based on an average rate base of $247.3 million. The filing was based on system investments including costs associated with resiliency and reliability, consumer focused technology and building improvements and upgrades. The new WUTC order does not specify the underlying inputs of the cost of capital such as capital structure and ROE. This multiyear rate case is purposed to recover investments and costs for system resiliency and reliability as well as headquarter leasehold improvements and rent costs. It also provides for recovery of upgrades to the Vancouver, Washington service center.

ESG considerations

Northwest Natural Gas Company's ESG credit impact score is CIS-3

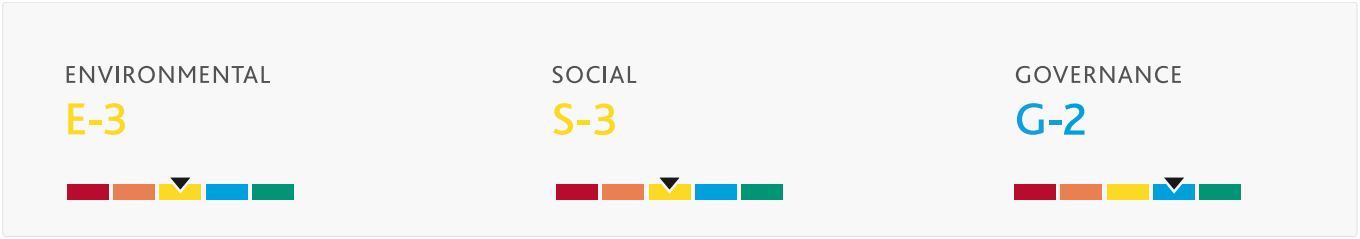
Exhibit 5
ESG credit impact score



Source: Moody's Ratings

NW Natural's **CIS-3** indicates that its ESG attributes are overall considered as having a limited impact on the current rating, with greater potential for future negative impact over time. The utility's scores reflect a combination of higher risk exposure to carbon transition, physical climate and demographic and societal trends.

Exhibit 6
ESG issuer profile scores



Source: Moody's Ratings

Environmental

NW Natural's **E-3** issuer profile score is driven by its moderately negative carbon transition and physical climate risks. Favorably, the company has a strong track record of meeting established emissions targets set by legislative (Oregon Senate Bill 98) and regulatory policies. NW Natural established a Low Carbon Savings goal of 30% by 2035 that includes customers emissions and a goal of being a carbon neutral provider by 2050. This will be achieved through increasing the use of renewable natural gas as well as hydrogen blending. Although the utility is exposed to moderately high physical climate risks, the company worked to mitigate these risks by removing all bare steel pipe from its system by completing the multi-year investment in 2015. Additionally, the system is predominantly underground, which makes the infrastructure more resilient and less vulnerable to weather or other events that could disrupt power to the region.

Social

NW Natural's **S-3** issuer profile score reflects higher risk to responsible production and demographics and societal trends that increase public concern over environmental, social, or affordability issues that could lead to adverse regulatory political intervention. These

risks are balanced by neutral to low exposure to health and safety, human capital, and customer relations. NW Natural has historically worked collaboratively with its regulator to make energy transition as affordable as possible for customers and we see this trend continuing as the company executes on its energy transmission goals over the next several years. Additionally, the company has a strong hedging program including storage and contracts that draw from a diverse supply to ensure reliability and reduce commodity risk

Governance

NW Natural's **G-2** issuer profile score is broadly in line with other utilities and does not pose a particular risk. This is supported by neutral to low exposure to financial strategy and risk management and management credibility and track record.

ESG Issuer Profile Scores and Credit Impact Scores for the rated entity/transaction are available on Moodys.com. In order to view the latest scores, please click here to go to the landing page for the entity/transaction on MDC and view the ESG Scores section.

Liquidity analysis

NW Natural maintains adequate liquidity through the use of external credit facilities and market issuances to fund negative free cash flow. As of the last twelve months ending 31 March 2024, NW Natural's internal liquidity included about $62 million of cash on hand and produced about $225 million in cash flow from operations; this compares to about $299 million in capital expenditures and $94 million in dividends for the same last twelve month period.

The utility has access to a $400 million revolving credit agreement that expires on 3 November 2026. The credit agreement includes a feature that allows NW Natural to request an increase to the total amount up to $600 million as well as request to extend the agreement for two additional one-year periods, subject to lender approval. Additionally, the credit agreement also permits the issuance of letters of credit in an aggregate amount of up to $60 million. As of 31 March 2024, NW Natural did not have any outstanding balance drawn under its credit facility or letters of credit. The primary restrictive covenant requires the company to maintain a debt to capitalization ratio of 70% or less, which NW Natural was in compliance with at 31 March 2024 (52.1%).

NW Natural's next debt maturities are due in September 2025 and December 2025, when $20 million and $10 million of senior secured notes are due, respectively.

Northwest Natural Gas Company

Update following rating affirmation

Summary

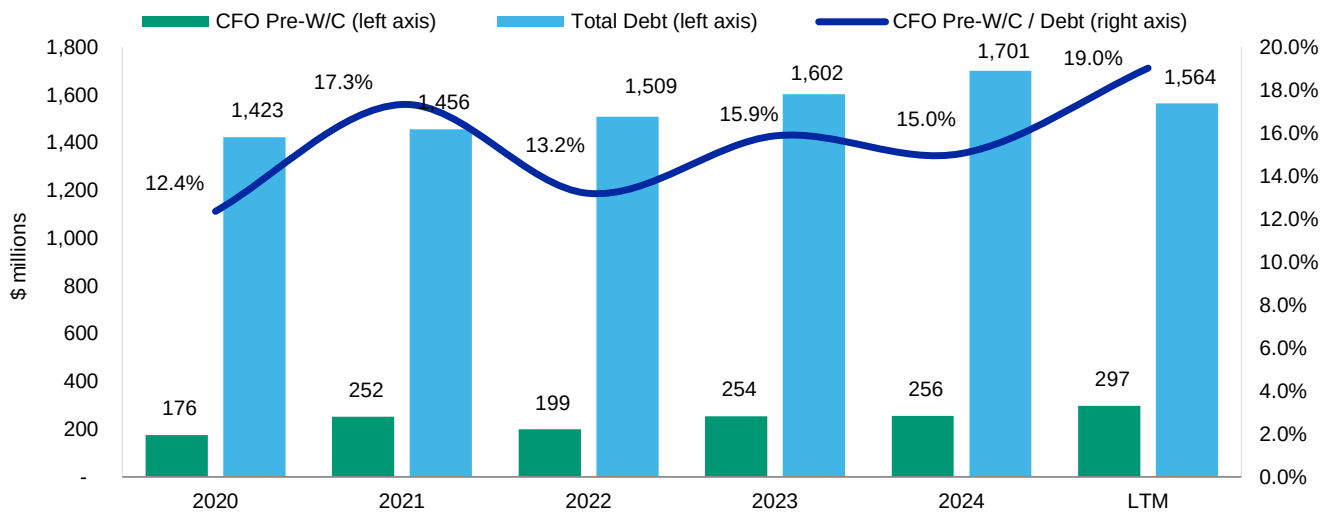
Northwest Natural Gas Company's (NW Natural, Baa1 stable) credit profile incorporates the company's low business risk as a local gas distribution company (LDC) operating in generally supportive regulatory environments. In particular, Oregon's suite of cost recovery mechanisms and constructive stakeholder relationships have supported NW Natural's solid, albeit volatile, cash flow generation over the last several years.

We expect NW Natural's financial performance to improve over the next several years driven by timely cash flow generation and credit supportive regulatory proceedings. The utility's cash flow from operations before changes in working capital (CFO pre-WC) to debt ratio has averaged about 15% over the last three years, ending at 15% in 2024. As of the last twelve months ending 31 March 2025, the ratio increased to 19%.

The recent improvement is attributed to stronger cash flow generation and temporarily reduced debt levels, aligning the utility's capital structure to a higher equity layer of 52%, as filed in their most recent general rate case. NW Natural entered into a stipulation, subject to commission approval, with parties in its 2025 rate case that includes a 50% equity layer as well as a 9.5% ROE (increase from 9.4%) and a $21 million revenue increase. Although we view a higher equity ratio as a credit positive because it supports higher required revenue and reduces reliance on debt, which helps to support stronger credit metrics, we view the 2025 rate case settlement as constructive.

Because of its supportive regulatory outcomes, we expect NW Natural's financial profile to improve over the next several years. We estimate that the CFO pre-WC to debt ratio will range between 16% and 18% over the next 12 to 18 months with a stronger longer-term run rate ranging between 17% and 19%. These estimates include an about $1.6 billion capital expenditure plan (2025-2029), which is consistent with the last five-year capex spend of $1.5 billion (2019-2024). We estimate funding at 50% equity and 50% debt as in prior years.

Exhibit 1
Historical CFO Pre-WC, Total Debt and CFO Pre-WC to Debt ($ MM)



LTM= Last Twelve Months
Source: Moody's Financial Metrics™

Credit strengths

» Low business risk local gas distribution company

» Improving financial metrics

» Supportive regulatory jurisdictions, including cost tracking mechanisms and legislation that can help investment prospects

Credit challenges

» Historically volatile financial metrics

» CFO pre-W/C to debt has been below 14% downgrade threshold in some years

» Heightened social risk due to state led decarbonization goals

Rating outlook

The stable outlook reflects our expectation that NW Natural's track record of supportive regulatory outcomes will continue over the next several years. We expect credit metrics to improve to levels that are more commensurate with its current ratings, including a ratio of CFO pre-WC to debt ranging between 16% and 18% over the next 12 to 18 months with a stronger longer-term run rate in the 17% to 19% range.

Factors that could lead to an upgrade

A rating upgrade could occur if NW Natural's regulatory environment remains credit supportive and metrics improve such that its CFO pre-WC to debt ratio increases to 18% or above on a sustained basis.

Factors that could lead to a downgrade

A rating downgrade could occur if NW Natural's regulatory environment becomes less credit supportive. A rating downgrade could also be considered if CFO pre-WC to debt falls below 14%.

This publication does not announce a credit rating action. For any credit ratings referenced in this publication, please see the issuer/deal page on https://ratings.moodys.com for the most updated credit rating action information and rating history.

Profile

Northwest Natural Gas Company (NW Natural) is a natural gas local distribution company (LDC), serving 807,000 customers in Oregon (about 88% of utility margins) and Washington (about 12% of utility margins). NW Natural is regulated by the Oregon Public Utility Commission (OPUC) and the Washington Utilities and Transportation Commission (WUTC).

NW Natural's parent, Northwest Natural Holding Company (NW Holdings), is a holding company headquartered in Portland, Oregon and owns NW Natural (largest subsidiary), SiEnergy, NW Natural Water Company, LLC (NW Natural Water), NW Natural Renewables Holdings, LLC (NW Natural Renewables), and other businesses and activities.

Detailed credit considerations

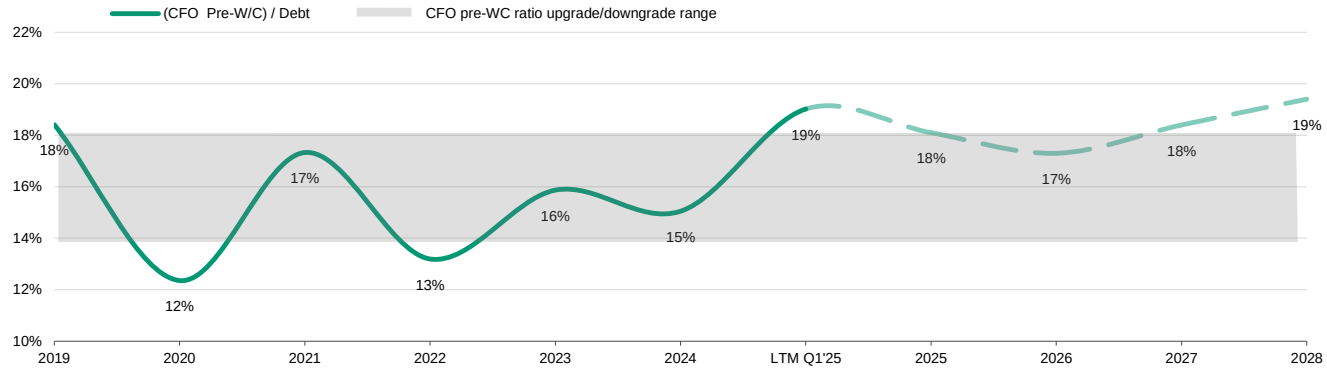
Improving financial performance driven by constructive regulatory proceedings

Over the past five years, NW Natural's credit metrics have experienced significant volatility, primarily driven by one-time events and the company's strategic investments in technology. These investments increased regulatory lag, with the utility's CFO pre-working capital (pre-WC) to debt ratio averaging approximately 15% from 2020 through 2024, falling below the 14% downgrade threshold in some years. However, in its 2024 general rate case, NW Natural received regulatory approval to recover these investments. Combined with a temporary reduction in debt, this led to a recent improvement in the CFO pre-WC to debt ratio, which rose to 19% on a last twelve months ending 31 March 2025.

We expect NW Natural's credit metrics to improve over the next several years driven by more timely recovery of cash flow as a result of supportive general rate case outcomes. As shown in Exhibit 3, we project the CFO pre-WC to debt ratio for the next 12 to 18 months to be between 16% and 18% with a longer-term run rate ranging between 17% and 19%, at or slightly above the 18% upgrade threshold. These estimates include capital expenditures for the next five years (2025-2029) of about $1.6 billion, an average of about $320 million annually. This compares to about $1.5 billion, or an average of about $300 million annually, from 2020 to 2024.

Exhibit 3

Improving credit metrics driven by credit supportive regulatory outcomes
Historical and projected CFO pre-WC to debt ratio, upgrade/downgrade threshold range



The range indicated is one of several factors that could lead to an upgrade or downgrade of the ratings if the CFO pre-WC to debt ratio is above or below the level for a sustained period
Source: Moody's Ratings

The utility had two years (2020 and 2022) where CFO pre-WC to debt dropped below 14%. In 2020, the utility's cash flow was affected by the coronavirus pandemic as well as debt levels that increased to ensure adequate liquidity that year amid pandemic uncertainties. The pandemic-related debt was subsequently repaid in 2021. In 2022, the weak metrics were due to cost inflation pressures, primarily within materials used in field work, higher natural gas prices and related short term debt to cover these gas costs. Notably, these were pressures that plagued the entire industry during most of 2022. Favorably, the utility was able to recover the deferred costs within a year as reflected in its stronger credit metrics for 2023.

Supportive legislative and regulatory framework in both Oregon and Washington

NW Natural's low business risk profile is supported by gas distribution operations that receive supportive regulatory treatment from the Oregon Public Utility Commission (OPUC) and Washington Utilities and Transportation Commission (WUTC), which allows for several cost recovery mechanisms that help provide stability and predictability of the utility's cash flow.

Oregon

Since 88% of the utility's margins are derived from Oregon customers, the legislative and regulatory support that NW Natural receives from the OPUC is a fundamental credit driver. In general, NW Natural has cooperative relationships with stakeholders in the state and has been able to negotiate supportive rate case outcomes and obtain tracking mechanisms for its most material costs.

The most important cost recovery mechanisms include: the use of forward test years for capital expenditures; a weather adjusted rate mechanism (WARM); a conservation tariff (i.e., revenue decoupling); purchased gas adjustment (PGA); utility gas reserve investments included in rate base; and a Site Remediation and Recovery Mechanism (SRRM), primarily for the recovery of manufactured gas plant environmental expenditures. These various cost recovery mechanisms help support recovery of the most significant costs that NW Natural faces.

The utility filed its most recent Oregon general rate case in December 2024 and entered into a stipulation, subject to commission approval, with parties that included a 50% equity layer as well as a 9.5% ROE (increase from 9.4%) and a $21 million revenue increase. NW Natural's original request included a $59.4 million revenue increase, a 10.4% ROE and 52% equity layer. Because the utility requested a higher equity layer, NW Natural reduced its debt to align with the requested capital structure. Although we view a higher equity ratio as more credit supportive, we view the stipulated filing as credit supportive despite the 50% equity ratio and lower revenue increase than requested.

NW Natural's last general rate case concluded in an all-party settlement agreement, that was approved by the OPUC in October 2024. The order authorized a $95 million revenue increase (10.2%) and a 9.4% ROE and 50% equity layer. The initial request included a $154.9 million revenue increase (16.6%), a 10.10% ROE, 50% equity layer and a $2.14 billion rate base. NW Natural's initial filing represented the largest base rate increase requested in recent years, underscoring the inflationary pressures that the utility was facing.

Washington

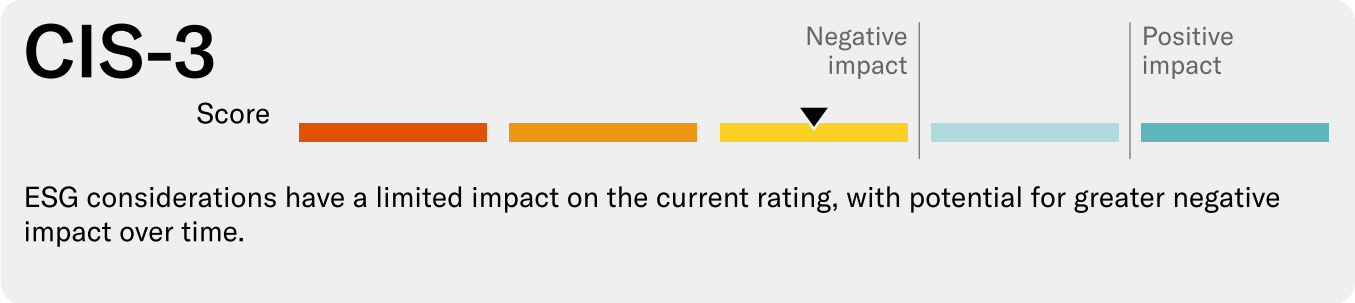
In October 2021, it most recent rate order, the WUTC authorized an annual revenue requirement increase over two years; a 6.4% or $5 million increase in the first year, effective 1 November 2021, and up to a 3.5% or $3 million increase in the second year beginning 1 November 2022. The order was based on an average rate base of $247.3 million.

The filing was based on system investments including costs associated with resiliency and reliability, consumer focused technology and building improvements and upgrades. The WUTC order did not specify the underlying inputs of the cost of capital such as capital structure and ROE. This multiyear rate case was filed for the recovery of investments and costs for system resiliency and reliability as well as for headquarter leasehold improvements and rent costs. It also provided for recovery of upgrades to the Vancouver, Washington service center.

ESG considerations

Northwest Natural Gas Company's ESG credit impact score is CIS-3

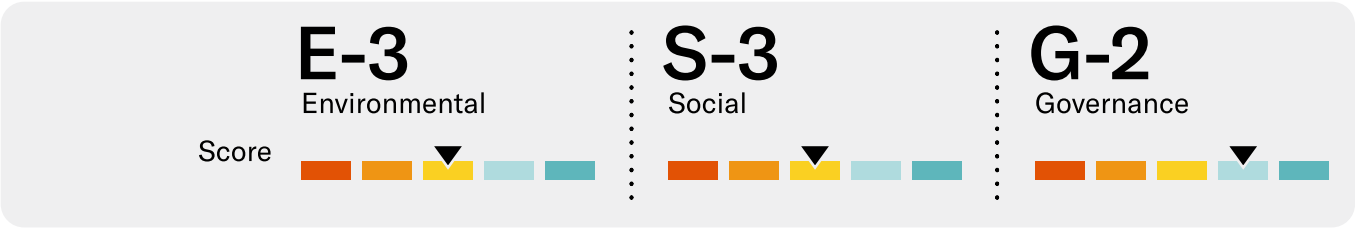
Exhibit 4
ESG credit impact score



Source: Moody's Ratings

NW Natural's **CIS-3** indicates its ESG considerations that have a limited impact on the current rating, with greater potential for future negative impact over time. The utility's scores reflect a combination of higher risk exposure to carbon transition, physical climate and demographic and societal trends.

Exhibit 5
ESG issuer profile scores



Source: Moody's Ratings

Environmental

NW Natural's **E-3** issuer profile score is driven by its higher risk exposure to carbon transition and physical climate risks. Favorably, the company has a strong track record of meeting established emissions targets set by legislative (Oregon Senate Bill 98) and regulatory policies. NW Natural established a Low Carbon Savings goal of 30% by 2035 that includes customers emissions and a goal of being a carbon neutral provider by 2050. This will be achieved through increasing the use of renewable natural gas as well as hydrogen blending. Although the utility is exposed to moderately high physical climate risks, the company worked to mitigate these risks by removing all bare steel pipe from its system by completing the multi-year investment in 2015. Additionally, the system is predominantly underground, which makes the infrastructure more resilient and less vulnerable to weather or other events that could disrupt power to the region.

Social

NW Natural's **S-3** issuer profile score reflects higher risk to responsible production and demographics and societal trends that increase public concern over environmental, social, or affordability issues that could lead to adverse regulatory political intervention. These risks are balanced by neutral to low exposure to health and safety, human capital, and customer relations. NW Natural has historically worked collaboratively with its regulator to make energy transition as affordable as possible for customers and we see this trend continuing as the company executes on its energy transmission goals over the next several years. Additionally, the company has a strong hedging program including storage and contracts that draw from a diverse supply to ensure reliability and reduce commodity risk

Governance

NW Natural's **G-2** issuer profile score is broadly in line with other utilities and does not pose a particular risk. This is supported by neutral to low exposure to financial strategy and risk management and management credibility and track record.

ESG Issuer Profile Scores and Credit Impact Scores for the rated entity/transaction are available on Moodys.com. In order to view the latest scores, please click here to go to the landing page for the entity/transaction on MDC and view the ESG Scores section.

Liquidity analysis

NW Natural maintains adequate liquidity through the use of external credit facilities and market issuances to fund negative free cash flow. As of the last twelve months ending 31 March 2025, NW Natural's internal liquidity included about $82 million of cash on hand and produced about $290 million in cash flow from operations; this compares to about $365 million in capital expenditures and $70 million in dividends for the same last twelve month period, resulting in approximately $150 million of negative free cash flow.

The utility has access to a $400 million revolving credit agreement. In December 2024, the agreement was amended with a new maturity date of 3 November 2027, with an option to extend one additional year, subject to lender approval. The credit agreement includes a feature that allows NW Natural to request an increase in the total amount up to $600 million. The credit agreement also permits the issuance of letters of credit in an aggregate amount of up to $60 million.

In January 2024, the utility entered into an uncommitted letter of credit and reimbursement agreement. Although there is no expressly stated maximum amount of letters of credit that can be issued or outstanding under the facility due to current regulatory authority from the OPUC, the sum of LCs outstanding cannot exceed $100 million at any one time. As of 31 March 2025, NW Natural did not have any outstanding balance drawn under its credit facility or letters of credit. The primary restrictive covenant for both agreements requires the company to maintain a debt to capitalization ratio of 70% or less, which NW Natural was in compliance with at 31 March 2025 (47.4%).

NW Natural's next debt maturities are in September 2025 and December 2025, when $20 million and $10 million of senior secured notes are due, respectively.

April 19, 2024

Rating Action Overview

- We concluded our review of the insulating measures in place and determined that they are sufficient to potentially rate Northwest Natural Holding Co. (NWNH) subsidiary Northwest Natural Gas Co. (NWNG) up to two notches higher than its parent's group credit profile (GCP). We also assess the cumulative value of these insulating measures as increasing risk for parent NWNH because they limit or even materially restrict NWNH's access to NWNG's cash flows.
- Consequently, we lowered our rating on parent NWNH to 'A' from 'A+'. The outlook is negative.
- At the same time, we revised our outlook on subsidiary NWNG to stable from negative and affirmed our ratings on NWNG, including the 'A+' long-term issuer credit rating (ICR), the 'A+' unsecured debt rating, the 'AA-' senior secured debt rating, and the 'A-1' short-term rating. The recovery rating on the senior secured debt remains '1+'.
- The stable outlook on NWNG reflects our assessment that the insulating measures in place are sufficient to potentially rate NWNG up to two notches above NWNH's GCP and as such a downgrade to NWNH would not directly lead to a downgrade at NWNG. The stable outlook also reflects our expectations that NWNG's stand-alone financial measures will consistently remain above our downgrade threshold. Specifically, we expect stand-alone funds from operations (FFO) to debt of 15%-18% through 2026.
- The negative outlook on NWNH reflects its weak consolidated financial measures for the current rating. FFO to debt in 2023 was around 12%, significantly below our 15% downgrade threshold. We expect financial performance in 2024 will remain weak but improve in 2025, primarily reflecting our expectations for a fair Oregon rate case order.

Rating Action Rationale

Our downgrade of NWNH to 'A' from 'A+' reflects higher risks because of material restrictions of cash flows within the company's corporate group. NWNG accounts for about 95% of NWNH's consolidated cash flows. We assess the cumulative value of the insulation measures in place as sufficient to rate NWNG up to two notches above NWNH's GCP. However, these insulating measures limit and could materially restrict NWNH's full access to NWNG cash flows. These insulating measures include dividend restrictions, a non-consolidation opinion, and independent directors on NWNG's board of directors that have effective influence on decision-making and whose vote is required for a voluntary bankruptcy filing.

The negative outlook on NWNH reflects its historical weak financial measures and our expectation that financial performance will remain weak for 2024. Since 2020, NWNH's FFO to debt has been consistently below our 15% downgrade threshold. The company's historical financial underperformance reflects its rising capital investments, including multiple acquisitions of water utilities, which increased its leverage and weakened its financial measures. More recently, NWNH's financial measures have been negatively affected by higher interest rates, higher cash taxes, and inflationary pressures, including higher operating costs.

We expect the company's financial measures will remain challenged in 2024 due to its elevated capital spending plan, including water utility acquisitions, investments in renewable natural gas (RNG) projects, and ongoing infrastructure investments. We expect financial improvement beginning in 2025, primarily reflecting a fair Oregon rate case order. However, financial measures could remain weak for the current rating if elevated capital investments and cash flow deficits are primarily debt funded or the company's rate case order is significantly below expectations.

We affirmed our 'A+' rating on subsidiary NWNG. Our rating largely reflects NWNG's low-risk regulated gas distribution operations in Oregon and Washington. NWNG provides natural gas service to approximately 800,000 customers with 65% of its margin generated from residential customers, 25% from commercial customers, and 7% from industrial customers. The company benefits from stable and supportive regulatory environments in both jurisdictions where it operates, with purchased gas adjustments and environmental cost recovery, decoupling and a forward-looking test year in Oregon, and multiyear rate case fillings in Washington. We view these mechanisms as supportive to its financial measures, allowing the company to largely mitigate regulatory lag. However, over the past few years, the company's earned return on equity (ROE) has been modestly weaker than its authorized ROEs, reflecting a potential weakening of management's ability to manage regulatory risk.

We also view the energy transition risks in Oregon and Washington as potentially increasing business risk. Washington has implemented decarbonization mandates and Oregon is contemplating various decarbonization initiatives. Furthermore, several cities are contemplating the implementation of a gas ban for new gas connections. We assess these evolving risks as potentially negative for credit quality and will continue to monitor future developments.

We assess NWNG's financial risk profile using our low-volatility benchmarks, reflecting the low-risk nature of its natural gas distribution operations and its track record of effective management of regulatory risk. We assume continued use of regulatory mechanisms and rate riders to effectively manage regulatory risk, annual capital spending averaging of about $330 million, and annual dividends averaging of about $75 million. We expect NWNG's stand-alone financial measures to remain in the middle range of its financial risk profile category such that FFO to debt is 15%-18% through 2026.

We consider NWNG to be insulated from its parent NWNH. Based on the strength of the insulating measures, NWNG could potentially be rated up to two notches higher than NWNH's GCP. Currently, NWNG is rated only one notch higher than its GCP, limited by its 'a+' standalone credit profile.

The key insulating measures include:

- NWNG's financial performance and funding prospects are independent from those of the group.
- NWNG issues its own debt and has its own credit facility.
- NWNG is regulated by Oregon and Washington regulatory commissions.
- NWNG has dividend restrictions.
- NWNG's board is highly independent with 11 out of 12 board of directors being independent.
- Independent directors on NWNG's board have effective influence on decision making, and their votes are required for a voluntary bankruptcy filing.
- NWNG is unlikely to be drawn or forced into a NWNH bankruptcy.
- There is an independent third party which is the holder of the "golden share" whose vote is required to file for bankruptcy.

We revised our outlook on NWNG to stable reflecting the insulation measures and the strength of its stand-alone credit profile. The stable outlook reflects our view that NWNG, because of the cumulative value of the insulating measures, could potentially be rated up to two notches above its parent's NWNH GCP. Because of the insulating measures, a downgrade to parent NWNH would not directly lead to a downgrade at NWNG. In addition, the stable outlook reflects our expectation that the company will continue to effectively manage regulatory risk and maintain financial measures consistent with the middle range for its financial risk profile category. Specifically, we expect stand-alone FFO to debt of 15%-18% through 2026.

Outlook

Northwest Natural Holding Co. (NWNH)

The negative outlook on NWNH reflects its current weak financial measures and the possibility that financial measures could remain weak. Our base case assumes continued weak financial performance in 2024 and then for financial performance improvement in 2025. This improvement primarily reflects a fair Oregon rate case order, such that FFO to debt is consistently greater than 15%.

Downside scenario

We could lower our ratings on NWNH over the next 12 to 24 months if FFO to debt remains below 15%. We could also lower our ratings on NWNH if business risk increases. This could reflect an unfavorable rate case outcome, higher risks due to decarbonization mandates and potential gas bans, a weakening of the company's management of regulatory risk, or an inability to consistently earn its authorized ROE.

Upside scenario

We could affirm ratings and revise our outlook on NWNH back to stable over the next 12 to 24 months if FFO to debt improves to consistently greater than 15%, with no increase of business risk.

Outlook

Northwest Natural Gas Co. (NWNG)

The stable outlook on NWNG reflects our base-case assumption that NWNG will generate sufficient cash flows to maintain appropriate consolidated financial measures for the current rating, including FFO to debt of 15%-18% through 2026. The stable outlook also reflects our expectation of strong operating performance and effective management of regulatory risk.

Downside scenario

We could lower our rating on NWNG over the next 24 months if the company's consolidated financial performance weakens such that FFO to debt remains consistently below 15%.We could also lower our rating on NWNG if the company's business risk increases. This could reflect a higher risks due to decarbonization mandates and potential gas bans, a weakening of the company's management of regulatory risk, or an inability to consistently earn its authorized ROE.

Upside scenario

We could raise our rating on NWNG over the next 12 to 24 months if the company's financial performance improves such that FFO to Debt is consistently above 21%, with no weakening of business risk.

Company Description

NWNH is the holding company of NWNG, NWNR and NW Natural Water Co. LLC (NWWC). NWNG operates as a regulated natural gas distribution company, providing natural gas service to approximately 800,000 residential, commercial, and industrial natural gas customers in Oregon and Southwest Washington through 14,200 miles of pipeline systems. Approximately 90% of customers are in Oregon and 10% are in southwest Washington. NWNR is engaged in investing competitive RNG operations while NWWC owns and operates several regulated water utilities. Together, NWNR and NWWC contribute about 5% of NWNH's revenues while NWNG contributes the remaining 95% revenues.

Our Base-Case Scenario

- Modest customer growth and continued use of regulatory mechanisms.
- Continued negative discretionary cash flow.
- Annual capital spending averaging about $370 million over our forecast period.

- Small tuck-in regulated water utilities acquisitions funded in a credit supportive manner.
- Annual dividends averaging about $77 million.
- All debt maturities refinanced.

Liquidity

We assess NWNH's liquidity as adequate, with sources covering uses by 1.1x over the coming 12 months, and that its sources cover uses even if forecasted consolidated EBITDA declines by 10%. We believe the predictable regulatory framework for NWNH provides a manageable level of cash flow stability for the company even in times of economic stress, supporting our use of slightly lower thresholds to assess liquidity. In addition, NWNH has the ability to absorb high-impact, low-probability events, reflecting that the company maintains about $600 million in committed credit facilities through 2026, and our belief that the company can lower its high capital spending (averaging about $370 million annually) during stressful periods, indicative of a limited need for refinancing under such conditions.

Furthermore, our assessment reflects the company's generally prudent risk management, sound relationships with its banking group (which includes over four well-established banks). Overall, we believe the company can withstand adverse market circumstances over the next 12 months with sufficient liquidity to meet its obligations. The company has no large long-term debt maturity coming due, and we expect the company to proactively address any maturities well in advance of its scheduled due dates.

Principal liquidity sources

- Cash and cash equivalents of about $33 million;
- Credit facilities of about $600 million; and
- Cash FFO estimated of about $275 million.

Principal liquidity uses

- Debt maturities, including commercial paper outstanding of about $241 million;
- Capital expenditure (capex) of about $400 million; and
- Dividend payments of about $75 million.

Environmental, Social, And Governance

ESG factors have no material influence on our credit rating analysis of NWNH.

Issue Ratings - Subordination Risk Analysis

Capital structure

The short-term rating on NWNG is 'A-1', based on our 'A+' issuer credit rating on the company. As on Dec 31, 2023, NWNG's capital structure consists of approximately $1.4 billion first mortgage bonds. The company also maintains a medium-term note program which is currently not utilized.

Analytical conclusions

We rate NWNG's medium-term notes program 'A+', equal to its issuer credit rating, because we view any debt issued under this program as debt issued by a qualifying investment-grade utility.

Issue Ratings - Recovery Analysis

Key analytical factors

NWNG's first-mortgage bonds benefit from a first-priority lien on substantially all of the utility's real property, owned or subsequently acquired. Collateral coverage of more than 1.5x supports a recovery rating of '1+ and an issue-level rating one notch above the issuer credit rating.

Credit Highlights

Overview

Key strengths	Key risks
Low-risk natural gas distribution operations with limited unregulated storage operations.	Limited geographic and regulatory diversity.
Effective management of regulatory risks with operations under the credit-supportive regulatory frameworks in Washington and Oregon.	Decarbonization initiatives that pressure future growth.
Insulating measures that we assess as sufficient to rate the company above its parent's group credit profile.	Continued negative discretionary cash flow over the next few years, indicating external funding needs.

We continue to monitor the ongoing Oregon rate case proceedings. On June 23, 2025, Northwest Natural Gas Co. (NWNG), and certain parties filed a stipulation in the company's 2024 rate case filing for a revenue increase of $21.3 million (about 35% of the company's original request). The stipulation is based on a modestly improved return on equity (ROE) of 9.5% and maintaining the 50% equity structure. While the stipulated revenue increase appears modest, it is in line with our base-case expectations, and we believe it will continue to support credit quality. We expect the stipulation, subject to approval by the Public Utility Commission of Oregon (OPUC), will be in effect by year-end 2025. We also believe items not addressed in the

stipulation, will be subject to ongoing litigation process. This current filing follows a $95 million rate case order based on a settlement that was approved in late 2024. We assessed this previous rate case order as supportive of credit quality and expect that the company will continue to effectively manage regulatory risk.

We view the insulating measures in place as sufficient to rate NWNG two-notches above the 'a-' group credit profile on parent Northwest Natural Holding Co. (NWNH). Our analysis incorporates our 'a+' stand-alone credit profile (SACP) on NWNG and the cumulative value of the insulating and regulatory measures in place. NWNG has the following insulating measures:

- NWNG's financial performance and funding prospects are independent from those of NWNH.
- NWNG issues its own debt and has its own credit facility.
- NWNG is regulated by the Oregon and Washington regulatory commissions.
- NWNG has dividend restrictions. It must maintain 45% equity before distributing any dividends upstream if its secured issue-level ratings are below 'A-', maintain 46% equity if its secured issue-level ratings are below 'BBB'. No dividends are allowed if its equity falls below 44% or the secured issue-level ratings drop below 'BBB-'.
- NWNG's board of directors is highly independent with eight independent directors on a board of 10.
- Independent directors on NWNG's board have effective influence on decisions, and their votes are required for a voluntary bankruptcy filing.
- NWNG is unlikely to be drawn or forced into a NWNH bankruptcy due to absence of cross-default provisions.
- An independent third party holds the "golden share" vote required to file for a bankruptcy filing.

Outlook

The stable rating outlook on NWNG reflects our base-case assumption that the company will generate sufficient cash flow to maintain appropriate consolidated financial measures for the current rating, including funds from operations (FFO) to debt of 15%-17% through 2027. The stable outlook also reflects our expectation of continued strong operating performance and effective management of regulatory risk.

Downside scenario

We could lower our rating on NWNG over the next 24 months if:

- The company's consolidated financial performance consistently weakens such that FFO to debt falls below 15%; or
- The company's business risk increases. This could reflect higher risks due to decarbonization mandates and potential gas bans, a weakening of the company's effective management of regulatory risk, or an inability to consistently earn its authorized ROE.

Upside scenario

We could raise our rating on NWNG over the next 12-24 months if the company's financial performance improves such that FFO to debt is consistently above 21%, with no increase to business risk.

Our Base-Case Scenario

Assumptions

- Modest customer growth and continued use of regulatory mechanisms.
- Continued negative discretionary cash flow through 2027.
- Annual capital spending averaging about $350 million through 2027.
- Annual dividends averaging about $85 million.
- All debt maturities refinanced.

Business Risk

We assess NWNG's business risk based on its low-risk regulated gas distribution operations accounting for about 95% of consolidated operating revenue, residential-focused customer base, and effective management of regulatory risks.

The company benefits from stable and supportive regulatory environments in both jurisdictions in which it operates, with purchased gas adjustments and environmental cost recovery, decoupling, and a forward-looking test year in Oregon and multiyear rate case fillings in Washington. We view these mechanisms as supportive of its financial measures, allowing the company to mitigate regulatory lag. In addition, 90% of the margin is generated from residential and commercial customers, providing a stable margin profile.

Northwest Natural Gas Co.'s natural gas distribution by segment

As of Dec. 31, 2024

Financial Risk

Under our base case, we assess NWNG using our low-volatility table, reflecting the low-risk nature of its natural gas distribution operations and effective management of regulatory risk. NWNG's 2024 stand-alone FFO to debt was 14.6%, and we expect it to strengthen modestly over our forecast period but remain in the middle of the range for its financial risk profile category. Specifically, we project FFO-to-debt in the range of 15%-17% through 2027. Our assumptions include the 2024 and 2025 Oregon rate case increases, annual capital spending averaging about

$350 million, and annual dividends averaging about $85 million through 2027. We expect a majority of the capital spending to fund replacing and improving system reliability.

Liquidity

As of March 31, 2025, we assess NWNG's liquidity as adequate, with sources covering uses by more than 1.1x over the coming 12 months, even if forecast consolidated EBITDA declines 10%. We believe the predictable regulatory framework for NWNG provides a manageable level of cash flow stability even in times of economic stress, supporting our use of slightly lower thresholds to

assess liquidity. In addition, NWNG can absorb high-impact, low-probability events, reflecting that the company maintains about $400 million in committed credit facilities through 2027. It also reflects our belief that the company can lower its high capital spending (averaging about $350 million annually through 2027) during stressful periods, indicating a limited need for refinancing under such conditions. Furthermore, our assessment reflects the company's generally prudent risk management and sound relationships with its banking group (which includes over four well-established banks).

Overall, we believe that the company can withstand adverse market circumstances over the next 12 months, with sufficient liquidity to meet its obligations. The company has no big long-term debt maturity coming due, and we expect it to proactively address this maturity well in advance of its scheduled due date.

Principal liquidity sources

- Cash and cash equivalents of about $81.8 million as of March 31, 2025;
- Credit facility availability of about $400 million; and
- Cash FFO estimated of about $280 million.

Principal liquidity uses

- Debt maturities of about $30 million;
- Capital expenditure of about $360 million; and
- Dividend payments of about $80 million

Environmental, Social, And Governance

ESG factors have no material influence on our credit rating analysis of NWNG.

Group Influence

Under our group rating methodology, we consider NWNH as the parent of the group with a GCP of 'a-'. We assess NWNG as a core subsidiary of NWNH because we view the utility as integral to the group's identity, highly unlikely to be sold, and having a strong commitment from NWNH's senior management, given the company's emphasis on maintaining its strategic focus on regulated gas distribution operations.

That said, our issuer credit rating on NWNG is two notches above the parent's GCP. Because NWNG is operationally separate from NWNH and there are certain regulatory restrictions in place, which we view the utility as having sufficient insulating measures that allow NWNG to be rated up to two notches above the NWNH's GCP. These regulatory protections include dividend restrictions, a highly independent board, and an independent third party that is the holder of the "golden share" whose vote is required to file for bankruptcy.

Issue Ratings--Subordination Risk Analysis

Capital structure

The short-term rating on NWNG is 'A-1' based on our 'A+' issuer credit rating on the company.

Analytical conclusions

We rate the company's medium-term notes program 'A+', equal to its issuer credit rating, because we view any debt issued under this program as debt issued by a qualifying investment-grade utility.

Issue Ratings--Recovery Analysis

Key analytical factors

NWNG's first-mortgage bonds benefit from a first-priority lien on substantially all of the utility's real property, owned or subsequently acquired. Collateral coverage of more than 1.5x supports a recovery rating of '1+' and an issue rating one notch above the issuer credit rating.

RRA Regulatory Focus
Alternative ratemaking plans in the U.S.

A key to reducing regulatory lag and providing certainty for investors

In these increasingly volatile times, when investors are struggling to understand what the ongoing COVID-19 pandemic and the related recessionary pressures will mean for utility cash flow and profitability, alternative ratemaking plans can provide some degree of protection.

Even before the current global crisis, Regulatory Research Associates, a group within S&P Global Market Intelligence, had taken note of an uptick in state regulators' and policymakers' interest in pursuing innovative forms of regulation to address challenges associated with expanding utility capital spending plans, modest to flat sales growth in most parts of the country, regulatory lag and changes in the way the utilities are expected to do business.

Alternative ratemaking plans is a term applied to a wide-ranging complement of mechanisms that are generally outside of the traditional base rate case model.

These plans can be broadly or narrowly focused. Broad-based plans like formula based ratemaking, multi-year rate plans and earnings sharing mechanisms streamline the regulatory process, lessen the burden on regulatory commissions, their staff and stakeholders and reduce regulatory lag for utilities. These type of mechanisms may be implemented on a stand-alone basis or in combination. Many of these arrangements also include an opportunity for earnings enhancement.

As of this writing, 13 of the 53 jurisdictions followed by RRA had formula based ratemaking plans in place for at least one company in the jurisdiction, including jurisdictions where such plans were combined with other mechanisms. There are 17 jurisdictions in which a multi-year rate plan is in place for at least one utility, including instances where it is combined with other types of plans. Earnings sharing mechanisms are in place for at least one utility in 25 jurisdictions, on a stand-alone basis or as part of either a multi-year plan or a formula-based ratemaking mechanism.

Alternative regulation plans in the US[1]

Formula-based ratemaking	Multi-year rate plans	Earnings sharing	Incentive ROEs	Electric fuel/ Gas costs	Capacity release/ Off-system sales

Source: Regulatory Research Associates, a group withinn S&P Global Market Intelligence

In certain jurisdictions, legislation or commission rules permit these types of plans, but the commission has yet to approve a specific plan for one of the utilities.

Narrowly focused plans generally target a specific type of behavior or investment on the part of a utility. For example, some may allow a company to retain a portion of cost savings relative to a base level of some expense type, such as fuel, purchased power or pension costs.

Others might permit a company to retain for shareholders a portion of off-system sales or capacity release revenues.

Still others provide a company an enhanced equity return, or ROE, for achieving operational performance targets, customer service metrics, reliability standards, demand reduction targets under energy conservation programs or for meeting or exceeding renewable portfolio standards.

In some instances, commissions have approved ROE premiums for specific types of plant investment when there was a preference for in-state generation versus wholesale power purchases, or in order to incent the deployment of renewable resource facilities.

While narrowly focused plans do not necessarily stream line the regulatory process the way that more broadly focused plans do, they do provide the utilities with the opportunity for earnings enhancement that could offset the impact of regulatory lag.

RRA generally views the presence of alternative ratemaking plans as constructive from an investor viewpoint.

A more detailed discussion of the various types of plans in place is provided in the sections that follow, and a listing of the plans that are currently in place across the U.S. is provided in the related data file.

For additional information, refer to the Alternative regulation section of the Commission Profile for each jurisdiction.

Setting the stage

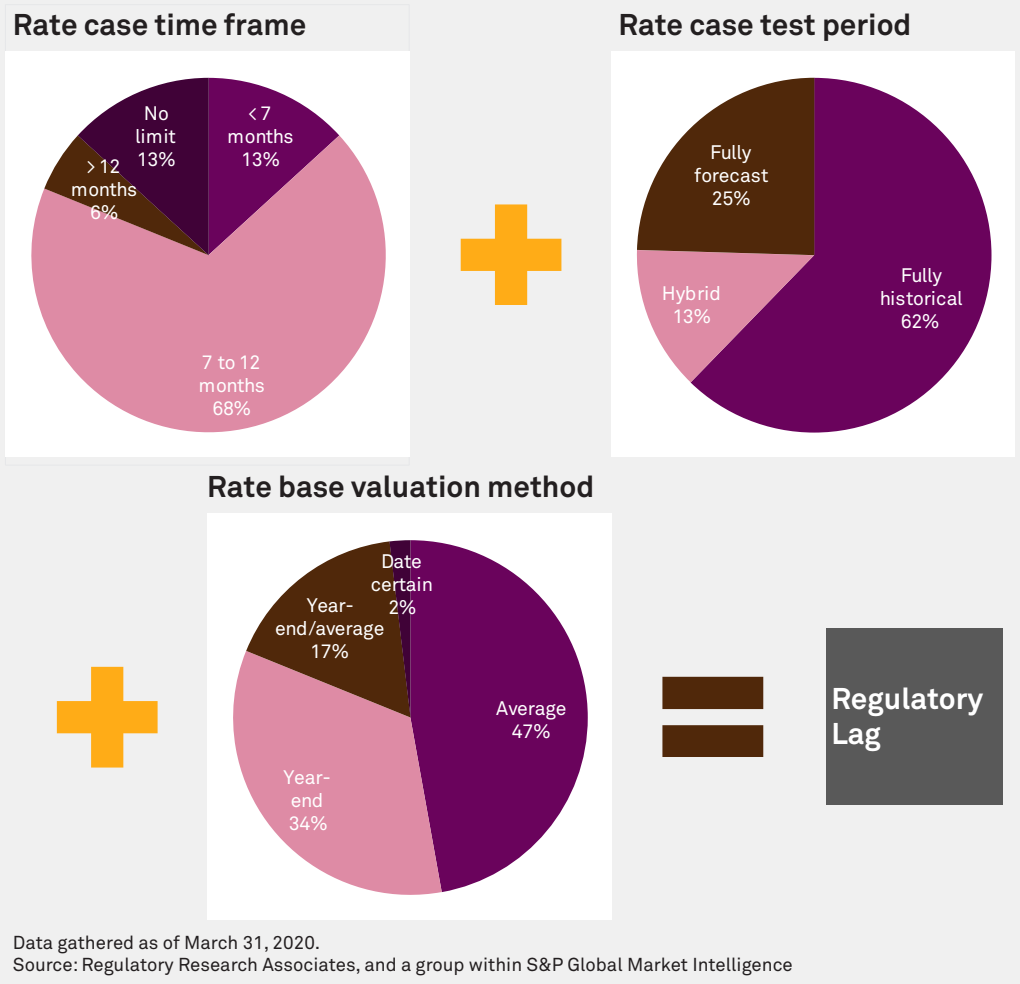
A quick word on regulatory lag

Regulatory lag refers to the time it takes for an investment or cost change to be reflected in rates after that change has occurred. This lag is an inherent part of the rate case process and comes in different forms.

First, is the sheer amount of time it takes for a rate case to be completed. Most states have rules in place that require rate cases to be completed within seven to 12 months of filing, but in some the time frame is substantially longer than 12 months and in others there is no statutory time frame at all.

Aside from processing time, there are the issues of whether the test year is historical, whether the commission employs an average or test-year-end rate base and/or to what extent adjustments to test year data are permitted. For information concerning how these policies are addressed in each state, refer to the Rate Case Timing/Interim Procedures and Rate Base and Test Period sections of RRA's Commission Profiles.

Changes to the basic components of the traditional process are often difficult to achieve, requiring legislative authority. Even in situations where the legislature is on board, stakeholders and commissioners may be slow to embrace the new concepts and there may be unintended consequences, such as a reduction in authorized ROE — whether implicit or explicit — to reflect the perceived reduced risk associated with these mechanisms.



Data gathered as of March 31, 2020.

Capital spending trends reviewed

Robust capital spending in recent years has been a driver of regulators' interest in and acceptance of alternative forms of regulation.

Based on a study conducted by RRA in October 2019, it was estimated that capital spending for the 52 power and gas utility holding companies in RRA's Financial Focus coverage universe would exceed $134 billion in 2019.

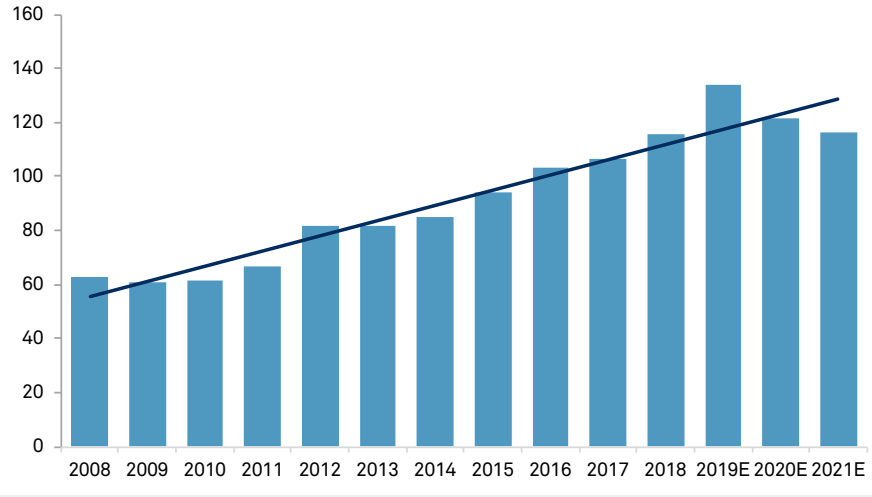
That figure is more than double 2008 capital spending for the group of $63 billion.

These expenditures are largely dedicated to projects such as grid modernization, deployment of advanced technologies, physical safety, reliability, environmental remediation and cyber security.

Such programs are aimed at improving service to existing customers, rather than expanding business into unserved territories or increasing per customer usage.

Up until this point, utilities have been able to achieve rate recognition of the increased investment, despite relatively flat load growth, without much complaint from regulators, because low interest rates and low gas and power market prices kept customer bills from rising precipitously.

Energy utility actual and estimated capital expenditures ($B)

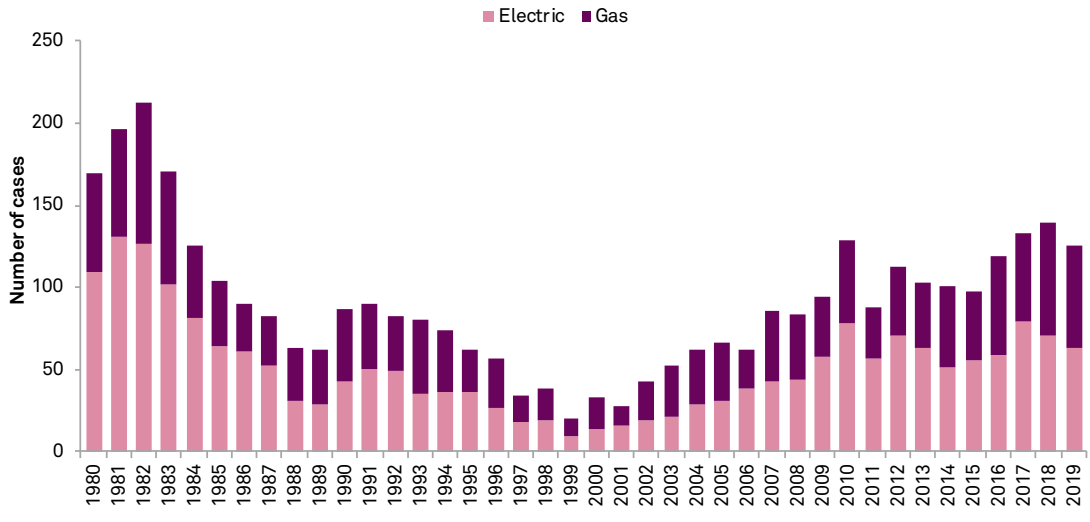


Data compiled Oct. 16, 2019.
E=Estimated
Source: S&P Global Market Intelligence

But that headroom has been eroding, there has already begun to be some pushback from regulators and stakeholders. The costs associated with maintaining service during the pandemic and the burgeoning recession will further erode that headroom. These added pressures may well result in changes to capital spending plans, at least in the near term.

Be that as it may, these increases in capital spending have been a major driver of the heightened level of rate case activity RRA has observed since 2010, as well as a driver of the increasing proliferation in alternative ratemaking frameworks.

Major rate case decisions, 1980-2019



Data gathered as of Jan. 2, 2020.
Source: Regulatory Research Associates, a group within S&P Global Market Ingelligence

There were almost 400 state-level electric and gas rate cases followed by RRA that were completed during the three years 2017 through 2019 — the busiest stretch since the generation construction boom of the 1980s.

Refer to RRA's report Major Rate Case Decisions — January - December 2019 for a discussion of rate case trends.

As of March 31, 2020, there were 31 electric and gas rate cases that had been decided nationwide and another 80 cases were pending. Thus, prior to the pandemic becoming so widespread, RRA had expected that 2020 could be another year where more than 100 rate cases were adjudicated.

In response to the financial strain on customers posed by the pandemic, schedules for several pending proceedings are already being delayed, others may be withdrawn and expected filings may be postponed for the time being, pushing the rate case cycle out to next year or perhaps longer.

Alternative ratemaking frameworks a closer look

As noted earlier, alternative ratemaking plans can be either broad-based or narrowly focused. In years passed these plans may have been referred to as incentive regulation because many were designed to accord the utility the ability to achieve incremental earnings relative to its authorized ROE for doing something regulators wanted them to do.

The term performance-based ratemaking was also used interchangeably with incentive regulation. The concept of mitigating regulatory lag is a newer phenomenon. As time has gone on, states have used a patchwork of these mechanisms. The discussion below is designed to provide a broad overview of what the plans currently in place entail, with some key examples for illustrative purposes. For detail concerning the specifics of the plans in place in a given jurisdiction, refer to the Alternative regulation section of the Commission Profile for that jurisdiction.

Formula based ratemaking plans

Formula based ratemaking plans generally refer to frameworks where the commission established a revenue requirement, including a target ROE, capital structure and rate of return for an initial rate base as part of a traditional cost or service base rate proceeding.

Once the initial parameters are set, rates may adjust periodically to reflect changes in expenses, revenue and capital investment. These changes generally occur on an annual basis, and there may be limitations on the percentage change that can be implemented in a given year or period of years.

The plans may remain in place until changed or rescinded by the commission, or there may be a set term. In some instances there are earnings sharing provisions and/or performance metrics the companies are required to meet with penalties/rewards embedded in the periodic rate adjustment to reflect the failure to meet or the ability to exceed the benchmark.

Alabama was the first state to embrace formula-based ratemaking and is perhaps the quintessential example of this construct. All three of the major utilities in the state have a formula ratemaking plan in place and they are all slightly different.

Taking Southern Company subsidiary Alabama Power Co.'s Rate RSE as an example—the framework was first implemented in 1982 and with the exception of a review several years ago to address allegations that the ROE incorporated in the plan was excessive, has operated uninterrupted since.

Under the plan, Alabama Power is permitted to adjust rates annually using a forward-looking test year. Rate changes are capped at 5% for any single year, and the two-year rolling average increase cannot exceed 4%.

The adjustment are designed to keep Alabama Power's earnings within a pre-established weighted cost of equity range — the ROE multiplied by the equity component of the capitals structure — of 5.75% to 6.15%. The Alabama Public Service Commission order approving the framework did not specify the ROE and capital structure; so, using this metric allows the utility added degree of financial flexibility.

Just to provide some perspective on the range, the average ROE authorized for vertically electric utilities in rate cases decided during 2019 was 9.73%, as calculated by RRA. According to RRA, the average authorized equity ratio for electric utilities that year was of 49.94%, which would equate to a 4.86% weighted average cost of equity.

Refunds are required of earnings in excess of the upper end of the range, but the utilities cannot recoup under-earnings below the lower end of the band. The company may earn a seven-basis-point return adder for achieving an "A" credit rating.

In addition to the Rate RSE mechanism, adjustment mechanisms are in place for energy costs and new generation facilities that are separate from the RSE framework.

This framework is viewed as constructive from an investor viewpoint. The automatic annual adjustments take into account changes in costs and sales volumes, up or down, and can also accommodate sea changes such as the federal tax overhaul that occupied so many of the states' time and energy during 2018 and 2019.

The rate change caps provide incentive for the companies to operate efficiently and the use of a target earnings range provides some upside potential.

The use of the weighted average cost of equity, rather than a straight ROE percentage takes into account the impact of changes in capital structure on the required ROE, while discouraging the utility from bulking up the capital structure to increase earnings. Conversely, the premium for maintaining a certain credit rating discourages the company from over-levering the utility.

Another example of formula based ratemaking is Southern Company subsidiary Mississippi Power Co.'s Performance Enhancement Plan, or PEP.

The PEP was implemented in 1986, and has remained in place with modest changes since. The plan allows for automatic annual increases based on a forward-looking test year, with the adjustments capped at 4% annually.

However, under the PEP, the ROE changes each year. First, a benchmark ROE is established using a combination of the Discounted Cash Flow, Capital Asset Pricing Model and Risk Premium methods and includes flotation costs. That ROE is then adjusted based on a formula that takes into account the company's performance against pre-established benchmarks for price, reliability and customer satisfaction.

No rate change is implemented if the company's actual ROE is within 50 basis points of the target. Outside of the range, there is a graduated sharing of the costs/benefits based on the company's performance on those same metrics.

There are separate mechanisms in place for fuel/purchased power and environmental compliance, with adjustments for the latter capped at 2% per year.

Similar mechanisms are in place for the other major utilities in the state.

While a bit more prescriptive than the Alabama plan the Mississippi plan is similarly viewed as constructive by investors even though the ROEs under the plan have been somewhat below prevailing industry averages when established. Like the Alabama plan, it can accommodate a variety of changes that affect the cost of service that may or may not be within the company's control. The price change cap and sliding scale ROE hold the utility accountable for operational efficiency, but provide opportunity for upside potential.

Mississippi Power PEP
Target ROE formula

Base ROE	
Discounted cash flow	33%
Capital asset pricing model	33%
Risk premium	30%
+Flotation costs	
+/- Company performance rating	
Price indicator	40%
Reliability	40%
Customer satisfaction	20%

Multi-year rate plans

As the name suggests, under multi-year rate plans, the commission approves a succession of rate changes that are designed to take into account anticipated changes in revenues, expenses and rate base. The PSC may approve a static authorized ROE or the plan may provide for adjustments to the ROE during the plan's term.

These plans often include true-up mechanisms to ensure that the company makes the investments it has committed to make at the inception of the plan. The plans often include earnings sharing mechanisms and may also include performance-based ratemaking provisions.

Generally, the company cannot come in for a new rate case during the term of a multi-year plan unless extraordinary circumstances occur, but there may be certain volatile costs that are addressed via adjustment clauses or deferral mechanisms.

New York has been one of the most prolific states when it comes to multi-year rate plans, as this framework has been used for virtually all of the state's major investor-owned utilities for decades.

Notably, there is no stated policy or statute that calls for the use of these types of plans. The plans have been approved following settlement negotiations among the parties to the affected company's rate case. One could make the argument that because they are the result of settlements, they represent a balance of stakeholder interests by definition.

New York uses fully forecasted test years, so the entire plan is forward looking. The rate changes, rate of return and updated rate bases for each year of the plan are identified up front, and are subject to true-up. The ROEs incorporated in the plans have generally been significantly below prevailing industry averages when established.

While the plans do vary from company to company, the most recent electric and gas rate plans, adopted for Consolidated Edison Co. subsidiary Consolidated Edison Co. of New York, or CECONY, in January 2020, provide a fair representation of how the plans generally work. The plans cover the calendar years 2020 through 2022.

CECONY is authorized an aggregate $810 million three-step electric base rate increase that includes a $113.3 million increase effective Jan. 1, 2020, a $370.3 million increase effective Jan. 1, 2021, and a $326.4 million increase effective Jan. 1, 2022.

For CECONY's gas operations, the company is authorized a $373 million aggregate three-step rate increase, consisting of an $83.9 million rate increase effective Jan. 1, 2020, a $122 million increase effective Jan. 1, 2021, and a $167.1 million increase effective Jan. 1, 2022.

The plan incorporates an 8.8% return on equity (48% of capital) and overall returns of 6.61% in rate years one, two and three for both electric and gas operations.

The 8.8% stipulated ROE is significantly below the electric and gas industry average authorizations nationwide for rate cases decided in recent years for similar utilities. Refer to RRA's report Major Rate Case Decisions — January - December 2019 for a discussion of trend in authorized ROEs.

Consolidated Edison ROE sharing provisions

Earned ROE	Sharing of incremental earnings
Up to 9.3%	None
Between 9.3% and 9.8%	50% ratepayers/50% shareholders
Between 9.8% and 10.3%	75% ratepayers/25% shareholders
Above 10.3%	90% to ratepayers/10% shareholders

As of Jan. 16, 2020.
Source: Regulatory Research Associates, a group within S&P Global Market Intelligence

The plan includes earnings sharing provisions under which actual earnings above a threshold ROE are to be allocated between shareholders and customers.

CECONY is to continue to defer and reconcile through future rate proceedings the following expenses: pension and other post-employment benefits expense, variable-rate tax-exempt debt, major storms, property taxes, municipal infrastructure support costs and the impact of new laws, and environmental site investigation and remediation.

In addition, CECONY will be permitted to earn incentives for electric and gas energy efficiency. The company will be subject to penalties if certain performance targets related to reliability, safety and other matters are not met.

The joint proposal reflects a productivity adjustment ranging from 1% to 2% over the three-year rate plan as well as an imputation for "business cost optimization" savings. The PSC has a long-standing policy of imputing a productivity adjustment, which typically has been calculated as 1% of total labor expense, all employee benefits and payroll taxes.

CECONY is also subject to incentive mechanisms related to the utility's achievement of the state's clean energy targets and advancement of distributed resources, as well as reliability initiatives, including the deployment of non-wires and non-pipes alternatives to meet demand growth.

The company's existing revenue decoupling mechanisms as well as adjustment clauses for renewables expense and other items will continue to operate during the term of the multi-year plan.

In effect, the plan contains many of the constructive attributes of the formula rate plans discussed previously. The ROE sharing mechanism provides the potential to accelerate recovery of certain assets and for earnings enhancement tied to improving efficiency. Additional earnings enhancement is offered for attaining certain performance objectives. The plan recognizes planned new future new investment without the need for additional rate cases.

California has used multi-year rate plans for many years as well, although the framework is more of an established policy and so the process is more defined.

Until recently, the energy utilities filed general rate cases every three years. In the context of these cases, the PUC generally approved a rate change for the current rate year, reflecting a future test year and two subsequent test years, referred to as attrition years. In January 2020, the PUC voted to change the three-year cycle to a four-year cycle in the hopes of making rate cases more efficient and predictable. The change is intended to allow utilities more time to implement risk-mitigation and accountability structures and devote less time to litigating issues with stakeholders in Investor-owned utilities in California had pushed for the change, citing challenges that have prevented the commission from resolving general rate case proceedings in a timely fashion.

In the past, the amounts of the out-year rate changes and rate bases were specified, but in recent cases, the commission has approved overall percentage rate changes without specifying the amount or the rate base. Cost of capital is not an issue in these cases, as the cost of capital for each utility is reset annually through a separate formulaic process. This process is discussed more fully in the relevant section below.

In Connecticut, the Connecticut Public Utility Regulatory Authority has in recent years adopted earnings sharing mechanisms as part of multi-year rate plans approved for the utilities as part of settlements in rate cases.

In a plan approved in 2018 for Eversource Energy Inc. subsidiary Connecticut Light and Power Co., the company was authorized a series of three rate increases aggregating to $124.7 million during the years 2018 through 2020.

The plan reflects expected changes in rate base, senior capital cost rates and includes a static 9.25% authorized ROE. This ROE was below the averages authorized in cases decided during 2018 and 2019.

The company is subject to an earnings sharing mechanism under which any earnings above the stipulated 9.25% ROE are allocated evenly between ratepayers and shareholders.

Connecticut Light & Power Co. rate plan

Year	Rate change ($M)	ROE (%)	ROR (%)	Rate base ($B)
2018	64.3	9.25	7.15	3.701
2019	31.1	9.25	7.04	3.780
2020	29.2	9.25	7.09	3.861

As of April 18, 2018.
Source: Regulatory Research Associates, a group within S&P Global Market Intelligence

Any amounts due customers under the terms of the earnings sharing mechanism are first applied to reduce various regulatory assets associated with certain unamortized environmental remediation costs. Remaining amounts due customers would then be used to offset the cost of catastrophic storms.

The plan also included a capital tracking mechanism for the recovery of core capital, system resiliency and grid modernization costs.

Rate freeze/stayout

Rate freezes, otherwise known as "stayouts," may be required as part of multi-year rate plans explicitly or implicitly, since the plan sets out the revenue requirements or a methodology for calculating the revenue requirements for the years covered by the plan. However, various other riders and adjustment mechanisms may be permitted to operate even if base rates are frozen.

By that definition, utilities in California, Connecticut, Massachusetts, New Hampshire, New York, Rhode Island, South Carolina and Wisconsin that are operating under multi-year rate plans that include specified latter year rate adjustments can be said to be subject to a stayout because they cannot file for rates that differ from those specified in the plan, unless some extraordinary event occurs. For purposes of this report, those instances have been excluded from the discussion.

Stayouts may also be a part of a settlement adopted in a traditional base rate case where no specific multi-year rate plan is implemented. In South Dakota, Black Hills Power, a subsidiary of Black Hills Corp., is subject to a rate freeze that runs through July 2023 that was approved as part of a 2017 settlement addressing recovery of certain transmission facility and environmental investments.

Also in South Dakota, Xcel Energy subsidiary Northern States Power Co. and Northwestern Corp. are operating under rate freezes that extend to Jan. 1, 2021; the stayouts were included in the terms of settlements adopted in 2018 that addressed the revenue requirement impacts of the 2017 federal tax reform.

Rate freezes have also commonly been part of the conditions placed on mergers. With less merger activity going on, many of the merger-related rate freezes and stayouts have expired. However, in Texas, Oncor Electric Delivery Co. LLC is subject to a stayout that expires later this year related to its 2018 acquisition by Sempra Energy Inc.

Rate freezes and stayouts are a subtle form of performance-based regulation and can be a double-edged sword. Generally, in addition to the company agreeing to refrain from filing a rate case, the intervenors will agree to refrain from filing complaints against the company's existing rates.

There is an incentive for the company to control its costs because to the extent costs are lower than the levels reflected in rates, the company would be able to retain the benefits. If costs are higher, then the utility would not have the ability to seek a rate increase.

In RRA's view the benefits for utilities of such programs are limited in times like these when capital spending is increasing at a steady pace, interest rates are at or near all-time lows, employee-related costs are on the rise and demand growth is limited at best.

Earnings sharing mechanisms

As the name implies, earnings sharing mechanism provide for the allocation between ratepayers and shareholders of earnings that differ from a target or target range established by the commission. As noted in the preceding sections, these mechanisms can be approved as part of formula based ratemaking plans.

They can also be implemented as part of multi-year rate plans, in conjunction with a rate freeze, as part of a merger-related filing, or on a stand-alone basis as part of a rate case.

For example, in Kansas, in 2018, the Kansas Corporation Commission, or KCC, approved a settlement related to the merger of Great Plains Energy Inc. and Westar Energy Inc.; the combined entity is now known as Evergy Inc.

The settlement incorporates a rate plan under which, following the conclusion of a then-pending rate case for Kansas City Power and Light, now Evergy Metro Inc., the utility's rates and those of then-Westar, subsidiary Kansas Gas and Electric, now Evergy Kansas Central Inc. are to be subject to a five-year base rate moratorium. However, the companies are permitted to seek rate changes under existing rate riders and to reflect the impact of new KCC rules or policies.

The companies are also subject to an earnings review and sharing plan. The companies were each awarded a 9.3% ROE in subsequently completed rate cases. For each of the years 2019 through 2022, the utilities are to file a report with the KCC. If in any year, the difference between the authorized 9.3% ROE and Evergy Metro's earned Kansas jurisdictional ROE, subject to certain adjustments, multiplied by the equity portion of rate base and grossed up for taxes, exceeds a $2.8 million rate credit, the company's ratepayers would receive one half of the difference. For Evergy Kansas Central, a similar calculation would apply, relative to an $8.6 million bill credit for the company.

In a 2019, rate case decision for Sierra Pacific Power Co., or SPP, the Public Utilities Commission of Nevada approved a settlement authorizing the company a 9.5% ROE and instituting an earnings sharing mechanism under which the company may retain earnings up to a 9.7% ROE, 20 basis points above the authorized return. Incremental earnings in excess of a 9.7% ROE are to be allocated evenly between ratepayers and shareholders.

Similarly in a 2017 decision for SPP affiliate Nevada Power Company, or NVP, the commission approved an earnings sharing mechanism as part of a rate case decision. The agreement and order specified a 9.51% ROE that included certain incentives for reliability performance. NVP may retain 100% of earnings up to a 9.7% ROE. Any earnings that exceed a 9.7% ROE would be shared evenly by ratepayers and shareholders.

These plans are to remain in place until the companies' next base rate proceeding is completed, at which time the commission may decide to terminate the plan, modify it, or replace it with some other mechanism.

SPP and NVP are subsidiaries of NV Energy Inc., which is a subsidiary of Berkshire Hathaway Energy and do business in Nevada as NV Energy. Berkshire Hathaway Energy is owned by a consortium of investors, including Berkshire Hathaway Inc.

While earnings sharing mechanisms are generally considered to be constructive from an investor viewpoint, there are some factors to consider. One consideration is how the benchmark ROE compares to the industry average. In the Kansas and Nevada plans discussed in this section and the Connecticut and New York plans discussed in the multi-year rate plan section, the benchmark ROEs were somewhat below the industry average when established.

Another consideration is whether there are provisions to allow the companies to recoup a portion of earnings below the authorized ROE. In the plans described so far, no such provisions exist, and for that reason RRA refers to these mechanisms as asymmetrical. So, they would be considered less constructive than the earnings sharing provisions in place as part of the formula rate plans for the Alabama and Mississippi utilities that contain symmetrical sharing mechanisms that allow the companies to adjust rates upward if earnings are below the benchmark.

Formulaic ROEs

Typically, the authorized ROE is one of the most, if not the most, highly contested issue in a rate case. While the commissions rely on generally accepted formulas, such as the discounted cash flow, risk premium and capital asset pricing models, the parties can vary widely as to the proxy group to which the analyses should apply, the weighting to granted each methodology employed and the inputs that go into many of the models.

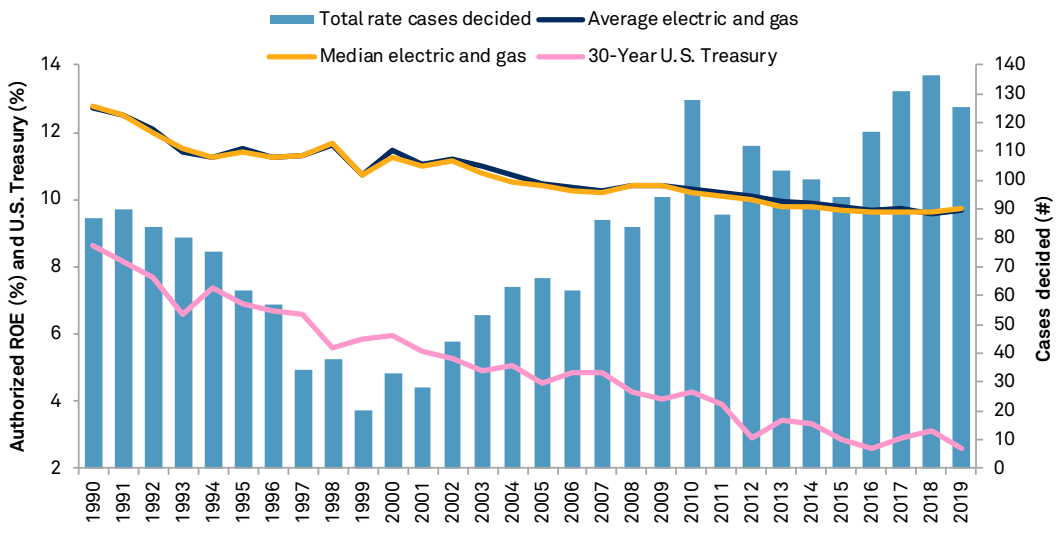
As a result, the recommendations from the different parties can differ by as much as 100 basis points versus the ROE sought by the company. This disparity increases the uncertainty when a utility does its internal analysis to decide whether it is worthwhile for the company to file a rate case at a particular time.

In order to reduce this uncertainty and lessen the amount of time it takes to complete rate cases, some states are taking a formulaic approach to selecting an authorized ROE. The idea being that establishing certain guidelines that must be adhered to will reduce or eliminate the variations among the parties and lessen the resource devoted to litigating these issues.

RRA generally views these mechanisms to be constructive for ratepayers; however, these formulaic plans may produce ROEs that are lower than prevailing industry averages at the time established.

As noted in the formula base ratemaking proceeding section, the Mississippi Power PEP plan employs a formulaic ROE in the sense that the plan specifies how much weight each of the calculation methodologies, but this only addresses a portion of the issues cited above.

Composite electric and gas authorized ROEs and number of rate cases, 1990-2019



Data compiled Jan.29, 2020.

Plans in place in Alabama, Illinois, California and Virginia take a more proscriptive approach. In Alabama, the formula rate plans in place of Spire Inc. subsidiaries Spire Alabama Inc. and Spire Gulf Inc. include a static ROE range, but the company may request a review of the authorized ROE should the interest rate for 30-year U.S. Treasury Bonds increase by more than 300 basis points. Conversely, the PSC may reexamine the authorized ROE should the interest rate for 30-year Treasury Bonds decrease by more than 200 basis points.

In California, automatic cost of capital, or COC, adjustment mechanisms are in place for Pacific Gas and Electric Co., or PG&E, Southern California Edison Co., or SCE, San Diego Gas & Electric Co., or SDG&E, and Southern California Gas Co., or SCG.

Under the mechanism, authorized ROEs are reviewed annually and reset if changes in the 12-month average of a Moody's long-term utility bond index yield, relative to a benchmark based on the same Moody's index yield, are greater than plus or minus 100 basis points.

If the ROE reset provision is triggered, the equity return would be adjusted, effective the following Jan. 1, by one-half of the difference in the 12-month average bond yield and the benchmark yield; in addition, long-term debt and preferred stock costs would be updated, but the authorized capital structure would not be adjusted. In any year in which the ROE is reset, the new 12-month average bond index yield would become the new benchmark.

A similar mechanism is in place for Southwest Gas Corp., or SWG, under which the authorized ROE is adjusted annually if utility bond yields change by more than 100 basis points.

SWG is a subsidiary of Southwest Gas Holdings Inc., PG&E is a subsidiary of PG&E Corp., SCE is a subsidiary of Edison International and SDG&E and SCG are subsidiaries of Sempra Energy.

In Illinois, the formula-based ratemaking plans in place for Exelon Corp. subsidiary Commonwealth Edison Co. and the electric operations of Ameren Corp. subsidiary Ameren Illinois incorporate ROEs that are updated annually and are equal to the 12-month average 30-year Treasury Bond yield for the prior calendar year, plus 580 basis points.

Hence, there is no controversy surrounding the ROE to be used for any give rate adjustment; however, the ROEs approved have been below industry averages when established. In the most recent adjustment, which was approved in December 2019, the formula produced an 8.91% ROE. The average ROE approved in electric delivery rate cases nationwide that were decided during 2019 was 9.37%.

In Virginia, in setting the base ROE for APCO's and VEPCO's rider mechanisms and for purposes of period earnings reviews for these companies, the SCC may "use any methodology to determine such return it finds consistent with the public interest." However, the ROE "shall not be set lower than the average of the returns on common equity reported to the Securities and Exchange Commission for the three most recent annual periods for which such data are available by not less than a majority, selected by the Commission ... of other investor-owned electric utilities in the peer group of the utility subject to such ... review." The selected ROE cannot be more than 300 basis points higher than the aforementioned average.

Incentive ROEs

Several states have approved "adders" to a company's overall ROE for achieving certain performance targets. As noted in the section on formula-based rate plans, the frameworks in place for the Mississippi utilities take certain performance metrics into account when setting the ROE benchmark for a given year. In Iowa, a utility may be awarded an ROE premium for achieving certain management efficiency goals.

In Indiana and Kansas the ROE may be adjusted to the extend the company meets certain renewable energy targets.

In Kansas and Wisconsin, ROE incentives may be awarded based on performance of some or all of company's generation units.

In Ohio one of the utilities has the opportunity to earn an enhanced ROE to the extent it meets certain grid modernization targets and in Washington, ROE premiums are available for meeting or exceeding certain distributed generation deployment targets.

In other instances, the utilities are permitted to earn an enhanced ROE on specific assets or asset classes.

For example, in Iowa, state law requires that the Iowa Utilities Board, or IUB, specify ratemaking principles — in advance of utility construction — to be applied to new baseload generation facilities of 300 MW or more for combined-cycle plants, alternative energy production facilities and certain investments to significantly alter an existing generation facility.

The IUB is not limited to traditional ratemaking with conventional cost recovery mechanisms and may authorize a rate of return on a new facility that is different than the return the utility is permitted to earn on existing generation assets. The enhanced ROEs remain in place for the life of the projects

Most recently, in 2016, the IUB approved an 11% ROE for Interstate Power & Light's, or IP&L's, New Wind Project, which will consist of up to a total of 500 MW. In 2013, for IP&L's 600-MW gas-fired Marshalltown plant, which went into commercial operation in April 2017, the IUB approved an 11% ROE. In 2008, the IUB adopted an 11.7% ROE for IP&L's 200-MW Whispering Willow-East Wind Farm, which was ultimately completed in 2009. IP&L is a subsidiary of Alliant Energy Corp.

Between 2002 and 2016, the IUB approved enhanced ROEs for a series of wind facilities constructed by MidAmerican Energy Co., or MEC, and these facilities were accorded ROEs ranging from 11.35% to 12.2%. MEC's 540-MW combined-cycle gas plant, the Greater Des Moines Energy Center, which was ultimately completed in 2004, was awarded a 12.23% ROE. MidAmerican's investment in a coal-fired generation facility, Council Bluffs Energy Center Unit 4, which was placed into service in 2007, was authorized a 12.29% ROE. MEC's ultimate parent is Berkshire Hathaway Energy.

The incentive ROEs are reflected in rates as part of base rate cases, where the IUB approves a blended ROE that represents the weighted average of the ROEs applied to the various categories of rate base.

In Virginia, state law allows the Virginia State Corporation Commission to authorize Appalachian Power Co. or APCO and Virginia Electric and Power Co., or VEPCO to recover certain types of investment through limited-issue rider mechanisms.

The riders include incentives for certain types of new generation, including a cash return on construction work in progress and an ROE premium that applies during construction and through up to the first 20 years of the plant's life.

The statute initially allowed premiums of up to: 200 basis-points on new nuclear generation facilities through the first 12 to 25 years of the plant's operation; 200 basis points on new carbon-capture compatible, clean-coal-powered facilities through the first 10 to 20 years of commercial operation; 200 basis points on new renewable resources through the first five to 15 years of commercial operation; and 100 basis points on new conventional coal or combined-cycle combustion turbine plants through the first 10 to 20 years of commercial operation.

The SCC approved ROE incentives for several VEPCO facilities prior to 2013, when legislation was enacted limiting the prospective availability of incentive ROE premiums to new nuclear and offshore wind facilities.

Such facilities could be eligible for premiums of 100 basis points that would apply during construction and continue through the first 12 to 25 years of a nuclear facility's useful life or the first five to 15 years of an offshore wind facility's useful life.

The SCC has yet to address any requests for ROE incentives for new nuclear or offshore wind. VEPCO has several other riders in place for generation and other types of investment that do not include ROE incentives.

Virginia Electric & Power Co. power plants with incentives

Plant Name(s)	Fuel source	ROE premium (basis points)	First year of operation	Duration of premium (years)
Altavista	Biomass	200	2013	5
Bear Garden	Gas	100	2011	10
Brunswick County Power Station	Gas	100	2016	10
Hopewell	Biomass	200	2013	5
Southampton Power Station	Biomass	200	2013	5
Virginia City Hybrid Energy Center	Coal/gas	100	2012	12
Warren County Power Station	Gas	100	2014	10

As of March 31, 2020
Source: Regulatory Research Associates, a group within S&P Global Market Intelligence

A limited issue rider is in place for APCO related to its investment in the natural gas-fired Dresden Energy Facility, but no ROE incentive is included.

VEPCO does business as Dominion Energy Virginia and is a subsidiary of Dominion Energy Inc., while APCO is a subsidiary of American Electric Power.

It goes without saying that ROE premiums in and of themselves are viewed as constructive from an investor standpoint, but the Virginia program that allows for expedited recovery through a limited issue rider, and recognition of construction work in progress goes a step even beyond the premium itself.

Cost savings sharing/performance based ratemaking

Many of the broader-based, holistic alternative regulation plans discussed so far contain performance-based components for achieving cost savings, management efficiency, meeting or exceeding public policy goals and the like. However, in many instances these type of mechanisms are separate from those plans, or where those plans do not exist, were adopted on a stand-alone basis.

RRA generally views these mechanisms as constructive from an investor viewpoint.

While the attached data tables provide a listing of what type of incentives are in place for each utility in each state, they are too numerous to go into detail here; the sections that follow are designed to provide some color about these mechanisms. Further details about the specific provisions in place in a given state can be found in the Commission Profiles.

Fuel/Purchased Power/Gas costs — Mechanisms that segregated commodity costs, i.e., fuel and purchased power for electric utilities and the gas commodity for gas utilities, are employed for all the utilities covered by RRA in each of the 53 state-level regulatory jurisdictions.

These mechanisms, which are separate from base rates, were implemented in the 1970s to address dramatic increases in commodity costs that were outside of the utility's control. The mechanisms were designed to allow the company's to adjust rates outside of a base rate case, hence on an accelerated basis, to reflect these rising costs that would otherwise threaten the utilities' solvency.

The costs were recovered on a dollar for dollar basis. Once commodity prices became less volatile, there was little incentive for the utilities to actively seek out lower cost alternatives, because any benefit would be passed on to ratepayers. In response, many states modified the recovery mechanisms to include a performance component, whereby the company could share in the benefit associated with lowering its commodity costs, and in many instances would be at risk of non-recovery if the costs rose beyond a certain point.

Commodity cost recovery mechanisms that include incentives are currently in place in close to 20 jurisdictions and RRA generally views these mechanisms as constructive, provided that there is a symmetrical sharing of risk i.e., the opportunity to achieve benefits is equal to the potential for non-recovery.

Capacity release/off-system sales sharing — These types of mechanisms arose largely due to the difficulty in timing capacity additions — be it gas pipeline or electric generation — with demand growth and also the need retain at least some reserve capacity on the system.

While there was a great deal of controversy in the 1990s surrounding major new generation additions that were seen as excess capacity when they were initially brought on line, the facilities were eventually recognized in base rates. Once they are there, customers within the utility service territories continue to pay the portion of fixed costs included in rates regardless of whether where demand goes from there on.

Under traditional ratemaking, were an electric utility to sell power to another utility that was in a load crunch or if a gas utility were to lease pipeline capacity on its system to another utility, the related revenues would be used to offset the cost to provide service to native load customers, thus flowing 100% of the benefit to customers.

Hence, there would be no incentive for the utility to actively pursue this type of activity. By allowing the utility to retain a portion of the benefit, regulators reasoned that the companies would increase their level of such activity to the benefit of both customers and shareholders.

Demand-side management program costs — The rationale here is similar to that for off-system sales. All else being equal utilities would not be amenable to instituting programs to encourage customers to use less power or gas. In the short-term revenues are lower. Presumably the lower volume would be reflected in the revenue requirement in a rate case and costs per unit sold would rise to make sure fixed costs were recovered, but there would be a lag. In addition, in the longer term there would be no need to add incremental facilities to the system and grow rate base, thus eroding future earnings potential.

Fixed vs. variable costs

Fixed	Variable
Depreciation	Gas commodity
Delivery O&M	Electric commodity
Property taxes	Generation O&M
Return on investment	
Customer service

Source: Regulatory Research Associates, a group within S&P Global Market Intelligence.

In order to encourage utilities to pursue these types of programs, many commissions implemented mechanisms that allow the utility to recover the direct program costs and recoup the lost revenues on an expedited basis. These mechanisms remove the disincentive to pursue such programs, and are discussed further in later sections of this report. However, they do not provide an affirmative incentive to pursue these initiatives.

In RRA's view, an incentive would entail the ability to earn a higher ROE for achieving certain demand reduction goals, the ability to earn a return on program costs, which are usually considered expenses rather than "rate base," and/or the ability to retain a portion of the avoided marginal costs. About 20 jurisdictions currently have these types of mechanisms in place for at least one utility in the jurisdiction.

Reliability/customer satisfaction — The regulatory compact that forms the basis for utility regulation in the U.S. requires the utility to provide safe, reliable service at just and reasonable rates. In exchange the utility is provided the sole right to operate within its franchised service territory and regulators are to provide the company the opportunity to earn a just and reasonable return commensurate with the level of risk for shareholders.

This begs the question of why the company would need an incentive to provide reliable service, and many consumer advocates have asked this same question. The answers are both simple and complex.

When faced with a choice between upgrading an existing asset that will provide better service to existing customers but will not, at least until the next rate case, generate any new revenue and investing in projects that will increase penetration into unserved areas or accommodate new customers in existing areas thus generating new revenue sources and ultimately growing rate base in the next rate case, utilities will choose the latter every time.

Also, in the context of a base rate proceeding it is easier for the utility to provide objective proof of why an investment is/was needed to serve new customers which can be documented than it is to show that an investment is needed to forestall some catastrophe that may or may not occur in the future.

However, as weather volatility has increased with severe storms and wildfires becoming both more frequent and more widespread, failures of aging infrastructure leading to well publicized catastrophes and advanced technologies of the digital age requiring higher quality more consistent power flows, reliability has become a front burner issue.

As will be discussed in the next section of this report, these realities have given rise to the spread of expedited cost recovery mechanisms that remove some of the disincentives to investments in these non-growth related projects.

Some jurisdictions are going a bit further and providing companies incentives for meeting exceeding deployment targets, or for hitting certain benchmarks for service interruptions and customer satisfaction. There are four states with explicit incentives in place for at least one utility associated with reliability and two with customer satisfaction.

RRA finds these mechanisms to be constructive from an investor viewpoint, provided that there is as much of an opportunity for the utility to achieve benefit a benefit for shareholders as there is to incur a penalty.

Productivity — Productivity is a broad term that can include: achieving overall operations maintenance cost or a specific expense, such a pension costs; lowering commodity costs; demonstrating superior generation plant operational performance; meeting or exceeding energy conservation program participation or demand reduction targets; attaining or exceeding goals with respect to clean energy or advanced technology deployment; or, beating benchmarks associated with reliability and customer service.

Incentives are generally in the form or ROE enhancement, sharing of incremental revenues or retention of cost savings. Several examples were included in the preceding discussions of the other types of alternative forms of regulation that are in place.

Adjustment clauses — Alternative ratemaking by another name?

While the above-discussed mechanisms are generally what comes to mind when the phrase "alternative ratemaking" is used, adjustment clauses, also known as limited issue riders, are another approach to reducing regulatory lag, and using a broad definition could be considered "alternative ratemaking."

Adjustment clauses were first introduced in the 1970s to mitigate volatile fuel costs that were threatening company earnings and cash flows. In the ensuing years, the use of these mechanisms expanded to include other expenses that were outside of a company's control or were mandated by government regulation.

More recently, they have become increasingly prevalent to address capital investment, be it gas main replacement, electric grid modernization or in some cases new generation — particularly when a state wanted to foster construction of a particular type of generation or the deployment of new technologies. It is because of this "incentive" aspect and the use of these mechanisms to address regulatory lag that they are included in this discussion.

Like the broader-based alternative regulation plans discussed earlier, these mechanisms tend to reduce regulatory lag, but only as it pertains to the assets, asset classes, or expenses that are permitted to be recovered through these mechanisms. It is also noteworthy that the presence of a broad based alternative ratemaking does not preclude the use of stand-alone adjustment mechanisms for certain items.

However, in some instances, where these mechanisms are used heavily, RRA has observed some degree of pushback from customers, consumer advocates and commissions.

Virginia, Texas and Pennsylvania are states that rely heavily on limited issue with or without "alternative ratemaking" per se.

Virginia's electric utilities have remained vertically integrated. Retail choice is only available for large volume industrial customers and commercial customers that can aggregate load to reach a 5MW threshold.

For the two largest electric utilities, "base rates" have largely been frozen for several years pursuant to a statutory periodic earnings review process. In this instance, "base rates" refers to legacy generation and distribution assets.

The periodic earnings review process incorporates an ROE-based earnings-sharing mechanism. The ROEs are set based on a formula laid out in state law.

Back in 2007 when other mid-Atlantic states were grappling with congestion issues, Virginia embarked on a course to incent "inside the fence" generation in order to avoid incurring PJM Interconnection congestion charges, and specifically targeted gas-fired baseload generation.

State policy allowed these investments to be recovered through plant-specific generation riders that included a cash return on construction work in progress while the facilities were being constructed and an incentive ROE premium of as much as 200 basis points on the investment for a fixed term.

Adjustments under the riders are based on forward-looking "rate years," that are the first year the new rates are in effect. As noted above certain types of plants are eligible for and have received ROE premiums within the riders.

This paradigm was ultimately expanded to include other types of capital investment including utility-owned renewables, certain types of electric infrastructure and environmental compliance costs.

Riders are also permitted for demand-side management program costs, and the utilities are awarded a return on these expenses as an incentive to pursue the programs.

At the same time, Virginia allows certain expenses to be passed through to ratepayers using an adjustment clause – examples include fuel, renewable energy credit costs and FERC transmission charges.

For the most part these riders are updated annually and the capital investment related riders are essentially mini rate cases that take eight to nine months to adjudicate. Each adjustment includes a true-up for prior period over- and under-recoveries.

Over the last couple of years, there has been some backlash with regard to this approach, including legislative changes to the framework, some successful, others not. There has also been a push by large commercial customers to aggregate load in order to qualify to obtain their supply competitively. See the Virginia Commission Profile for additional detail.

In Texas, electric utilities and gas utilities are regulated by different agencies and the policies are very different. On the electric side, part of the state is restructured and part is not.

There are adjustment clauses to pass-through costs such as fuel and purchased power, wholesale transmission costs assigned to the utility by regional transmission organizations, demand-side management and storm costs.

Annual and semi-annual adjustments are permitted for distribution investment and transmission investment for both vertically integrated and delivery only companies.

State law allows for adjustment mechanisms for incremental generation facilities in the areas of the state that have not implemented retail competition.

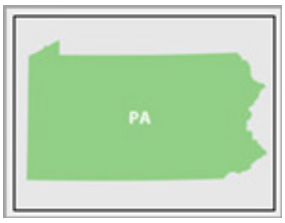
The adjustments rely on the ROE approved in the company's most recent rate case and a historical test year, consistent with the policy for base rate cases in the state. A prudence determination does not occur until the next base rate case, when related investments and revenue requirement roll into base rates and the adjustment clause is reset to zero.

Notably, there have been instances where the Public Utility Commission of Texas has in the context of a base rate case, disallowed recovery of assets that were reflected in the adjustment mechanism.

In addition, state law requires the PUC to maintain a schedule so that there is no more than four years between utility base rate cases. Also, the PUC staff conducts an earnings analysis for each utility at the end of each calendar year and then makes recommendations to the PUC regarding whether a full earnings investigation is warranted.

For additional information, see the Texas PUC Commission Profile.

Pennsylvania is one of the states that allows retail competition for all generation service customers. In 2012, Pennsylvania transitioned from using a historical test period to a fully forecasted test period. At the same time, the state adopted the distribution system improvement charge, or DSIC, framework for incremental infrastructure spending between rate cases.



Adjustments under the mechanism occur quarterly and are forward looking. The ROEs used are either those established in the companies' most recent base rate case, or if the last fully litigated ROE is more than three years old, a "generic" ROE set by the PUC for each industry based on a quarterly review the utilities' earnings is used.

A utility may only adjust rates under the DSIC if it is earning below the established ROE, a provision that offers some assurances for stakeholders that the utilities are not "gaming the system."

The costs reflected in each adjustment are subject to prudence review in the company's next base rate case. So, despite the frequency of the adjustments, it does not appear that the framework places an undue burden on the participants.

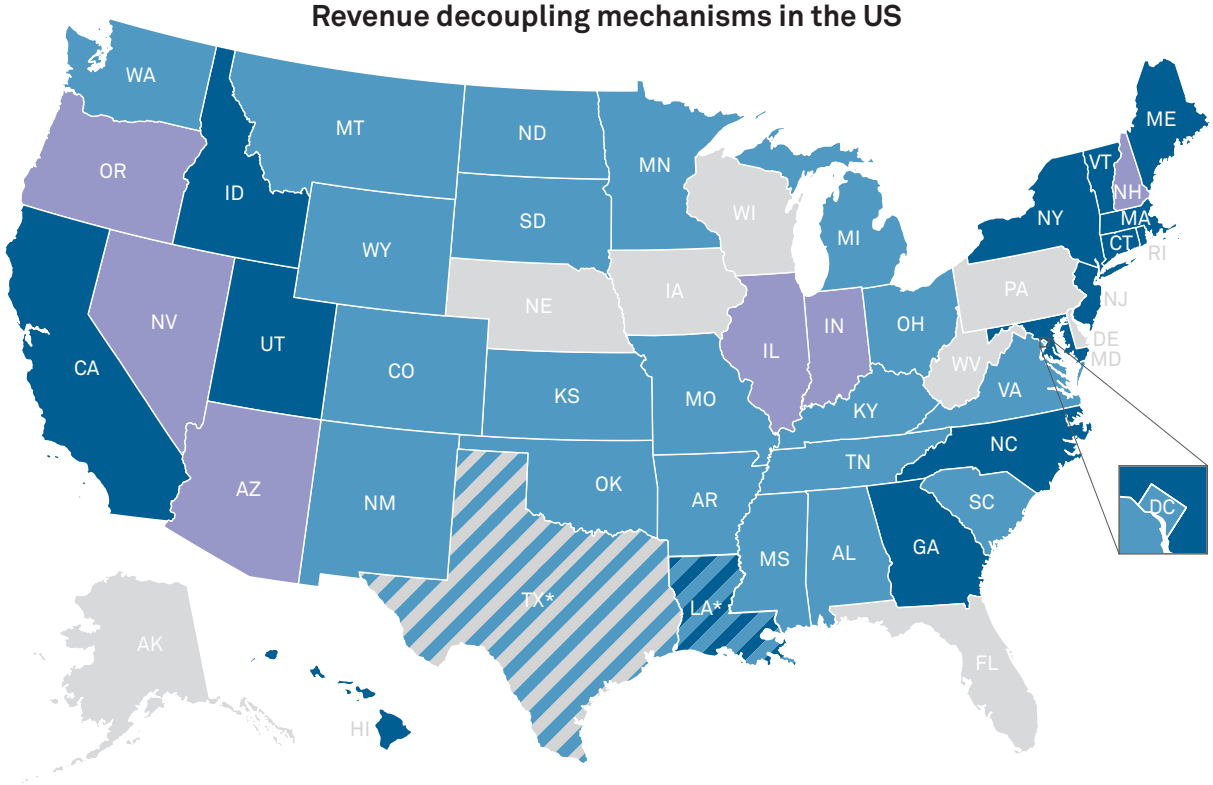
Until recently, Pennsylvania had eschewed "alternative ratemaking." However, legislation permitting various forms of alternative regulation was enacted recently and the commission has adopted rules for implementing these mechanisms on a company-specific basis. No alternative ratemaking plans have been requested or approved to date.

Revenue decoupling mechanisms

Decoupling mechanisms allow utilities to adjust rates between rate cases to reflect fluctuations in revenues versus the level approved in the most recent base rate case that are caused by a variety of factors.

Some of these factors, such as weather are beyond a utility's control and the mechanism can work both ways — in other words it can allow the company to raise rates to recoup revenue losses associated with weather trends that reduce customer usage and can also require the company to reduce rates when weather trends cause usage to be higher than normal.

Revenue decoupling mechanisms in the US



Partial	At least one company has a mechanism in place and it is partial
Full	At least one company has a mechanism in place and it is full
Varies	Multiple companies have a mechanism, some are partial others are full
None	No companies have a decoupling mechanism in place

As of March 31, 2020.

Market Intelligence

As clean energy policies have gained momentum, driving ever-expanding energy efficiency initiatives, decoupling mechanisms have been implemented to reduce the disincentive for utilities in pursuing energy conservation programs by making the utilities whole for reductions in sales volumes and revenues associated with customer participation in these programs.

Some of these mechanisms also allow the utility to adjust rates to reflect fluctuations in customer usage that are brought about by broader economic issues, such as demographic shifts, the migration of large commercial/industrial customers to other service areas, the shutdown of such businesses due to changes in their respective industries, recessions and theoretically, crises such as the current COVID-19 pandemic.

RRA considers a decoupling mechanism that adjusts for all three of these factors to be a “full” decoupling mechanism and designates those that address only one or two of these factors as “partial” decoupling mechanisms.

Some the mechanisms include a cap on the percentage rates can change under the mechanism. Others only permit adjustments if the utility is earning below the authorized ROE or include performance criteria, such as achieving a targeted demand reduction level. RRA also classifies these type of plans as partial decoupling even if they do address all of the three factors.

Similar to the investment-related adjustment clauses noted above, decoupling mechanisms are included in this discussion of alternative regulation because they streamline the regulatory process and allow the company to reflect changes in usage/revenues in rates without the need for a rate case.

Also, in many instances the mechanisms were intended to encourage the utilities to pursue energy efficiency/demand side management programs rather building new generation, even if there were no specific demand reduction goals in the state, or in cases where there were goals to exceed those goals.

In addition, keeping revenue stable despite changes in these exogenous factors provides something of an "incentive" for management efficiency, as achieved cost savings can be retained until the next rate case, unless there is return cap built into the mechanism.

As of this writing, 21 jurisdictions had full decoupling mechanisms in place for at least one company, including six states that have different types of mechanisms for different companies. Partial revenue decoupling mechanisms were in place for companies in 28 jurisdictions, including six states that have different types of mechanisms for different companies and there are no decoupling mechanisms in place in 10 jurisdictions.

A more comprehensive discussion of adjustment clauses and rider mechanisms is provided in RRA' November 2019 report Adjustment Clauses — A State by State Overview and related data tables.

This information is also available in the Adjustment clauses sections of the state Commission Profiles.

Introduction

In the face of the robust expansion of utility capital expenditures in recent years, increases in expenses attributable in part to increased levels of inflation and sluggish demand growth in some parts of the U.S., industry stakeholders have developed innovative strategies that support timely rate recognition of these costs. As shown in the image below, capex for 47 energy utilities covered by Regulatory Research Associates, a group within S&P Global Commodity Insights, is estimated to exceed $154 billion in 2022, well above the $131.8 billion of actual investment in 2021 by the same companies.

Energy utility actual and estimated capital expenditures

The electric and gas utilities' use of adjustment clauses to recover variations in costs outside of the traditional rate case process has its origins in the 1973 Arab oil embargo, when fuel costs skyrocketed, leaving the utilities with no way to recover the increased costs in a timely manner. At that time, the only remedy for the utilities was to file a rate case; however, rate proceedings frequently took more than a year to litigate, and fuel prices climbed more rapidly than the utilities could obtain rate recognition of the increased costs. Some jurisdictions permitted the utilities to have more than one rate case pending simultaneously, but most did not.

In the years following the embargo, utility earnings were under considerable pressure, prompting some jurisdictions to establish a more constructive framework to allow more timely recovery of cost increases that were beyond the utilities' control.

The result was the creation of the fuel adjustment clause, or FAC — a single-issue ratemaking process whereby a utility is permitted to implement periodic rate adjustments to reflect changes in its cost of fuel. The utility is generally authorized to defer incremental variations in its fuel costs to offset any effect on earnings from the variation. The deferred amount is then recovered from, or refunded to, ratepayers in the next FAC rate adjustment. In some circumstances, the FAC includes a forward-looking component that is subject to true-up provisions. In addition to fuel costs, most jurisdictions allow to include the utilities' purchased power expense in the FAC.

State utility commissions have approved adjustment clauses for recovery of environmental compliance, energy efficiency and conservation program expenses, transmission charges allocated to the utility by the Federal Energy Regulatory Commission and investments associated with meeting renewable resource requirements. Such mechanisms have also been approved to pass through to customers all or a portion of the margins that the company receives from selling excess power or pipeline capacity in the open market through off-system sales.

Another type of adjustment clause — a decoupling mechanism — enables utilities to offset the effect on revenues of fluctuations in sales caused by customer participation in energy efficiency programs, deviations from "normal" temperature patterns or economic conditions. RRA considers a decoupling mechanism that adjusts for these factors to be a "full" decoupling mechanism and designates those that address only one or two of these factors as "partial" decoupling mechanisms. RRA also assigns a partial decoupling tag to those mechanisms that include rate caps or other limitations.

More recently and with greater frequency, commissions have approved mechanisms that permit the costs associated with the construction of new generation or delivery infrastructure to be used, effectively including these items in rate base without the need for a full rate case. In some instances, these mechanisms may even provide the utilities a cash return on construction work in progress.

As shown in the following infographic, certain types of adjustment clauses are more prevalent than others. For example, those that address electric fuel and gas commodity charges are in place in all jurisdictions. Also, about two-thirds of all utilities have riders in place to recover costs related to energy efficiency programs, and roughly half of the utilities have some type of decoupling mechanism in place.

About this report

This report covers the key adjustment clauses used by the largest electric and gas utilities in the 53 jurisdictions covered by RRA. This report does not address surcharges that have been approved to enable a utility to recover specific one-time items, e.g.,such as excess storm-restoration costs incurred in a given year, where the utility is recovering a fixed amount over a defined period.

This report also does not include expense trackers, which provide for the deferral of variations in costs for potential recovery at a future time when the commission will consider the accumulated balance for inclusion in rates. Although an expense tracker is designed to keep the utility's earnings whole, rates and cash flows do not change on a current basis. Expense trackers are sometimes authorized to account for variations in pension-related costs. While there are similarities between each of these types of ratemaking provisions, only adjustment clauses allow rates to change on an expedited basis in accordance with cost changes.

The accompanying table includes footnotes (denoted by "✓*" or "--*"), where clarification regarding the specific adjustment clause is necessary. Further details concerning the adjustment clauses included in this report can be found in each of RRA's Commission Profiles.

SCC	State Corporation Commission (Virginia)
URC	Utility Regulatory Commission (Indiana)
WUTC	Washington Utilities and Transportation Commission

The Take

A key component of innovative strategies supporting timely rate recognition has been the use of adjustment clauses to address recovery of utility investments, as well as issues related to rising/volatile costs. A defining characteristic of an adjustment clause is that it effectively shifts the risk associated with recovery of an expense from shareholders to customers. If the clause operates as designed, the company is able to change its rates to recover its costs on a current basis, without any negative effect on the bottom line and without the expense and delay that accompany a rate case filing.

The use of adjustment clauses has expanded significantly. These clauses are generally reserved for expenses that are outside the utility's control or are required by law or rule. Some jurisdictions have approved the use of adjustment clauses for recovery of environmental compliance, energy efficiency and conservation program expenses, transmission charges allocated to the utility by the Federal Energy Regulatory Commission and investments associated with meeting renewable resource requirements.

Related footnotes for data table — by state

Alabama

Electric fuel/gas commodity/purchased power — The certificated new plant, or Rate CNP, adjustment clause for Alabama Power Co. provides for recovery of costs, excluding fuel, associated with certified purchased power agreements. Adjustments under the clause are subject to a staff and Alabama PSC review process that includes public hearings. Alabama Power also utilizes an energy cost recovery adjustment clause. Spire Alabama Inc. and Spire Gulf Inc. utilize a competitive fuel clause that allows the companies to immediately adjust prices to compete with any alternate fuel or gas supply source, with no loss of earnings margin.

Decoupling — Spire Alabama and Spire Gulf operate under weather normalization adjustment, or WNA, mechanisms.

Traditional generation/environmental compliance — The Rate CNP adjustment clause used by Alabama Power provides for recovery of costs related to the commercial operation of certified generating facilities, certified purchased power agreements and environmental mandates. Recoverable environmental costs include applicable operation and maintenance expenses, depreciation and a return on capital beginning with investments made in 2005. Such costs are generally subject to review but not to a full evidentiary hearing.

Arizona

Decoupling — Arizona Public Service Co. utilizes a lost fixed cost recovery, or LFCR, mechanism designed to make the company whole for contributions to fixed-cost recovery that would otherwise be foregone due to customer participation in energy efficiency and distributed energy programs. The LFCR is capped at 1% of annual revenues, with any excess being deferred for future recovery. Arizona Public Service' LFCR also now includes an earnings test.

A full decoupling mechanism, called the delivery charge adjustment, is in place for Southwest Gas Corp. The mechanism compares actual revenues with revenues authorized in the company's last general rate case.

Tucson Electric Power Co. operates under an LFCR mechanism designed to mitigate the revenue impact of lost sales associated with the ACC's energy efficiency standards and the distributed generation requirements under the commission's renewable energy standards. The annual adjustments are capped at 2% of retail revenues, with any excess to be deferred for future recovery.

UNS Electric Inc. utilizes an LFCR mechanism under which the company is permitted to implement annual rate adjustments related to any shortfall in recovery of fixed costs due to energy efficiency and distributed generation. The LFCR is not intended to recover fixed costs due to other factors, such as weather or general economic conditions, and, as such, is not considered a full decoupling mechanism. The annual adjustments are to be capped at 1%, with any excess amount to be deferred for future recovery.

UNS Gas Inc. is subject to an incentive-based LFCR plan that allows the company to attain greater amounts of fixed-cost recovery as it meets commission-defined energy efficiency goals. Residential customers are permitted to opt out of the LFCR provisions if they agree to a rate structure that incorporates a higher basic service fixed monthly charge. The LFCR is capped at 1% of annual revenues, with any excess being deferred for future recovery.

Delivery infrastructure — A surcharge is in place for Southwest Gas that pertains to a distribution pipeline replacement program associated with pre-1970 vintage steel pipes. Southwest Gas also has a mechanism in place that provides for the recovery of costs associated with programs through which the company replaces certain assets located on customers' properties with assets that are owned and operated by the utility.

Arkansas

Decoupling — A generic framework, effectively a partial decoupling mechanism, is in place that provides for the electric and gas utilities to recover the lost contribution to fixed costs associated with energy efficiency-related usage reductions and to retain a portion of the net benefits related to these programs. The gas utilities have been using full decoupling mechanisms for several years.

Generation — Entergy Arkansas LLC, or EA, utilizes a capacity acquisition rider to recover costs associated with its investment in certain generation facilities and a capacity cost recovery rider to flow through the net costs related to the company's purchases of capacity to serve retail customers.

Delivery infrastructure — EA uses a rider to recover costs associated with certain government-mandated investments. A gas main replacement program is in place for Summit Utilities Arkansas Inc., or SUA, Black Hills Energy Arkansas Inc., or BHEA, and Arkansas Oklahoma Gas Corp., or AOG, under which the companies are authorized to recover the cost of replacing cast iron and bare steel gas mains and associated services through a mechanism. BHEA and SUA also have an at-risk meter relocation program rider in place to permit timely recovery of the costs associated with moving meters from customers' property lines to the structures being served.

Colorado

Decoupling — An adjustment clause is in place for Public Service Company of Colorado's, or PSCO's, gas operations that provides for recovery of lost revenues associated with customer participation in demand-side management programs.

PSCO's electric operations are subject to a pilot partial decoupling mechanism that applies to the company's residential and small commercial customers. The mechanism is to terminate Dec. 31, 2023. Annual adjustments under the mechanism are to be capped at 3% of class revenues.

Generation — Black Hills Colorado Electric Utility Inc., or BHCE, has a rider in place that reflects the company's investment in a gas-fired plant at the Pueblo Generating Station. Costs recovered through the rider are accorded a lower ROE than that established for BHCE's other Colorado jurisdictional operations. The rider is to remain in place until BHCE's next rate case.

Delivery infrastructure — PSCO operates under a pipeline system integrity adjustment mechanism for its gas operations, through which the company recovers the costs associated with reliability improvements and compliance with certain federal safety regulations. A similar mechanism, known as the system safety and integrity rider, is in place for Black Hills Gas Distribution LLC.

Connecticut

Electric fuel/gas commodity/purchased power — Connecticut Light and Power Co., or CL&P, and United Illuminating Co. no longer own generation, and both are permitted to recover, on a current basis, their full costs of providing generation service to those customers who do not choose an alternative supplier. These costs are allocated to ratepayers outside of a rate case.

Decoupling — State law mandates the adoption of decoupling mechanisms for the electric and gas utilities.

Renewables/Non-traditional generation — State law permits the electric distribution companies to recover prudently incurred costs associated with the energy storage pilot programs, first through a fully reconciling mechanism, and then through base rate cases following the utility's next rate case.

Delivery infrastructure — A system expansion reconciliation mechanism is in place that permits the gas utilities to reconcile gas-expansion-related revenue annually between rate cases. Yankee Gas Services Co., Connecticut Natural Gas Co. and Southern Connecticut Gas Co. also utilize a distribution integrity management program mechanism that allows for recovery, between rate cases, of the costs associated with main replacement activity. A capital tracker, referred to as the electric system improvements charge, is in place for CL&P for capital additions for system resiliency and grid modernization.

Delaware

Electric fuel/gas commodity/purchased power — In conjunction with the implementation of retail competition, Delmarva Power and Light Co.'s electric fuel adjustment was largely eliminated. Power to meet the standard offer service, or SOS, needs is now procured competitively and reflected in rates on a current basis.

Delivery infrastructure — State law allows electric and gas utilities to implement a distribution system improvement charge. Delmarva is permitted to recover the cost of relocation of aerial and underground facilities required or necessitated by the Department of Transportation or other government agency projects.

Environmental compliance — Chesapeake Utilities Corp. has a rider in place to recover environmental costs associated with cleaning up former manufactured gas plants. Delmarva has a mechanism in place for its gas operations to recover costs associated with the cleanup of a manufactured gas plant.

District of Columbia

Electric fuel/gas commodity/purchased power — Fuel and purchased power adjustment clauses are permitted by law. However, with the onset of electric retail competition, Potomac Electric Power Co., or Pepco, divested most of its generation assets and those not divested have since been retired. Pepco purchases the power to meet its SOS requirements via a competitive bidding process, and prices paid by SOS customers reflect the weighted average of the winning bids. SOS prices are adjusted on a current basis.

Decoupling — A bill stabilization adjustment mechanism is in place for Pepco that is designed to mitigate the volatility of revenues and customer bills caused by abnormal weather and customer participation in energy efficiency programs.

Renewables/non-traditional generation — The utilities' rates include a charge to fund the Sustainable Energy Trust Fund; amounts collected are remitted to the third-party — Sustainable Energy Utility. Additionally, Pepco and Washington Gas Light Co., or WGL, have in place a charge to contribute to the Energy Assistance Trust Fund.

Delivery infrastructure — State law provides for the district to issue bonds, finance or securitize a portion of the costs associated with a plan, under which Pepco is to relocate certain above-ground distribution facilities below ground. In addition, the bill authorizes the PSC to approve a mechanism to achieve rate recognition of the unsecuritized portion of the project. Pepco has a mechanism in place to recover costs associated with work performed to underground certain electric power lines in the district. The PSC has approved a $1 billion, 40-year accelerated pipeline replacement program for WGL and a related mechanism.

Florida

Traditional generation — Electric utilities are permitted to recover all prudently incurred site-selection and preconstruction costs, including carrying charges, for nuclear and integrated gasification combined-cycle, or IGCC, power plants through the capacity cost recovery clause, or CCRC. A cash return on construction work in progress for nuclear plant construction and uprates and IGCC construction is also reflected in the CCRC.

Renewables/non-traditional generation — Duke Energy Florida LLC is allowed to petition the Florida PSC for cost recovery for installation of solar generation capacity through a solar base rate adjustment, or SoBRA, mechanism. Tampa Electric Co. also has a SoBRA mechanism. Florida Power & Light Co. is authorized to recover the costs of solar generation through SoBRA upon each unit's commercial operation date if it is determined to be cost-effective and the costs are reasonable.

Delivery infrastructure — Peoples Gas System Inc. utilizes a rider to recover the costs associated with accelerating the replacement of cast-iron and bare-steel distribution pipes on its system. The smaller gas utilities — Florida Public Utilities Co., the Florida division of Chesapeake Utilities and Pivotal Utility Holdings Inc. — use similar riders.

State law allows for establishment of a storm protection plan cost recovery clause for electric utilities in the state. The law allows utilities to seek more timely recovery of storm-hardening investments outside of a general rate case. The law requires utilities to submit to the PSC a 10-year plan explaining "the systematic approach the utility will follow to achieve the objectives of reducing restoration costs and outage times associated with extreme weather events and enhancing reliability." Such grid-hardening activities include burying transmission lines and vegetation management.

Georgia

Electric fuel/gas commodity/purchased power — As a result of the restructuring of the natural gas industry in Georgia, Atlanta Gas Light Co., or ATGL, no longer procures gas for its customers and, thus, is no longer subject to the purchased gas adjustment mechanism, or PGAM. The much smaller Liberty Utilities (Peach State Natural Gas) Corp., which is still regulated under a non-restructured framework, utilizes a non-automatic PGAM.

Decoupling — Liberty Utilities (Peach State Natural Gas) is subject to the Georgia rate adjustment mechanism, or GRAM — an alternative regulatory framework. The GRAM provides for a "revenue true-up," under which the company is to compare actual revenues to a previous revenue projection. ATGL operates under a straight fixed-variable rate design.

Traditional generation — A nuclear construction cost recovery tariff is in place for Georgia Power Co., or GP, that enables GP to earn a cash return on construction work in progress related to the Plant Vogtle Units 3 and 4 nuclear units.

Delivery infrastructure — Various infrastructure programs previously authorized by the PSC, including the Integrated Vintage Plastic Replacement Program to replace aging plastic pipes and the Integrated System Reinforcement Program to upgrade ATGL's distribution system and liquefied natural gas facilities continue under the GRAM, and the recovery of and return on the infrastructure program investments are included in annual rate adjustments.

Environmental compliance — ATGL is authorized to recover cleanup costs related to former manufactured gas plant sites through an environmental response cost recovery rider. Costs that are recoverable under this rider include investigation, testing, remediation and/or litigation costs or other liabilities. Georgia Power has in place a rider that allows for the recovery of environmental compliance costs.

Hawaii

Renewables/non-traditional generation — Riders are in place for Hawaiian Electric Co. Inc. and Maui Electric Co. Ltd. to address costs associated with the utilities' renewable energy infrastructure program projects.

Idaho

Electric fuel/gas commodity/purchased power — Avista Corp.'s power cost adjustment enables the company to defer, in a balancing account, for subsequent recovery/refund to customers, 90% of the difference between actual net power costs and the amount included in retail rates. Idaho Power Co., or IP, has a similar mechanism in place with a sharing provision under which annual rate adjustments reflect 95% of the cost variations associated with water supply for hydroelectric production, wholesale energy prices and retail load changes. An energy cost adjustment mechanism is in place for PacifiCorp that allows for the recovery of 90% of the difference between actual power costs and those included in rates.

Decoupling — IP operates under a decoupling mechanism referred to as a fixed cost adjustment, or FCA, which is designed to adjust the company's electric rates to recover fixed costs independent of the volume of energy sales. The FCA calculation reflects actual sales, and there is a 3% cap on annual rate increases that may be implemented under the mechanism. Unrecovered balances are to be carried forward to future years, with interest. Avista Corp. operates under an electric and gas decoupling mechanism, also referred to as an FCA. There is a 3% annual cap on rate increases that may be implemented under the mechanism. Unrecovered balances are to be carried forward to future years, with interest.

Illinois

Electric fuel/gas commodity/purchased power — Historically, the large electric utilities, namely Ameren Illinois Co., or AI, and Commonwealth Edison Co., or ComEd, were permitted to recover fuel costs and the energy component of purchased power costs through a fuel adjustment clause, or FAC. Their FACs were discontinued in conjunction with the implementation of electric industry restructuring. The power to meet the utilities' SOS obligations is now procured competitively. SOS costs and revenues are subject to an annual true-up mechanism. MidAmerican Energy Co. continues to use a FAC, as the company was not subject to all the provisions of the restructuring law and continues to own generation plants to serve its customers.

Decoupling — AI, Liberty Utilities (Midstates Natural Gas) Corp., Northern Illinois Gas Co., or NI-Gas, North Shore Gas Co. and Peoples Gas Light and Coke Co. have volume balancing adjustment riders in place that account for the impact on fixed cost recovery of energy efficiency efforts and weather.

Delivery infrastructure — AI, ComEd, North Shore and NI-Gas have riders in place to recover certain costs associated with maintaining infrastructure in accordance with requirements imposed by local governments. In accordance with state law, the ICC is permitted to approve adjustment clauses for the local gas distribution companies to recover the costs associated with their infrastructure replacement programs, and the ICC has done so for Peoples, NI-Gas and AI.

Environmental compliance — AI uses a hazardous materials adjustment clause rider, largely to address asbestos-related litigation and remediation costs. AI, ComEd, Peoples, North Shore and NI-Gas use riders to recover costs related to the investigation and cleanup of manufactured gas plants.

Indiana

Decoupling — Electric energy efficiency riders of Indianapolis Power and Light Co., or IP&L; Indiana Michigan Power Co., or IMP; Duke Energy Indiana Co., or DEI; Northern Indiana Public Service Company, or NIPSCO; and Southern

Indiana Gas and Electric, or SIGECO provide for the recovery of net lost revenues and shared savings, subject to commission approval.

Delivery infrastructure — State law allows the Indiana URC to authorize utilities to implement a transmission, distribution and storage system improvement charge rider to facilitate recovery of the costs associated with certain electric and gas infrastructure expansion projects, including those intended to improve safety or reliability, modernize the utility's system or improve an area's economic development prospects. The URC has approved such a rider for DEI, Indiana Gas Co., or IG, SIGECO's and NIPSCO's electric and gas operations and IP&L. IMP and NIPSCO use a rider to recover costs associated with certain government-mandated investments. SIGECO uses a rider to recover the costs associated with clean energy investments.

Environmental compliance — State law allows the URC to authorize electric utilities to recover, through a rate adjustment mechanism, 80% of the costs associated with certain federally-mandated emissions-control and transmission/distribution reliability projects. The remaining 20% of such costs are to be deferred for future recovery. Environmental cost recovery riders are in place for DEI, NIPSCO, IP&L, IMP and SIGECO. Through these riders, the utilities are permitted to recover the related operations and maintenance costs and depreciation expense after the environmental facilities become operational, as well as a return on the related investment.

Kansas

Conservation program expense/decoupling — State law allows electric and gas utilities to request KCC approval to implement energy efficiency-related cost-recovery mechanisms. Evergy Kansas Central Inc. and Evergy Kansas South Inc. participate in energy efficiency programs and recover program-related costs and related lost revenues through the companies' energy efficiency cost-recovery riders. WNA clauses are in place for Atmos Energy Corp., Black Hills/Kansas Gas Utility Co., or KGU, and Kansas Gas Service Co., or KGS.

Delivery infrastructure — Evergy Metro Inc. has a rider in place to recover the costs associated with projects to underground transmission and distribution infrastructure. State law permits local gas distribution companies to utilize a gas system reliability surcharge, or GSRS, mechanism to recover the costs associated with gas distribution system replacement projects between base rate proceedings. Atmos, KGS and KGU have a GSRS in place.

Kentucky

Decoupling — WNA mechanisms are in place for Atmos Energy Corp.; Columbia Gas of Kentucky Inc., or CGK; Delta Natural Gas Co.; and the gas operations of Duke Energy Kentucky Inc., or DEK, and Louisville Gas and Electric, or LG&E. DEK, LG&E, Atmos, CGK and Delta utilize energy efficiency riders to facilitate recovery of costs associated with gas energy efficiency programs; these riders include certain incentive provisions and permit recovery of lost revenues related to these programs. LG&E, DEK, Kentucky Utilities Co. and Kentucky Power Co. also utilize a similar mechanism for their electric businesses.

Louisiana - NOCC

Environmental compliance/transmission costs — An environmental adjustment clause and a rider associated with the Midcontinent Independent System Operator regional transmission organization are in place for Entergy New Orleans LLC's electric operations.

Louisiana PSC

Decoupling — An energy efficiency rider is in place for Cleco Power LLC, the electric operations of Entergy Louisiana LLC, or EL, and Southwestern Electric Power Co., or SWEPCO, through which the utilities recover costs associated with administering their programs and the lost contribution to fixed costs associated with customer participation in the programs. WNA mechanisms are in place for CenterPoint Energy Resources Corp. and Atmos Energy.

Renewables/non-traditional generation/delivery infrastructure/environmental compliance/transmission costs — Cleco Power has in place an infrastructure and incremental cost recovery rider through which the company may seek recovery of costs associated with, among other things, new generation capacity, renewables, environmental compliance, as well as transmission and delivery of assets/projects.

Delivery infrastructure — A gas infrastructure investment recovery rider is in place for EL's gas operations that addresses costs associated with the utility's pipeline replacement program.

Maine

Electric fuel/gas commodity/purchased power — Electric fuel adjustment clauses are no longer utilized due to the implementation of retail choice. For the most part, the state's electric utilities no longer own generation and, by law, are not allowed to provide SOS. SOS supply for the utilities is procured through a competitive process the Maine PUC conducts, and the cost of this supply is recovered from ratepayers.

Decoupling — Central Maine Power Co. and Versant Power are subject to a full decoupling mechanism, with any related annual adjustments capped at 2% of distribution revenues and any under-collections in excess of the capped to be deferred for future recovery. No cap is applied to the amount of over-collections to be returned to ratepayers.

Maryland

Electric fuel/gas commodity/purchased power — The electric fuel rate adjustment was eliminated coincident with the implementation of competition in the provision of electric supply. The power to meet default service requirements is obtained via competitive bids and the costs are recovered from ratepayers on a current basis.

Decoupling — Columbia Gas of Maryland Inc. and Washington Gas Light have revenue-normalization adjustment mechanisms in place for residential customers that address customer participation in energy efficiency/ conservation programs and WNA mechanisms in place that apply to all customer classes.

Delivery infrastructure — A grid resiliency program cost recovery mechanism is in place for Potomac Edison Co. that is to expire at the end of 2022.

Massachusetts

Electric fuel/gas commodity/purchased power — Electric fuel and purchased power adjustments were eliminated coincident with the start of retail competition. Rates for basic service, known as default service, are market-based and reflect the competitive contracts the distribution utility entered into for basic service supply. The utilities are not at risk for fluctuations in market prices.

Conservation program expense/environmental compliance — The Massachusetts DPU has adopted energy efficiency reconciliation factors, or EERF, for the state's electric utilities. The EERF is a fully reconciling funding mechanism designed to recover the costs associated with the state's electric energy efficiency investments that are in excess of the level collected from other funding sources, which include the systems benefits charge, proceeds from the forward capacity market and proceeds from the Regional Greenhouse Gas Initiative.

Local gas distribution adjustment clauses are in place to reflect the recovery of reconcilable distribution-related costs that are not included in base rates. Such expenses may include demand-side management costs, environmental response costs associated with manufactured gas plants, the revenue requirement on targeted infrastructure recovery factors and gas system enhancement plan, or GSEP, investment.

Renewables/non-traditional generation — The state's electric utilities utilize a solar cost adjustment mechanism to recover their investment and ongoing maintenance costs associated with their solar generation facilities. In addition, the electric utilities utilize a mechanism for long-term renewable energy contracts that allow for rates to be adjusted for the recovery of costs and contract remuneration arising in relation to long-term renewable energy contracts.

Delivery infrastructure — The state's electric utilities are subject to a grid modernization factor that provides for the recovery of incremental costs associated with their grid modernization plans.

A capital cost adjustment mechanism is in place for the electric division of Fitchburg Gas and Electric Co., or FG&E, that permits the company to recover costs associated with post-test-year capital additions. The mechanism contains an annual spending cap and a cap on annual rate increases under the mechanism of 1.5% of total revenues, with any amounts above the cap to be deferred for future recovery with carrying charges. To the extent that FG&E's capex exceed the amount it is allowed to recover through the mechanism, the company can seek to include such investments in rate base in its next base distribution rate proceeding.

Under state law, each of the local distribution companies files a GSEP with the DPU to address aging or leaking gas infrastructure and the related costs may be recovered through a GSEP provision.

Michigan

Decoupling — The Michigan PSC had approved implementation of electric revenue decoupling mechanisms, or RDMs, for Consumers Energy Co., or CE, Upper Peninsula Power Co., or UPP, and DTE Electric Co.; however, the Michigan Court of Appeals has ruled that the PSC does not have statutory authority to approve RDMs for electric utilities. State law now permits the PSC to adopt electric RDMs only for small electric utilities and Indiana Michigan Power and UPP have such a mechanism in place. State law permits a gas utility that spends at least 0.5% of its revenue on energy efficiency programs to institute an RDM. An RDM is currently in place for DTE Gas and CE.

Delivery infrastructure — DTE Gas utilizes an infrastructure recovery mechanism that enables it to earn a return of and on the costs associated with capital investment in the company's meter move-out, accelerated main replacement and pipeline integrity programs.

Transmission costs — CE, DTE Electric and UPP recover certain transmission costs through the power supply cost-recovery mechanism.

Minnesota

Decoupling — Minnesota Energy Resources Corp. is operating under a revenue decoupling mechanism, or RDM, that applies to the company's residential customers. There is a 10% symmetrical cap on revenue changes generated through the application of the RDM.

CenterPoint Energy Resources Corp. operates under an RDM that applies to all customer classes except market-rate customers and is subject to a cap on annual adjustments under the mechanism that is equal to 10% of non-gas margin revenue after removing conservation costs.

Northern States Power Co. - Minnesota has an electric RDM in place, such that decoupling is to be applied to residential and non-demand metered commercial customer classes subject to a 3% cap; an annual true-up with a 3% cap is to be utilized for the non-decoupled customer classes.

Mississippi

Decoupling — Atmos Energy utilizes a WNA rider. Entergy Mississippi LLC, Mississippi Power Co., or MP, and Atmos have energy efficiency riders in place that provide for recovery of the lost contributions to fixed costs associated with energy efficiency programs.

Environmental compliance — MP has in place a rider that establishes procedures to facilitate the PSC's review of the company's environmental compliance strategy and provides for recovery of the related costs, including the cost of capital, associated with PSC-approved environmental projects outside of a base rate case.

Missouri

Conservation program expense/decoupling — Evergy Metro Inc., Evergy Missouri West Inc. and Union Electric Co.'s, or UE, electric business have in place a mechanism that provides for recovery of demand-side management program-related costs and may provide for a performance incentive based upon measurable, verified energy efficiency savings. Spire Missouri Inc. and UE have a WNA rider in place, as does Liberty Utilities (Midstates Natural Gas) Corp.

Renewables/non-traditional generation — The PSC's rules specify that electric utilities may file for a renewable energy standards rate adjustment mechanism, or RESRAM, to reflect prudently incurred costs or a pass-through of benefits received as a result of compliance with the state's renewable energy standards. The RESRAM is to be capped at a 1% annual rate impact.

Delivery infrastructure — Evergy Metro, Evergy Missouri West and UE use a rider to recover costs associated with certain government-mandated investments.

Environmental compliance — The PSC's rules pertaining to environmental cost recovery mechanisms, or ECRMs, specify that a portion of the utility's environmental costs may be recovered through an ECRM, and a portion may be recovered through base rates. The annual recovery of these costs is to be capped at 2.5% of the utility's Missouri gross jurisdictional revenues, less certain taxes. None of the utilities currently have an ECRM in place.

Transmission costs — Empire's, Evergy Metro's, Evergy Missouri West's and UE's FACs reflect variations in certain transmission-related costs.

Montana

Electric fuel/gas commodity/purchased power — In accordance with the state's restructuring statutes, NorthWestern Corp. sold its generation assets and entered into purchased power contracts with competitive suppliers to serve provider-of-last-resort customers. NorthWestern recovers supply costs through a power costs and credits adjustment mechanism that allows the company to adjust for differences between the recovered and actual amounts of the utility's base power costs and credits, transitional costs and qualifying facility, or QF, costs. Regarding the base power costs and credits, 90% of the difference between the recorded and actual costs is rebated to customers, when costs are less than revenues, or recorded as a surcharge, when costs are greater than the revenues. For transitional and QF costs, 100% of the difference is rebated to customers when costs are less than the revenues or surcharged to ratepayers when costs are greater.

Conservation program expense — Universal system benefit charges are in place for the electric and gas customers of MDU Resources Group Inc. and NorthWestern, designed to recover costs associated with energy conservation efforts.

Decoupling — MDU Resources utilizes a mechanism to recoup revenues lost as a result of gas conservation programs.

Nevada

Decoupling — The lost revenues associated with energy efficiency and conservation programs for Sierra Pacific Power and Nevada Power are recovered using a periodically adjusted balancing account.

New Hampshire

Electric fuel/gas commodity/purchased power — Fuel and purchased power adjustment clauses had been utilized prior to the implementation of retail choice in the early 2000s. Public Service Co. of New Hampshire, or PSNH, now recovers its power costs through a periodically-adjusted default energy service charge, which recovers energy related costs incurred as a result of providing generation service supply to all customers that have not migrated to a competitive energy supplier. It also includes a reconciliation of the difference between the company's costs and revenues for the previous period. PSNH, Liberty Utilities (Granite State Electric) and Unitil Energy Systems have sold their generation and/or exited power supply contracts as part of their restructuring agreements. These distribution-only companies supply default energy service through a request-for-proposals process supervised by the PUC.

Decoupling — The PUC has established an energy efficiency resource standard, or EERS, for New Hampshire's electric and gas utilities and the utilities implemented lost revenue adjustment mechanisms, or LRAMs, to recover lost revenue due to the installation of energy efficiency measures. The PUC subsequently ordered the utilities to seek approval of a decoupling mechanism or other lost-revenue recovery mechanism as an alternative to the LRAM in their first distribution rate cases after the first EERS triennium, if not before.

Delivery infrastructure — Reliability enhancement and vegetation management programs and accompanying riders are in effect for Liberty Utilities (Granite State Electric), PSNH and Unitil Energy Systems. The programs provide for recovery of both the capital investment and increases to operation and maintenance expenses necessary for ongoing system reliability and vegetation management efforts.

New Jersey

Electric fuel/purchased power/gas commodity — Both electric and gas customers may purchase their respective commodity from competitive suppliers. The utilities provide default supply for customers that are not served by competitive suppliers. Costs associated with procurement of the supply are recovered on a current basis.

Conservation program expense — Costs associated with the NJ Clean Energy Program — a legislatively mandated initiative to encourage the initiation of energy efficiency and renewable energy programs — are included for recovery through a non-bypassable societal benefits charge on customer bills.

Decoupling — A version of a full revenue decoupling mechanism is in place for New Jersey Natural Gas Co., or NJNG, and South Jersey Gas Co., or SJG. The operation of the mechanisms is subject to an earnings test and a variable margin revenue adjustment and is contingent on the companies achieving certain capacity-reduction targets, as specified in their BPU-approved conservation incentive programs.

WNA clauses are in place for Elizabethtown Gas Co., or ETG, and the gas operations of Public Service Electric and Gas, or PSEG. Lost revenue adjustment mechanisms were approved for the electric utilities in the context of energy efficiency programs approved in 2020 and 2021.

Delivery infrastructure — The BPU directed utilities to develop mitigation and hardening infrastructure modernization plans and indicated that it would be open to innovative cost recovery mechanisms for such plans. The BPU subsequently approved modernization plans and related recovery mechanisms for several utilities. These have largely expired.

In 2017, the BPU adopted a rule outlining an infrastructure investment program, or IIP, framework that allows for expedited rate treatment of BPU-approved infrastructure improvement programs on an ongoing basis. IIPs have been approved for Atlantic City Electric Co., ETG, NJNG and PSE&G, for both electric and gas operations. IIP proposals filed by Rockland Electric Co. and SJG are pending.

Environmental compliance — Legislation enacted in 2018 required the BPU to establish a program to recognize the environmental and fuel diversity attributes of electricity generated by eligible nuclear power plants. Each investor-owned electric utility in the state must purchase zero emission credits on a monthly basis from each plant selected. Recovery of the related costs occurs via an irrevocable charge on the utility's customers. Certain other costs, including those associated with participating in the RGGI and the manufactured gas plant remediation, are recovered through the societal benefits charge.

New Mexico

Decoupling — New Mexico Gas Co. has a weather normalization adjustment mechanism in place.

New York

Electric fuel/gas commodity/purchased power — The state's electric distribution utilities are permitted to flow through the costs of power procured to serve customers who have not selected an alternative supplier. The electric utilities recover certain costs through the systems benefit charge for "clean energy activities" that include costs to comply with the state's renewable portfolio standards.

Renewables/non-traditional generation — The state's electric distribution companies are permitted to recover implementation costs, incremental costs and carrying charges associated with the procurement of qualified energy storage systems.

Delivery infrastructure/environmental compliance — New York State Electric and Gas Corp., or NYSEG, Rochester Gas and Electric Corp., or RG&E, and Central Hudson Gas and Electric Corp., or CHG&E, have rate adjustment mechanisms, or RAMs, in place that return to or collect from ratepayers eligible costs on a timely basis, subject to a cap. For NYSEG and RG&E, RAM-eligible deferrals include gas-leak-prone pipe-carrying costs.

For CHG&E's electric and gas operations, the RAM will return or collect the net balance of reconciliations for site investigation and remediation, or SIR, costs.

Brooklyn Union Gas Co. has a SIR mechanism in place. Consolidated Edison Co. of New York has a Safety and Reliability Surcharge Mechanism in place.

North Carolina

Conservation program expense — State law authorizes the NCUC to approve an annual rider outside of a general rate case for electric utilities to recover all reasonable and prudent costs incurred for the adoption and implementation of demand-side management, or DSM, and energy efficiency, or EE, programs. The NCUC has authorized the major electric utilities to retain a percentage of the net savings associated with their DSM/EE programs. In the most recent general rate cases involving Piedmont Natural Gas and Public Service Co. of North Carolina, or PSNC, the NCUC approved a three-year pilot program that includes several EE programs and an EE cost recovery rider.

Decoupling — Piedmont Natural Gas utilizes a margin decoupling mechanism that decouples the recovery of authorized margins from sales levels. PSNC also has such a mechanism in place.

Renewables/non-traditional generation — Costs incurred by electric utilities to procure renewable energy are recoverable through the FAC and the renewable energy portfolio standard, or REPS, rider, subject to certain caps. Incremental operations and maintenance costs are also recoverable through the REPS rider, as well as up to $1

million in annual research and development expenses. The cost of utility-owned renewable generating facilities is recovered through a combination of the FAC, the REPS rider and base rates.

Delivery infrastructure — Piedmont Natural Gas uses an integrity management rider, or IMR, that allows the company to track and recover capital expenditures incurred to comply with federal pipeline safety and integrity requirements outside of a general rate case. PSNC uses an IMR to recover capital expenditures related to the company's transmission and distribution pipeline integrity management programs.

North Dakota

Decoupling — MDU Resources' gas operations are subject to a WNA mechanism. Northern States Power - Minnesota, or NSP-M, operates under straight fixed-variable gas rates.

Traditional generation — Otter Tail Power established a generation cost recovery rider to reflect costs associated with the utility's Astoria Station and Merricourt Wind projects. Regarding the Hoot Lake plant, Otter Tail is to evaluate any retirement-related changes to costs of service and include them in the generation cost recovery rider until they can be transferred into base rates.

Environmental compliance/delivery infrastructure — Electric utilities are permitted to earn a cash return on construction work in progress through a separate rate adjustment mechanism for investments in transmission infrastructure and for federally-mandated environmental compliance projects. Once the facilities achieve commercial operation, the facilities are reflected in rate base as part of a general rate proceeding, and the surcharge terminates. NSP-M is operating under a transmission cost recovery rider. MDU and Otter Tail are operating under separate transmission and environmental cost recovery riders.

Ohio

Electric fuel/gas commodity/purchased power/delivery infrastructure — As a result of the electric industry restructuring, utilities operate under electric security plans, or ESPs, that provide for the pass-through of the utilities' cost of power to serve standard-service-offer customers.

The current ESPs for Cleveland Electric Illuminating Co., or CEI, Ohio Edison Co., or OE, and Toledo Edison Co., or TE, include delivery capital recovery riders that reflect a return of and on incremental distribution, sub-transmission and general plant-in-service investments not already included in the companies' base rates.

Under the current ESP with Duke Energy Ohio, or DEO, the company's generation requirements for non-switching customers are procured and priced through a competitive bid process, or CBP. The related riders are fully bypassable for switching customers.

Ohio Power Co.'s, or OP, ESP allows the company to utilize riders for costs related to distribution investment and enhanced service reliability.

East Ohio Gas Co., or EOG, Columbia Gas of Ohio Inc., or CGO, and Vectren Energy Delivery of Ohio, or VEDO, conduct auctions for competitive suppliers to bid to serve customers directly. The companies had previously obtained their gas supplies through negotiated bilateral contracts, but under the current plan, the companies conduct an auction that allows suppliers to compete to supply portions of the gas supply requirements. Customers who do not choose a specific competitive supplier are randomly assigned a supplier based on the auction results. DEO is the only major gas utility in the state to continue to use the gas cost recovery clause.

Conservation program expense/decoupling — The ESPs for each of the Ohio electric utilities include a rider that allows for the recovery of energy efficiency program costs and lost distribution margin associated with these programs. OP has a full decoupling mechanism in place for residential and small commercial customers. Ohio's gas distribution companies — namely EOG, CGO, VEDO and DEO —operate under straight fixed-variable prices.

Delivery infrastructure — The current ESPs in place for CEI/OE/TE, Dayton Power & Light and DEO include riders that reflect costs associated with incremental distribution-related investments not already included in base rates. OP's ESP allows the company to utilize riders for costs related to distribution investment. CGO has a rider in place for infrastructure replacement costs. VEDO has riders in place through which it recovers the costs associated with certain infrastructure replacement investments. EOG has riders in place to recover costs related to its pipeline infrastructure replacement program and its installation of automated meter-reading equipment. DEO uses a rider to recover the costs associated with its gas delivery infrastructure improvement program.

Environmental compliance — DEO recovers certain costs related to former manufactured gas plant sites through a rider.

Oklahoma

Conservation program expense/decoupling — Oklahoma Gas and Electric Co., or OG&E, and Public Service Co. of Oklahoma, or PSO, utilize riders to recover the costs associated with energy efficiency programs, related lost revenues and certain incentives.

Summit Utilities Oklahoma Inc. and Oklahoma Natural Gas Co., or ONG, utilize a WNA mechanism and also recover the costs associated with their energy efficiency programs and certain incentives through their performance-based ratemaking plan riders.

Renewables/non-traditional generation — PSO utilizes a wind facility asset rider designed to recover return on and of the wind facilities and operation and maintenance expenditures after the facilities commence commercial operation.

Delivery infrastructure/transmission costs — OG&E uses a rider for the Oklahoma jurisdictional costs associated with certain transmission projects that the Southwest Power Pool has approved and that have been completed. OG&E also utilizes a temporary grid enhancement mechanism that allows for interim recovery of the costs associated with its grid enhancement plan.

Environmental compliance — OCC rules permit the commission to approve requests to recover costs associated with environmental compliance through a rider.

Oregon

Conservation program expense/decoupling — Northwest Natural Gas, or NWNG, is authorized to recover costs associated with its energy efficiency program for industrial customers. NWNG uses a decoupling mechanism designed to counteract the impact on revenues of changes in the consumption patterns of average residential and commercial customers due to conservation efforts. The company has a separate weather-adjusted rate mechanism in place for these customers.

Cascade Natural Gas, or CNG, has a partial decoupling mechanism in place until Jan. 1, 2025, with a review to be completed by Sept. 30, 2024.

A decoupling mechanism is in place for Avista's residential and commercial rate groups.

Traditional generation — PacifiCorp is authorized to recover costs associated with its Lake Side 2 generation investment. Portland General Electric, or PGE, utilizes a mechanism to implement in rates its share of the revenue requirement for the Colstrip Power Plant units 3 and 4 and associated common facilities.

Renewables/Non-traditional Generation — PGE is authorized to recover through an adjustment clause the revenue requirement associated with qualifying company-owned or contracted new renewable energy resource and energy storage projects associated with renewable energy resources not otherwise included in rates. PacifiCorp utilizes a renewable adjustment clause to recover between rate cases the costs to construct or otherwise acquire facilities that generate electricity from renewable energy sources and for associated electricity transmission.

Environmental compliance — CNG employs an environmental remediation adjustment to recover costs for a former manufactured plant. NWNG utilizes a site remediation and recovery mechanism to provide for recovery of costs that have been incurred or will continue to be incurred for environmental remediation of legacy-manufactured gas plant operations. PGE has an environmental remediation cost recovery adjustment that recovers the costs and revenues associated with the Portland Harbor Superfund site and other environmental obligations. PacifiCorp utilizes an adjustment mechanism which recovers deferred amounts associated with the Deer Creek Mine closure.

Pennsylvania

Electric fuel/gas commodity/purchased power — In conjunction with electric industry restructuring, the electric energy cost rate was eliminated. The supply to meet provider-of-last-resort, or POLR, obligations for each company is competitively procured and prices for POLR service are adjusted on a current basis.

Decoupling — Columbia Gas of Pennsylvania has a WNA mechanism in place for residential customers.

Delivery infrastructure — State law allows the PUC to approve automatic adjustment clauses to recognize, between general rate cases, utility investments in certain infrastructure projects.

Rhode Island

Electric fuel/gas commodity/purchased power — Prior to the implementation of electric industry restructuring, automatic FACs were used by the utilities. In accordance with the restructuring law and PUC-approved restructuring plans, investor-owned utilities are to provide SOS to customers who do not select an alternative provider through 2020. The cost of providing this service is fully recoverable, with such rates reset on a periodic basis.

Conservation program expense/environmental compliance — Narragansett Electric Co., or NE, utilizes a distribution adjustment clause, or DAC, for its gas operations to recover costs associated with energy efficiency programs and environmental response.

Delivery infrastructure — State law permits NE to submit for PUC approval of annual infrastructure spending plans for its electric and gas operations and recovery of expenses associated with an inspection and maintenance program and a vegetation management program.

South Carolina

Decoupling — WNA mechanisms are in place for the gas operations of Dominion Energy South Carolina and Piedmont Natural Gas that apply only to residential and small commercial customers.

Traditional generation — The South Carolina Legislature in 2018, overrode the governor's veto of House Bill 4375, which among other things, repealed the state's Base Load Review Act, or BLRA; thus, no future projects could fall under its purview. Previously, under the BLRA, the PSC was permitted to issue a BLRA order, which constituted an upfront determination that a generating plant is "used and useful" and that associated capex are prudent and ultimately should be reflected in rates as long as the plant is constructed within the estimated construction schedule, including contingencies and capital budget.

South Dakota

Conservation program expense/decoupling — A DSM cost adjustment mechanism is in place for NSP-M through which the company recovers costs associated with DSM/efficiency programs. The mechanism includes a 30% bonus to account for lost margins related to DSM/efficiency measures. MDU Resources' gas business utilizes a WNA mechanism.

Environmental compliance — Black Hills Power Inc.'s, or BHP, environmental improvement adjustment was suspended for a six-year moratorium period effective July 1, 2017; however, in 2020, the South Dakota PUC extended the moratorium period by an additional three years, whereby the recovery mechanism will not be effective prior to July 1, 2026.

Traditional generation/delivery infrastructure — NSP-M utilizes an infrastructure rider to recover costs associated with certain generation, transmission and distribution capital additions once the related facilities have achieved commercial operation to reflect certain changes in property taxes. Otter Tail Power has a mechanism in place that allows the utility to recover costs associated with new generation facilities.

Transmission costs — BHP utilizes a transmission cost adjustment that reflects the flow-through of costs allocated to the utility by FERC. Additionally, BHP utilizes a transmission facility adjustment, or TFA. Similar to the utility's environmental improvement adjustment, the TFA was suspended for a six-year moratorium period effective July 1, 2017; however, in 2020, the PUC extended the moratorium period by an additional three years, whereby the recovery mechanism will not be effective prior to July 1, 2026.

Tennessee

Decoupling — WNA clauses are in place for Atmos Energy and Piedmont Natural Gas. A full revenue decoupling mechanism is in place for Chattanooga Gas' residential and small commercial customers, and a WNA rider is in place for the company's industrial, commercial and other customers that do not operate under the decoupling mechanism.

Texas PUC

Electric fuel/purchased power — For electric utilities operating in areas of the state where retail competition for generation service has not been implemented, fuel and purchased power costs are recovered through a separate

fuel factor. For companies that implemented retail competition, i.e., within the Electric Reliability Council of Texas, or ERCOT, the transmission and distribution utilities do not participate in generation procurement, and fuel/purchased power adjustment clauses were eliminated.

Traditional generation — Legislation enacted in 2019 and PUC rules promulgated in 2020 allow vertically integrated utilities — those outside of ERCOT — to seek the recovery of new generation investment through a rider. Such a rider is in place for Entergy Texas.

Texas RRC

Gas commodity — Purchased gas cost recovery factors are subject to the RRC's discretion.

Decoupling — WNA mechanisms are in place for Atmos Energy Inc. and Texas Gas Service Co.

Utah

Decoupling — A WNA mechanism is in place for Questar Gas; however, customers may choose not to participate in the WNA. Questar Gas also utilizes a conservation-enabling tariff, or CET, which decouples non-gas revenues from the volume of gas used by general service, or GS, customers. Incremental CET accruals that exceed the 5% cap do not earn interest. The amortization of CET accruals is limited to 2.5% of the total Utah-jurisdictional base distribution non-gas GS revenues. Together, the WNA and CET act as a full revenue decoupling mechanism.

Renewables/non-traditional generation — An adjustment mechanism is in place for PacifiCorp through which the company recovers costs associated with its solar program.

Vermont

Electric fuel/gas commodity/purchased power — Power cost adjustment mechanisms are permitted, provided that the mechanisms are part of an alternative regulation plan.

Virginia

Decoupling — WNA riders are in place for Virginia Natural Gas Inc., or VNG, WGL, Columbia Gas of Virginia, or CGV, and Roanoke Gas. A separate revenue normalization adjustment is also in place for WGL, VNG and CGV that is designed to mitigate the impact on revenues of customers' participation in energy conservation programs.

Washington

Electric fuel/gas commodity/purchased power — Avista Corp.'s energy recovery mechanism includes a graduated sharing of differences from a benchmark level. Power cost adjustment mechanisms are in place for PacifiCorp and Puget Sound Energy, or PSE, that allow for variations in power costs to be apportioned, on a graduated scale, between the company and customers.

Decoupling — Revenue decoupling mechanisms are in place for PSE's electric and gas operations. Full decoupling mechanisms for Avista's electric and gas operations are to be in place through March 2025, incorporate an earnings test and demand-reduction targets, and specify caps on the increases to be implemented under the mechanism. Cascade Natural Gas' decoupling mechanism incorporates an earnings test and a conservation target, as well as caps on annual increases. PacifiCorp's decoupling mechanism incorporates an earnings test and demand reduction targets, as well as cap increases that may be implemented under the mechanism.

West Virginia

Traditional generation/environmental compliance/delivery infrastructure — In the past, the PSC has approved temporary riders to provide recognition between rate cases of certain electric generation and infrastructure investments.

State law allows the PSC to approve expedited cost recovery mechanisms associated with commission-approved multiyear gas infrastructure improvement plans; such treatment has been approved for Mountaineer Gas and Hope Gas.

Wisconsin

Electric fuel/gas commodity/purchased power — Under the Wisconsin PSC's electric fuel rules, which apply to the state's five largest investor-owned utilities, each utility forecasts monthly and annual fuel and purchased power

costs on a prospective basis. If a company's actual fuel and purchased power costs are outside a monthly or cumulative monthly variance range around the forecasts and the utility can demonstrate that these costs will likely be outside the annual range, the PSC may conduct a hearing to establish new rates. Currently, the annual variance range is plus or minus 2%. An electric utility is permitted to defer any fuel costs that are outside of its annual symmetrical variance range for subsequent recovery or refund. However, the utility is prohibited from recovering deferrals if the company is found to be earning in excess of its authorized equity return.

Conservation program expense — Wisconsin has a statewide energy efficiency and renewable resources program that is funded through a non-bypassable charge on customer bills. Program cost recovery is handled via individual rate cases. A conservation escrow account is used for voluntary energy efficiency and programs. Program costs are recovered through rates, the money goes into an escrow account and the costs are then adjusted in the next rate case.

Traditional generation/delivery infrastructure — At times, the PSC has authorized the utilities to file a limited-issue reopener of a previously completed base rate case instead of a new rate case filing. The reopener provides for recognition of certain specified investments and/or expenses and does not involve the re-determination of rate of return.

Wyoming

Decoupling — Cheyenne Light Fuel and Power's, or CLF&P, demand-side management, or DSM, mechanism for its electric operations includes a provision for the recovery of lost margins associated with customer participation in DSM programs.

Black Hills Wyoming Gas has a partial decoupling mechanism in place for small and medium general service-class distribution customers. The mechanism does not address revenue variations due to weather. The utility, also formally part of CLF&P's gas operations, has a DSM mechanism similar to CLF&P's electric operations.

Questar Gas has a WNA mechanism in place, as does MDU Resources' gas business.

Sector-Specific Corporate Methodology

April 4, 2024

(Editor's note: On March 10, 2025, we republished this criteria article to correct a publication error in the unregulated power and gas section. See the "Revisions And Updates" section for details.)

This criteria article describes the credit factors and assumptions S&P Global Ratings uses in its analysis of each of the sectors covered by "Corporate Methodology," published Jan. 7, 2024. For information about key changes, the impact on ratings, and superseded criteria, see our media release announcing the publication of these criteria, titled "Sector-Specific Corporate Methodology Published," published in conjunction with this article.

This criteria article should be read in conjunction with our corporate methodology, which provides the general framework. This framework is applied using:

- Sector-specific provisions contained in this methodology;
- Management and governance considerations, as contained in "Management And Governance Credit Factors For Corporate Entities," published Jan. 7, 2024;
- Adjustments to financial metrics and ratio calculations, as described in "Corporate Methodology: Ratios And Adjustments," published April 1, 2019; and
- Liquidity considerations, as described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers," published Dec. 16, 2014.

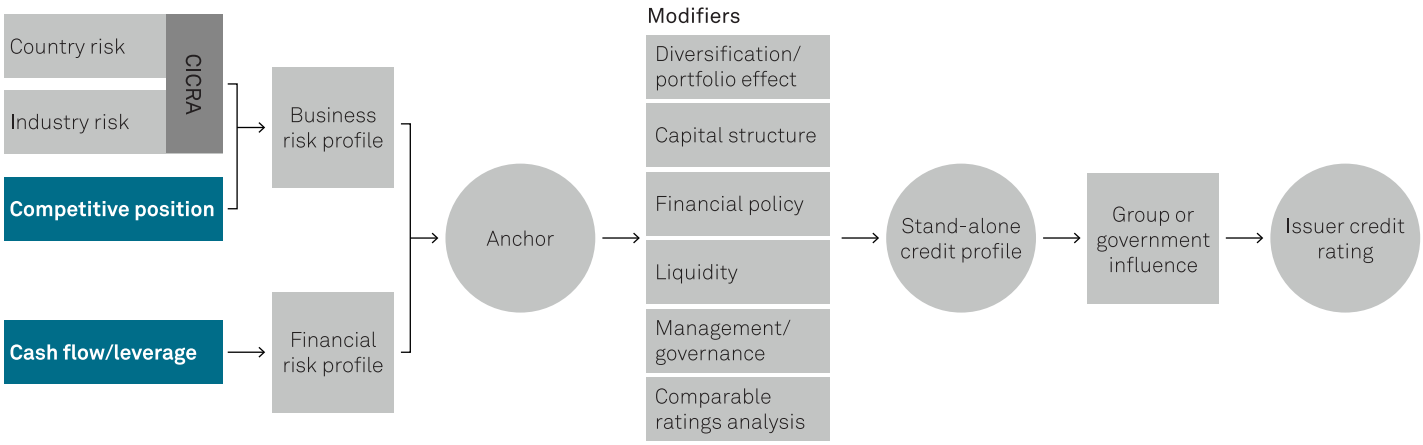
Methodology

Overview

These criteria primarily address sector-specific considerations related to competitive position, cash flow/leverage, and in some cases, certain of the modifiers shown in the framework below. The article applies globally to all corporate ratings and to certain nonbank financial institution entities that we rate using our global corporate methodology. Although our overall approach is the same for all sectors, we incorporate sector-specific provisions into our analysis.

Corporate criteria framework



Source: S&P Global Ratings.

Primarily, the criteria describe the relevant factors used to assess the competitive position for each sector as part of the business risk profile analysis. We assess competitive advantage; scale, scope, and diversity; and operating efficiency by reviewing a variety of subfactors that may reinforce or weaken each other. For any company, our assessment of these elements reflects the relative strengths and importance of its subfactors in the context of its industry.

In line with our corporate methodology, we assess each factor as strong, strong/adequate, adequate, adequate/weak, or weak. For each sector, the criteria include tables that summarize the characteristics that we typically expect to see across this range. The tables do not specify the characteristics expected at the adequate level: we assess a component as adequate if the characteristics fall between those for a strong or strong/adequate assessment, and those for an adequate/weak or weak assessment.

For each sector covered by these criteria, we list the competitive position group profiles (CPGPs) we would typically apply for each subsector. In some cases, the most appropriate CPGP differs from the one listed; for example, because the company has a monopoly position in its market or benefits from regulatory protection. The CPGP affects the weighting we ascribe to each element of our competitive position assessment within our framework.

The criteria also notes the sector-specific approaches we use when assessing the financial risk profile or the modifiers that apply to it, including the typical supplementary ratios used, the volatility adjustment and benchmark volatility tables, or the financial policy.

Please see appendix 1 for a glossary of terms, appendix 2 for the metrics we use to calculate volatility of profitability, and appendix 3 for the sector and industry variables.

Section 29 | Regulated Utilities

Business Risk Profile

Regulatory advantage

Market forces are not typically the main driver of competitive position for regulated utilities, and therefore we do not measure competitive advantage in the same way as we do for competitive firms. Instead, we assess regulatory advantage because the influence of the regulatory framework and regime is of critical importance. It defines the environment in which a utility operates and has a significant bearing on a utility's financial performance.

Regulations vary across different regulatory jurisdictions, that is, the area over which a regulator has oversight. Each regulatory jurisdiction can include one or more subsectors (water, gas, and power). A geographic region may have several regulatory jurisdictions.

We determine the regulatory advantage assessment by combining:

- Our preliminary regulatory advantage assessment, resulting from our review of the four subfactors that we believe are key for a utility to recover all its costs--on time and in full-- and to earn a return on the capital it deploys; and
- Our view of the utility's business strategy--in particular, its regulatory strategy and its ability to manage the tariff-setting process.

We assess the preliminary regulatory advantage assessment for each regulatory jurisdiction based on:

- Regulatory stability,
- Tariff-setting procedures and design,
- Financial stability, and
- Regulatory independence and insulation.

Regulatory stability: Our view is based on how transparent the key components of the rate-setting process are, and how they are assessed. We also monitor the predictability and consistency of the regulatory framework over time. Greater consistency reduces uncertainty for the utility and its stakeholders.

Tariff-setting procedures and design: Our view is based on whether all operating and capital costs can be recovered in full, and how the rate scheme balances the interests and concerns of all stakeholders. We look for incentives that are achievable, contained, and symmetrical (that is, mostly indexed to overperformance and underperformance).

Financial stability: If costs are recovered in a timely manner, cash flow volatility can be avoided. We see greater flexibility as favorable, because it allows for the recovery of unexpected costs. Financial stability also depends on the framework's ability to attract long-term capital, and the availability of capital support during construction, to alleviate funding and cash flow pressure when heavy investment is needed.

Table of contents

Sector description

Companies that provide an essential or near-essential infrastructure product, commodity, or service that has few or no substitutes and are shielded from competition, while also being subject to comprehensive regulation by a regulatory body or oversight by a public body.

Subsectors	Typical CPGP
Electricity	National industry and utilities
Gas	National industry and utilities
Multi-utilities	National industry and utilities
Water	National industry and utilities

Other adjustments

To calculate a company's financial metrics, please refer to the sector-specific adjustments in "Corporate Methodology: Ratios And Adjustments."

Our sector-specific liquidity considerations are described in "Methodology And Assumptions: Liquidity Descriptors For Global Corporate Issuers."

Regulatory independence and insulation: We consider this to be stronger where the market framework and energy policies support the long-term financial stability of the utilities, are clearly enshrined in law, and protect the regulator's independence. Where there is limited risk of political intervention, the regulator is more able to efficiently protect the utility's credit profile, even during a stressful event.

Preliminary regulatory advantage: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
From a credit perspective, the utility operates in a regulatory climate that is transparent, predictable, and consistent.	The utility operates in an opaque regulatory climate that lacks transparency, predictability, and consistency.
The utility can fully and timely recover all its fixed and variable operating costs, investments, and capital costs (depreciation and a reasonable return on the asset base).	The utility cannot recover its fixed and variable operating costs, investments, and capital costs (depreciation and a reasonable return on the asset base) fully and/or in a timely fashion.
Any regulatory incentives are limited and mainly symmetrical. The tariff setting includes mechanisms allowing for an adjustment for the timely recovery of volatile or unexpected operating and capital costs.	The utility must make significant capital commitments with no solid legal basis for the full recovery of capital costs.
The tariff setting may include a pass-through mechanism for major expenses--such as commodity costs--or a higher return on new assets, effectively shielding the utility from volume and input cost risks.	Ratemaking practices actively harm credit quality.
There is a record of earning a stable, compensatory rate of return in cash through various economic and political cycles and a projected ability to maintain that record.	There is a record of earning minimal or negative rates of return in cash through various economic and political cycles and a projected inability to improve that record sustainably.
The utility operates under a regulatory system that is sufficiently insulated from political intervention to protect the utility's credit risk profile, even during stressful periods. There is support for cash flow during construction of large projects, and preapproval of capital investment programs and large projects lowers the risk of subsequent disallowances of capital costs.	The utility is regularly subject to overt political influence.

Natural monopolies: Where a utility has a natural monopoly and its tariffs are controlled, but it is not subject to a detailed regulatory framework or oversight by a regulatory body, we may still assess regulatory advantage, rather than competitive advantage. We would assess it using the same four subfactors, as follows:

- For regulatory stability, we evaluate the stability of the setup, and give more emphasis to the historical record and our expectations regarding future changes.
- For tariff-setting procedures and design, we examine the utility's ability to fully recover operating costs, its investment requirements, and its debt-service obligations.
- For financial stability, we consider tariff flexibility, and whether this is sufficient to counter volume risk or commodity risk. In addition, we consider indirect competition, for example, while Nordic district heating companies operate under a natural monopoly, their tariff flexibility is partly restricted by customers' option to change to a different heating source if tariffs are increased significantly.
- For regulatory independence and insulation, we evaluate the risk that political intervention could change the setup, and in turn, affect the utility's credit profile. Although political intervention tends to be mostly negative, state ownership might positively influence tariff determination.

Because these four subfactors effectively capture the benefit of the close relationship with the state as owner, we do not typically modify our regulatory advantage assessment for natural monopolies based on business strategy.

Business strategy: After determining the preliminary regulatory advantage assessment, we assess the utility's business strategy as positive, neutral, negative, or very negative, and may modify the preliminary regulatory advantage assessment as a result. This factor chiefly addresses the effectiveness of a utility's regulatory risk management in the jurisdictions where it operates. In certain jurisdictions, a utility can create a sustainable competitive advantage through its regulatory strategy and ability to manage the tariff-setting process effectively. Ensuring that revenue changes with costs is a key regulatory risk factor, especially if the risk of political intervention is high. Our assessment of the utility's business strategy is informed by historical performance and business objectives in the context of industry dynamics and the regulatory climate.

We assess the utility's business strategy as positive and modify the preliminary regulatory advantage assessment upward if we consider the business strategy effectively bolsters the utility's regulatory advantage through favorable commission rulings, beyond what is typical for a utility in that jurisdiction. Where business strategy has limited effect relative to peers, our assessment is neutral. Where the business strategy leads to worse regulatory outcomes than peers, such as failing to achieve recovery of typical costs, we may see the implications as negative or very negative, and would apply the downward modifications as shown in the table below.

Regulated utilities: determining the final regulatory advantage assessment

	--Business strategy modifier--			
Preliminary regulatory advantage score	**Positive**	**Neutral**	**Negative**	**Very negative**
Strong	Strong	Strong	Strong/adequate	Adequate
Strong/adequate	Strong	Strong/adequate	Adequate	Adequate/weak
Adequate	Strong/adequate	Adequate	Adequate/weak	Weak
Adequate/weak	Adequate	Adequate/weak	Weak	Weak
Weak	Adequate/weak	Weak	Weak	Weak

Scale, scope, and diversity

We assess scale, scope, and diversity in the regulated utilities sector based on:

- Operational scale; and
- The geographic, economic, and regulatory diversity of a utility's markets and service territories.

These characteristics can contribute to cash flow stability while dampening the effect of economic and market threats. We generally believe a larger service territory--with a diverse customer base and average to above-average economic growth prospects--provides a utility with cushion and flexibility in the recovery of operating costs and ongoing investments (including replacement and growth capital spending). It also lessens the effect of external shocks (such as extreme local weather) because the incremental effect on each customer declines as the scale increases.

We consider that residential and small commercial customers have more stable usage patterns and are less exposed to periodic economic weakness, even after accounting for some weather-driven usage variability. Significant industrial exposure--combined with a local economy that largely depends on one or few cyclical industries--could contribute to the cyclicality of a utility's load and financial performance, magnifying the effect of an economic downturn.

A utility's cash flow generation and stability can benefit from operating in multiple geographic regions that exhibit average to better-than-average levels of wealth, and where employment and growth levels underpin the local economy and support long-term growth. Operating in a single geographic region carries a risk that can be ameliorated if the region is sufficiently large, demonstrates economic diversity, and has at least average demographic characteristics. In addition, if a utility operates in a single large geographic area and has a strong regulatory assessment, the benefit of diversity can be incremental.

Scale, scope, and diversity: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Stability of its revenue and profits limits its vulnerability to most combinations of adverse factors, events, or trends.	Revenue and profits are unstable and unsustainable, so that the utility is vulnerable to economic, competitive, or technological threats.
Customer base is large and diverse, with no meaningful customer concentration risk; that is, residential and small and midsize commercial customers typically provide most of the operating income.	Customer base is small and demonstrates customer or industry concentrations, combined with little economic diversity and average to below-average economic prospects.
Exposed to a wider range of service territories than others in the sector.	Exposed to a single service territory.
Operates in multiple regulatory jurisdictions where we assess the final regulatory advantage as adequate or stronger; or operates in a single regulatory jurisdiction where we assess final regulatory advantage as strong or strong/adequate.	Operates in a single regulatory jurisdiction where we assess the final regulatory advantage as adequate or adequate/weak.
No meaningful concentrations by asset or supplier that could weigh on operations; or assets and suppliers can easily be replaced.	Dependence on a single supplier or asset that cannot easily be replaced and that could damage the utility's operations.

Operating efficiency

We assess operating efficiency in the regulated utilities sector based on:

- A utility's compliance with the terms of its operating license--including safety, reliability, and environmental standards;
- Its cost management; and
- The scale, scope, and management of its capital spending.

We analyze management's record in these three key areas, relative to peers, and the resulting cash flow stability. In addition, we consider how management reduces the prospect of penalties for noncompliance; operating costs being greater than allowed; or capital projects running over budget and time--all of which could impair the company's ability to recover its full costs.

The relative importance of the above three factors, particularly cost and capital spending management, is determined by the type of regulation under which the utility operates. Utilities operating under robust cost-plus regimes tend to be more insulated given the high degree of confidence that costs will invariably be passed through to customers. Utilities operating under incentive-based regimes are likely to be more sensitive to achieving regulatory standards. This is particularly so where regulatory regimes involve active consultation between regulator and utility, and market testing, as opposed to just handing down an outcome on a more-arbitrary basis. In some jurisdictions, absolute performance standards are less relevant than how the utility

performs against the regulator's performance benchmarks. This performance will drive any penalties or incentive payments and can determine the utility's credibility on operating and asset management plans with its regulator.

Therefore, we believe that well-managed utilities are more likely to maximize the likelihood of cost recovery and full inclusion of capital spending in their asset bases. When regulatory resets are more at the discretion of the utility, effective cost management--including of labor--may allow for more control over the timing and magnitude of rate filings. This would maximize the chances of a constructive outcome--such as full operational and capital cost recovery--while protecting against reputational risks.

Operating efficiency: typical characteristics

Strong or strong/adequate	Adequate/weak or weak
Cost structure is better than that of peers and volatility is limited. Generates revenue and profits by minimizing costs, increasing efficiencies, and asset utilization.	Cost structure is worse than that of peers; its cost position and efficiency factors do not support profit sustainability; and volatility is above-average.
Asset profile (including age and technology) is such that we have confidence that it could sustain favorable performance against targets.	The capital spending program is so large and complex that overall operating efficiency is compromised.
Strong safety record.	Poor safety performance
Strong service reliability, with a record of meeting the operating performance requirements of stakeholders (including regulators).	Service reliability has been sporadic or nonexistent, with a track record of not meeting operating performance requirements of stakeholders (including regulators); we do not believe the utility can consistently meet performance targets without additional capital spending.
Where applicable, well-placed to meet current and potential future environmental standards.	Where applicable, the utility is challenged to comply with current environmental standards and is highly vulnerable to more onerous standards.
Management maintains very good control over both fixed and variable costs, in line with regulatory expectations (including labor and working capital management being in line with regulator's allowed collection cycles).	Management typically exceeds operating costs authorized by regulators.
Strong record of projects managed almost invariably within regulatory allowances for timing and budget.	Inconsistent project management skills, as demonstrated by cost overruns and delays, including for maintenance capital spending.

Profitability

A utility with above-average profitability would, relative to its peers, generally earn a rate of return at or above what regulators authorize and has minimal exposure to earnings volatility from affiliated unregulated business activities or market-sensitive regulated operations. Conversely, a utility with below-average profitability would generally earn rates of return well below the authorized return relative to its peers or have significant exposure to earnings volatility from affiliated unregulated business activities or market-sensitive regulated operations.

We typically use the EBITDA margin as key indicator of profitability, unless it is distorted--for example, by pass-through costs like congestion revenue or collection of third-party revenue, or by accelerated asset depreciation that we do not view as sustainable in the long run. In such cases, we would use ROC or ROE to benchmark the company against peers.

For regulated utilities subject to full cost-of-service regulation and return-on-investment requirements, we normally measure profitability using ROE, the ratio of net income available for common stockholders to average common equity. When setting rates, the regulator ultimately bases its decision on an authorized ROE. However, different factors--such as variances in costs and usage--may influence the return a utility is actually able to earn. Consequently, our analysis

of profitability for cost-of-service-based utilities centers on the utility's ability to consistently earn the authorized ROE.

Volatility of profitability: We may observe a clear difference between the volatility of actual reported profitability and the volatility of underlying regulatory profitability. In these cases, we could use the regulatory accounts as a proxy to judge earnings stability.

Financial Risk Profile

Accounting characteristics

Important accounting practices for utilities include:

- For integrated electric utilities that meet native load obligations partly by using third-party power contracts, we use our purchased power methodology to adjust measures for such contracts' debt-like obligations.
- Where substantial seasonal working capital requirements--for example, at natural gas distribution utilities--distort leverage measures, we adjust inventory and debt balances by netting the value of inventory against outstanding short-term borrowings. This adjustment informs balance sheet analysis by reducing seasonal debt balances when we are very confident of near-term cost recovery.
- We deconsolidate securitized debt (and associated revenue and expense) that has been accorded specialized recovery provisions.

In the U.S. and certain other regions, utilities employ "regulatory accounting," which permits a rate-regulated company to defer some revenue and expense to match the timing of the recognition of those items in rates, as determined by regulators. A utility subject to regulatory accounting therefore records assets and liabilities that an unregulated corporation--or even regulated utilities in other global regions--cannot record. We do not adjust GAAP earnings or balance-sheet figures to remove the effects of regulatory accounting. While IFRS does not currently provide for any recognition of the effects of rate-setting for financial reporting purposes, our financial analysis focuses on the economics and actual cash flow generation.

Volatility tables

We apply the low volatility benchmark table to regulated utilities where:

- They derive about two-thirds or more of their operating cash flows or profits from regulated operations that are predominantly at the low end of the utility risk spectrum (such as a network or distribution/transmission business unexposed to commodity risk and with very low operating risk);
- Their regulated operations have a regulatory advantage assessment of strong;
- They are expected to maintain their established record of achieving stable credit measures and low funding costs; and
- No other activities contribute significantly to the group's overall risk profile and are viewed as high-risk or volatile.

We apply the medial volatility table to regulated utilities that do not qualify for low volatility and that either:

- Derive about 50% or more of their operating cash flows or profits from regulated activities that have a regulatory advantage assessment of at least adequate and operate in a jurisdiction where the country risk is '4' or better; or
- Derive about one third or more of their consolidated operating cash flows or profits from regulated utility activities that have a regulatory advantage assessment of strong; or a regulatory advantage assessment of strong/adequate and a CICRA of '3' or better.

In both cases, the competitive position for the remaining activities must be assessed as at least satisfactory.

In all other cases, we use the standard volatility benchmark table.

Table of contents

Key Changes From Previous Criteria

The criteria incorporate the changes described in "Request for Comment: Sector-Specific Corporate Methodology," published Dec. 11, 2023, and consolidate detailed sector-specific provisions for corporate entities, currently described in nine different articles, into a single article. Most of the changes relate to the overall presentation of the criteria. We have also incorporated a few updates to enhance transparency, usability, and comparability between sectors.

- In the transportation infrastructure, regulated utilities, and unregulated power and gas sectors, we revised some of the conditions for applying the benchmark volatility tables when assessing cash flow/leverage. This is to better encapsulate the benefit of supportive regulatory or contractual revenue frameworks, and to capture potential gradual transitions in credit risk.
- In the financial services finance companies sector, we revised our adjusted EBITDA calculation for distressed debt purchasers. We add 50% of the principal collections back to revenue and EBITDA when assessing cash flow/leverage, to provide a more-comprehensive picture of the company's debt repayment capacity. The cash flow associated with collections on distressed receivables could be used to support debt repayment.
- In the forest and paper sector, we removed a supplementary ratio specific to timber REITs because it adds unnecessary complexity.

Impact On Outstanding Ratings

Based on our testing, and assuming that the entities in scope of this criteria (about 5,000) maintain their credit risk characteristics, we expect to take fewer than 15 rating actions, all of only one notch. We expect most of these rating actions to be upgrades.

Revisions And Updates

This article was originally published on April 4, 2024.

Changes introduced after original publication:

- On Aug. 13, 2024, we republished this criteria article to correct a publication error in Appendix 3. Specifically, we included industry-specific SER parameters for real estate that inform our view of volatility of profitability. These parameters were inadvertently omitted when we consolidated sector-specific criteria that previously appeared in "Guidance: Corporate Methodology," which has since been archived.
- On Nov. 18, 2024, we republished this criteria article to make nonmaterial changes to sector and industry variables. Specifically, we refreshed the SER calibration by industry tables in Appendix 3 by rolling the seven-year period forward to include the financial year-end of Dec. 31, 2022 (2016-2022). We also corrected a publication error that appeared in the SER ranges in the prior version of the EBITDA margin table for financial market Infrastructure companies. Additionally, we updated contact information.

Table of contents

- On March 10, 2025, we republished this criteria to correct a publication error in the unregulated power and gas section. Specifically, we included a paragraph to explain how we determine the industry cyclicality for this sector. This paragraph was inadvertently deleted from the original criteria in 2021.

This report does not constitute a rating action.

This article is a criteria article. Criteria are the published analytic framework for determining credit ratings. Criteria include fundamental factors, analytical principles, methodologies, and/or key assumptions that we use in the ratings process to produce our credit ratings. Criteria, like our credit ratings, are forward-looking in nature. Criteria are intended to help users of our credit ratings understand how S&P Global Ratings analysts generally approach the analysis of issuers or issues in a given sector. Criteria include those material methodological elements identified by S&P Global Ratings as being relevant to credit analysis. However, S&P Global Ratings recognizes that there are many unique factors / facts and circumstances that may potentially apply to the analysis of a given issuer or issue. Accordingly, S&P Global Ratings criteria is not designed to provide an exhaustive list of all factors applied in our rating analyses. Analysts exercise analytic judgement in the application of criteria through the rating committee process to arrive at rating determinations.

Rating Methodology

Regulated Electric and Gas Utilities

This rating methodology replaces the *Regulated Electric and Gas Utilities* methodology published on June 23, 2017. We have reordered and made editorial updates to various sections of the methodology. These updates do not change our methodological approach.

Scope

This methodology applies to rate-regulated electric and gas utilities globally whose predominant business is the sale of electricity and/or gas or related services under a rate-regulated framework, in most cases to retail customers. Companies in many industries are regulated. We use the term rate-regulated to distinguish companies whose rates (by which we also mean tariffs or revenues in general) are set by regulators. Rate-regulated utilities that own generating assets as any material part of their business, utilities whose charges or bills to customers include a meaningful component related to the electric or gas commodity, utilities whose rates are regulated at a sub-sovereign level (e.g., by provinces, states or municipalities), and companies providing an independent system operator function to an electric grid are also rated using this methodology. Companies rated using this methodology are primarily rate-regulated monopolies or, in certain circumstances, companies that may not be outright monopolies but where government regulation effectively sets prices and limits competition.

We generally consider a company to be predominantly a regulated electric and gas utility when a majority of its cash flows, prospectively and on a sustained basis, are derived from regulated electric and gas utility businesses. Since cash flows can be volatile (such that a company might have a majority of utility cash flows simply due to a cyclical downturn in its non-utility businesses), we may also consider the breakdown of assets and/or debt of a company to determine which business is predominant.

This methodology applies to a wide variety of companies, including vertically integrated utilities, transmission and distribution utilities with retail customers and/or sub-sovereign regulation, natural gas local distribution utility companies (LDCs), independent system operators, and regulated generation companies. These companies may be operating companies or holding companies.

This methodology does not apply to regulated electric and gas networks, which are rated using a separate methodology. Regulated electric and gas networks are companies whose predominant business is purely the transmission and/or distribution of electricity and/or natural gas without involvement in the procurement or sale of electricity and/or gas; whose charges to customers thus do not include a meaningful commodity cost component; which sell mainly (or in many cases exclusively) to non-retail customers; and which are rate-regulated under a national framework.

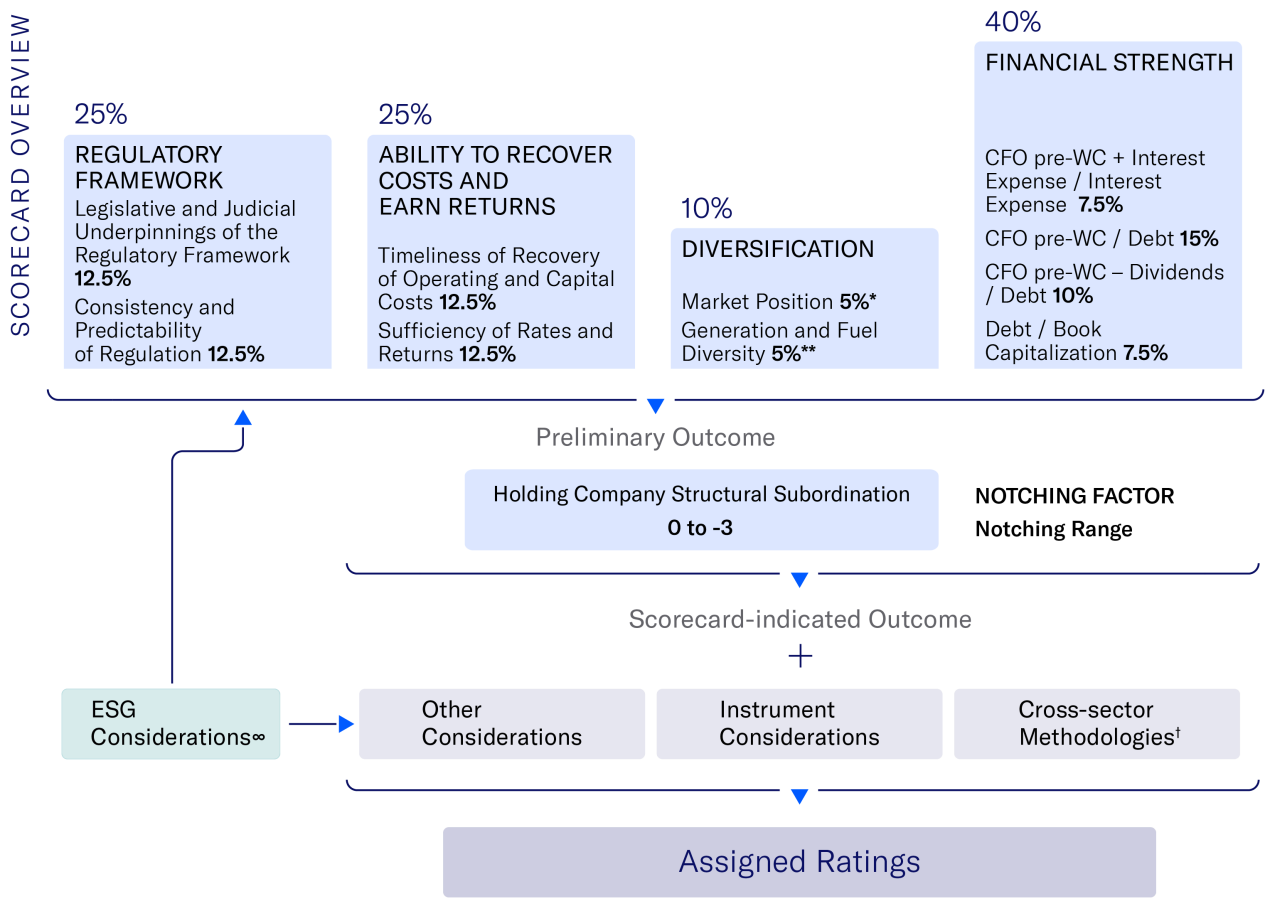
Unregulated utilities and power companies, public power utilities, municipal joint action agencies, electric cooperatives, regulated water companies, natural gas pipelines and midstream energy companies are also rated using separate methodologies.[1]

Rating approach

In this rating methodology, we explain our general approach to assessing credit risk of regulated electric and gas utilities globally, including the qualitative and quantitative factors that are likely to affect rating outcomes in this sector. We seek to incorporate all material credit considerations in ratings and to take the most forward-looking perspective that visibility into these risks and mitigants permits.

The following schematic illustrates our general framework for the analysis of regulated electric and gas utilities, which includes the use of a scorecard. The scorecard-indicated outcome is not expected to match the actual rating for each company. For more information, see the "Other considerations" and "Limitations" sections.

Exhibit 1
Illustration of the regulated electric and gas utilities methodology framework



* 10% weight for issuers that lack generation.
** 0% weight for issuers that lack generation.
∞ Environmental, social and governance (ESG) considerations, including, where available, our opinions of exposure to them as expressed in Issuer Profile Scores (IPSs), may affect scorecard factors and other considerations outside of the scorecard. For more information, see the "Other considerations" section.
† Some of the methodological considerations described in one or more cross-sector rating methodologies may be relevant to ratings in this sector. A link to a list of our sector and cross-sector methodologies can be found in the "Moody's related publications" section.

Regulated electric and gas utilities scorecard

For general information about how we use the scorecard and for a discussion of scorecard mechanics, please see the "Using the scorecard to arrive at a scorecard-indicated outcome" section. The scorecard does not include or address every factor that a rating committee may consider in assigning ratings in this sector. Please see the "Other considerations" and "Limitations" sections.

Exhibit 2

Regulated electric and gas utilities scorecard

	Weight	Aaa	Aa	A	Baa	Ba	B	Caa
Factor: Regulatory Framework (25%)								
Legislative and Judicial Underpinnings of the Regulatory Framework	12.5%	Utility regulation occurs under a fully developed framework that is national in scope based on legislation that provides the utility a nearly absolute monopoly [1] within its service territory, an unquestioned assurance that rates will be set in a manner that will permit the utility to make and recover all necessary investments, an extremely high degree of clarity as to the manner in which utilities will be regulated and prescriptive methods and procedures for setting rates. Existing utility law is comprehensive and supportive such that changes in legislation are not expected to be necessary; or any changes that have occurred have been strongly supportive of utilities credit quality in general and sufficiently forward-looking so as to address problems before they occurred. There is an independent judiciary that can arbitrate disagreements between the regulator and the utility should they occur, including access to national courts, very strong judicial precedent in the interpretation of utility laws, and a strong rule of law. We expect these conditions to continue.	Utility regulation occurs under a fully developed national, state or provincial framework based on legislation that provides the utility an extremely strong monopoly [1] within its service territory, a strong assurance, subject to limited review, that rates will be set in a manner that will permit the utility to make and recover all necessary investments, a very high degree of clarity as to the manner in which utilities will be regulated and reasonably prescriptive methods and procedures for setting rates. If there have been changes in utility legislation, they have been timely and clearly credit supportive of the issuer in a manner that shows the utility has had a strong voice in the process. There is an independent judiciary that can arbitrate disagreements between the regulator and the utility, should they occur including access to national courts, strong judicial precedent in the interpretation of utility laws, and a strong rule of law. We expect these conditions to continue.	Utility regulation occurs under a well-developed national, state or provincial framework based on legislation that provides the utility a very strong monopoly[1] within its service territory, an assurance, subject to reasonable prudency requirements, that rates will be set in a manner that will permit the utility to make and recover all necessary investments, a high degree of clarity as to the manner in which utilities will be regulated, and overall guidance for methods and procedures for setting rates. If there have been changes in utility legislation, they have been mostly timely and on the whole credit supportive for the issuer, and the utility has had a clear voice in the legislative process. There is an independent judiciary that can arbitrate disagreements between the regulator and the utility, should they occur, including access to national courts, clear judicial precedent in the interpretation of utility law, and a strong rule of law. We expect these conditions to continue.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation that provides the utility a strong monopoly within its service territory that may have some exceptions such as greater self-generation,[1] a general assurance that, subject to prudency requirements that are mostly reasonable, rates will be set in a manner that will permit the utility to make and recover all necessary investments, reasonable clarity as to the manner in which utilities will be regulated and overall guidance for methods and procedures for setting rates; or (ii) under a new framework where independent and transparent regulation exists in other sectors. If there have been changes in utility legislation, they have been credit supportive or at least balanced for the issuer but potentially less timely, and the utility had a voice in the legislative process. There is either (i) an independent judiciary that can arbitrate disagreements between the regulator and the utility, including access to courts at least at the state or provincial level, reasonably clear judicial precedent in the interpretation of utility laws, and a generally strong rule of law; or (ii) regulation has been applied (under a well-developed framework) in a manner such that redress to an independent arbiter has not been required. We expect these conditions to continue.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation or government decree that provides the utility a monopoly within its service territory that is generally strong but may have a greater level of exceptions,[1] and that, subject to prudency requirements which may be stringent, provides a general assurance (with somewhat less certainty) that rates will be set in a manner that will permit the utility to make and recover necessary investments; or (ii) under a new framework where the jurisdiction has a history of less independent and transparent regulation in other sectors. Either: (i) the judiciary that can arbitrate disagreements between the regulator and the utility may not have clear authority or may not be fully independent of the regulator or other political pressure, but there is a reasonably strong rule of law; or (ii) where there is no independent arbiter, the regulation has mostly been applied in a manner such redress has not been required. We expect these conditions to continue.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation or government decree that provides the utility monopoly within its service territory that is reasonably strong but may have important exceptions, and that, subject to prudency requirements which may be stringent or at times arbitrary, provides more limited or less certain assurance that rates will be set in a manner that will permit the utility to make and recover necessary investments; or (ii) under a new framework where we would expect less independent and transparent regulation, based either on the regulator's history in other sectors or other factors. The judiciary that can arbitrate disagreements between the regulator and the utility may not have clear authority or may not be fully independent of the regulator or other political pressure, but there is a reasonably strong rule of law. Alternately, where there is no independent arbiter, the regulation has been applied in a manner that often requires some redress adding more uncertainty to the regulatory framework. There may be a periodic risk of creditor-unfriendly government intervention in utility markets or rate-setting.	Utility regulation occurs (i) under a national, state, provincial or municipal framework based on legislation or government decree that provides the utility a monopoly within its service territory, but with little assurance that rates will be set in a manner that will permit the utility to make and recover necessary investments; or (ii) under a new framework where we would expect unpredictable or adverse regulation, based either on the jurisdiction's history in other sectors or other factors. The judiciary that can arbitrate disagreements between the regulator and the utility may not have clear authority or is viewed as not being fully independent of the regulator or other political pressure. Alternately, there may be no redress to an effective independent arbiter. The ability of the utility to enforce its monopoly or prevent uncompensated usage of its system may be limited. There may be a risk of creditor-unfriendly nationalization or other significant intervention in utility markets or rate-setting.

	Weight	Aaa	Aa	A	Baa	Ba	B	Caa
Factor: Regulatory Framework (25%)								
Consistency and Predictability of Regulation	12.5%	The issuer's interaction with the regulator has led to a strong, lengthy track record of predictable, consistent and favorable decisions. The regulator is highly credit supportive of the issuer and utilities in general. We expect these conditions to continue.	The issuer's interaction with the regulator has a led to a considerable track record of predominantly predictable and consistent decisions. The regulator is mostly credit supportive of utilities in general and in almost all instances has been highly credit supportive of the issuer. We expect these conditions to continue.	The issuer's interaction with the regulator has led to a track record of largely predictable and consistent decisions. The regulator may be somewhat less credit supportive of utilities in general, but has been quite credit supportive of the issuer in most circumstances. We expect these conditions to continue.	The issuer's interaction with the regulator has led to an adequate track record. The regulator is generally consistent and predictable, but there may some evidence of inconsistency or unpredictability from time to time, or decisions may at times be politically charged. However, instances of less credit supportive decisions are based on reasonable application of existing rules and statutes and are not overly punitive. We expect these conditions to continue.	We expect that regulatory decisions will demonstrate considerable inconsistency or unpredictability or that decisions will be politically charged, based either on the issuer's track record of interaction with regulators or other governing bodies, or our view that decisions will move in this direction. The regulator may have a history of less credit supportive regulatory decisions with respect to the issuer, but we expect that the issuer will be able to obtain support when it encounters financial stress, with some potentially material delays. The regulator's authority may be eroded at times by legislative or political action. The regulator may not follow the framework for some material decisions.	We expect that regulatory decisions will be largely unpredictable or even somewhat arbitrary, based either on the issuer's track record of interaction with regulators or other governing bodies, or our view that decisions will move in this direction. However, we expect that the issuer will ultimately be able to obtain support when it encounters financial stress, albeit with material or more extended delays. Alternately, the regulator is untested, lacks a consistent track record, or is undergoing substantial change. The regulator's authority may be eroded on frequent occasions by legislative or political action. The regulator may more frequently ignore the framework in a manner detrimental to the issuer.	We expect that regulatory decisions will be highly unpredictable and frequently adverse, based either on the issuer's track record of interaction with regulators or other governing bodies, or our view that decisions will move in this direction. Alternately, decisions may have credit supportive aspects, but may often be unenforceable. The regulator's authority may have been seriously eroded by legislative or political action. The regulator may consistently ignore the framework to the detriment of the issuer.
Factor: Ability to Recover Costs and Earn Returns (25%)								
Timeliness of Recovery of Operating and Capital Costs	12.5%	Tariff formulas [2] and automatic cost recovery mechanisms provide full and highly timely recovery of all operating costs and essentially contemporaneous return on all incremental capital investments, with statutory provisions in place to preclude the possibility of challenges to rate increases or cost recovery mechanisms. By statute and by practice, general rate cases are efficient, focused on an impartial review, quick, and permit inclusion of fully forward-looking costs.	Tariff formulas [2] and automatic cost recovery mechanisms provide full and highly timely recovery of all operating costs and essentially contemporaneous or near-contemporaneous return on most incremental capital investments, with minimal challenges by regulators to companies' cost assumptions. By statute and by practice, general rate cases are efficient, focused on an impartial review, of a very reasonable duration before non-appealable interim rates can be collected, and primarily permit inclusion of forward-looking costs.	Automatic cost recovery mechanisms provide full and reasonably timely recovery of fuel, purchased power and all other highly variable operating expenses. Material capital investments may be made under tariff formulas [2] or other rate-making permitting reasonably contemporaneous returns, or may be submitted under other types of filings that provide recovery of cost of capital with minimal delays. Instances of regulatory challenges that delay rate increases or cost recovery are generally related to large, unexpected increases in sizeable construction projects. By statute or by practice, general rate cases are reasonably efficient, primarily focused on an impartial review, of a reasonable duration before rates (either permanent or non-refundable interim rates) can be collected, and permit inclusion of important forward-looking costs.	Fuel, purchased power and all other highly variable expenses are generally recovered through mechanisms incorporating delays of less than one year, although some rapid increases in costs may be delayed longer where such deferrals do not place financial stress on the utility. Incremental capital investments may be recovered primarily through general rate cases with moderate lag, with some through tariff formulas.[2] Alternately, there may be formula rates that are untested or unclear. Potentially greater tendency for delays due to regulatory intervention, although this will generally be limited to rates related to large capital projects or rapid increases in operating costs.	There is an expectation that fuel, purchased power or other highly variable expenses will eventually be recovered with delays that will not place material financial stress on the utility, but there may be some evidence of an unwillingness by regulators to make timely rate changes to address volatility in fuel, or purchased power, or other market-sensitive expenses. Recovery of costs related to capital investments may be subject to delays that are somewhat lengthy, but not so pervasive as to be expected to discourage important investments.	The expectation that fuel, purchased power or other highly variable expenses will be recovered may be subject to material delays due to second-guessing of spending decisions by regulators or due to political intervention. Recovery of costs related to capital investments may be subject to delays that are material to the issuer, or may be likely to discourage some important investment.	The expectation that fuel, purchased power or other highly variable expenses will be recovered may be subject to extensive delays due to second-guessing of spending decisions by regulators or due to political intervention. Recovery of costs related to capital investments may be uncertain, subject to delays that are extensive, or that may be likely to discourage even necessary investment.

	Weight	Aaa	Aa	A	Baa	Ba	B	Caa
Factor: Ability to Recover Costs and Earn Returns (25%)								
Sufficiency of Rates and Returns	12.5%	Sufficiency of rates to cover costs and attract capital is (and will continue to be) unquestioned.	Rates are (and we expect will continue to be) set at a level that permits full cost recovery and a fair return on all investments, with minimal challenges by regulators to companies' cost assumptions. This will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are strong relative to global peers.	Rates are (and we expect will continue to be) set at a level that generally provides full cost recovery and a fair return on investments, with limited instances of regulatory challenges and disallowances. In general, this will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are generally above average relative to global peers, but may at times be average.	Rates are (and we expect will continue to be) set at a level that generally provides full operating cost recovery and a mostly fair return on investments, but there may be somewhat more instances of regulatory challenges and disallowances, although ultimate rate outcomes are sufficient to attract capital without difficulty. In general, this will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are average relative to global peers, but may at times be somewhat below average.	Rates are (and we expect will continue to be) set at a level that generally provides recovery of most operating costs but return on investments may be less predictable, and there may be decidedly more instances of regulatory challenges and disallowances, but ultimate rate outcomes are generally sufficient to attract capital. In general, this will translate to returns (measured in relation to equity, total assets, rate base or regulatory asset value, as applicable) that are generally below average relative to global peers, or where allowed returns are average but difficult to earn. Alternately, the tariff formula may not take into account all cost components and/or remuneration of investments may be unclear or at times unfavorable.	We expect rates will be set at a level that at times fails to provide recovery of costs other than cash costs, and regulators may engage in somewhat arbitrary second-guessing of spending decisions or deny rate increases related to funding ongoing operations based much more on politics than on prudency reviews. Return on investments may be set at levels that discourage investment. We expect that rate outcomes may be difficult or uncertain, negatively affecting continued access to capital. Alternately, the tariff formula may fail to take into account significant cost components other than cash costs, and/or remuneration of investments may be generally unfavorable.	We expect rates will be set at a level that often fails to provide recovery of material costs, and recovery of cash costs may also be at risk. Regulators may engage in more arbitrary second-guessing of spending decisions or deny rate increases related to funding ongoing operations based primarily on politics. Return on investments may be set at levels that discourage necessary maintenance investment. We expect that rate outcomes may often be punitive or highly uncertain, with a markedly negative impact on access to capital. Alternately, the tariff formula may fail to take into account significant cash cost components, and/or remuneration of investments may be primarily unfavorable.
Factor: Diversification (10%)								
Market Position	5% [3]	A very high degree of multinational and regional diversity in terms of regulatory regimes and/or service territory economies.	Material operations in three or more nations or substantial geographic regions providing very good diversity of regulatory regimes and/or service territory economies.	Material operations in two to three nations, states, provinces or regions that provide good diversity of regulatory regimes and service territory economies. Alternately, operates within a single regulatory regime with low volatility, and the service territory economy is robust, has a very high degree of diversity and has demonstrated resilience in economic cycles.	May operate under a single regulatory regime viewed as having low volatility, or where multiple regulatory regimes are not viewed as providing much diversity. The service territory economy may have some concentration and cyclicality, but is sufficiently resilient that it can absorb reasonably foreseeable increases in utility rates.	Operates in a market area with somewhat greater concentration and cyclicality in the service territory economy and/or exposure to storms and other natural disasters, and thus less resilience to absorbing reasonably foreseeable increases in utility rates. May show somewhat greater volatility in the regulatory regime(s).	Operates in a limited market area with material concentration and more severe cyclicality in service territory economy such that cycles are of materially longer duration or reasonably foreseeable increases in utility rates could present a material challenge to the economy. Service territory may have geographic concentration that limits its resilience to storms and other natural disasters, or may be an emerging market. May show decided volatility in the regulatory regime(s).	Operates in a concentrated economic service territory with pronounced concentration, macroeconomic risk factors, and/or exposure to natural disasters.
Generation and Fuel Diversity	5% [4]	A high degree of diversity in terms of generation and/or fuel sources such that the utility and rate-payers are well insulated from commodity price changes, no generation concentration, and very low exposures to Challenged or Threatened Sources (see definitions below).[5]	Very good diversification in terms of generation and/or fuel sources such that the utility and rate-payers are affected only minimally by commodity price changes, little generation concentration, and low exposures to Challenged or Threatened Sources.	Good diversification in terms of generation and/or fuel sources such that the utility and rate-payers have only modest exposure to commodity price changes; however, may have some concentration in a source that is neither Challenged nor Threatened. Exposure to Threatened Sources is low. While there may be some exposure to Challenged Sources, it is not a cause for concern.	Adequate diversification in terms of generation and/or fuel sources such that the utility and rate-payers have moderate exposure to commodity price changes; however, may have some concentration in a source that is Challenged. Exposure to Threatened Sources is moderate, while exposure to Challenged Sources is manageable.	Modest diversification in generation and/or fuel sources such that the utility or rate-payers have greater exposure to commodity price changes. Exposure to Challenged and Threatened Sources may be more pronounced, but the utility will be able to access alternative sources without undue financial stress.	Operates with little diversification in generation and/or fuel sources such that the utility or rate-payers have high exposure to commodity price changes. Exposure to Challenged and Threatened Sources may be high, and accessing alternate sources may be challenging and cause more financial stress, but ultimately feasible.	Operates with high concentration in generation and/or fuel sources such that the utility or rate-payers have exposure to commodity price shocks. Exposure to Challenged and Threatened Sources may be very high, and accessing alternate sources may be highly uncertain.

[1] The strength of the monopoly refers to the legal, regulatory and practical obstacles for customers in the utility's territory to obtain service from another provider. Examples of a weakening of the monopoly would include the ability of a city or large user to leave the utility system to set up their own system, the extent to which self-generation is permitted (e.g., cogeneration) and/or encouraged (e.g., net metering, DSM generation). At the lower end of the ratings spectrum, the utility's monopoly may be challenged by pervasive theft and unauthorized use. Since utilities are generally presumed to be monopolies, a strong monopoly position in itself is not sufficient for a strong score in this sub-factor, but a weakening of the monopoly can lower the score.
[2] Tariff formulas include formula rate plans as well as trackers and riders related to capital investment.
[3] 10% weight for issuers that lack generation.
[4] 0% weight for issuers that lack generation.
[5] Challenged Sources are generation plants that face higher but not insurmountable economic hurdles resulting from penalties or taxes on their operation, or from environmental upgrades that are required or likely to be required. Some examples are carbon-emitting plants that incur carbon taxes, plants that must buy emissions credits to operate, and plants that must install environmental equipment to continue to operate, in each where the taxes/credits/upgrades are sufficient to have a material impact on those plants' competitiveness relative to other generation types or on the utility's rates, but where the impact is not so severe as to be likely require plant closure. Threatened Sources are generation plants that are not currently able to operate due to major unplanned outages or issues with licensing or other regulatory compliance, and plants that are highly likely to be required to de-activate, whether due to the effectiveness of currently existing or expected rules and regulations or due to economic challenges.
[6] When debt/book capitalization is negative, the score is Caa.

Sector overview

Regulated electric and gas utilities globally are engaged in the production, transmission, coordination, distribution and/or sale of electricity and/or natural gas, and they are either investor-owned companies, commercially oriented government-owned companies or, in the case of independent system operators, not-for-profit or similar entities.

An over-arching consideration for regulated utilities is the regulatory environment in which they operate. The nature of regulation can vary significantly from jurisdiction to jurisdiction and is dynamic and subject to political intervention. The direct relationship that a regulated utility has with the retail customer, including billing for electric or gas supply that has substantial price volatility, can lead to a more politically charged rate-setting environment. Similarly, regulation at the sub-sovereign level is often subject to intervention from disaffected customers and influenced by public officials . Our views of regulatory environments evolve over time in accordance with our observations of regulatory, political and judicial events that affect issuers in the sector.

The principal categories of companies rated using this methodology include the following:

Vertically integrated utility: Vertically integrated utilities are regulated electric or combination utilities (see below) that own generation, distribution and (in most cases) electric transmission assets. Vertically integrated utilities are generally engaged in all aspects of the electricity business. They build power plants, procure fuel, generate power, build and maintain the electric grid (including high and low voltage lines, transformers and substations) that delivers power from a group of power plants to end-users , and generally meet all of the electric needs of the customers in a specific geographic area (also called a service territory). The rates or tariffs for all of these monopolistic activities are set by the relevant regulatory authority.

Transmission and distribution utility: Transmission and distribution utilities (T&Ds) typically operate in deregulated markets where generation is provided under a competitive framework. T&Ds own and operate the electric grid that transmits and/or distributes electricity within a specific state or region.

T&Ds provide electrical transportation and distribution services to carry electricity from power plants and transmission lines to retail, commercial, and industrial customers. T&Ds are typically responsible for billing customers for electric delivery and/or supply, and most have an obligation to provide a standard supply or provider-of-last-resort (POLR) service to customers that have not switched to a competitive supplier. These factors distinguish T&Ds from networks, whose customers are retail electric suppliers and/or other electricity companies. In a smaller number of cases, T&Ds rated using this methodology may not have an obligation to provide POLR services, but are regulated in sub-sovereign jurisdictions. The rates or tariffs for these monopolistic T&D activities are set by the relevant regulatory authority.

Natural gas local distribution company: Distribution is the final step in delivering natural gas to customers. While some large industrial, commercial, and electric generation customers receive natural gas directly from high capacity pipelines that carry gas from gas producing basins to areas where gas is consumed, most other users receive natural gas from their local gas utility, also called a local distribution company (LDC). LDCs are regulated utilities involved in the delivery of natural gas to consumers within a specific geographic area. Specifically, LDCs typically transport natural gas from delivery points located on large-diameter pipelines (that usually operate at fairly high pressure) to households and businesses through thousands of miles of small-diameter distribution pipe (that usually operate at fairly low pressure). LDCs are typically responsible for billing customers for gas delivery and/or supply, and most also have the responsibility to procure gas for at least some of their customers, although in some markets gas supply to all customers is on a competitive basis. These factors distinguish LDCs from gas networks, whose customers are retail gas suppliers and/or other natural gas companies. The rates or tariffs for these monopolistic activities are set by the relevant regulatory authority.

Integrated gas utility : Integrated gas utilities are regulated utilities that deliver gas to all end users in a particular service territory by sourcing the commodity; operating transport infrastructure that often combines high pressure pipelines with low pressure distribution systems and, in some cases, gas storage, re-gasification or other related facilities; and performing other supply-related activities, such as customer billing and metering. The rates or tariffs for the totality of these activities are set by the relevant regulatory authority. Many integrated gas utilities are national in scope.

Combination utility: Combination utilities are those that combine an LDC or integrated gas utility with either a vertically integrated utility or a T&D utility. The rates or tariffs for these monopolistic activities are set by the relevant regulatory authority.

Regulated generation utility: Regulated generation utilities (regulated gencos) are utilities that almost exclusively have generation assets, but their activities are generally regulated like those of vertically integrated utilities. This typically means that the purchasers of their output (typically other investor-owned, municipal or cooperative utilities) pay a regulated rate based on the total allowed costs of the regulated genco, including a return on equity, based on a capital structure designated by the regulator. Companies that have been included in this group include certain generation companies that are not rate-regulated in the usual sense of recovering costs plus a regulated rate of return on either equity or asset value.

Independent system operator: An independent system operator (ISO) is an organization formed in certain regional electricity markets to act as the sole chief coordinator of an electric grid. In the areas where an ISO is established, it coordinates, controls and monitors the operation of the electrical power system to assure that electric supply and demand are balanced at all times, and, to the extent possible, that electric demand is met with the lowest-cost sources. ISOs seek to assure adequate transmission and generation resources, usually by identifying new transmission needs and planning for a generation reserve margin above expected peak demand. In regions where generation is competitive, they also seek to establish rules that foster a fair and open marketplace, and they may conduct price-setting auctions for energy and/or capacity. The generation resources that an ISO coordinates may belong to vertically integrated utilities or to independent power producers. ISOs may not be rate-regulated in the traditional sense but fall under governmental oversight. All participants in the regional grid are required to pay a fee or tariff (often volumetric) to the ISO that is designed to recover its costs, including costs of investment in systems and equipment needed to fulfill their function. ISOs may be for profit or not-for-profit entities.

Transmission-only utility: Transmission-only utilities are solely focused on owning and operating transmission assets. The transmission lines these utilities own are typically high-voltage and allow energy producers to transport electric power over long distances from where it is generated (or received) to the transmission or distribution system of a T&D or vertically integrated utility.

Utility holding company (utility holdco): As detailed in Appendix B, regulated electric and gas utilities are often part of corporate families under a parent holding company. The operating subsidiaries of utility holdcos are overwhelmingly regulated electric and gas utilities.

Hybrid holding company (hybrid holdco): Some utility families contain a mix of regulated electric and gas utilities and other types of companies, but the regulated electric and gas utilities represent the majority of the consolidated cash flows, assets and debt. The parent company is thus a hybrid holdco.

Discussion of the scorecard factors

In this section, we explain our general approach for scoring each scorecard factor or sub-factor, and we describe why they are meaningful as credit indicators.

Factor: Regulatory Framework (25%)

Why it matters

The regulatory framework is important because it provides the basis for decisions that affect utilities, including rate-setting as well as the consistency and predictability of regulatory decision-making. Core aspects of a regulatory framework are its legislative and judicial underpinnings, and the consistency and predictability of regulatory decisions and rule-making.

Utility rates are set in a political/regulatory process rather than a competitive or free-market process; thus, the regulatory framework is a key determinant of the credit quality of a utility. In jurisdictions where utility revenues include material government subsidy payments, we consider utility rates to be inclusive of these payments, and we thus evaluate sub-factors under the first two factors in light of both rates and material subsidy payments. For example, we would consider the legal and judicial underpinnings and consistency and predictability of subsidies as well as rates. The regulatory framework has many components: the governing body and the utility legislation or decrees it enacts, the manner in which regulators are appointed or elected, the rules and procedures promulgated by those regulators, the judiciary that interprets the laws and rules and that arbitrates disagreements, and the manner in which the utility manages the political and regulatory process. In many cases, utilities have experienced credit stress or default because of a breakdown or obstacle in the regulatory framework – for instance, laws that prohibited regulators from including , in rates, the recovery of investments in uncompleted power plants or plants not deemed “used and useful,” or a disagreement about rate-making that could not be resolved until after the utility had defaulted on its debts.

How we assess it for the scorecard

Scoring for this factor is based on two sub-factors: Legislative and Judicial Underpinnings of the Regulatory Framework; and Consistency and Predictability of Regulation.

Legislative and Judicial Underpinnings of the Regulatory Framework

For this sub-factor, we consider the scope, clarity, transparency, supportiveness and granularity of utility legislation, decrees, and rules as they apply to the issuer. We also consider the strength of the regulator's authority over rate-making and other regulatory issues affecting the utility, the effectiveness of the judiciary or other independent body in arbitrating disputes in a disinterested manner, and whether the utility's monopoly has meaningful or growing carve-outs. In addition, we consider how well-developed the framework is – both how fully fleshed out the rules and regulations are and how well-tested it is – and the extent to which regulatory or judicial decisions have created a body of precedent that help determine future rate-making. We consider how effective the utility is in navigating the regulatory framework – both the utility's ability to shape the framework and adapt to it.

A utility operating in a regulatory framework that is characterized by legislation that is credit-supportive of utilities and eliminates doubt by prescribing many of the procedures that the regulators use in determining fair rates (which legislation may show evidence of being responsive to the needs of the utility in general or specific ways), a long history of transparent rate-setting, and a judiciary that has provided ample precedent by impartially adjudicating disagreements in a manner that addresses ambiguities in the laws and regulations typically receives higher scores for this sub-factor. A utility operating in a regulatory framework that, by statute or practice, allows the regulator to arbitrarily prevent the utility from recovering its costs or earning a reasonable return on prudently incurred investments, or where regulatory decisions may be reversed by politicians, typically receives a lower score.

In general, we view national utility regulation as being less susceptible to political intervention than regulation by state, provincial or municipal entities, so the highest scoring in this sub-factor is typically reserved for this category. However, we acknowledge that states and provinces in some countries may be larger than small nations, such that their regulators may be equally impartial. In such cases, issuers are likely to receive higher scores for this sub-factor.

The relevant judicial system can be a major factor in the regulatory framework, particularly in countries like the US, where disagreements between a utility and its state or municipal regulator may eventually be adjudicated in a federal district court or even by the US Supreme Court. In addition, bankruptcy proceedings in the US occur in federal courts, which have at times been able to impose rate settlement agreements on state or municipal regulators. As a result, the range of decisions available to state regulators may be effectively circumscribed by court precedent at the state or federal level, which we generally view as a favorable characteristic of the regulatory framework.

We consider regulated electric and gas utilities generally to have strong monopolies that are likely to continue, which allows these companies to have high leverage. Thus, the existence of a monopoly in itself is unlikely to be a driver of strong scoring in this sub-factor. On the other hand, a strong challenge to the monopoly could result in lower scores because of the potential loss of customers and revenue. A utility can only recover its costs and investments and service its debt if customers purchase its services. Examples of incursions into utilities' monopoly include the takeover of the utility by a municipality, self-generation such as rooftop solar panels, distributed generation with net metering, in which customers generate power and sell excess power to the utility, or unauthorized use beyond the level for which the utility receives compensation in rates. Incursions that are growing significantly or are having a meaningful impact on rates for customers that remain with the utility could have a negative impact on the scoring of this sub-factor and on the Ability to Recover Costs and Earn Returns factor.

The scoring of this sub-factor may not be the same for every utility in a particular jurisdiction. Some utilities appear to have greater sway over the relevant utility legislation and promulgation of rules than other utilities – even those in the same jurisdiction. The content and tone of publicly filed documents and regulatory decisions sometimes indicates that the management team at one utility has better responsiveness to and credibility with its regulators or legislators than the management at another utility.

While the underpinnings to the regulatory framework tend to change relatively slowly, they do evolve, and our scoring reflects that evolution. For instance, a new regulatory framework typically becomes tested over time as regulatory decisions are issued, or perhaps litigated, thereby setting a body of precedent. Utilities may seek changes to laws in order to permit them to securitize certain costs or collect interim rates, or a jurisdiction in which rates were previously recovered primarily in base rate proceedings may institute riders

and trackers. These changes would likely affect scoring of the Timeliness of Recovery of Operating and Capital Costs sub-factor, but they may also be sufficiently significant to indicate a change in the regulatory underpinnings.

The regulatory framework may also change as a result of a judiciary that had formerly been independent of the executive branch, but which may start to issue decisions that indicate it is conforming its decisions to the expectations of an executive branch that wants to mandate lower rates.

Consistency and Predictability of Regulation

In assessing this sub-factor, we consider the track record of regulatory decisions in terms of consistency, predictability and supportiveness. We evaluate the utility's interactions in the regulatory process as well as the overall stance of the regulator toward the utility.

In most jurisdictions, the laws and rules seek to make rate-setting a primarily technical process that examines costs the utility incurs and the returns on investments the utility needs to earn so it can make investments that are required to build and maintain the utility infrastructure, which includes power plants, electric transmission and distribution systems, and/or natural gas distribution systems. Where the process remains technical and transparent such that regulators can support the financial health of the utility while balancing their public duty to assure that reliable service is provided at a reasonable cost, and where the utility is able to align itself with the policy initiatives of the governing jurisdiction, the utility typically receives higher scores for this sub-factor. Where the process includes substantial political intervention, which could take the form of legislators or other government officials publicly second-guessing regulators, dismissing regulators who have approved unpopular rate increases, or preventing the implementation of rate increases, or where regulators ignore the laws/rules to deliver an outcome that appears more politically motivated, the utility typically receives a lower score for this sub-factor.

As with the prior sub-factor, we may score different utilities in the same jurisdiction differently, based on outcomes that are more or less supportive of credit quality over a period of time. Some utilities are better able to meet the expectations of their customers and regulators, whether through better service, greater reliability, more stable rates or simply more effective regulatory outreach and communication. These utilities typically receive more consistent and credit-supportive outcomes, so they typically score higher for this sub-factor. Conversely, if a utility has multiple, rapid rate increases, chooses to submit major rate increase requests during a sensitive election cycle or a severe economic downturn, has chronic customer service issues, is viewed as frequently providing incomplete information to regulators, or is tone-deaf to the priorities of regulators and politicians, it may receive less consistent and supportive outcomes and thus receive a lower score for this sub-factor.

In scoring this sub-factor, we primarily evaluate the actions of regulators, politicians and jurists rather than their words. Nonetheless, words matter when they are an indication of future action. We seek to differentiate between political rhetoric that is perhaps oriented toward gaining attention for the viewpoint of the speaker and rhetoric that is indicative of future actions and trends in decision-making.

Factor: Ability to Recover Costs and Earn Returns (25%)

Why it matters

The ability of a utility to recover its costs and earn a return, including during different market and economic conditions, directly affects its ability to generate cash flow and service its debt. Core aspects of this factor are the timeliness of recovery of operating and capital costs, and the sufficiency of rates and returns.

The ability to recover prudently incurred costs on a timely basis and to attract debt and equity capital are crucial credit considerations. The inability to recover costs, for instance if fuel or purchased power costs ballooned during a rate freeze period, has been one of the greatest drivers of financial stress in this sector, as well as the cause of some utility defaults. In a sector that is typically free cash flow negative (due to large capital expenditures and dividends) and that routinely needs to refinance very large maturities of long-term debt, investor concerns about a lack of timely cost recovery or the sufficiency of rates can, in an extreme scenario, strain access to capital markets and potentially lead to insolvency of the utility. While our scoring for this factor may primarily be influenced by our assessment of the regulatory relationship, it can also be highly affected by the management and business decisions of the utility.

The timeliness and sufficiency of rates are interrelated. Timeliness can have an impact on our view of what constitutes sufficient returns, because a strong assurance of timely cost recovery reduces risk. Conversely, utilities may have a strong assurance that they will earn a full return on certain deferred costs until they are able to collect them, or their generally strong returns may allow them to weather some rate lag on recovery of construction-related capital expenditures. The timeliness of cost recovery is particularly important in a period of rapidly rising costs. For example, fuel is a large component of total costs for vertically integrated utilities and for natural gas utilities, and fuel prices are highly volatile, so the timeliness of fuel and purchased power cost recovery is especially important.

The first two factors are closely interrelated, but utilities may receive different scores for each of these. For example, a utility could have a regulatory framework that causes considerable credit concerns, perhaps because it is untested or undergoing a transition to de-regulation, but where the track record of rate-case outcomes is positive. This could result in a higher score for the Ability to Recover Costs and Earn Returns factor than for the Regulatory Framework factor. Conversely, there may be instances of strong Legislative and Judicial Underpinnings of the regulatory framework where a commission ignores the framework, which affects the Consistency and Predictability of Regulation as well as the Ability to Recover Costs and Earn Returns. In some cases, a commission has used extraordinary measures to prevent or defer a rate increase that might have been justifiable from a cost perspective but would have caused rate shock.

Scoring for the Ability to Recover Costs and Earn Returns factor places more emphasis on our expectation of timeliness and sufficiency of rates over time; whereas financial metrics may be affected by one-time events, market conditions or construction cycles, which are trends that could normalize or even reverse.

How we assess it for the scorecard

Scoring for this factor is based on two sub-factors: Timeliness of Recovery of Operating and Capital Costs; and Sufficiency of Rates and Returns.

Timeliness of Recovery of Operating and Capital Costs

In assessing this sub-factor, we consider provisions and cost recovery mechanisms for operating costs, mechanisms that allow operating and/or capital expenditures to be trued up periodically in rates without having to file a rate case (this may include formula rates, rider and trackers, or the ability to periodically adjust rates for construction work in progress). We also consider the process and time frame of rate proceedings and the track record of recovery. For instance, having a formula rate plan is positive, but if the actual process has included reviews that are delayed for long periods, it may diminish the benefit to the utility. In addition, we consider the lag between the time that a utility incurs a major construction expenditure and the time that the utility will start to recover and/or earn a return on that expenditure.

Sufficiency of Rates and Returns

In assessing this sub-factor, we consider statutory protections that assure full cost recovery and a reasonable return for the utility on its investments, the regulatory mechanisms used to determine what a reasonable return should be, and the track record of the utility in actually recovering costs and earning allowed returns.

We examine outcomes of rate cases/tariff reviews and compare them to the request submitted by the utility, to prior rate cases/tariff reviews for the same utility and to recent rate/tariff decisions for a peer group of comparable utilities. In this context, comparable utilities are typically utilities in the same or similar jurisdiction. In cases where the utility is unique or nearly unique in its jurisdiction, we compare it to other peers with an adjustment for local differences, including prevailing rates of interest and returns on capital, as well as the timeliness of rate-setting . We consider regulatory disallowances of costs or investments, with a focus on their financial severity and also on the reasons provided by the regulator, in order to assess the likelihood that such disallowances will be repeated in the future.

Factor: Diversification (10%)

Why it matters

Diversification of overall business operations is important because it helps to mitigate the risk that economic cycles, material changes in a single regulatory regime, or commodity price movements have on the cash flow and credit quality of a utility. While utilities' sales

volumes have lower exposure to economic downturns than many non-financial corporate issuers, some sales components, including industrial sales, are directly affected by economic trends that result in lower production and/or plant closures. In addition, economic activity performs a role in the commercial sector or rate of customer growth in the service territory and, absent energy efficiency and conservation, can often affect usage per customer.

The economic strength or weakness of the service territory can affect the political and regulatory environment for rate increase requests by the utility. For utilities in areas prone to severe storms and other natural disasters, the utility's geographic diversity or concentration can be a key determinant for creditworthiness.

Diversity among regulatory regimes can mitigate the impact of a single unfavorable decision affecting one part of the utility's footprint.

For utilities with electric generation, fuel-source diversity can mitigate the impact to the utility and to its rate-payers of changes in commodity prices, hydrology and water flow, and environmental or other regulations affecting plant operations and economics; so fuel diversity typically leads to more stable rates over time.

Regulatory environments are most likely to become unfavorable during periods of rapid rate increases, which are more important than absolute rate levels. Fuel diversity can be important even if fuel and purchased power expenses are an automatic pass-through to the utility's rate-payers, because rapid price increases can cause regulators or utilities to seek recovery over a more prolonged period than the pass-through mechanism allows. Changes in environmental, safety and other regulations have caused vulnerabilities for certain technologies and fuel sources. These vulnerabilities have varied widely in different countries and have changed over time.

How we assess it for the scorecard
Scoring for this factor is based on two sub-factors: Market Position, and Generation and Fuel Diversity.

Market Position

In assessing market position, we consider the economic diversity of the utility's service territory and the diversity of its regulatory regimes, as well as the size and scale of a utility's operations. We also consider the diversity of utility operations (e.g., regulated electric, gas, water, steam) where there are material operations in more than one area.

Economic diversity is typically a function of the population, size and breadth of the territory and the businesses that drive its gross domestic product (GDP) and employment. For the size of the territory, we typically consider the number of customers and the volume of generation and/or throughput. For breadth, we consider the number of sizable metropolitan areas served, the economic diversity and vitality in those metropolitan areas, and any concentration in a particular area or industry. In our assessment, we may consider various information sources. We also consider the mix of the utility's sales volumes among customer types, as well as the track record of volume sales and any notable payment patterns during economic cycles. For diversity of regulatory regimes, we typically look at the number of regulators and the percentages of revenues and utility assets that are under the purview of each. Issuers regulated in multiple jurisdictions typically receive the highest scores in the Market Position sub-factor. Where there is only one regulator, we make a differentiation of regimes perceived as having lower or higher volatility. Size of the utility is also considered, since a larger utility can better absorb the impact of temporary, or one-time, adverse events.

Issuers with multiple supportive regulatory jurisdictions, a balanced sales mix among residential, commercial, industrial and governmental customers in a large service territory with a robust and diverse economy generally receive a higher score for this sub-factor than issuers that lack these characteristics. Issuers with a small service territory economy that has a high dependence on one or two sectors , especially highly cyclical industries, generally receive lower scores for this sub-factor, as do issuers with meaningful exposure to economic dislocations caused by natural disasters.

For issuers that are vertically integrated utilities having a meaningful amount of generation, this sub-factor has a weighting of 5%. For electric transmission and distribution utilities without meaningful generation and for natural gas local distribution companies, this sub-factor has a weighting of 10%.

Generation and Fuel Diversity

We consider the fuel type of the issuer's generation and important power purchase agreements, the ability of the issuer to shift its generation and power purchases when there are changes in fuel prices, the extent to which the utility and its rate-payers are exposed to or insulated from changes in commodity prices, and exposure to challenged sources and threatened sources (see the explanations for how we generally characterize these generation sources in the table below).

A regulated utility's capacity mix may not in itself be an indication of fuel diversity or the ability to shift fuels, because utilities may keep old and inefficient plants (e.g., natural gas boilers) to serve peak load. For this reason, we do not incorporate set percentages reflecting an "ideal" or "sub-par" mix for capacity or even generation. In addition to looking at a utility's generation mix to evaluate fuel diversity, we consider the efficiency of the utility's plants, their placement on the regional dispatch curve, and the demonstrated ability/inability of the utility to shift its generation mix in accordance with changing commodity prices.

Issuers having a balanced mix of fuel types as well as low exposure to challenged and threatened sources of generation typically receive higher scores for this sub-factor. Issuers that have concentration in one or two sources of generation, especially if they are threatened or challenged sources, typically receive lower scores.

In assessing an issuer's extent of exposure to challenged and threatened sources , we consider not only the existence of those plants in the utility's portfolio, but also the relevant factors that determine the impact on the utility and on its rate-payers. For instance, an issuer that has a fairly high percentage of its generation from challenged sources could be assessed very differently if its peers experience the same magnitude of those issues than if its peers have no exposure to challenged or threatened sources. In assessing threatened sources, we consider a utility's progress in its plan to replace those sources, its reserve margin, the availability of purchased power capacity in the region, and the overall impact of the replacement plan on the issuer's rates relative to its peer group. We also consider the extent to which the utility's generation resources plan is aligned with the relevant government's fuel/energy policy and the economic support of the underlying economy (e.g., if the fuel or plants are important sources of jobs and tax revenue).

Factor: Financial Strength (40%)

Why it matters

Financial strength is necessary for a regulated electric and gas utility to attract capital at a reasonable cost in order to invest in its generation, transmission and distribution assets, so the utility can fulfill its service obligations at a reasonable cost to rate-payers and service debt. The financial strength of utilities, which are characterized by large investments in long-lived property, plant and equipment, includes the ability to service debt and provide a return to shareholders.

The financial statements of regulated electric and gas utilities have certain aspects that affect financial analysis, including disparate treatment of certain elements under US Generally Accepted Accounting Principles (GAAP) compared with International Financial Reporting Standards (IFRS). Regulatory accounting may permit utilities to defer certain costs (thereby creating regulatory assets) that a non-utility corporate entity would have to expense. For instance, a regulated utility may be able to defer a substantial portion of costs related to recovery from a storm based on the general regulatory framework for those expenses, even if the utility does not have a specific order to collect the expenses from rate-payers over a set period. A regulated utility may be able to accrue and defer a return on equity (in addition to capitalizing interest) for construction work in progress for an approved project based on the assumption that it will be able to collect that deferred equity return once the asset comes into service. Because of the disparate treatment of certain elements under the different accounting standards , we focus more on a utility's cash flow than on its reported net income.

Conversely, utilities may collect certain costs in rates well ahead of the time they must be paid (for instance, pension costs), thereby creating regulatory liabilities. Many of our metrics focus on Cash Flow from Operations Before Changes in Working Capital (CFO Pre-WC) because, unlike Funds from Operations (FFO), it captures the changes in long-term regulatory assets and liabilities.

However, under IFRS the two metrics are essentially the same. In general, we view changes in working capital as being less useful in the financial analysis of a utility because such changes are often seasonal (for example, power demand is generally greatest in the summer) or caused by changes in fuel prices that are typically a relatively automatic pass-through to the customer. We nonetheless consider the impact of working capital changes in analyzing a utility's liquidity (see the "Liquidity" section in "Other rating considerations").

CFO Pre-Working Capital Plus Interest Expense / Interest Expense

This metric is an indicator of a utility's ability to cover the cost of its borrowed capital.

CFO Pre-Working Capital / Debt

This metric provides important indications of the cash-generating ability of a utility compared to its total debt.

CFO Pre-Working Capital Minus Dividends / Debt

This ratio is an indicator for financial leverage as well as an indicator of the strength of a utility's cash flow after dividend payments are made. Dividend obligations of utilities are often substantial, quasi-permanent outflows that can affect the ability of a utility to cover its debt obligations, and this ratio can also provide insight into the financial policies of a utility or utility holding company. The higher the level of retained cash flow relative to a utility's debt, the more cash the utility has to support its capital expenditure program.

Debt / Book Capitalization

This ratio is a traditional measure of balance sheet leverage. Total capitalization includes minority interest and deferred taxes in addition to total debt, preferred stock, other hybrid securities, and common equity. Since the presence or absence of deferred taxes is a function of national tax policy, comparing utilities using this ratio may be more meaningful among utilities in the same country or in countries with similar tax policies. High debt levels in comparison to capitalization can indicate higher interest obligations, can limit the ability of a utility to raise additional financing if needed, and can lead to leverage covenant violations in bank credit facilities or other financing agreements. We also examine debt/capitalization ratios as defined in applicable covenants (which typically exclude deferred taxes from capitalization) relative to the covenant threshold level. A high ratio may result from a regulatory framework that does not permit a robust cushion of equity in the capital structure, or from a material write-off of an asset, which may not have affected current period cash flows but could affect future period cash flows relative to debt.

How we assess it for the scorecard
Scoring for this factor is based on four quantitative sub-factors: CFO Pre-Working Capital Plus Interest Expense/Interest Expense ; CFO Pre-Working Capital/Debt; CFO Pre-Working Capital Minus Dividends/Debt; and Debt/Book Capitalization.

There are two sets of thresholds for three of these ratios based on the level of the issuer's business risk – the Standard Grid and the Lower Business Risk (LBR) Grid. In our view, the different types of utility entities rated using this methodology have different levels of business risk.

Generation utilities and vertically integrated utilities generally have a higher level of business risk because they are engaged in power generation, so we apply the Standard Grid. We view power generation as the highest-risk component of the electric utility business, as generation plants are typically the most expensive part of a utility's infrastructure (representing potential asse t concentration risk) and are subject to the greatest risks in both construction and operation, including the risk that incurred costs will either not be recovered in rates or recovered with material delays.

Other types of utilities may have lower business risk, such that we consider that they are more appropriately assessed using the LBR Grid, due to factors that could include a generally greater transfer of risk to customers, very strong insulation from exposure to commodity price movements, good protection from volumetric risks, fairly limited capex needs and/or low exposure to storms, major accidents and natural disasters. For instance, we consider many US natural gas LDCs and certain US electric T&Ds , which lack generation but generally retain some procurement responsibilities for customers, as typically having a lower business risk profile than their vertically integrated peers. In cases of T&Ds that we do not view as having materially lower risk than their vertically integrated peers, we apply the Standard grid. This could result from a regulatory framework that exposes them to energy supply risk, large capital expenditures for required maintenance or upgrades, a heightened exposure to catastrophic climate events , increased regulatory scrutiny due to poor reliability or other considerations. The Standard Grid also applies to LDCs that in our view do not have materially lower risk; for instance, due to their ownership of high pressure pipes or older systems requiring extensive gas main replacements, where gas commodity costs are not fully recovered in a reasonably contemporaneous manner, where the LDC is not well-insulated from declining volumes, or if the jurisdiction of operation has aggressive policies to limit or reduce its business.

CFO Pre-Working Capital Plus Interest Expense / Interest Expense

The numerator is the sum of CFO Pre-WC and interest expense, and the denominator is interest expense.

CFO Pre-Working Capital / Debt

The numerator is CFO Pre-WC, and the denominator is total debt.

CFO Pre-Working Capital Minus Dividends / Debt

The numerator is CFO Pre-WC minus dividends, and the denominator is total debt.

Debt / Book Capitalization

The numerator is total debt, and the denominator is book capitalization.

Notching factor: Structural Subordination of Holding Companies

Our assessment of the Structural Subordination of Holding Companies may result in a downward adjustment to the preliminary outcome that results from the four weighted factors. We apply this adjustment in whole-notch increments, with a maximum of three alphanumeric notches down from the preliminary scorecard-indicated outcome to arrive at the scorecard-indicated outcome.

In cases where we consider that the credit weakness or credit strength represented by the notching factor is greater than the scorecard range, we incorporate this view into the rating, which may be different from the scorecard-indicated outcome. For a discussion of scorecard mechanics, please see the "Using the scorecard to arrive at a scorecard-indicated outcome" section.

Why it matters

Notching for the structural subordination of holding companies is important because in the regulated utility sector, barriers to movement of cash among companies in the corporate family can vary, depending on the regulatory framework. These barriers can lead to significantly different probabilities of default for holding companies (HoldCos) and operating subsidiaries (OpCos).

A typical utility company structure consists of a HoldCo that owns one or more OpCos. OpCos may be regulated utilities or non-utility companies. A HoldCo typically has no operations – its assets are mostly limited to its equity interests in subsidiaries, and potentially other investments in subsidiaries that are structured as equity, debt or even hybrid instruments.

Most HoldCos present their financial statements on a consolidated basis that blurs legal considerations about priority of creditors based on the legal structure of the family, and scorecard scoring is thus based on consolidated ratios. However, HoldCo creditors typically have a secondary claim on the group's cash flows and assets after OpCo creditors. We refer to this as structural subordination because it is the corporate legal structure, rather than specific subordination provisions, that causes creditors at each of the utility and non-utility subsidiaries to have a more direct claim on the cash flows and assets of their respective OpCo obligors. By contrast, the debt of the HoldCo is typically serviced primarily by dividends that are up-streamed by the OpCos. The HoldCo and OpCo may also have intercompany agreements, including tax sharing agreements, that can be another source of cash to the HoldCo. Under normal circumstances, these dividends are made from net income, after payment of the OpCo's interest and preferred dividends.

Structural subordination also affects loss given default. Under most default scenarios, an OpCo's creditors will be satisfied from the value residing at that OpCo before any of the OpCo's assets can be used to satisfy claims of the HoldCo's creditors. Actual priority in a default scenario will be determined by many factors, including the corporate and bankruptcy laws of the jurisdiction, the asset value of each OpCo, specific financing terms, inter-relationships among members of the family, etc. The prevalence of debt issuance at the OpCo level is another reason that structural subordination is usually a more serious concern in the utility sector than for investment-grade issuers in other non-financial corporate sectors.

The first four factors are primarily oriented to OpCos (and to some extent for HoldCos with minimal structural subordination; for example, there is no current structural subordination to debt at the operating company if all of the utility family's debt and preferred stock is issued at the HoldCo level, although there is structural subordination to other liabilities at the OpCo level). The additional risk from structural subordination is addressed via a notching adjustment to bring scorecard-indicated outcomes (on average) closer to the actual ratings of HoldCos.

How we assess it for the scorecard

Scorecard-indicated outcomes of holding companies may be notched down based on structural subordination. The risk factors and mitigants that impact structural subordination are varied and can be present in different combinations, such that a formulaic approach is not practical and case-by-case analyst judgment of the interaction of all pertinent factors that may increase or decrease its importance to the credit risk of an issuer is essential.

Some of the potentially pertinent features that could increase the extent or impact of structural subordination include the following:

» Regulatory or other barriers to cash movement from OpCos to HoldCo

» Specific ring-fencing provisions

» Strict financial covenants at the OpCo level

» Higher leverage at the HoldCo level While higher leverage at the HoldCo does not increase structural subordination per se, it exacerbates the impact of any structural subordination that exists.

» Significant dividend limitations at an important OpCo

» HoldCo exposure to subsidiaries with high business risk or volatile cash flows

» Strained liquidity at the HoldCo level

» The group's investment program is primarily in businesses that are higher risk or new to the group

Some of the potentially mitigating features that could decrease the extent and/or impact of structural subordination include the following:

» Substantial diversity in cash flows from a variety of utility OpCos

» Meaningful dividends to HoldCo from unlevered utility OpCos

» Dependable, meaningful dividends to HoldCo from non-utility OpCos

» The group's investment program is primarily in strong utility businesses

» Inter-company guarantees - however, in many jurisdictions the value of an upstream guarantee may be limited by certain factors, including by the value that the OpCo received in exchange for granting the guarantee

Notching for structural subordination within the scorecard may range from 0 to three downward notches. Instances of extreme structural subordination are relatively rare, so the scorecard convention does not accommodate wider differences, although in the instances where we believe it is present, actual ratings do reflect the full impact of structural subordination.

A related issue is the relationship of ratings within a utility family with multiple operating companies, and sometimes intermediate holding companies. Some of the key issues are the same, such as the relative amounts of debt at the holding company level compared to the operating company level (or at one OpCo relative to another), and the extent to which operating companies have credit insulation due to regulation or other protective factors. Appendix A has additional insights on ratings within a utility family.

Other considerations

Ratings may reflect consideration of additional factors that are not in the scorecard, usually because the factor's credit importance varies widely among the issuers in the sector or because the factor may be important only under certain circumstances or for a subset of issuers. Such factors can include financial controls and the quality of financial reporting; corporate legal structure; the quality and experience of management; assessments of corporate governance, as well as environmental and social considerations; exposure to uncertain licensing regimes; and possible government interference in some countries. Regulatory, litigation, liquidity, technology and reputational risk, as well as changes to consumer and business spending patterns, competitor strategies and macroeconomic trends can also affect ratings.

The following are examples of additional considerations that may be reflected in our ratings and that may cause ratings to be different from scorecard-indicated outcomes.

Environmental, social and governance considerations

Where environmental, social and governance (ESG) issues are meaningful for credit profiles, we incorporate them into our ratings analysis in a variety of ways in the application of our sector-specific methodologies. As one part of our overall credit analysis, we consider how ESG risks could affect the qualitative and quantitative factors and sub-factors in the scorecard.

Even where ESG considerations do not affect the measures in the scorecard, or where they cannot be quantified, we incorporate them into our overall analysis of credit drivers that are meaningful to the rating. As a result, we may incorporate these ESG risks qualitatively outside of the scorecard. As part of our ratings analysis, we may establish Issuer Profile Scores (IPSs), which indicate our opinion of the extent to which a given issuer is exposed to E, S and G risks (incorporating ESG-specific mitigants) or benefits from its exposure to E, S or G. The IPSs are inputs to credit ratings. For more information, please see our methodology that describes our general principles for assessing ESG risks.[2]

Increasing requirements and efforts to reduce greenhouse gas emissions (known as carbon transition) may lead to higher costs for many regulated electric and gas utilities. In addition, the ownership or operation of assets that may become "stranded" (i.e., assets that become unprofitable due to carbon transition) may indicate higher risk.

We also consider the impact of decarbonization efforts on the electrification of heating, transportation and industry. In our assessment of the net impact of decarbonization on issuers in this sector, we consider the share of generation in the business mix, the location of generation assets and the technology employed and exposure to natural gas transportation and distribution. Pressure for issuers to decarbonize and implementation timelines may be affected by regulation, policies and the potential for renewable energy to displace carbon intensive generation in each market. In general, carbon-intensive generation assets such as coal-fired plants are most exposed to carbon transition risk, followed by gas-fired plants. Renewable energy projects and other low-carbon power generation assets are well-positioned to benefit from carbon transition. Our assessment of the net impact of decarbonization also takes into account the central role of electricity networks in decarbonization efforts. In contrast, decarbonization may reduce demand for gas networks in many markets, particularly for residential heating supply.

We also consider waste and pollution risks, including emissions of non-carbon air pollutants, which can also impose significant compliance costs on thermal generators, as well as long-term storage costs for nuclear generators, particularly in regions where the generators are fully or partially responsible for those costs. Issuers in this sector are also exposed to physical risks associated with climate change, including damage to electricity networks caused by storms or wildfires. For example, operators of hydro generators and water-cooled thermal plants may experience lower output during periods of low rainfall. Conversely, generators in hydro-dominated markets may be exposed to lower electricity prices during unusually wet periods. Issuers in this sector are also exposed to weather-related disasters and other catastrophic events, including nuclear accidents and natural gas pipeline explosions, as well as costs to enhance climate resilience or remediate environmental damage.

Social issues are often important considerations. Regulated electric and gas utilities are highly exposed to socially driven policy agendas resulting from public concern about affordable energy, energy security and the environment, often enabled by the direct involvement of governments and regulators in setting energy policy. In addition to health and safety risks associated with maintaining heavy equipment and machinery, the sector is also prone to event risks with social risk repercussions, such as nuclear and hydropower disasters and gas pipeline explosions.

Among the areas of focus in corporate governance are audit committee financial expertise, the incentives created by executive compensation packages, related-party transactions, interactions with outside auditors, and ownership structure.

Liquidity

Liquidity is an important rating consideration for all electric and gas utilities, and extremely weak liquidity can heavily affect ratings in many cases. However, the relative strength or weakness of liquidity may not have a substantial impact in discriminating between two issuers with an otherwise similar credit profile. Liquidity can be particularly important where issuers have large short-term demands on liquidity, for example in highly seasonal operating environments where working capital needs must be considered. We form an

opinion on likely near-term liquidity requirements from the perspective of both sources and uses of cash. For more information on our approach, please see our liquidity cross-sector methodology.[3]

Liquidity encompasses a company's ability to generate cash from internal sources as well as the availability of external sources of financing to supplement these internal sources. Liquidity and access to financing are of particular importance in this sector. Utility assets can often have a very long useful life- 30, 40 or even 60 years is not uncommon, as well as high costs. Partly as a result of construction cycles, the utility sector has experienced prolonged periods of negative free cash flow – essentially, the sum of its dividends and its capital expenditures for maintenance and growth of its infrastructure frequently exceeds cash from operations, such that a portion of capital expenditures must routinely be financed by debt or equity. Utilities are among the largest debt issuers in the corporate universe and typically require consistent access to the capital markets to assure adequate sources of funding and to maintain financial flexibility. Substantial portions of capital expenditures are non-discretionary (for example, maintenance, adding customers to the network, or meeting environmental mandates); however, utilities have been swift to cut or defer discretionary spending during economic downturns. Dividends represent a quasi-permanent outlay, because utilities typically only rarely cut their dividends. Liquidity is also important to meet maturing obligations, which can often be large,, and to meet collateral calls under any hedging agreements.

Due to the importance of liquidity, incorporating it as a factor with a fixed weighting in the scorecard would suggest an importance level that is often far different from the actual weight in the rating. In normal circumstances, most companies in the sector have good access to liquidity. The industry generally requires, and for the most part has, large, syndicated, multi-year committed credit facilities. In addition, utilities have demonstrated strong access to capital markets , even under difficult conditions. As a result, liquidity generally has not been an issue for most utilities, and a utility with very strong liquidity may not warrant a rating distinction compared to a utility with strong liquidity. However, when there is weakness in liquidity or liquidity management, it can be the dominant consideration for ratings.

Our assessment of liquidity for regulated utilities involves an analysis of total sources and uses of cash over the next 12 months or more, as is done for all corporates. Using our financial projections of the utility and our analysis of its available sources of liquidity (including an assessment of the quality and reliability of alternate liquidity such as committed credit facilities), we consider how its projected sources of cash (cash from operations, cash on hand and existing committed multi-year credit facilities) compare to its projected uses (including all or most capital expenditures, dividends, maturities of short and long-term debt, our projection of potential liquidity calls on financial hedges, and important issuer-specific items such as special tax payments). We assume no access to capital markets or additional liquidity sources, no renewal of existing credit facilities, and no cut to dividends. We assess a company's liquidity profile under this scenario, its ability to make adjustments to improve its liquidity position, and any dependence on liquidity sources with lower quality and reliability.

Management strategy

The quality of management is an important factor supporting the credit strength of a regulated utility or utility holding company. Assessing the execution of business plans over time can be helpful in assessing management's business strategies, policies, and philosophies and in evaluating management performance relative to performance of competitors and our projections. Management's track record of adhering to stated plans, commitments and guidelines provides insight into management's likely future performance, including in stressed situations.

We assess financial policy (including dividend policy and planned capital expenditures) and how management balances the potentially competing interests of shareholders, fixed income investors and other stakeholders. Dividends and discretionary capital expenditures are the two primary components over which management has the greatest control in the short term. For holding companies, we consider the extent to which management stretches its payout ratio (through aggressive increases or delays in needed decreases) in order to satisfy common shareholders. For a utility that is a subsidiary of a parent company with several utility subsidiaries, dividends to the parent may be more volatile depending on the cash generation and cash needs of that utility, because parents typically want to assure that each utility maintains the regulatory debt/equity ratio on which its rates have been set. The effect is that utility subsidiaries typically pay higher dividends when they have lower capital needs and lower dividends when they have higher capital expenditures or other cash needs. Any dividend policy that cuts into the regulatory debt/equity ratio is a material credit negative.

Size

Size can be a very important factor in our assessment of certain risks that affect ratings in this sector, including exposure to natural disasters, customer concentration, primarily to industrial customers in a single sector, and construction risks associated with large projects. While the scorecard incorporates the first two of these risks into the Diversification factor, for some issuers these considerations may be sufficiently important that the rating reflects a greater weight for these risks. Construction projects typically carry the risk of cost overruns and delays, but these risks are materially heightened for projects that are very large relative to the size of the utility.

While size brings certain economies of scale that can somewhat affect the utility's cost structure and competitiveness, rates are more heavily affected by costs related to fuel and fixed assets. Smaller utilities have sometimes been better able to focus their attention on meeting the expectations of a single regulator than their multi-state peers.

Interaction of utility ratings with government policies and sovereign ratings

Government actions can have a credit impact on regulated utilities directly through rate regulation, and indirectly through energy, environmental and tax policies. Government actions affect fuel prices, the mix of generating plants, the certainty and timing of revenues and costs, and the likelihood that regulated utilities will experience financial stress. While our evolving view of the impact of such policies and the general economic and financial climate is reflected in the ratings of each utility, some considerations do not lend themselves to incorporation in a simple scorecard.[4]

Non-utility operations

In some cases, regulated utilities have non-utility operations that are segments within the utility company, compared with the more common practice of housing such operations in one or more separate affiliates. In general, we evaluate the other businesses that are material in accordance with the appropriate methodology, and the rating on the regulated electric and gas utility reflects considerations from such methodologies. There may be analytical limitations in evaluating the utility and non-utility businesses where segment financial results are not fully available , and these may be addressed through estimation based on available information. Diversified non-utility operations generally increase the business risk profile of a regulated utility, which is a relatively low-risk business . To reflect this heightened risk, we may assign ratings that are lower than scorecard-indicated outcomes for companies with diversified operations.

Event risk

We also recognize the possibility that an unexpected event could cause a sudden and sharp decline in a utility's fundamental creditworthiness, which may cause actual ratings to be lower than the scorecard-indicated outcome. Event risks — which are varied and can range from leveraged recapitalizations to sudden regulatory changes or liabilities from an accident — can overwhelm even a stable, well-capitalized utility. Some other types of event risks include M&A, asset sales, spinoffs, shareholder distributions, litigation, pandemics, significant cybercrime events and geopolitical conflicts.

Financial controls

We rely on the accuracy of audited financial statements to assign and monitor ratings in this sector. The quality of financial statements may be influenced by internal controls, including the proper tone at the top, centralized operations, and consistency in accounting policies and procedures. Auditors' reports on the effectiveness of internal controls, auditors' comments in financial reports and unusual restatements of financial statements or delays in regulatory filings may indicate weaknesses in internal controls.

Parental support

Ownership can provide ratings lift for a particular company in the regulated electric and gas utilities sector if it is owned by a highly rated owner(s) and is viewed to be of strategic importance to those owners. In our analysis of parental support, we consider whether the parent has the financial capacity and strategic incentives to provide support to the issuer in times of stress or financial need (e.g., a major capital investment or advantaged operating agreement), or has already done so in the past. Conversely, if the parent puts a high dividend burden on the issuer, which in turn reduces its flexibility, the ratings would reflect this risk.

Government-related issuers may receive ratings uplift due to expected government support. However, for certain issuers, government ownership can have a negative impact on the underlying Baseline Credit Assessment.[5] For example, price controls, onerous taxation and high distributions can have a negative effect on an issuer's underlying credit profile.

Other institutional support

In some countries, large corporate issuers have received government or banking support in the event of financial difficulties because of their overall importance to the functioning of the economy. In Japan, our corporate ratings consider the support that has operated there for large and systemically important organizations. Over the years, this has resulted in lower levels of default than might otherwise have occurred. Our approach considers whether the presence of group and banking relationships may provide support when systemically important companies encounter significant financial stress.

Using the scorecard to arrive at a scorecard-indicated outcome

1. Measurement or estimation of factors in the scorecard

In the "Discussion of the scorecard factors" section, we explain our analytical approach for scoring each scorecard factor or sub-factor, and we describe why they are meaningful as credit indicators. When a factor comprises sub-factors, we score at the sub-factor level. Some factors do not have sub-factors, in which case we score at the factor level.

The information used in assessing the sub-factors is generally found in or calculated from information in the company's financial statements or regulatory filings, derived from other observations or estimated by Moody's analysts. We may also incorporate non-public information.

Our ratings are forward-looking and reflect our expectations for future financial and operating performance. However, historical results are helpful in understanding patterns and trends of a company's performance, as well as for peer comparisons. Financial metrics, unless otherwise indicated, are typically calculated based on an average of the most recent three years of reported results. However, the factors in the scorecard can be assessed using various time periods. For example, rating committees may find it analytically useful to examine both historical and expected future performance for periods of several years or more.

Given the long-term nature of utility assets and the often uneven nature of their capital expenditures, we consider a utility's historical financial performance as well as its prospective future performance. Multi-year periods are usually more representative of credit quality because utilities can experience swings in cash flows from one-time events, including such items as rate refunds, storm cost deferrals that create a regulatory asset, or securitization proceeds that reduce a regulatory asset. Nonetheless, we also look at trends in metrics for individual periods, which may influence our view of future performance and ratings.

All of the quantitative credit metrics incorporate our standard adjustments[6] to income statement, cash flow statement and balance sheet amounts for items such as restructuring, impairment, off-balance sheet accounts, receivable securitization programs, under-funded pension obligations, and recurring operating leases. We may also make other analytical adjustments that are specific to a particular issuer.

2. Mapping scorecard factors to a numeric score

After estimating or calculating each factor or sub-factor, each outcome is mapped to a broad Moody's rating category (Aaa, Aa, A, Baa, Ba, B, or Caa, also called alpha categories).

Qualitative factors are scored based on the description by broad rating category in the scorecard. The numeric value of each alpha score is based on the scale below.

Exhibit 3
Numeric equivalents for factor and sub-factor scores

Aaa	Aa	A	Baa	Ba	B	Caa	Ca
1	3	6	9	12	15	18	20

Source: Moody's Ratings

3. Determining the overall scorecard-indicated outcome

The numeric score for each weighted sub-factor (or each factor, when the factor has no sub-factors) is multiplied by the weight for that sub-factor (or factor), with the results then summed to produce an aggregate numeric score before notching factors (the preliminary outcome). We then consider whether the preliminary outcome that results from the four weighted factors should be notched downward in order to arrive at an aggregate numeric score after notching factors, based on Holding Company Structural

Subordination. Numerically, a downward notch adds 1 to the score, and an upward notch subtracts 1 from the score. In aggregate, the notching factor can result in a total of up to three downward notches from the preliminary outcome to arrive at the scorecard-indicated outcome.

The aggregate numeric score before and after notching factors is mapped to an alphanumeric]. For example, an issuer with an aggregate numeric score before notching factors of 11.7 would have a Ba2 preliminary outcome, based on the ranges in the table below. If the combined notching factors totaled two downward notches, the aggregate numeric score after notching factors would be 13.7, which would map to a B1 scorecard-indicated outcome.

Exhibit 4
Scorecard-indicated outcome

Aggregate numeric score	Scorecard-indicated outcome
x < 1.5	Aaa
1.5 ≤ x < 2.5	Aa1
2.5 ≤ x < 3.5	Aa2
3.5 ≤ x < 4.5	Aa3
4.5 ≤ x < 5.5	A1
5.5 ≤ x < 6.5	A2
6.5 ≤ x < 7.5	A3
7.5 ≤ x < 8.5	Baa1
8.5 ≤ x < 9.5	Baa2
9.5 ≤ x < 10.5	Baa3
10.5 ≤ x < 11.5	Ba1
11.5 ≤ x < 12.5	Ba2
12.5 ≤ x < 13.5	Ba3
13.5 ≤ x < 14.5	B1
14.5 ≤ x < 15.5	B2
15.5 ≤ x < 16.5	B3
16.5 ≤ x < 17.5	Caa1
17.5 ≤ x < 18.5	Caa2
18.5 ≤ x < 19.5	Caa3
x ≥ 19.5	Ca

Source: Moody's Ratings

In general, the scorecard-indicated outcome is oriented to the corporate family rating (CFR) for speculative-grade issuers and to the senior unsecured rating for investment-grade issuers. For issuers that benefit from rating uplift from parental support, government ownership or other institutional support, we consider the underlying credit strength or Baseline Credit Assessment for comparison to the scorecard-indicated outcome. For an explanation of the Baseline Credit Assessment, please refer to *Rating Symbols and Definitions* and to our cross-sector methodology for government-related issuers.[7]

Assigning issuer-level and instrument-level ratings

After considering the scorecard-indicated outcome, other considerations and relevant cross-sector methodologies, we typically assign a corporate family rating (CFR) to speculative-grade issuers or a senior unsecured rating for investment-grade issuers. For issuers that benefit from rating uplift from government ownership, we may assign a Baseline Credit Assessment.[8]

Individual debt instrument ratings may be notched up or down from the CFR or the senior unsecured rating to reflect our assessment of differences in expected loss related to an instrument's seniority level and collateral. The documents that provide broad guidance for such notching decisions are the rating methodology on loss given default for speculative-grade non-financial companies, the methodology for notching corporate instrument ratings based on differences in security and priority of claim, and the methodology for assigning short-term ratings.[9]

Key rating assumptions

For information about key rating assumptions that apply to methodologies generally, please see *Rating Symbols and Definitions*.[10]

Limitations

In the preceding sections, we have discussed the scorecard factors and many of the other considerations that may be important in assigning ratings. In this section, we discuss limitations that pertain to the scorecard and to the overall rating methodology.

Limitations of the scorecard

There are various reasons why scorecard-indicated outcomes may not map closely to actual ratings.

The scorecard in this rating methodology is a relatively simple tool that can be used in most cases to approximate credit profiles of issuers in this sector and to explain, in summary form, many of the factors that are generally most important in assigning ratings to these issuers. Credit loss and recovery considerations, which are typically more important as an issuer gets closer to default, may not be fully captured in the scorecard. The scorecard is also limited by its upper and lower bounds, causing scorecard-indicated outcomes to be less likely to align with ratings for issuers at the upper and lower ends of the rating scale.

The weights for each factor and sub-factor in the scorecard represent an approximation of their importance for rating decisions across the sector, but the actual importance of a particular factor may vary substantially based on an individual company's circumstances.

Factors that are outside the scorecard, including those discussed above in the "Other considerations" section, may be important for ratings, and their relative importance may also vary from company to company. In addition, certain broad methodological considerations described in one or more cross-sector rating methodologies may be relevant to ratings in this sector.[11] Examples of such considerations include the following: how sovereign credit quality affects non-sovereign issuers, the assessment of credit support from other entities, the relative ranking of different classes of debt and hybrid securities, and the assignment of short-term ratings.

We may use the scorecard over various historical or forward-looking time periods. Furthermore, in our ratings we often incorporate directional views of risks and mitigants in a qualitative way.

General limitations of the methodology

This methodology document does not include an exhaustive description of all factors that we may consider in assigning ratings in this sector. Companies in the sector may face new risks or new combinations of risks, and they may develop new strategies to mitigate risk. We seek to incorporate all material credit considerations in ratings and to take the most forward-looking perspective that visibility into these risks and mitigants permits.

Ratings reflect our expectations for an issuer's future performance; however, as the forward horizon lengthens, uncertainty increases and the utility of precise estimates, as scorecard inputs or in other considerations, typically diminishes. Our forward-looking opinions are based on assumptions that may prove, in hindsight, to have been incorrect. Reasons for this could include unanticipated changes in any of the following: the macroeconomic environment, general financial market conditions, industry competition, disruptive technology, or regulatory and legal actions. In any case, predicting the future is subject to substantial uncertainty.

Appendix A: Approach to ratings within a utility family

Typical composition of a utility family

A typical utility company structure consists of a HoldCo that owns one or more OpCos). OpCos may be regulated utilities or non-utility companies. Financing of these entities varies by region, in part due to the regulatory framework. A HoldCo typically has no operations – its assets are mostly limited to its equity interests in subsidiaries, and potentially other investments in subsidiaries or minority interests in other companies. However, in certain cases there may be material operations at the HoldCo level. Financing can occur primarily at the OpCo level, primarily at the HoldCo level, or at both HoldCo and OpCos in varying proportions. When a HoldCo has multiple utility OpCos, they will often be located in different regulatory jurisdictions. A HoldCo may have both levered and unlevered OpCos.

General approach to a utility family

In our analysis, we generally consider the stand-alone credit profile of an OpCo and the credit profile of its ultimate parent HoldCo (and any intermediate HoldCos), as well as the profile of the family as a whole, while acknowledging that these elements can have cross-family credit implications in varying degrees, principally based on the regulatory framework of the OpCos and the financing model (which has often developed in response to the regulatory framework).

In addition to considering individual OpCos under this (or another applicable) methodology, we typically[12] approach a HoldCo rating by assessing the qualitative and quantitative factors in this methodology for the consolidated entity and each of its utility subsidiaries. Ratings of individual entities in the issuer family may be pulled up or down based on the interrelationships among the companies in the family and their relative credit strength.

In considering how closely aligned or how differentiated ratings should be among members of a utility family, we assess a variety of factors, including:

- Regulatory or other barriers to cash movement among OpCos and from OpCos to HoldCo
- Differentiation of the regulatory frameworks of the various OpCos
- Specific ring-fencing provisions at particular OpCos
- Financing arrangements – for instance, each OpCo may have its own financing arrangements, or the sole liquidity facility may be at the parent; there may be a liquidity pool among certain but not all members of the family; certain members of the family may be better able to withstand a temporary hiatus of external liquidity or access to capital markets
- Financial covenants and the extent to which an Event of Default by one OpCo limits availability of liquidity to another member of the family
- The extent to which higher leverage at one entity increases default risk for other members of the family
- An entity's exposure to or insulation from an affiliate with high business risk
- Structural features or other limitations in financing agreements that restrict movements of funds, investments, provision of guarantees or collateral, etc.
- The relative size and financial significance of any particular OpCo to the HoldCo and the family

Our approach to a Hybrid HoldCo depends in part on the importance of its non-utility operations and the availability of information on individual businesses. If the businesses are material and their individual results are fully detailed in financial disclosures, we may be able to assess each material business individually by reference to the relevant Moody's methodologies to arrive at a composite assessment for the combined businesses.[13] If non-utility operations are material but are not available in financial disclosures, we may look at the consolidated entity under more than one methodology. When non-utility operations are less material but could still impact the overall credit profile, the difference in business risks and our estimation of their impact on financial performance will be qualitatively incorporated in the rating.

Higher barriers to cash movement with financing predominantly at the OpCos

Where higher barriers to cash movement exist at an OpCo or OpCos due to the regulatory framework or debt structural features, ratings among family members are likely to be more differentiated. The degree of separateness may be greater or smaller and is assessed on a case-by-case basis, because situational considerations are important.

One area we consider is financing arrangements. For instance, there will tend to be greater differentiation if each member of a family has its own bank credit facilities and difficulties experienced by one entity would not trigger events of default for other entities. While the existence of a money pool might appear to reduce separateness between the participants, there may be regulatory barriers within money pools that preserve separateness. For instance, non-utility entities may have access to the pool only as a borrower, only as a lender, and even the utility entities may have regulatory limits on their borrowings from the pool or their credit exposures to other pool members. If the only source of external liquidity for a money pool is borrowings by the HoldCo under its bank credit facilities, there would be less separateness, especially if the utilities were expected to depend on that liquidity source. However, the ability of an OpCo to finance itself by accessing capital markets must also be considered. Inter-company tax agreements can also have an impact on our view of how separate the risks of default are.

For a HoldCo, the greater the regulatory, economic, and geographic diversity of its OpCos, the greater its potential separation from the default probability of any individual subsidiary. Conversely, if a HoldCo's actions have made it clear that the HoldCo will provide support for an OpCo encountering some financial stress (for instance, due to delays and/or cost over-runs on a major construction project), we would be likely to perceive less separateness.

Even where high barriers to cash movement exist, onerous leverage at a parent company may not only give rise to greater notching for structural subordination at the parent, it may also pressure an OpCo's rating, especially when there is a clear dependence on an OpCo's cash flow to service parent debt.

While most of the regulatory barriers to cash movement are very real, they are not absolute. Furthermore, while it is not usually in the interest of an insolvent parent or its creditors to bring an operating utility into a bankruptcy proceeding, such an occurrence is not impossible.

The greatest separateness occurs where strong regulatory insulation is supplemented by effective ring- fencing provisions that fully separate the management and operations of the OpCo from the rest of the family and limit the parent's ability to cause the OpCo to commence bankruptcy proceedings as well as limiting dividends and cash transfers. Typically, most entities in US utility families (including HoldCos and OpCos) are rated within 3 notches of each other. However, it is possible for the HoldCo and OpCos in a family to have much wider notching due to the combination of regulatory imperatives and strong ring-fencing that includes a significant minority shareholder who must agree to important corporate decisions, including a voluntary bankruptcy filing.

Lower barriers to cash movement with financing predominantly at the OpCos

Our approach to rating issuers within a family where there are lower regulatory barriers to movement of cash from OpCos to HoldCos places greater emphasis on the credit profile of the consolidated group. Individual OpCos are considered based on their individual characteristics and their importance to the family, and their assigned ratings are typically banded closely around the consolidated credit profile of the group due to the expectation that cash will transit relatively freely among family entities.

Some utilities may have OpCos in jurisdictions where cash movement among certain family members is more restricted by the regulatory framework, while cash movement from and/or among OpCos in other jurisdictions is less restricted. In these situations, OpCos with more restrictions may vary more widely from the consolidated credit profile while those with fewer restrictions may be more tightly banded around the other entities in the corporate family group.

Appendix B: Regional and other considerations

Notching considerations for US first mortgage bonds

In most regions, our approach to notching between different debt classes of the same regulated utility issuer follows the guidance on notching corporate instrument ratings based on differences in security and priority of claim, including a one notch differential between senior secured and senior unsecured debt.[14] However, in most cases we have two notches between the first mortgage bonds and senior unsecured debt of regulated electric and gas utilities in the US. Wider notching differentials between debt classes may also be appropriate in speculative-grade issuers.[15]

First mortgage bond holders in the US generally benefit from a first lien on most of the fixed assets used to provide utility service, including such assets as generating stations, transmission lines, distribution lines, switching stations and substations, and gas distribution facilities, as well as a lien on franchise agreements. In our view, the critical nature of these assets to the issuers and to the communities they serve has been a major factor that has led to very high recovery rates for this class of debt in situations of default, thereby justifying a two-notch uplift. The combination of the breadth of assets pledged and the bankruptcy-tested recovery experience has been unique to the US.

In some cases, there is only a one-notch differential between US first mortgage bonds and the senior unsecured rating. For instance, this is likely when the pledged property is not considered critical infrastructure for the region, or if the mortgage is materially weakened by carve-outs, lien releases or similar creditor-unfriendly terms.

Securitization

The use of securitization, a financing technique utilizing a discrete revenue stream (typically related to recovery of specifically defined expenses) that is dedicated to servicing specific securitization debt, has primarily been used in the US, where it has been pervasive in the past. The first generation of securitization bonds were primarily related to recovery of the negative difference between the market value of utilities' generation assets and their book value when certain states switched to competitive electric supply markets and utilities sold their generation (so-called stranded costs). This technique was then used for significant storm costs (especially hurricanes) and was eventually broadened to include environmental related expenditures, deferred fuel costs, or even deferred miscellaneous expenses. In its simplest form, a securitization isolates and dedicates a stream of cash flow into a separate special purpose entity (SPE). The SPE uses that stream of revenue and cash flow to provide annual debt service for the securitized debt instrument. Securitization is typically underpinned by specific legislation to segregate the securitization revenues from the utility's revenues to assure their continued collection, and the details of the enabling legislation may vary from state to state. The utility benefits from the securitization because it receives an immediate source of cash (although it gives up the opportunity to earn a return on the corresponding asset), and ratepayers benefit because the cost of the securitized debt is lower than the utility's cost of debt and much lower than its all-in cost of capital, which reduces the revenue requirement associated with the cost recovery.

In the presentation of US securitization debt in published financial ratios, we make our own assessment of the appropriate credit representation but in most cases follow the accounting in audited statements under US Generally Accepted Accounting Principles (GAAP), which in turn considers the terms of enabling legislation. As a result, accounting treatment may vary. In most states, utilities have been required to consolidate securitization debt under GAAP, even though it is technically non-recourse.

In general, we view securitization debt of utilities as being on-credit debt, in part because the rates associated with it reduce the utility's headroom to increase rates for other purposes while keeping all-in rates affordable to customers. Thus, where accounting treatment is off balance sheet, we adjust the company's ratios by including the securitization debt and related revenues for our analysis. Where the securitized debt is on balance sheet, our credit analysis focuses on the ratios that exclude securitization debt and related revenues. Since securitization debt amortizes mortgage-style, including it makes ratios look worse in early years (when most of the revenue collected goes to pay interest) and better in later years (when most of the revenue collected goes to pay principal).

Appendix C: Treatment of Power Purchase Agreements ("PPAs")

Although many utilities own and operate power stations, some have entered into PPAs to source electricity from third parties to satisfy retail demand. The motivation for these PPAs may be one or more of the following: to outsource operating risks to parties more skilled in power station operation, to provide certainty of supply, to reduce balance sheet debt, to fix the cost of power, or to comply with regulatory mandates regarding power sourcing, including renewable portfolio standards. While we regard PPAs that reduce operating or financial risk as a credit positive, some aspects of PPAs may negatively affect the credit of utilities. The most conservative treatment would be to treat a PPA as a debt obligation of the utility as, by paying the capacity charge, the utility is effectively providing the funds to service the debt associated with the power station. At the other end of the continuum, the financial obligations of the utility could also be regarded as an ongoing operating cost, with no long-term capital component recognized.

Under most PPAs, a utility is obliged to pay a capacity charge to the power station owner (which may be another utility or an Independent Power Producer – IPP); this charge typically covers a portion of the IPP's fixed costs in relation to the power available to the utility. These fixed payments usually help to cover the IPP's debt service and are made irrespective of whether the utility calls on the IPP to generate and deliver power. When the utility requires generation, a further energy charge, to cover the variable costs of the IPP, will also typically be paid by the utility. Some other similar arrangements are characterized as tolling agreements, or long-term supply contracts, but most have similar features to PPAs and thus we analyze them as PPAs.

PPAs are recognized qualitatively to be a future use of cash whether or not they are treated as debt-like obligations in financial ratios

The starting point of our analysis is the issuer's audited financial statements – we consider whether the utility's accountants determine that the PPA should be treated as a debt equivalent, a capitalized lease, an operating lease, or in some other manner. PPAs have a wide variety of operational and financial terms, and it is our understanding that accountants are required to have a very granular view into the particular contractual arrangements in order to account for these PPAs in compliance with applicable accounting rules and standards. However, accounting treatment for PPAs may not be entirely consistent across US GAAP, IFRS or other accounting frameworks. In addition, we may consider that factors not incorporated into the accounting treatment may be relevant (which may include the scale of PPA payments, their regulatory treatment including cost recovery mechanisms, or other factors that create financial or operational risk for the utility that is greater, in our estimation, than the benefits received). When the accounting treatment of a PPA is a debt or lease equivalent (such that it is reported on the balance sheet, or disclosed as an operating lease and thus included in our adjusted debt calculation), we generally do not make adjustments to remove the PPA from the balance sheet.

However, in relevant circumstances we consider making adjustments that impute a debt equivalent to PPAs that are off-balance sheet for accounting purposes.

Regardless of whether we consider that a PPA warrants or does not warrant treatment as a debt obligation, we assess the totality of the impact of the PPA on the issuer's probability of default. Costs of a PPA that cannot be recovered in retail rates create material risk, especially if they also cannot be recovered through market sales of power.

Additional considerations for PPAs

PPAs have a wide variety of financial and regulatory characteristics, and we may treat each particular circumstance differently. Factors which determine where on the continuum we treat a particular PPA include the following:

» **Risk management:** An overarching principle is that PPAs have normally been used by utilities as a risk management tool and we recognize that this is the fundamental reason for their existence. Thus, we will not automatically penalize utilities for entering into contracts for the purpose of reducing risk associated with power price and availability. Rather, we will look at the aggregate commercial position, evaluating the risk to a utility's purchase and supply obligations. In addition, PPAs are similar to other long-term supply contracts used by other industries and their treatment should not therefore be fundamentally different from that of other contracts of a similar nature.

- **Pass-through capability:** Some utilities have the ability to pass through the cost of purchasing power under PPAs to their customers. As a result, the utility takes no risk that the cost of power is greater than the retail price it will receive. Accordingly we regard these PPA obligations as operating costs with no long-term debt-like attributes. PPAs with no pass-through ability have a greater risk profile for utilities. In some markets, the ability to pass through costs of a PPA is enshrined in the regulatory framework, and in others can be dictated by market dynamics. As a market becomes more competitive or if regulatory support for cost recovery deteriorates, the ability to pass through costs may decrease and, as circumstances change, our treatment of PPA obligations will alter accordingly.
- **Price considerations:** The price of power paid by a utility under a PPA can be substantially above or below the market price of electricity. A below-market price will motivate the utility to purchase power from the IPP in excess of its retail requirements, and to sell excess electricity in the spot market. This can be a significant source of cash flow for some utilities. On the other hand, utilities that are compelled to pay capacity payments to IPPs when they have no demand for the power or at an above-market price may suffer a financial burden if they do not get full recovery in retail rates. We will focus particularly on PPAs that have mark-to-market losses, which typically indicates that they have a material impact on the utility's cash flow.
- **Excess reserve capacity:** In some jurisdictions, there is substantial reserve capacity and thus a significant probability that the electricity available to a utility under PPAs will not be required by the market. This increases the risk to the utility that capacity payments will need to be made when there is no demand for the power. We may determine that all of a utility's PPAs represent excess capacity, or that a portion of PPAs are needed for the utility's supply obligations plus a normal reserve margin, while the remaining portion represents excess capacity. In the latter case, we may impute debt to specific PPAs that are excess or take a proportional approach to all of the utility's PPAs.
- **Risk-sharing:** Utilities that own power plants bear the associated operational, fuel procurement and other risks. These must be balanced against the financial and liquidity risk of contracting for the purchase of power under a PPA. We will examine on a case-by case basis the relative credit risk associated with PPAs in comparison to plant ownership.
- **Purchase requirements:** Some PPAs are structured with either options or requirements to purchase the asset at the end of the PPA term. If the utility has an economically meaningful requirement to purchase, we would most likely consider it to be a debt obligation. In most such cases, the obligation would already receive on-balance sheet treatment under relevant accounting standards.
- **Default provisions:** In most cases, the remedies for default under a PPA do not include acceleration of amounts due, and in many cases PPAs would not be considered as debt in a bankruptcy scenario and could potentially be cancelled. Thus, PPAs may not materially increase Loss Given Default for the utility. In addition, PPAs are not typically considered debt for cross-default provisions under a utility's debt and liquidity arrangements. However, the existence of non-standard default provisions that are debt-like would have a large impact on our treatment of a PPA. In addition, payments due under PPAs are senior unsecured obligations, and any inability of the utility to make them materially increases default risk.

Methods for estimating a liability amount for PPAs

According to the weighting and importance of the PPA to each utility and the level of disclosure, we may approximate a debt obligation equivalent for PPAs using one or more of the methods discussed below. In each case, we look holistically at the PPA's credit impact on the utility, including the ability to pass through costs and curtail payments, the materiality of the PPA obligation to the overall business risk and cash flows of the utility, operational constraints that the PPA imposes, the maturity of the PPA obligation, the impact of purchased power on market-based power sales (if any) that the utility will engage in, and our view of future market conditions and volatility.

- **Operating cost:** If a utility enters into a PPA for the purpose of providing an assured supply and there is reasonable assurance that regulators will allow the costs to be recovered in regulated rates, we may view the PPA as being most akin to an operating cost. Provided that the accounting treatment for the PPA is, in this circumstance, off-balance sheet, we will most likely make no adjustment to bring the obligation onto the utility's balance sheet.

- **Annual obligation x 6:** In some situations, the PPA obligation may be estimated by multiplying the annual payments by a factor of six (in most cases). This method is sometimes used in the capitalization of operating leases. This method may be used as an approximation where the analyst determines that the obligation is significant but cannot otherwise be quantified due to limited information.
- **Net present value:** Where the analyst has sufficient information, we may add the NPV of the stream of PPA payments to the debt obligations of the utility. The discount rate used will be our estimate of the cost of capital of the utility.
- **Debt look-through:** In some circumstances, where the debt incurred by the IPP is directly related to the off-taking utility, there may be reason to allocate the entire debt (or a proportional part related to share of power dedicated to the utility) of the IPP to that of the utility.
- **Mark-to-market:** In situations in which we believe that the PPA prices exceed the market price and thus will create an ongoing liability for the utility, we may use a net mark-to-market method, in which the NPV of the utility's future out-of-the-money net payments will be added to its total debt obligations.
- **Consolidation:** In some instances where the IPP is wholly dedicated to the utility, it may be appropriate to consolidate the debt and cash flows of the IPP with that of the utility. If the utility purchases only a portion of the power from the IPP, then that proportion of debt might be consolidated with the utility.

If we have determined to impute debt to a PPA for which the accounting treatment is not on-balance sheet, we will, in some circumstances, use more than one method to estimate the debt equivalent obligations imposed by the PPA, and compare results. If circumstances (including regulatory treatment or market conditions) change over time, the approach that is used may also vary.

Moody's related publications

Credit ratings are primarily determined through the application of sector credit rating methodologies. Certain broad methodological considerations (described in one or more cross-sector methodologies) may also be relevant to the determination of credit ratings of issuers and instruments. A list of sector and cross-sector methodologies can be found here.

For data summarizing the historical robustness and predictive power of credit ratings, please click here.

For further information, please refer to *Rating Symbols and Definitions*, which is available here.

I. Introduction and Summary 2

II. Capital Expenditures: Budgeting/Forecasting, Management Approval and Project Lifecycles 3

III. List of Exhibits 18

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position with Northwest Natural Gas Company ("NW Natural" or "the Company").

A. My name is Jorge Moncayo, and I serve as the Business Planning Senior Director at NW Natural. I lead the Financial Planning and Analysis ("FP&A") group, Business Analytics, and the Project Management Office ("PMO"). My responsibilities include developing both short- and long-term financial plans, and preparing the annual Operations and Maintenance (O&M) budget, Capital Expenditures (CapEx) budget, and Income Statement budget.

Q. Please summarize your educational background and business experience.

A. I hold bachelor's degrees in Business Administration and Accounting from Universidad Catolica, Ecuador, as well as a Master of Business Administration and a Master of Science in Industrial Engineering from Oregon State University. Since joining NW Natural in 2003 as a market research analyst, I have held positions in Consumer Research and Analysis, Operations Support Services, Business Analysis and Finance. I have served in my current role since 2019.

Q. Please provide a summary of your testimony.

A. My testimony describes the Company's capital expenditures budgeting and forecasting processes, including management approval and project/program lifecycle phases.

II. CAPITAL EXPENDITURES: BUDGETING/FORECASTING, MANAGEMENT APPROVAL AND PROJECT LIFECYCLES

Q. Please provide a narrative description of NW Natural's capital expenditures budgeting and management approval processes.

A. NW Natural updates its capital expenditure forecast multiple times throughout the year. This forecast incorporates the most recent information based on requirements to maintain a safe and reliable system. The annual budget for the following year is based on the forecast created in December.

FP&A facilitates this process with the five individual business units that provide those forecasts: Engineering, Customer Acquisition, Information Technology and Services ("IT&S"), Facilities, and Transportation & Meter Shop. Each business unit uses a bottom-up approach to identify and prioritize projects, based on the need to support system reliability and safety, integrity, regulatory compliance, jurisdictional requirements, system expansion and customer growth. I will address the more specific processes used by each of these business units later in my testimony. Management and executives review and validate the assumptions and forecasts before FP&A aggregates them into the Company's overall forecast. The overall forecast is used to inform various groups on progress, adjust the Company's planned spend and incorporate impacts to the current and long-range forecast. FP&A also facilitates a monthly review of current year variances against the approved budget.

The business units coordinate with the Portfolio Management Committee ("PMC"), which meets to discuss, review, prioritize and approve new projects, considering factors like urgency, operational needs/customer benefit, financial impact,

and resource constraints. The business units triangulate with the PMC to ensure that projects are approved and included in the budget/forecasting process. Following approval, projects are included in the forecast cycle.

The final budget is presented to and approved by the Board of Directors. The Board then receives periodic updates on capital spend as compared to budget, including a comprehensive year-end report. If overall capital expenditures are expected to exceed the amount approved by the Board, management must seek additional authorization from the Board.

Q. Has NW Natural categorized these capital investments in accordance with the Commission's Used and Useful Policy Statement?

A. Yes. NW Natural has categorized its capital investments in alignment with the Washington Utilities and Transportation Commission's Used and Useful Policy Statement,[1] utilizing four main categories: Large and Discrete, Projected, Programmatic, and Short-Lived IT&S. Please see Table 3 in the prefiled Direct Testimony of Kyle T. Walker (Exh. KTW-1T) for a breakdown of these categories by rate year, including capital expenditure amounts for which the Company is seeking recovery in this rate case.

The primary drivers behind Large and Discrete capital expenditures are discussed in the prefiled Direct Testimonies of Daniel B. Kizer and Scott S. Johnson (Exh. DBK-SSJ-1T), Joe S. Karney (Exh. JSK-1T), Wayne K. Pipes (Exh. WKP-1T),

[1] *In the Matter of the Commission Inquiry into the Valuation of Public Service Company Property that Becomes Used and Useful after Rate Effective Date,* Docket U-190531, Policy Statement on Property that Becomes Used and Useful After Rate Effective Date (Jan. 31, 2020) ("Used and Useful Policy Statement").

and Holly J. Braun (Exh. HJB-1CT). Projected capital expenditures are discussed in this testimony and in the Direct Testimonies of Daniel B. Kizer and Scott S. Johnson (Exh. DBK-SSJ-1T) and Kyle T. Walker (Exh. KTW-1T). Programmatic capital expenditures are discussed in this testimony, as well as the Direct Testimonies of Daniel B. Kizer and Scott S. Johnson (Exh. DBK-SSJ-1T) and Kyle T. Walker (Exh. KTW-1T). The confidential and highly confidential Direct Testimonies of Brian E. Fellon (Exh. BEF-1CT and Exh. BEF-23HCT) discusses short-lived IT&S investments.

To forecast for Programmatic capital expenditures, the Company will generally rely on historical baselines and plans prepared in the regular course of business by managers in charge of each category. An example of Programmatic capital is vehicle replacements. Vehicle replacements are evaluated based on a combination of vehicle vintage, mileage, and industry standards for the lifecycle of vehicles and equipment. Each year, the list of vehicles that meets either the age or mileage limits are evaluated. That list creates the replacement list for the following year.

To forecast Projected capital expenditures, the Company generally relies on historical baselines and escalates costs for inflation. An example of Projected capital expenditures are public works/jurisdictionally required projects. For these projects, the Company forecasts an expected level of public works into the budget, because the Company has the historical experience to be certain that jurisdictions across its service territory will require NW Natural to support jurisdictional construction projects. NW Natural does not know the exact location or type of project that will be required from year to year, but NW Natural always forecasts that these types of projects will occur.

At the time when a jurisdiction notifies NW Natural of a specific public works project, NW Natural will treat that construction as a project under the purview of the PMO as described in detail below.

It is important to point out that for all capital expenditures, but specifically for Projected and Programmatic capital expenditures, NW Natural's forecast accuracy improves as the time horizon shortens. As described above, forecast projections for Projected and Programmatic capital expenditures further out in time necessarily rely on higher-level planning assumptions. As the planning cycle advances each year, previously longer-term Projected and Programmatic capital expenditures move into the near term and are refined with updated scope, cost estimates, and scheduling, which enhances the overall precision of the forecast. This means that, for example, the level of Projected capital expenditures for public works may be entirely based on historical experience in the outer years of the forecast, but in the upcoming year, NW Natural may know with specificity the jurisdictional work that needs to be completed and those project budgets will be based on the specifics of the jurisdictional work required.

Q. Turning next to the individual business units, please provide further details on the capital expenditures budgeting/forecasting processes used by the Engineering business unit.

A. For the Engineering business unit, capital expenditures cover all work on NW Natural's pipeline system and storage operations. Large and Discrete projects are based on need, as well as resource, operational and financial constraints. These capital expenditures can be identified years in advance based on planning that includes, but is not limited to, system modeling, long range plans, facility assessment reports, and equipment

studies. Priority is given to projects based on urgency and deadlines required by regulatory, jurisdictional and safety agencies.

Projected capital expenditures include costs to respond to unforeseen needs and to meet anticipated standard operational requirements. Unforeseen expenditures can be due to equipment unexpectedly failing or showing near end of life or to avoid potential pipeline safety impacts due to natural forces. These are Projected capital expenditures because NW Natural must forecast a certain amount of capital expenditures for these investments, even though the Company cannot say with specificity when and where these investments will be needed. As discussed more below, larger projects are individually assigned projects in the Company's PMO and have capital spend budgets and expected in-service dates that are managed through the duration of the project. Those are all individually tracked through the Company's PMO lifecycle review process.

Anticipated operational Projected capital expenditures include work such as Damages, Leakage, District Regulators, and Relocates. These capital expenditures are based on historical spending trends adjusted for inflation. Each are briefly described here:

- ***Damages*** - The Company's pipeline system incurs third-party damage each year. At the time of planning, the Company does not know where and when the damage will occur. The Company can rely on historical baselines adjusted for inflation to project the costs in the forecast.
- ***Leakage*** – Leakage costs represent replacements of services and mains to address leaks on the Company's system. Like damage and public works

projects, these projects are not necessarily identified in advance. However, the Company can rely on historical baselines adjusted for inflation to project the costs in the forecast.

- ***District Regulators*** – These costs represent the installation or replacement of district regulators due to system expansion, public works, system reinforcement, quality assurance remediation, and corrosion protection or compliance requirements. As noted above, there can be several reasons why district regulators are replaced, and therefore, the Company forecasts a level amount each year based on historical baselines adjusted for inflation.
- ***Relocates*** **–** These projects involve the relocation of pipe for safety and compliance purposes. Projections for relocates are based on historical baselines adjusted for inflation.

Programmatic capital expenditures include safety and integrity management programs, such as those required by the United States Department of Transportation Pipeline and Hazardous Materials Safety Administration's (PHMSA) Transmission Integrity Management Program (TIMP), and Distribution Integrity Management Program (DIMP).

The Direct Testimony of Daniel B. Kizer and Scott S. Johnson (Exh. DBK-SSJ-1T) introduces and describes the Engineering business unit's distribution system and storage facility projects for which the Company is seeking recovery in this case.

Q. Please provide further details on the capital expenditures processes used by the IT&S business unit.

A. The collection of projects for the IT&S business unit reflects various business needs. Generally, these capital expenditures are categorized by several distinct but related business functions at the Company: Enterprise Applications, Information Security, Enterprise Architecture, Network, Infrastructure and Service, and Operational Technology. NW Natural classified these capital expenditures as Short-Lived IT&S because of the shorter depreciable lives of all of IT&S investments relative to other capital expenditures at the Company. Within these categories, there are Programmatic and Large and Discrete capital expenditures.

- ***Enterprise Applications*** – These projects are driven by new software and applications or changes to existing systems to support new or changed compliance requirements, or to support new business needs.
- ***Information Security*** – These projects follow the cybersecurity strategic plan. The highly confidential Direct Testimony of Brian E. Fellon (Exh. BEF-23HCT) describes this work.
- ***Enterprise Architecture –*** These projects are planned to build resilient modern platforms, optimize value of existing platforms, and build new capabilities as required.
- ***Network, Infrastructure and Service*** – These projects typically entail technical refresh cycles. This category includes radio/electronic equipment (e.g., radio, microwave, telemetry equipment).

- ***Operational Technology*** **–** These projects represent engineering projects that require IT&S execution, so this forecast follows the needs and projections of some of the Engineering business unit's capital plan.

The confidential Direct Testimony of Brian E. Fellon (Exh. BEF-1CT) introduces and describes the IT&S capital expenditures for which the Company is seeking recovery in this case.

Q. Please provide further details on the capital expenditures budgeting processes used by the Facilities business unit.

A. Potential projects for the Facilities business unit are identified by the business and/or Facilities department for consideration. Forecasts for each project are updated quarterly. Typically, Facilities projects are Large and Discrete. The Direct Testimony of Wayne K. Pipes (Exh. WKP-1T) introduces and describes the Large and Discrete Facilities project, as well as the Programmatic physical security upgrades the Company is undertaking at various sites, for which the Company is seeking recovery in this case.

Q. Please provide further details on the capital expenditures budgeting/forecasting processes used by the Customer Acquisition business unit.

A. The Customer Acquisition business unit forecasts customer growth capital expenditures necessary to connect new customers to the Company's system. These projects require extending mains and installing service lines, regulators, and meters, as well as related permitting. These capital investments are Programmatic. The Company uses housing start projections when developing new customer projections. Permits are based on previous-year actuals plus inflation. Meter installations are based on estimated number of units times cost per unit. The Company can accurately forecast

these costs based on its gross customer addition projections. Meter and regulator equipment cost trends are also influenced by periodic cause for change ("PCC") requirements (*e.g.*, replacements of faulty or outdated equipment). There are not Large or Discrete projects covered by the Customer Acquisition business unit for which the Company is seeking recovery in this case.

Q. Please provide further details on the capital expenditures budgeting/forecasting processes used by the Transportation, Tools, and Meters business units.

A. As explained above, vehicle replacements are Programmatic. Similarly, equipment and trailers are determined to be replaced based on the same process as vehicle replacements.

Tool replacement is also Programmatic. Tools are requested by field operation departments and are evaluated for business need and included on a list for purchasing the following year. Like transportation and equipment, the Company incurs costs each year to purchase and repair its small tools (items that can be small or larger in nature such as electronics that detect gas) that are necessary for employees to perform their job functions. These costs are projected based on annual trends, the Company's inventories, safety needs, and best practices for replacement of equipment at the end of its useful life.

Meter purchases and installations are Programmatic. Meter needs are developed based on current meter inventory, customer growth forecasts, meter change outs, PCC meters, as well as factoring in vendor lead times. The Direct Testimony of Joe S. Karney (Exh. JSK-1T) introduces and describes the Company's Meter

Modernization Program (MMP), which is the major meter-related project for which the Company is seeking recovery in this case.

Q. Now that you have described the capital expenditures budgeting/forecasting and management approval processes, please describe the lifecycle of capital projects.

A. To manage capital projects, NW Natural's Project Management Office (PMO) has developed a multi-phased project initiation, assessment, planning, execution, and completion process. That process is documented in the Company's General Procedure No. G-67 (Project Management Processes) (the "Procedure"), a copy of which is provided as the first exhibit to my testimony, Exh. JOM-2. In order to ensure that the Procedure continues to reflect current practices and applicable legal requirements, a regularly scheduled review of the Procedure is conducted every three years unless changes in the law or business needs supersede this requirement. Exh. JOM-2 is the current version of the Procedure, issued in June 2025. Additionally, the Company maintains a Project Management Handbook that provides the detailed step-by-step process for a project, a copy of which is provided as confidential Exh. JOM-3C.

Q. What is the purpose of the Procedure?

A. As stated in Exh. JOM-2, the Procedure outlines the process and requirements for managing projects through the full project lifecycle – starting with the proposal of the idea through Intake/Initiate, Assess, Plan, Execute and Close. I will describe each of these phases of a project later in my testimony. The Company has adopted the Procedure to ensure consistent treatment and appropriate due diligence on projects by establishing the following:

- Approval and stage gate requirements, which grant authority to proceed with the project expenditure.
- Tier definitions that guide the governance rigor of the project.
- Phase definition and key activities and requirements.
- Mechanism and approval process for change control (scope, budget variance, schedule, etc.).

Q. Does the Company have a central repository for all of the key information through the entire project lifecycle?

A. Yes. Key project information is captured in the Company's project management software, Planview. Planview serves as the system of record for the project delivery lifecycle.

Q. How are the tiers that guide the governance rigor of a capital project determined?

A. A project's tier (from Tier 5 down to Tier 0, as described in Exh. JOM-2) is initially determined by its estimated total cost (i.e., prior to any jurisdictional allocation), then further assessed for factors such as risk, impact, and complexity, which may elevate its classification. The project tier dictates the information and level of detailed documentation required for each lifecycle stage of the project and the approval requirements needed to move forward to the next stage. If project cost, risk, complexity or impact assessment change during the lifecycle of the project, the project will need to be evaluated for re-tiering. The processes outlined in the Procedure apply to all projects classed as Tier 1 or higher. Generally speaking, Tier 5 projects cost in excess of $10 million or have major risk/impact/complexity, Tier 4 projects cost between $2.5 million and $10 million or have significant risk/impact/complexity, Tier 3 projects cost

between $1 million and $2.5 million or have moderate risk/impact/complexity, Tier 2 projects cost between $250,000 and $1 million or have low risk/impact/complexity, and Tier 1 projects cost between $100,000 and $250,000 or have very low risk/impact/complexity. Tier 0 projects (less than $100,000 and very low risk/impact/complexity) are not governed by the Procedure but may follow it as a best practice.

Q. Please describe the phases and their requirements in the Procedure.

A. As noted earlier, the phases follow the full project lifecycle – starting with the proposal of the idea through Intake/Initiate, Assess, Plan, Execute and Close. Between each phase, projects submit a stage gate request, which is reviewed by approvers to grant approval to move to the next phase. Each gate is a critical point in the project where the project team evaluates the previous phase and confirms approval and readiness for the following phase.

Q. What happens in the Intake/Initiate phase?

A. The Intake/Initiate phase documents the decision to select a project. This task is accomplished through project sponsors for projects in Tiers 1 and 2. For projects in Tiers 3, 4 and 5, the project sponsor applies to the PMO to intake a project and submits it to the Portfolio Management Committee. The PMC reviews the project, validates the value of the core project or opportunity it addresses, confirms available funds and internal staff resources to support the project, and prioritizes the project within the Company's portfolio of other projects (e.g., Engineering, IT&S, Facilities). At completion of this phase, the project team may receive authorization to take action to move the project forward to the Assess phase. If so, a nominal budget is authorized for

internal labor to kick-off the project and further identify and develop the scope of resources and funds needed to complete the Assess phase.

Q. What is the purpose of the Assess phase?

A. In the Assess phase, the project team works to more fully develop project requirements, assess available options to address the project's needs and determine the alternatives, and perform feasibility and front-end engineering and design ("FEED") studies that lead to identification of the preferred solution. If a significant study is needed to explore various alternatives to a potential solution, the Assess phase is used to take the time for this evaluation. For projects estimated to cost more than $1 million (with construction overhead[2]), this phase culminates in the project sponsors and subject matter experts' completion of an Alternatives Analysis ("AA"). The AA is a document that explains why the Company needs to solve a problem, the possible solutions, and why the Company selected the chosen solution. Projects that require an AA do not advance to the Plan phase until the AA receives approval. The AA approval process requires approval from the Vice President of Regulatory Affairs & Resource Planning, Senior Director of Strategic Planning, Director of Business Analytics, and my position, Senior Director of Business Planning. Cost estimates developed at the Assess phase, such as in a FEED study, include some variability on the order of approximately -25% to +50%.

[2] Construction overhead ("COH") represents indirect capital costs that are applied to capital projects. COH rates are communicated by the FP&A team.

Q. Please describe the Plan phase.

A. In the Plan phase, the project team's focus is to develop a design, budget, and schedule for the preferred alternative selected during the Assess phase. The intent is to ensure that the project has a fully defined plan and approach for moving to execution. The Plan phase will have a budget to account for items such as engineering design, exploratory field work, and permits. The Plan phase may experience change orders if additional funds are needed to address Plan phase costs that were not foreseen when the initial Plan phase budget was prepared.[3] The first Execute phase cost estimate is developed during this phase. Pricing for materials, internal labor, external vendors and equipment is collected based on current market conditions and is used to develop the Execute phase cost estimate. Ideally, the level of uncertainty at the end of the Plan phase allows for the development of an Execute cost estimate with reduced variability on the order of approximately -10% to +10%.

Q. After the Plan phase, is the project constructed to completion?

A. Yes. This is called the Execute phase. The Execute phase has a budget to account for direct costs necessary for constructing the project and is in addition to funding approved for previous phases. Ideally, the level of uncertainty at the start of the Execute phase allows for development of cost estimates with a range of plus or minus 10%. The asset is placed in service at the end of the Execute phase.

[3] Approved changes must be documented in a project change order if contingency (which represents the amounts allocated to a project to be used, with approval, for unplanned expenses) needs to be used, the project is forecasted to be over budget and needs more funding, the project needs to use the final 20% of contingency, there are changes to the schedule that impact key milestones or the end date, or there is a material scope change (adding or deleting scope).

Q. What happens after the Execute phase is complete?

A. Finally, in the Close phase, the project team closes the project budget, saves all relevant project files, captures lessons learned, and releases the project team.

Q. So far, this testimony has focused on the lifecycle of individual capital projects. What is a program?

A. In addition to individual projects, the PMC may determine the need for a program if there are multiple projects with a connected goal, such that benefits of managing the collection outweigh managing projects as individual units or if those projects have multiple critical interdependencies. A program is submitted to the PMC for review, but each individual project that comprises the program is still subject to the lifecycle review process. To be clear, a PMO program would not necessarily be classified as Programmatic under NW Natural's interpretation of the Used and Useful standard. Under the PMO Procedure, a program could be a collection of Large and Discrete capital investments or Short-Lived IT&S investments. But a PMO program could also overlap with the Programmatic category; for example, the Meter Modernization Program is both a PMO program and falls within the Programmatic Used and Useful category. This program consists of a collection of thousands of small projects (meter and encoder receiver transmitters replacements) that have a high impact to the Company and its customers, and therefore, it was appropriate to classify the many capital investments into an overarching program that is project-managed through the PMO.

Q. Does this conclude your Direct Testimony?

A. Yes, it does

GENERAL PROCEDURE

PROJECT MANAGEMENT PROCESSES

Index Number: 67

APPLICATION

This Procedure applies to all projects required to follow the Project Management Office (PMO) processes as defined below. This Procedure acts as an overview of PMO processes and works in conjunction with the PMO processes detailed in the Project Management Handbook. Please note there is a glossary of key terms located at the end of this document.

PURPOSE

This Procedure outlines the structure and requirements for managing projects for the full project lifecycle – starting with the proposal of the idea through intake, initiate, assess, plan, execute and close. The Company has adopted this Procedure to ensure consistent treatment and appropriate due diligence on projects by establishing the following:

- Approval and stage gate requirements, which grant authority to proceed with the project expenditure
- Tier definitions that guide the governance rigor of the project
- Phase definition and key activities and requirements
- Mechanism and approval process for change control (scope, budget variance, schedule, etc.).

PROCEDURE

TIER DEFINITIONS

A project's Tier is initially determined by its estimated cost, then further assessed for factors such as risk, impact, and complexity, which may elevate its classification. The project Tier dictates the tools and level of detailed documentation required to be completed during each lifecycle stage of the project and the approval requirements needed to move forward to the next stage. If project cost, risk, complexity or impact assessment change during the lifecycle of the project, the project will

need to be evaluated for re-tiering. The processes outlined in this Procedure apply to all projects classed as Tier 1 or higher. Tier 0 projects are not governed by these processes but may follow them as best practices.

	Gates	Gate + Change Order Approvals	Sponsorship Requirements	PMC Intake Approval
Tier 5: $10M+ or Major Risk / Impact / Complexity	Initiate Move to assess Move to plan Move to execute Close	Portfolio Manager Sponsor Exec Sponsor Finance Director Company President CFO CEO	C-Level Executive	Required
Tier 4: $2.5 - $10M or Significant Risk / Impact / Complexity	Initiate Move to assess Move to plan Move to execute Close	Portfolio Manager Sponsor Exec Sponsor Finance Director Company President	C-Level Executive	Required
Tier 3: $1M - $2.5M or Moderate Risk / Impact / Complexity	Initiate / Move to assess Move to plan Move to execute Close	Portfolio Manager Sponsor Exec Sponsor Finance Director Company President	C-Level Executive	Required
Tier 2: $250K - $1M or Low Risk / Impact / Complexity	Initiate / Move to plan Move to execute Close	Portfolio Manager Sponsor Exec Sponsor	VP or above	Required (Eng. projects without other teams exempt)
Tier 1: $100K- $250K and Very Low Risk / Impact / Complexity	Initiate / Move to plan Move to execute Close	Portfolio Manager Sponsor	Sr. Director or above	None (through sponsor approval only)
Tier 0: <$100K and Very Low Risk / Impact / Complexity	None	None required; initial PPM gate if using for funding	Director	None (through sponsor approval only)

Note: All estimates of project costs must include contingencies and allocations of appropriate internal resources that would be charged to capital. The total project costs, inclusive of these items, are used for determining tier level. Except where noted, project costs exclude AFUDC (Allowance for Funds Used During Construction) and COH (Construction Overhead).

GENERAL PROCEDURE

PHASES & GATES

All Tier 1 and above projects are governed by this Procedure and must follow the Stage Gating process. Between each phase, projects submit a Stage Gate request, which is reviewed by approvers to grant approval to move to the next phase. The specific gate requirements and approval authorities vary by project Tier. Each gate evaluates the previous phase and confirms approval and readiness for the following phase:

- **Intake / Move to Initiate (PMC review)**
    - **Goal**: Document the decision to select the project, based on officer priorities, confirmation of available resources and priority, and through validating the value of the core problem or opportunity it addresses.
        - For Tiers 4 and 5: Funds $50K to support pre-assessment resource gathering.
        - For Tiers 1, 2, and 3: Funds the first project phase (planning for Tier 1; assessment for Tiers 2 and 3).
    - **Required for:** Tiers 3, 4 and 5 through the PMC, Tiers 1 and 2 through sponsors.
    - **Key Documentation Reviewed at Gate:** Intake Form, Risk Assessment

- **Move to Assess**
    - **Goal**: Validate the project charter and confirm a plan is in place to assess the problem – including initial budget, schedule and resources. Funds the Assess phase.
    - **Required for**: Tiers 4 and 5
    - **Key Documentation Reviewed at Gate**: Initial Project Charter, Assess-Phase Schedule, Budget, Resource Plan

- **Move to Plan**
    - **Goal**: Confirm that the recommended solution and approach align with project goals. Validates that the estimated total budget is reasonable, represents a sound investment, and aligns with overall department budget constraints. Funds the Plan phase.

        - Additionally, for projects over $1M including COH: confirms successful completion of the Alternatives Analysis (AA) process.
    - **Required for:** Tiers 4 and 5
    - **Key Documentation Reviewed at Gate**: Full Project Charter, Plan-Phase Schedule, Budget, Resource Plan, AA (>$1M with COH)

- **Move to Execute**
    - **Goal**: Ensure that the project is sufficiently planned and designed for successful execution. Confirms that the execution budget aligns with NWN's financial strategy and delivers value for cost. Funds the Execute phase.
    - **Required for:** Tiers 1, 2, 3, 4 and 5
    - **Key Documentation Reviewed at Gate:** Execution Approach, Full Schedule, Full Budget, Full Resource Plan

- **Move to Close**
    - **Goal**: Verify that the project has been delivered as promised and the intended value has been achieved.
    - **Required for**: Tiers 1, 2, 3, 4 and 5
    - **Key Documentation Reviewed at Gate**: Project Closeout Report, Final Budget

Projects estimated to be greater than $1MM (with COH) submit an Alternatives Analysis (AA) during the Assess phase or at the point at which the expected project costs exceed that threshold – as enough information is gathered to understand the options forward, but before any decisions are made. The chart below shows the process for Tier 3 and 4 projects. As indicated above, projects that are smaller complete a modified intake and then begin their project work in Plan.

Between stage gates, projects progress through defined phases where key planning, analysis, and design activities take place. These phases build the foundation for informed decisions at each gate, ensuring the project is aligned, resourced, and ready to move forward. The following section

outlines the primary objectives, activities, and expected outputs for each phase. Additional deliverable requirements are assigned based on project type, focus and risk.

	Tier Requirements	Intent	Overview	Deliverables
Initiate	Tier 4 and 5 projects	Align on business case and resources needed to assess the project	Assemble core team, define governance structure, change control plan, and initiate tools (risk log, SharePoint, comms plan) Refine objectives and document initial Project Charter Develop assessment plan (e.g., studies, strategies, requirements), then create proposed Assess-phase budget and schedule	Assess-Phase Budget Assess-Phase Schedule Initial Project Charter Project Team Plans (RACI, etc.)
Assess	Tier 3, 4 and 5 projects	Develop requirements/designs, assess options, define preferred solution	Conduct studies and gather needed documentation (requirements, as-builts, surveys, etc.) Explore solution options; for >$1MM with COH, complete Alternatives Analysis Finalize Full Project Charter Define Plan-phase schedule and budget	Plan-Phase Budget Plan-Phase Schedule Full Project Cost Estimate Alternatives Analysis (*If >$1MM w/COH) Full Project Charter Status, Risk, Issue Reporting

GENERAL PROCEDURE

Plan	Tier 1–5 projects	Flesh out solution and define execution path	Complete final project design and scope approval Align stakeholders on governance/support after launch Define acceptance criteria Finalize Execution Schedule and Budget	Execution Budget / Full Budget Execution Schedule Final Designs and/or Specifications Status, Risk, Issue Reporting
Execute	Tier 1–5 projects	Track, monitor, and control project delivery	Monitor project progress against cost, schedule, and scope Support stabilization and operationalization upon completion	Status Reporting Risk Register, Issue Register, Change Orders (as needed)
Close	Tier 1–5 projects	Operationalize, adopt, and hand off project deliverables	Facilitate transition of projects to operations, including knowledge and documentation handover Capture lessons learned Complete final budget reconciliation	Lessons Learned Updated Documentation Final Budget

GENERAL PROCEDURE

CHANGE CONTROL PROCESS

It is not uncommon for elements of projects to change as plans develop and evolve. This could occur at any time after a project is started. The procedures to be followed by the Project Manager are based on when the change is identified. The Project Manager keeps the Project Plan updated and follows the stated process of Change Control for any requests for changes in cost, scope, or schedule, before actions are taken (e.g., budget is requested before additional budget is spent). Approved changes must be documented in a Project Change Order request if:

- Contingency needs to be used.
- Project is forecasted to be over budget and needs more funding.
- Project needs to use the final 20% of contingency.
- There are changes to the schedule that impact key milestones or the end date.
- There is a material scope change (adding or deleting scope).

The project's approvals (based on project tier) will evaluate change requests.

PROGRAM MANAGEMENT

In addition to individual projects, the PMC may determine the need for a program if there are multiple projects with a connected goal, such that benefits of managing the collection outweigh managing projects as individual units or those projects have multiple critical interdependencies. In this case, the program is submitted to the PMC for review, followed by the individual projects. Each project will continue to follow the project process defined above, and an additional "project" may be managed to handle any program-specific funding requests.

GENERAL PROCEDURE

KEY PROJECT ROLES

There are several key roles within a project organization that provide the necessary leadership structure. These roles are:

Project Requestor / Owning Department: Business unit or functional manager who will benefit from the project or who originates the idea for the project. In the case of Engineering, this may be the Project Manager.

Project Manager (PM): The PM is responsible for the successful delivery of a project, ensuring project deliverables are met within the agreed scope, schedule, and budget.

Project Sponsor: makes business decisions for the project or program. They are typically members of senior/director management – those with a stake in the project's outcome and the ultimate owner of the delivered asset.

Executive Sponsor: has ultimate authority and accountability for a project or program. They are typically members of officer/executive management and secures approval for funding.

Project Steering Committee: Projects with varied stakeholders may utilize a Steering Committee to provide strategic direction. While the Executive Sponsor holds authority and responsibility for a project or program, a project or program Steering Committee makes decisions beyond a single sponsor's purview.

Portfolio Management Committee: A group of key strategic business individuals who review proposed ideas, weigh them against company priorities and resources and select priority projects to start.

GENERAL PROCEDURE

GLOSSARY OF TERMS

Alternative Analysis (AA): A document created during the Assess phase that outlines why we need to solve a problem, the possible solutions and why we've selected the solution we chose. The AA applies to projects with an estimated cost greater than $1MM (including COH).

Change Order: A request to accept mid-stream changes to a project's budget, scope, or schedule.

Contingency: WBS cost line item representing the money allocated to a project to be used (with approval) for unplanned expenses.

Construction Overhead (COH): COH represents indirect capital costs that are applied to capital projects for back-office support. COH rates are communicated by the financial planning and budgeting team, with the latest rates stored on the Hub here

Planview: NW Natural's Project Portfolio Management (PPM) tool, the home for the full project lifecycle and the source of truth for project information.

Portfolio Management Committee (PMC): A group of key strategic business individuals who review proposed ideas, weigh them against company priorities and resources and select priority projects to start.

Program: Related projects that are managed as a group, with a holistic and strategic lens to allow a company to drive toward core objectives across teams

Project: A temporary endeavor undertaken to create a unique product, service, or result; in our case, projects of a specific size are managed through the PMO depending on their cost and impact on customers or the business

RACI/RAPID: Project documents that help organize work and decisions on a project.

Stage Gate: Critical points in a project where the project team pauses to review and approve. This is managed through Planview where PMs submit a request with documentation, and it is filtered to a defined set of approvers for sign off before moving forward.

Tier: A project categorization from 0 (low) to 5 (high) based on the project's anticipated cost, risk, complexity and impact.

GENERAL PROCEDURE

REVIEW OF PROCEDURE

In order to ensure that this Procedure continues to reflect current practices and applicable legal requirements, a regularly scheduled review will be conducted every three years unless changes in the law or business needs supersede this requirement.

I. INTRODUCTION AND SUMMARY

Q. Mr. Kizer, please state your name and position with Northwest Natural Gas Company dba NW Natural ("NW Natural" or "the Company").

A. My name is Daniel B. Kizer. I am the Engineering Senior Director at NW Natural. I am responsible for design, construction, operation, and maintenance of the gas transmission and distribution system (collectively herein, the "distribution system") and utility gas storage plants, and operations support services including work management functions, mapping and compliance.

Q. Mr. Kizer, please describe your education and employment background.

A. I graduated from Oregon State University with a Bachelor of Science in Civil Engineering, and I am a registered Professional Engineer. Before being promoted to my current position at NW Natural in June 2021, I was an Engineering Manager for the Company beginning January 2018. Prior to holding that position, I was a Field Engineer for the Company beginning May 2012. Before joining NW Natural, I worked as a Project Manager at Westech Engineering, Inc. from 1993 until 2012.

Q. Mr. Johnson, please state your name and position with NW Natural.

A. My name is Scott S. Johnson and I am Director of Gas Supply at NW Natural.

Q. Mr. Johnson, please describe your education and employment background.

A. I have a bachelor's degree in Accounting and started my career working at a public accounting firm where I focused on auditing utilities. I have worked at NW Natural for almost 15 years in various roles including financial reporting, gas and regulatory accounting and gas supply. I have worked in gas supply for 11 years.

Q. Which sections of this Direct Testimony are each of you sponsoring?

A. We are jointly sponsoring Sections II.B.5.a and b (Major Storage Facility Projects: Background of the Company's Storage Facilities, and Detailed Information about the Mist Storage Facility and the Natural Gas Market in the Pacific Northwest), and Mr. Kizer is individually sponsoring the remainder of this Direct Testimony.

Q. What is the purpose of your testimony?

A. The primary purpose of our testimony is to describe major distribution system projects (sponsored by Mr. Kizer) and storage facility projects (sponsored by Mr. Kizer and in part by Mr. Johnson) serving Washington customers that are included in this rate case. Our testimony covers Large and Discrete, Projected and Programmatic capital expenditures.[1] Before we do so, Mr. Kizer discusses aspects of the Company's long-term system planning and the Company's recent improvements to its system modeling. Mr. Kizer also discusses the Company's ongoing plans for discrete and non-discrete safety-driven system projects and programs. The Company's safety-related projects and programs address the Company's In-Line Inspection ("ILI") Conversion Projects, Proactive Excess Flow Valve ("EFV") Installation Program, and Probabilistic Distribution Risk Model Project. Finally, Mr. Kizer describes the Company's distribution system and gas storage pipeline safety operating and maintenance ("O&M") expenses.

[1] As described later in my testimony, in the testimony of Jorge O. Moncayo (Exh. JOM-1CT), and quantified in Table 3 in the testimony of Kyle T. Walker (Exh. KTW-1T), NW Natural has categorized its capital expenditures utilizing four main categories: Large and Discrete, Projected, Programmatic, and Short-Lived IT&S.

II. MAJOR DISTRIBUTION SYSTEM AND STORAGE FACILITY PROJECTS

A. Long-Term System Planning

Q. Before addressing the major distribution system and storage facility projects included in this rate case, are there any aspects of the Company's long-term system planning that you wish to discuss here?

A. Yes. Distribution system planning has historically been conducted as just-in-time planning, where traditional pipeline solutions were not developed until areas of the system became constrained. While this type of planning has long benefited customers, it does not allow for the lead time needed for non-pipeline alternative ("NPA") solutions. Forward-looking planning is necessary to evaluate and implement NPAs. NW Natural is in the process of expanding its suite of NPA solutions in Washington, such as Geographically Targeted Demand Response ("GeoDR"), Geographically Targeted Energy Efficiency ("GeoEE"), as well as a system-wide demand response program. Using updated, more sophisticated modeling, NW Natural has identified several areas on the system that have the potential for early NPA solutions, as they do not currently violate system reinforcement criteria but are areas where the gas distribution system is either approaching these thresholds and/or is showing evidence of growth in demand that drive the need for a system reinforcement. In addition to GeoDR and GeoEE, the Company has hired an outside consultant to prepare a compressed natural gas ("CNG") or liquefied natural gas ("LNG") trucking study to help determine when CNG or LNG gas supplies may be a viable alternative to a pipeline solution for a peak weather event for areas of the Company's system that fall

below its minimum system planning threshold. The Company intends to evaluate and pursue as many of these opportunities as possible and will document those for which it is not feasible and why. The Company is conducting all of these efforts and analyses concurrently and has included this information in NW Natural's Integrated Resource Plan ("IRP") filed with the Washington Utilities and Transportation Commission ("Commission") on August 1, 2025 (docket UG-240312).

Q. Please describe the improvements to the Company's system modeling.

A. The Company recently completed implementation of its Customer Management Module ("CMM") into the Company's pressure system modeling software, Synergi™ Gas. CMM effectively creates a link between NW Natural's Geographical Information System (GIS), Customer Information System ("CIS"), and Synergi™ Gas.

Q. How is CMM different from past system modeling software?

A. CMM provides NW Natural with the ability to import each customer's recent historical gas usage data from CIS to calculate a customer-specific demand using daily temperature, as well as update customer information such as rate schedule, customer status (active or inactive) and changes in forecasted consumption. Previous modeling methods utilized area-specific averages for residential and small commercial customers, whereas CMM allows for customer-specific predicted usages based on each customer's recent historical consumption. CMM ties individual customer demands to their specific geographic location in the model, allowing customer model demands to be automatically assigned to their respective locations in the models. The overall benefit of CMM is that it more accurately models local system pressures by using individual historical customer usage, rather than local average customer usages.

Q. Did the transition to CMM change the Company's understanding of the adequacy of the distribution system during design peak cold weather conditions?

A. Yes. The differences in customer usage became apparent when the transition to CMM was completed. After the implementation of CMM, the Company's system modeling revealed that its distribution pressures for the design cold weather planning event, and for less-than-peak cold weather events in some locations, fell below the Company's minimum system planning threshold in areas where customer demands were higher than previously modeled, and that customers would experience loss of gas service during a peak cold weather event. Likewise, in areas where customer demands were less than previously modeled, the Company's system modeling showed better system pressures during the peak cold weather planning event. The Company's cold weather planning event system modeling only evaluates demands from firm customers, and the usage for interruptible rate schedule customers is disabled in the model.

Q. Are these newly revealed areas that fail the minimum system planning criteria isolated or extensive throughout the Company's distribution system?

A. In general, the areas are isolated and limited to geographical areas within the Company's distribution system where customers exhibit higher-than-previously-assumed average demands.

Q. Has the Company validated the results of the CMM modeling?

A. Yes. The Company uses Supervisory Control and Data Acquisition (SCADA), Electronic Portable Pressure Recorders ("EPPRs"), and field gauge measurements to validate CMM model results against actual pressure readings. The Company installed EPPRs in several locations where CMM showed NW Natural's system pressures to be

weak. Most recently, the EPPRs recorded hourly pressure and temperature data during the January 2024 cold weather event (i.e., from Friday, January 12, 2024, through Thursday, January 18, 2024), which was used to validate CMM system modeling under the temperature conditions experienced during this cold weather event. The pressure and temperature data collected for the 2024 cold weather event also validated the Company's CMM modeling findings that, in areas of its system where customer demands were higher than previously modeled, the Company can expect to see a loss of service to customers during a peak cold weather event, and in some cases, at temperatures similar to what the area experienced during the January 2024 ice storm event.

Q. How is the Company addressing these areas that CMM shows currently fail the minimum system planning threshold?

A. The Company has identified reinforcement projects to improve supply in areas where CMM modeling predicts a loss of service for customers where gas demands were higher than previously modeled. The Company determined that certain NPA solutions cannot be employed fast enough to address the immediate need for improved gas supply to these areas recently identified by CMM. NW Natural is conducting additional modeling to forecast future constraints where load growth might be expected to occur over the next five years.

B. Discussion of Major Distribution System and Storage Facility Projects

Q. Has the Company previously sought cost recovery for any major distribution system and storage facility projects that have been completed since November 1, 2022, the rate effective date for Year Two of the Company's 2021 rate case (docket UG-200994)?

A. Yes. In its last rate case, the Company sought cost recovery for a project called the SE 1st Street Grading Project (Phase 2). The SE 1st Street Grading Project (Phase 2) was the second phase of a City of Vancouver public works road improvement project between SE 164th Avenue and SE 192nd Avenue. The second phase of this roadway improvement project included roadway widening between SE 177th Avenue and SE 192 Avenue for bike lanes, turns lanes and the addition of sidewalks. It also included relocation of public sanitary sewer, water, storm drainage, lighting and signage as well as relocation work by multiple private utilities. Phase 2 also included full roadway reconstruction as the road grade was lowered by approximately 30 feet to improve grades for a new roundabout at the new intersection with SE 184th Avenue.

By its Order 05 in dockets UG-200994, UG-200995, UG-200996 and UG-210085 on October 21, 2021, the Commission approved the Full Multi-Party Settlement Agreement ("Agreement") (and its Attachment 1), which, in relevant part, required the Company to make a Year Two Pro Forma Filing that presented evidence sufficient to demonstrate the prudence of the Year Two distribution system and storage facility capital projects listed in paragraph 10 of the Agreement. The Company made its Year Two Pro Forma Filing on December 2, 2022. That filing included the Direct Testimony of Mr. Kizer (Exh. DBK-1T) that the SE 1st Street Grading Project (Phase

2) would not be completed before the November 1, 2022, rate effective date of Year Two and that all costs for that project were removed from the portfolio of projects included in Year Two and were not included in Year Two rates.

Q. Please provide an update of the SE 1st Street Grading Project (Phase 2).

A. The Company completed and placed in service the SE 1st Street Grading Project (Phase 2) in October 2024. The total cost to complete the SE 1st Street Grading Project (Phase 2) was $9.4 million. The Company has included the net cost of this project in its revenue requirement in this rate case.

Q. Please explain why the SE 1st Street Grading Project (Phase 2) cost approximately $9.4 million when the amount the Company forecasted in December 2020 was approximately $2.3 million.

A. There are multiple factors that contributed to the cost of the project increasing above the $2.3 million amount forecasted in UG-200994. The Company's gas facility relocation work on the SE 1st Street Grading Project (Phase 2) occurred two years later than originally forecasted in UG-200994, and the scope of the Company's gas facility relocation work that occurred in 2024 was greater than the relocation design forecasted to occur in 2021. The staging to lower the roadway grade near the SE 184th Avenue intersection changed over what was presented to the Company back in 2000 and 2001. Rather than lower one-half of the roadway and allow private utilities to move over to the lowered roadway section after the grade was lowered, the full width of the roadway was lowered all at once. To accommodate this full-width roadway lowering, the Company had to cut and abandon its existing high-pressure distribution 4-inch steel main and Class B local distribution mains and services so the City's contractor could

perform the excavation activities to lower the road grade. In addition, the Company had to route temporary services to the asphalt and concrete plants on the north side of the roadway, which were reconnected to the new Class B main in the SE 1st Street roadway after the roadway grade was lowered.

In addition, during the construction phase, the Company incurred an additional $2.6 million in change orders due to actions by third parties that were beyond the Company's control.[2] NW Natural had been coordinating utility relocation with the City of Vancouver as early as 2020. This road improvement project proved to be complex logistically as active and historical gravel mining operations have lowered the elevation of the land on both sides of the public right-of-way for the project roadway segment by approximately 35 to 50 feet. A land developer partnered with the City to improve this Phase 2 segment of the SE 1st Street roadway, and an agreement was made to lower the elevation of the middle segment of the SE 1st Street roadway by approximately 35 feet to improve the access of the existing and former gravel mining properties to the improved SE 1st Street roadway. The developer was redeveloping the formal gravel mining site south of the roadway for urban residential land uses and had future redevelopment interests for the active gravel mining site north of the roadway. The City project experienced multiple delays due to the logistical complexity of lowering the roadway and all of the active public and private (franchise) utilities within the limited public right-of-way available.

[2] Exh. DBK-SSJ-2 is the Company's documentation of the change orders.

Another complexity was that all public and private utility relocation work, as well as the excavation to lower the right-of-way elevation by 35 feet, had to occur within the City contractor's one summer season construction project schedule. Once the Company began work to relocate its facilities in conflict with the roadway improvements, material changes to the City's design and the City contractor's schedule led to numerous changes that affected the scope, schedule, and costs of the Company's gas main installations for the SE 1st Street Grading Project (Phase 2).

Q. Please identify the significant large and discrete distribution system and storage facility projects that are included for recovery in this rate case.

A. In addition to the one project mentioned above, the Company is requesting recovery for the following significant discrete distribution system and storage facility projects. Each of these is described more fully below:

- Reinforcement Projects:
  - Vancouver Reinforcement Project (December 2028) (Rate Year 3) ($15.5M)
- Gate Station Improvement Projects:
  - Camas Gate Station Rebuild Project (October 2023) ($3.9M)
  - Camas Gate Station Building Improvements Project (September 2025) (Pro Forma Year) ($1.3M)
  - Deer Island Gate Station Improvements Project (October 2027) (Rate Year 2) ($0.6M Washington-allocated)
  - Felida Gate Station Rebuild Project (July 2028) (Rate Year 3) ($1.9M)
- Line Heater and Gate Station Projects:
  - West Vancouver Gate Metering Project (July 2026) (Rate Year 1) ($0.7M)

- Ridgefield and Battleground Line Heater Projects (both August 2028) (Rate Year 3) ($1.6M each)
- West Vancouver Gate Odorant Depot Project (August 2027) (Rate Year 2) ($1.2M)

- Major Storage Facility Projects: The projects listed below are designed to replace equipment and facilities that reached the end of their useful life and to promote the integrity and reliability of the Mist Storage Facility ("Mist") or the Company's Portland LNG or Newport LNG storage facilities.
  - Mist Projects:
    - Mist GC500 Turbine Compressor Replacement Project (Oct. 2025) (Pro Forma) ($6.6M Washington-allocated) and Mist GC600 Turbine Compressor Replacement Project (December 2026) (Rate Year 1) ($1.6M Washington-allocated)
    - Mist Main Power Feed Replacement Project (October 2026) (Rate Year 1) ($0.5M Washington-allocated)
    - Mist Miller Bruer/Flora Gathering Separator Upgrades Project (August 2027) (Rate Year 2) ($0.4M Washington-allocated)
    - Mist Miller Bruer/Flora/Meyer Metering Upgrades Project (July 2027) (Rate Year 1) ($0.3M Washington-allocated)
    - Mist Calvin Creek Gathering Separator Upgrades Project (October 2028) (Rate Year 3) ($0.2M Washington-allocated)
    - Mist Miller Air Compressor and Receiver Tank Upgrades Project (July 2027) (Rate Year 2) ($0.2M Washington-allocated)

- Newport LNG Projects:
  - Newport LNG Pretreatment Improvements Project (December 2024) (Test Year) ($0.7M Washington-allocated)
  - Newport LNG Plant Supply Generator Project (December 2026) (Rate Year 1) ($0.3M Washington-allocated)
  - Newport LNG Cold Box Replacement Project (April 2027) (Rate Year 1) ($4.5M Washington-allocated)
  - Newport LNG Molecular Sieve Vessels Repair and Upgrades Project (June 2026) (Pro Forma Period) ($0.3M Washington-allocated)
- Portland LNG Project:
  - Portland LNG Electrical Distribution Upgrades (August 2026) (Rate Year 1) ($0.3M Washington-allocated)

Q. Please identify the near-term or completed programmatic distribution system projects that are described in this rate case.

A. The following programmatic distribution system projects are included for recovery in this rate case:

- P04 Camas Trans ILI Conversion Project ("TIMP")[3]
- SE 1st Street Grading Project (Phase 2) (Public Works) (described earlier in this testimony)
- Proactive EFV Installation Program

[3] "TIMP" is the United States Department of Transportation Pipeline and Hazardous Materials Safety Administration's ("PHMSA's") Transmission Integrity Management Program.

- JANA DIMP[4] Probabalistic Risk Model Project (IT&S project to enhance engineering capabilities for Programmatic capital expenditures).

Q. Please describe the categories of Programmatic or Projected capital expenditures.

A. As described in the Direct Testimony of Jorge O. Moncayo (Exh. JOM-1T), the Company forecasts Programmatic and Projected capital expenditures that occur consistently and are related to the day-to-day operation of the Company. Programmatic capital expenditures include capital expenditures in furtherance of the Company's Transmission Integrity Management Plan (TIMP) and Distribution Integrity Management Plan ("DIMP").

Projected capital investments include work such as Damages, Leakage, District Regulators, and Relocates. These capital expenditures are based on historical spending trends adjusted for inflation. Each are briefly described here:

- ***Damages*** - The Company's pipeline system incurs third-party damage each year. At the time of planning, the Company does not know where and when the damage will occur. The Company can rely on historical baselines adjusted for inflation to project the costs in the forecast.
- ***Leakage*** – Leakage costs represent replacements of services and mains that result from leaks on the Company's system. Like damage and public works projects, these projects are not necessarily identified in advance. However, the Company can rely on historical baselines adjusted for inflation to project the costs in the forecast.

[4] "DIMP" is PHMSA's Distribution Integrity Management Program.

- ***District Regulators*** – These costs represent the installation or replacement of district regulators due to system expansion, public works, system reinforcement, quality assurance remediation, and corrosion protection or compliance requirements. As noted above, there can be several reasons why district regulators are replaced, and therefore, the Company forecasts a level amount each year based on historical baselines adjusted for inflation.
- ***Relocates –*** These projects involve the relocation of pipe for safety and compliance purposes. Projections for relocates are based on historical baselines adjusted for inflation.

1. Major Discrete Distribution System Projects

a. Vancouver Reinforcement Project

Q. Please describe the Vancouver Reinforcement Project.

A. The Company's high pressure distribution system in Clark County is supplied by gas from six gate stations, where gas is delivered to the Company's transmission and high-pressure distribution system from the interstate pipeline system. The high-pressure distribution system operating above design capacity has a maximum allowable operating pressure ("MAOP") of 250 pounds per square inch gauge ("psig"). Approximately 77,000 firm customers are served by the Company's transmission and high-pressure distribution system.

In 2022, the Company created a new Clark County hydraulic model incorporating forecasting data from the new (at the time) Customer Management Module (CMM). Initial system modeling using the new CMM data showed that pressures in the 250 psig MAOP high pressure distribution system would drop to 105

psig during a peak cold weather event. This system modeling turns off the demands for interruptible customers and only evaluates firm customer demands. A gas main pressure of 105 psig represents a 55 percent pressure drop from the 235 psig gate station delivery pressure on the 250 psig MAOP system. NW Natural's system planning criteria calls for system improvement measures to be taken when line pressures drop by 40 percent.[5] The 250 psig MAOP high pressure distribution system is constructed of a network of high pressure main consisting of 5.5 miles of 4-inch pipeline, 13.6 miles of 6-inch pipeline, 21.7 miles of 8-inch pipeline, and 5.4 miles of 12-inch pipeline. Modeling with the new CMM data showed that the 4-inch and 6-inch pipeline segments within the 250 psig MAOP high pressure distribution system were bottlenecks that restricted flow and contributed to the excess pressure drops modeled. EPPRs were placed in the field by the Company, and data collected during cold weather between 2023 and 2025 to confirm the CMM modeling findings.

On January 16, 2024, a Company EPPR recorded a pressure of 117.8 psig during a 43.5 Heating Degree Day ("HDD") on the 250 psig MAOP system when the average daily temperature was 21.5 degrees F, corresponding to a 41.3 percent pressure drop. On February 11, 2025, a Company EPPR recorded a pressure of 106.0 psig during a 37 HDD on the 250 psig MAOP system, corresponding to a 48.3 percent pressure drop.

[5] This standard is based on the Gas Engineering and Operating Practices (GEOP), Volume 3, Distribution, Book D-1, System Design Revised, Chapter 2: Gas Flow Calculations, page 111.

Q. What are the results of the CMM modeling for the existing local distribution system during a peak cold weather event?

A. The Company uses an HDD of 57.4 for peak cold weather system planning. The Company's latest modeling estimates that pressures would drop to 95 psig on the 250 psig MAOP high pressure distribution system during a 57 HDD peak cold weather event. The modeling results were validated using 2024 and 2025 EPPR data. Although gas would still flow at 95 psig, the flow rate is less than the maximum regulator capacity, which can lead to reductions in gas and pressure supplied to the local distribution system. Prior to the transition to the CMM, previous Company software models did not show system pressures to exceed the 40 percent pressure drop threshold.

Company system modeling for peak cold weather system planning shows large areas in the Vancouver core areas, between I-5 and I-205, with pressures between 0 and 10 psig (in red) as shown below in Figure 1 and in Exh. DBK-SSJ-3. Modeled low pressure in the 250 psig MAOP system lead to reduced inlet pressure and district regulator flow capacity for gas supply into the Class B local distribution system. Based on new CMM modeling since the 250 psig MAOP high pressure distribution system has experienced a greater than 40 percent pressure drop during recent cold weather events and has been modeled to exceed greater pressure drops during a peak cold weather event, the inlet supply to district (pressure) regulators has reached and passed a threshold where district regulator capacity will decrease with any small increases in load demand as shown below in Figure 2. Further reductions in the 250 psig MAOP system pressure will lead to increases in the number of customers with distribution pressure between 0 and 10 psig, and the areas shown in red in Figure 1 below will grow

with more customers expected to see meter inlet pressures between 0 and 10 psig, and with some losing pressure to their gas service during peak cold weather events.

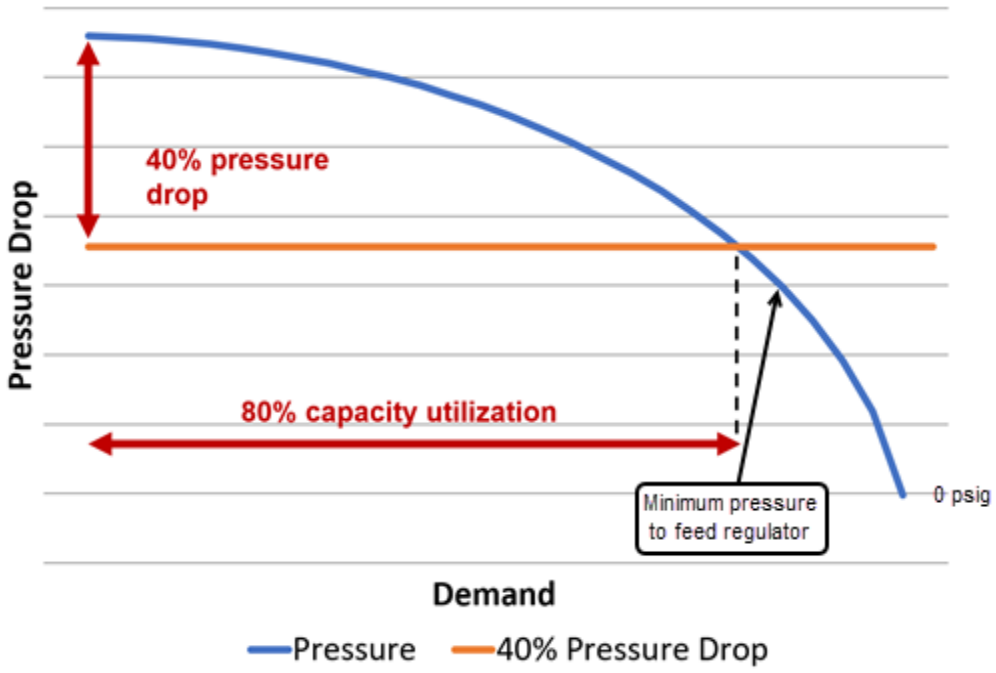
Figure 2. Pressure Loss Illustration



Q. How accurate is the Company's system modeling using CMM?

A. Models provide a good representation of expected system pressures during peak cold weather events, and the Company has utilized EPPRs to help field calibrate system modeling to make the system models as accurate as possible. CMM modeling is an improvement on the Company's previous modeling capabilities, but models are not perfect at predicting real-world conditions and there are unmodeled factors that could lead to unplanned use of the remaining capacity in the 250 psig MAOP system during peak cold weather events, which could lead to a reduction in district regulator flow capacity and lead to increases in customer gas service outages. This is reinforced by the fact that CMM modeling in 2022, before collection of EPPR data during cold weather events in 2024 and 2025, was 10 psig higher than after collection of the EPPR data and adjustment to the CMM model. The CMM modeling results showed the

Company that the pressures in the 250 psig MAOP high pressure distribution system are not as robust as previously calculated based on previous system modeling programs, and demands on the 250 psig MAOP system have reached a point where a large number of firm demand customers could lose their gas service during a single or multi-day cold weather event.

Q. How is NW Natural incorporating equity into its modeling for the Vancouver Reinforcement Project?

A. NW Natural is incorporating equity into its modeling for the Vancouver Reinforcement Project by first determining which areas of the system need this project the most. As explained above, the Vancouver Reinforcement Project is especially needed for those areas in Figure 1 that are shaded red (i.e., areas of the system that peak cold weather modeling indicates would experience pressures between 0 and 10 psig). Next, NW Natural examined the census tracts where these areas were located. Specifically, NW Natural overlaid the areas shaded in red in Figure 1 with the number of low-income customers that it serves in each census tract. Figure 3 below shows this overlay with the darker areas having a higher distribution of low-income customers. Specifically, Figure 3 shows the modeling results for the 250 MAOP system, with the lowest pressures in the 250 MAOP system found in the central Vancouver area along E. 18th Street and Burton Road, which are also areas with a high percentage of low-income customers.

NW Natural

Figure 3 also shows that other areas of the system with low pressures during peak cold weather are in census tracts with differing income levels. Areas to the north of Minnehaha and along Highway 14, for instance, have fewer low-income customers.

NW Natural plans to incorporate the information from Figure 3 into both its near-term planning and its alternative analysis. In its near-term planning for the period before the Vancouver Reinforcement Project is complete, NW Natural will conduct geographically targeted demand response (GeoDR) outreach to customers in these lower-income census tracts so that these communities have the opportunity to take advantage of that program, along with additional energy efficiency efforts that can both help lower customers' bills and provide system benefits.

NW Natural will also incorporate equity as a factor in its alternatives analysis by examining the impact of each of the alternatives for the Vancouver Reinforcement Project on the communities the Company serves, with a special emphasis on those census tracts with a higher distribution of low-income customers. This analysis would involve the construction impacts, if any, of each option that is identified. It will also examine the community impacts of any non-pipeline alternatives (NPAs), such as the use of CNG or LNG trailers that could inject gas into the system during peak cold-weather events.

Q. Has the Company identified any options for the Vancouver Reinforcement Project?

A. Yes. Options are presented in Exh. DBK-SSJ-3, which is the summary of the Vancouver Reinforcement Project. The Company identified four potential options for the Vancouver Reinforcement Project. One alternative is a pipeline solution that would

construct approximately 2.5 miles of 12-inch gas main to reinforce a segment of 4-inch main near Lacamas Lake in the east Vancouver area. A second alternative is a non-pipeline alternative (NPA) that would uprate the operating pressure of the 250 psig MAOP high pressure distribution system to 300 psig MAOP, to increase the delivery capacity of the existing 250 psig MAOP pipeline network. A third alternative is an NPA that would inject gas from CNG or LNG trailers sited on a parcel of land in the east Vancouver area during peak cold weather events, as mentioned in the previous answer. A fourth alternative considered and ruled out was a demand response NPA. The CMM modeling revealed an immediate need for more gas supply, demand response or load reduction. The volume of gas supply reduction needed to avoid the project is approximately 4,500 therms/hour during a design cold weather event, which is equivalent to shedding the full load from an estimated 10,000 to 12,000 residential homes or demand response from about 24,000 to 38,000 residential customers.

Q. What is the status of the Vancouver Reinforcement Project?

A. The Vancouver Reinforcement Project is currently in the Assess Phase. The Company has identified pipeline and non-pipeline solutions for the Vancouver Reinforcement Project and is studying each of the alternatives. Once the studies are completed for each alternative, the Company will then prepare an alternatives analysis to identify the least cost alternative.

The Company will be hiring an engineering consultant to prepare a pipeline routing study with cost estimates for the pipeline solution in late 2025. In 2025, the Company has hired a consultant to prepare a CNG and LNG trucking study so the Company can determine the cost of service for developing and siting a CNG or LNG

fuel tank facility. This study will inform the Company about site infrastructure requirements and development costs for siting the CNG or LNG trailer each winter season, and will include the annual purchase and delivery of the trailers full of CNG or LNG fuel.

In late 2025, the Company will prepare an engineering study to determine the estimated cost to uprate the 250 psig MAOP high pressure distribution system to 300 psig MAOP. For the uprate option, the Company would need to seek a waiver from Commission regulation WAC 480-93-155(f), as the uprate to 300 psig MAOP would produce a hoop stress greater than 20 percent for some of the pipe segments in the 250 psig MAOP high pressure distribution system, and the Company does not possess the original welding standards and welder records otherwise required by WAC 480-93-155(f). To reduce the risk of outages in the distribution capacity constrained areas before the reinforcement project is completed by the end of 2028, the Company will pursue a geographically targeted demand response (GeoDR) effort from 2026 to 2028 along with the energy efficiency effort as already planned by Energy Trust for the same period. The GeoDR effort will include: a) elevating the marketing effort for the existing Bring Your Own Thermostat ("BYOT") program by providing enrollment and participation incentives higher than the system-wide BYOT program; and b) scoping and implementing a large commercial and industrial customer behavioral demand response program with performance-based incentives comparable to those paid to the BYOT DR residential and small commercial customers in the area in terms of dollars per therm of peak hour load reduced.

Q. What is the timing of the Vancouver Reinforcement Project?

A. The Company expects to complete the Vancouver Reinforcement Project by December 2028 (Rate Year 3). In the current Assess Phase, the Company also is evaluating whether the various alternatives can be on a timeline for completion in 2027, given the low pressures that are currently being recorded during cold weather events on the system. Permitting for the project will likely be the biggest obstacle to accelerating the timeline, and therefore, the Company has conservatively estimated 2028 for completion. Following the completion of the alternatives analysis for this project, NW Natural can provide updated information.

Q. What is the estimated total cost of the Vancouver Reinforcement Project?

A. The Company's preliminary estimate for the Vancouver Reinforcement Project is approximately $15.5 million.

2. Gate Station Improvement Projects

a. Camas Gate Station Rebuild Project

Q. Please describe the Camas Gate Station Rebuild Project.

A. The Camas Gate Station is a key custody transfer point in the Camas area, as it serves as a gate station between Williams Northwest Pipeline ("NWP") and NW Natural. At this station, gas is odorized and the pressure is reduced to deliver into the P04 Camas Transmission system. The scope of the project was a full modernization of Camas Gate Station, including the P04 inline inspection (ILI) launcher facility, replacement of the end-of-life odorizer with a new zero-emissions odorizer system, replacement of a bulk odorant storage tank with a modern tank that included full secondary containment, removal of a regulator building constructed in 1957 using asbestos-containing

materials, installation of custody-transfer grade check metering, and installation of a new, low-emissions, high-efficiency line heater system.

This project required a facility agreement with Williams NWP to utilize additional land to the east of the Company's approximately 1,500 square foot parcel to locate the gate station facilities. Due to the cost of the project exceeding $200,000 and the facility agreement with Williams NWP, NW Natural was required to take over regulation and overpressure protection at this station, which attributed to the bulk of the project's cost. The resulting project benefits customers by providing increased safety and protection from vehicle damages, modernization of the regulation facilities, reduction in emissions from odorization and line heating, and increased metering accuracy.

Q. What is the status of the Camas Gate Station Rebuild Project?

A. The Camas Gate Station Rebuild Project was put into service in October 2023. The alternatives analysis supporting the Camas Gate Station Rebuild Project is provided as Exh. DBK-SSJ-4.

Q. What was the total cost of the Camas Gate Station Project?

A. The total cost of the Camas Gate Station Project was $3.9 million, but only the net book value of the asset at the time of the upcoming rate effective date is included for cost recovery in this case.

b. Camas Gate Station Building Improvements Project

Q. Please describe the Camas Gate Station Building Improvements Project.

A. Before the 2023 Camas Gate Station Rebuild Project, a regulator building which dated from the station's original construction in 1957 was installed to provide noise reduction

for the station regulator runs. During the Camas Gate Station Rebuild Project, this building was removed due to conflicts with the station construction and the asbestos materials present in the building construction. With installation of the new gas regulators, aerodynamic noise has been noted at this station and in the adjacent neighborhood, leading to customer inquiries and crew callouts.

In response to customer noise complaints, the Company installed temporary noise curtains at the station. The temporary noise curtains are not designed for permanent installation, and are susceptible to wind and deterioration due to exposure to the sun. The Camas Gate Station Building Improvements Project will install a new steel-frame, insulated metal building, similar in footprint and scale to the original 1957 building. This building will reduce noise pollution and prolong the life of the regulator station equipment. An advanced insulation system will provide noise attenuation to ensure compliance with state and local codes.

Q. What is the status of the Camas Gate Station Building Improvements Project?

A. The project is currently in the Execution Phase. The alternatives analysis supporting the Camas Gate Station Building Improvements Project is provided as Exh. DBK-SSJ-5.

Q. What is the expected timing of the Camas Gate Station Building Improvements Project?

A. The Company expects to complete the Camas Gate Station Building Improvements Project in September 2025 (Pro Forma Year).

Q. What is the estimated total cost of the Camas Gate Station Building Improvements Project?

A. The Company's estimate for the Camas Gate Station Building Improvements Project is $1.3 million.

c. Deer Island Gate Station Improvements Project

Q. Please describe the Deer Island Gate Station Improvements Project.

A. The Deer Island Gate Station is a custody transfer station where gas from Williams NWP is delivered to the Company's system. The station delivers odorized gas to customers and Mist storage. As described later in our testimony, Mist storage benefits the Company's customers both in Oregon and Washington. This project will replace end-of-life odorization equipment with new, zero-emissions systems. Due to equipment obsolescence, the existing regulator runs will be replaced and re-configured to limit crew call-outs and increase reliability. Finally, check metering and metering upgrades for three station meters will be installed to provide situational awareness to NW Natural's Gas Control and System Modeling teams and to increase measurement accuracy.

Q. What is the status of the Deer Island Gate Station Improvement Project?

A. This project has not reached intake status with the Project Management Office. The Deer Island Gate Station Improvements Project is identified in the Company's 2025 Gate and Regional Stations 10-Year Plan, provided as Exh. DBK-SSJ-6.

Q. What is the expected timing for the Deer Island Gate Station Improvements Project?

A. The Company expects to complete the Deer Island Gate Station Improvements Project by October 2027, which would be classified as provisional capital in Rate Year 2.

Q. What is the preliminary total cost of the Deer Island Gate Station Improvements Project?

A. The Company's preliminary total cost of the Deer Island Gate Station Improvements Project is $0.6 million on a Washington-allocated basis. This is a preliminary estimate used for budgeting that relies on recent similar projects adjusted for inflation.

d. Felida Gate Station Rebuild Project

Q. Please describe the Felida Gate Station Rebuild Project.

A. The Felida Gate Station is a custody transfer station where gas from Williams NWP is delivered to customers in the Felida area. The station provides line heating, regulation, check metering and odorization for customers on the west side of the City of Vancouver. This project will replace an end-of-life injection pump odorizer with a new, zero-emissions odorizer system, and modernize the odorizer controls. To provide metering data to precisely measure odorant injection rates, the existing ultrasonic meter will be replaced with a modern, custody transfer grade meter. The new metering system will allow for finer control of odorization in warmer weather, and will improve measurement accuracy.

Q. What is the status of the Felida Gate Station Rebuild Project?

A. The Felida Gate Station Rebuild Project is identified in the Company's 2025 Gate and Regional Stations 10-Year Plan, provided as Exh. DBK-SSJ-6. This project has not reached intake status with the Project Management Office.

Q. What is the expected timing for the Felida Gate Station Rebuild Project?

A. The Company expects to complete the Felida Gate Station Rebuild Project by July 2028, which would be classified as provisional capital in Rate Year 2.

Q. What is the preliminary total cost of the Felida Gate Station Rebuild Project?

A. The Company's preliminary total cost of the Felida Gate Station Rebuild Project is $1.9 million. This is a preliminary estimate used for budgeting that relies on recent similar projects adjusted for inflation.

3. Metering and Line Heater Projects

a. West Vancouver Gate Metering Project

Q. Please describe the West Vancouver Gate Metering Project.

A. The West Vancouver Gate Station is a custody transfer gate station located in Clark County, northwest of downtown Vancouver. This station provides regulation, overpressure protection and odorization for gas deliveries from Williams NWP to the Vancouver area. This project consists of two phases. In the first phase, an end-of-life annubar-style meter will be replaced with a new ultrasonic meter. This meter is required to control the station's proportional-to-flow gas odorization system, and the existing meter is no longer supported by the manufacturer. A new meter will ensure reliability of the odorization system and the ability to maintain the meter in the future. In the second phase, a new low-emissions, high-efficiency line heater will be installed

to pre-heat gas deliveries prior to regulation. Due to the Joule-Thomson effect, gas is cooled when regulated to a lower pressure, and this cooling can result in low gas temperatures that can induce icing on downstream piping. At the West Vancouver Gate Station, icing has been noted on downstream piping, and this piping is at risk of frost heave, coating damage or mechanical damage due to ice accumulation.

The West Vancouver Gate Metering Project has been identified in the Company's 2025 Gate and Regional Station 10-Year Plan (Exh. DBK-SSJ-6). The Phase 2 West Vancouver Gate Line Heater Replacement Project is also shown to be completed in 2026 in the Company's 2025 Gate and Regional Station 10-year Plan, but the Company delayed the line heater project until 2027 due to resource constraints.

Q. What is the status of the West Vancouver Gate Metering Project?

A. Phase 1 of the West Vancouver Gate Metering Project is in the Intake phase with the Project Management Office. The Initial Project Charter for the Project Management Office is attached as Exh. DBK-SSJ-7. The project will be entering into the alternatives analysis phase and then the Plan Phase later in 2025. Phase 2, which is the installation of the line heater, will commence in 2026 as a separate, discrete project (West Vancouver Gate Line Heater Replacement Project) and has not yet reached the Intake status with the Project Management Office.

Q. What is the expected timing for the West Vancouver Gate Metering Project?

A. The Company expects to complete the West Vancouver Gate Metering Project in July 2026, which would be classified as Pro Forma capital in Rate Year 1. The Company expects to complete the West Vancouver Gate Meter Project Phase 2 (West Vancouver Gate Line Heater Replacement Project) in 2027.

Q. What is the estimated total cost of the West Vancouver Gate Metering Project?

A. The estimated total cost of the West Vancouver Gate Metering Project is $0.7 million.

b. Ridgefield Gate Line Heater Replacement Project and Battleground Gate Line Heater Replacement Project

Q. Please describe the Ridgefield Gate Line Heater Replacement Project and the Battleground Gate Line Heater Replacement Project.

A. The scope and timing of the Ridgefield Gate Line Heater Replacement Project and the Battleground Gate Line Heater Replacement Project are identical (they are just in different locations), so they are being discussed together. The Ridgefield Gate Station and the Battleground Gate Station are custody transfer gate stations where gas is delivered from Williams NWP to NW Natural in Clark County. Each station is responsible for gas regulation and overpressure protection. When natural gas is regulated from the higher pressure Williams NWP to NW Natural's high pressure distribution system, the temperature of the gas drops due to the Joule-Thomson effect. If the gas temperature drops below freezing, it can cause the surrounding piping and soil to freeze as well. Freezing and icing can result in equipment damage and frost heave. To ensure that the gas remains above freezing, it is pre-heated using a line heater prior to regulation. The line heaters installed at the Ridgefield and Battleground Gate Stations are glycol water bath type heaters, and over time have been determined to be undersized for their application due to flow demand through these gate stations. These projects will replace this equipment with new, high-efficiency, low-emissions vacuum boiler systems. These systems will add heating capacity and increase efficiency at the sites.

Q. What are the statuses of these projects?

A. The Ridgefield Gate Line Heater Replacement Project and the Battleground Gate Line Heater Replacement Project are identified in the Company's 2025 Gate and Regional Stations 10-Year Plan, provided as Exh. DBK-SSJ-6. These projects have not reached intake status with the Project Management Office.

Q. What is the expected timing for the Ridgefield Gate Line Heater Replacement Project and the Battleground Gate Line Heater Replacement Project?

A. The Company expects to complete the Ridgefield Gate Line Heater Replacement Project and the Battleground Gate Line Heater Replacement Project in August 2028, which would be classified as provisional capital in Rate Year 3.

Q. What is the preliminary total cost of the Ridgefield Gate Line Heater Replacement Project and the Battleground Gate Line Heater Replacement Project?

A. The preliminary total cost of the Ridgefield Gate Line Heater Replacement Project is $1.6 million. The preliminary total cost of the Battleground Gate Line Heater Replacement Project is $1.6 million. These are preliminary estimates used for budgeting that rely on recent similar projects adjusted for inflation.

4. West Vancouver Gate Odorant Depot Project

Q. Please describe the West Vancouver Gate Odorant Depot Project.

A. The Company purchases odorant in bulk shipments, usually consisting of a single trailer load that is shipped typically two to three times per year. The Company maintains 16 odorizer stations in Washington, which must be supplied with odorant to ensure proper odorization of gas. Due to supplier constraints and supplier equipment malfunctions, in January 2024 the Company had to utilize a backup odorant supplier to

transport a shipment when there was risk of running out of odorant in the Washington system and beyond. The West Vancouver Gate Station is a bulk odorant storage location, with a single 2,000-gallon bulk odorant storage tank, and a 120-gallon day tank used for day-to-day odorization. Company crews utilize the bulk storage tank to both supply the West Vancouver Gate Station and to fill other odorizers throughout the Company's service territory in Washington. This project will increase the capacity of the bulk odorant storage by adding a new, larger odorant tank at the West Vancouver Gate Station, to allow for local storage to provide risk mitigation for odorant shipment interruptions.

Q. What is the status of this project?

A. The project is identified in the Company's 2025 Gate and Regional Stations 10-Year Plan, provided as Exh. DBK-SSJ-6. This project has not reached intake status with the Project Management Office.

Q. What is the expected timing for the West Vancouver Gate Odorant Depot Project?

A. The Company expects to complete the West Vancouver Gate Odorant Depot Project in August 2027, which would be classified as provisional capital in Rate Year 2.

Q. What is the preliminary total cost of the West Vancouver Gate Odorant Depot Project?

A. The preliminary total cost of the West Vancouver Gate Odorant Depot Project is $1.2 million. This is a preliminary estimate used for budgeting that relies on recent similar projects adjusted for inflation.

5. Major Discrete Storage Facility Projects

a. Background of the Company's Storage Facilities

Q. Please identify the Company's storage facilities.

A. The Company has three storage facilities: Portland LNG, Newport LNG and Mist.

Q. Please describe the Company's Portland LNG facility.

A. The Portland LNG facility is a peak shaving facility located in Portland, Oregon and consists of a 600,000 dekatherms ("Dth") capacity storage tank, liquefaction facilities capable of processing about 2,150 Dth/day, and vaporization capacity of up to 133,920 Dth/day. This facility was constructed by Chicago Bridge and Iron and commissioned in 1969.

Q. Please describe the Company's Newport LNG facility.

A. The Newport LNG facility is a peak shaving facility located in Newport, Oregon and consists of a 1,000,000 Dth capacity storage tank, liquefaction facilities capable of processing about 5,500 Dth/day, and vaporization capacity of up to 100,000 Dth/day.[6] This facility was constructed by Chicago Bridge and Iron and commissioned in 1977.

Q. Please describe the Mist Storage Facility.

A. NW Natural's Mist Storage Facility, located in Mist, Oregon, began operations in 1989. It features a natural gas storage field consisting of seven different underground reservoirs, 21 injection/withdrawal wells, gathering lines, an operational hub called

[6] Because the Company's pipeline system limits Newport to serving the central coast and Salem market areas, the full 100,000 Dth/day vaporization rate is not achievable. Instead, 78,000 Dth/day is the effective limit on vaporization at Newport.

Miller Station,[7] and other related facilities. In all, the Mist Storage Facility is a 17.5 billion cubic feet ("Bcf") facility with 13.1 Bcf used to provide gas storage for core customers. We will provide much more detail about the Mist Storage Facility later in our testimony.

Q. Are the Company's storage facility projects allocated to both Washington and Oregon?

A. Yes. The Company allocates storage facility projects to both states. Gas acquisition, including both capacity and commodity costs, has historically been accomplished on a system basis, with customers in both states providing recovery of pipeline capacity and storage costs proportionally, even though gas from the storage facilities in Oregon is not physically deliverable to Washington. In that sense, storage is considered as a substitute for pipeline capacity, and the lower cost of storage as compared to pipeline demand is shared among the customers in both states.

Q. Please describe further how the storage facility projects affect the Company's Washington operations.

A. For its gas supply portfolio, NW Natural operates its three storage facilities in Oregon – Mist, Newport LNG, and Portland LNG – on an integrated basis with Washington. That is, gas supplies from those facilities work in tandem with supplies delivered by Willams NWP to serve the requirements of customers in Washington as well as in Oregon. For example, withdrawals from the Mist Storage Facility flow directly to

[7] Miller Station, with peak certificated injection and withdrawal capacities of 335 million standard cubic feet per day ("MMscfd") and 515 MMscfd, respectively, is the compressor station within the Mist Storage Facility that contains the operations and controls facility as well as the process equipment for conveying natural gas between the wells and utility pipelines, including the natural gas compression and dehydration systems.

Oregon customers in and around the Portland area, which in turn allows the Company to divert an equivalent volume of Williams NWP deliveries from interconnection points (gate stations) serving Oregon to gate stations serving Washington customers. Thus, while not physically connected or delivered to Washington, in this way, i.e., via displacement, Washington customers receive storage gas from the Company's storage facilities.

The gas supplies used to fill the three storage facilities come through Williams NWP and other upstream pipelines during the spring/summer/fall months when customer usage is low and the Company's agreements with Williams NWP are not fully utilized. Withdrawals from storage avoid the need for additional upstream pipeline capacity – and associated demand charges – during the winter months when customer usage is high. The costs of the Company's upstream pipeline agreements flow to Washington and Oregon customers through the purchased gas adjustment ("PGA") process. In the PGA, upstream pipeline demand charges are allocated between Washington and Oregon customers based on sales volumes. This allows the benefits created by storage through the reduction of upstream pipeline demand charges to flow to both states.

The treatment of storage on an integrated basis between Washington and Oregon is also reflected in the resource acquisition decisions determined in the Company's IRP process.

Q. Has the Commission approved or accepted the inclusion of the Company's storage facility projects in Washington rates?

A. Yes. The state allocation methodology has been in use since its first implementation in 2000 (UG-000073). The most recent application of the methodology was in the Company's 2021 rate case (UG-200994).

Q. How are the Company's storage facility projects allocated to Washington customers?

A. The Company's storage facility projects are allocated to Washington and Oregon customers on the basis of firm sales volumes. The Washington allocation factor for firm sales volumes is currently 10.97 percent. The Direct Testimony of Kyle T. Walker (Exh. KTW-1T) addresses the topic of allocation factors and their associated methodology.

b. Detailed Information About the Mist Storage Facility and the Natural Gas Market in the Pacific Northwest

Q. Please describe how the Mist Storage Facility operates, especially during the winter heating season and even more particularly during peak system demand.

A. The Mist Storage Facility's gas storage for core customers is about 14 percent of the gas the Company distributes through its gas sales in an average calendar year, and a higher percentage when focusing on just the winter months when the facility is actively withdrawing. The remaining 4.4 Bcf of the facility is not in customer rates and is currently contracted with other utilities, third-party marketers, and electric generators through the Company's interstate storage service ("ISS"); however, core customers have the right to recall this storage capacity on an as-needed incremental basis. Mist

recall is typically identified as the lowest reasonable cost option to serve customer needs in the IRP because NW Natural's core customers have the right to recall capacity increments at Mist at its depreciated net book value. The actual energy stored at the Mist Storage Facility depends on the energy content of the gas. In recent years, NW Natural has seen an uplift of between 6 percent to 9 percent with more energy-dense gas being shipped there on the pipeline system. This means the 17.5 Bcf Mist Storage Facility can store between 18.5 million Dth and 19.1 million Dth of natural gas. Figures 4 and 5 below are charts that outline the growth of the Mist Storage Facility over time and highlight its capacity and deliverability allocation between core customers (including recall capacity) and ISS.

Figure 4. Mist Storage Capacity

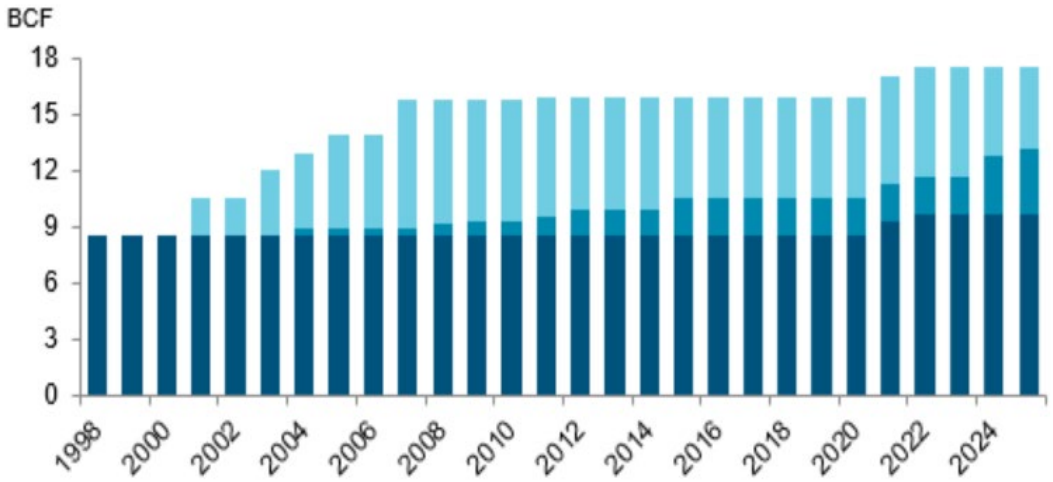

Figure 5. Mist Storage Deliverability

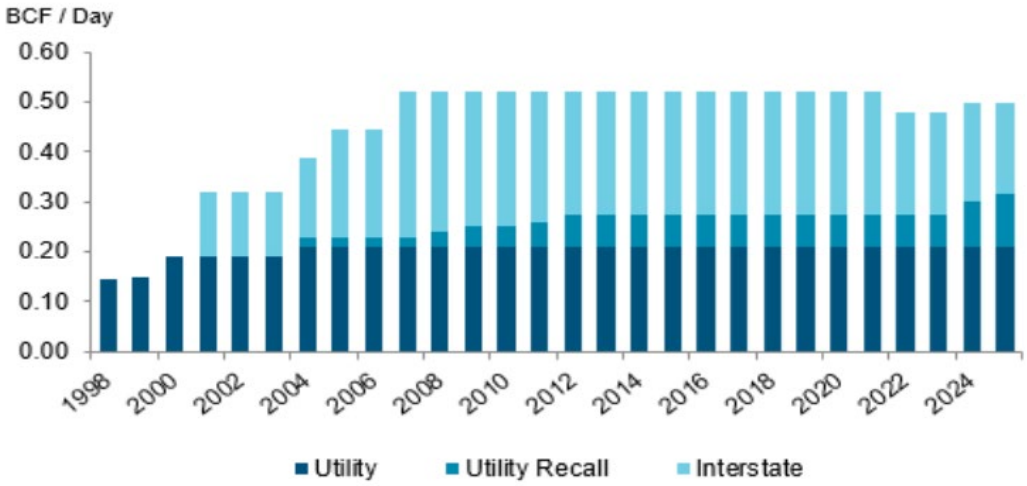

NW Natural's gas supply portfolio provides about 1 million Dth on a peak day. About one-third of this supply comes from the core utility service at the Mist Storage Facility. NW Natural's two LNG facilities contribute another 20 percent of that supply, bringing the total on-system supply to just over half of the Company's peak day. The Company's resource planning assumes all resources are available at their maximum output, so they need to be reliable. Utility peak day Mist Storage Facility supply of 340,000 Dth/day could serve over 460,000 average residential customers. The rest of the Mist Storage Facility, which is contracted through ISS, is also physically delivered onto the NW Natural system and those supplies could serve another 230,000 average residential customers.

Q. To what extent, if any, are upstream pipeline options available to replace the Company's reliance on the Mist Storage Facility?

A. NW Natural is connected exclusively to Williams NWP at all of its city gates. Williams NWP is fully subscribed, and no existing pipeline capacity is available to serve winter

season or peak day needs. In fact, the existing pipeline system has been strained past its design capacity during recent cold weather events. If NW Natural had to increase pipeline deliveries, it would need to participate in a pipeline expansion on Williams NWP. Such an expansion would require new pipe to be constructed either through the Columbia River Gorge or down the I-5 corridor between Canada and the NW Natural service territory. Pipeline capacity, while available 365 days a year, is not the best fit resource to satisfy the Company's needs that are currently met through use of the Mist Storage Facility. And when comparing the cost of such a pipeline expansion to costs of maintaining the Mist Storage Facility, the pipeline option would be orders of magnitude more expensive.

Figure 6 below is a map that shows the existing upstream pipeline and natural gas storage infrastructure in the Pacific Northwest.

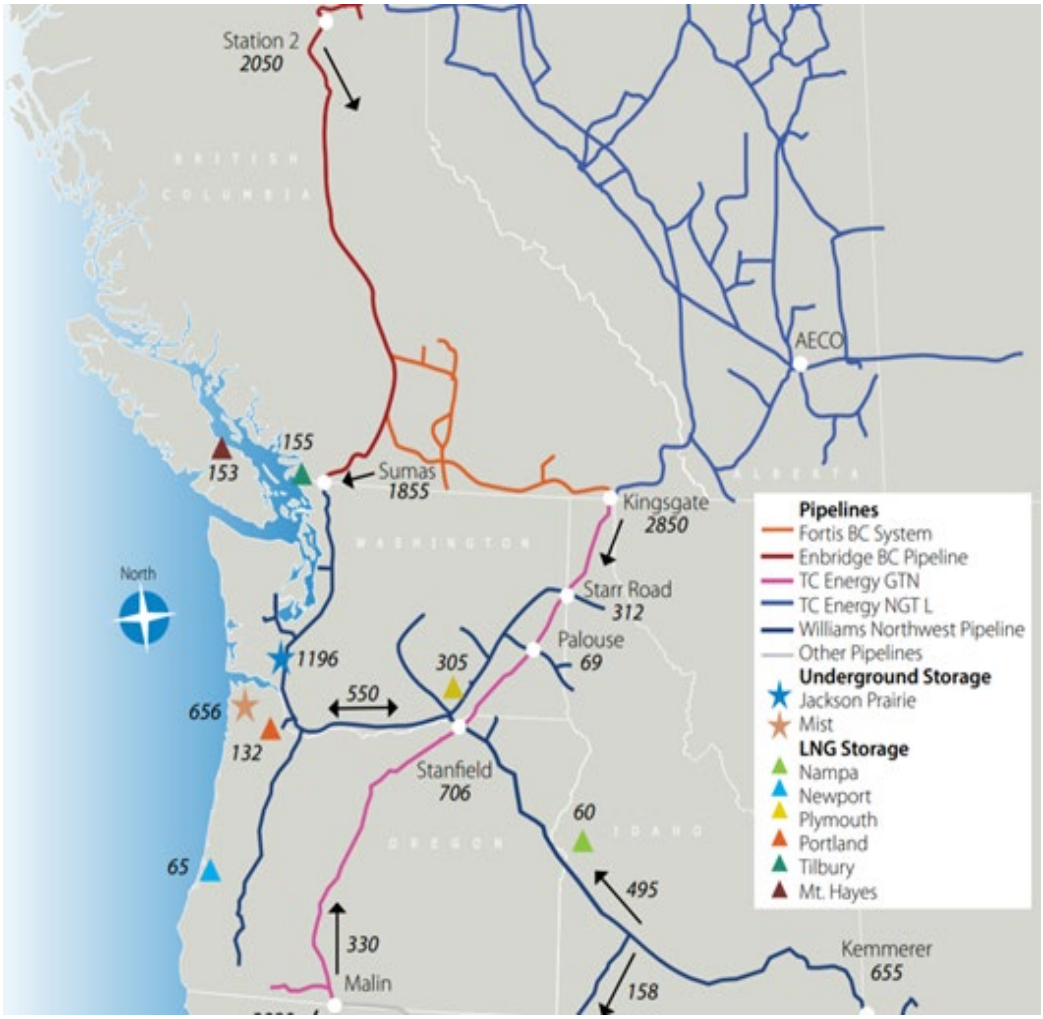
Figure 6. Pacific Northwest Interstate Pipeline and Storage Infrastructure



The Mist Storage Facility is designated as a tan star and noted as having 656,000 Dth/day of deliverability. This figure includes North Mist which is contracted exclusively to Portland General Electric. Williams NWP is shown in dark blue and runs down the I-5 corridor and through the Columbia River Gorge. The Woodfibre LNG facility is being constructed not far from the green triangle in southwestern British Columbia.

Q. How is the Woodfibre LNG facility expected to impact the gas market in the Pacific Northwest?

A. Pacific Northwest natural gas system infrastructure is highly utilized and operates past its design capacity on peak days. This system will become further constrained in 2027 when the Woodfibre LNG facility goes into service. Woodfibre is an LNG export terminal which is currently under construction in southern British Columbia and will liquefy 0.3 Bcf/day. Woodfibre LNG has already secured the pipeline capacity needed to supply the facility. This pipeline capacity is currently available in the broader market, but when the facility comes online it will be used solely by Woodfibre LNG. When the Woodfibre LNG facility comes online in 2027, it will have the impact of removing approximately 15 percent of the supply from the Sumas market.

Forward prices are up for the 2027-28 winter due to these fundamental market risks. An example of a similar energy constrained time period was in 2018, when the pipeline serving the Sumas market ruptured and flows from British Columbia were limited throughout the 2018/19 winter. Flows initially dropped by about one-third in November and December 2018, and then rebounded to a decrease of around 17 percent in January through March 2019. While the 2018/19 winter started out warmer than normal, February 2019 was quite cold and by early March 2019, regional storage was low and Sumas prices rose to approximately $200/Dth during a cold event.

The Company has seen growth in natural gas demand in the Pacific Northwest since 2018, and during this prior event certain industries shut down due to inadequate and/or prohibitively high-priced gas supplies. There is a chance the Company will see

demand destruction beginning in 2027 when the Woodfibre LNG facility comes online, especially if it is a cold winter.

Q. Is NW Natural doing anything with its gas supply portfolio to prepare for the expected impact of the Woodfibre LNG facility on the Pacific Northwest gas market?

A. Yes. At this time, NW Natural relies on 60,700 Dth/day of segmented pipeline capacity on Williams NWP as a peak day resource. Two things must happen for segmented capacity to be an effective resource. First, the path on Williams NWP cannot be constrained. Segmented capacity is not primary firm capacity, so constraints in the shipping path would not allow supplies to flow. Through analysis in its IRP, the Company notes that cold weather in the Pacific Northwest has historically caused pipeline dynamics that allow enough pipeline space for these supplies to flow. NW Natural is not expecting this dynamic to change when the Woodfibre LNG facility comes online in 2027.

Second, NW Natural needs to have sufficient liquidity in the Sumas spot (next day) market to purchase the 60,700 Dth/day of supplies. The Sumas market is already tight, and it can be difficult to procure this volume of supply in the current environment. When the Woodfibre LNG facility comes online, the Company expects liquidity to deteriorate past the level it would be comfortable relying on making purchases for a peak day.

Accordingly, NW Natural is planning to cease peak day reliance on segmented pipeline capacity when the Woodfibre LNG facility comes online in 2027. As a result, the Company's IRP currently indicates the need to recall Mist capacity in place of this

segmented capacity resource. A Mist recall of 60,000 Dth/day would shift this deliverability (and the related capacity) from NW Natural's ISS customers to its core customers. Assuming no other recalls in the interim, this would increase the core customer Mist Storage Facility portfolio from 340,000 Dth/day of deliverability to 400,000 Dth/day. In percentage terms, this would shift about 6 percent of NW Natural's peak day supply from pipeline resources to the Mist Storage Facility, thereby increasing the Company's reliance on the Mist Storage Facility to almost 40 percent of its portfolio on a peak day.

Q. Are there any other LNG export projects that could impact gas supplies in the West?

A. Yes. Construction is approximately 85 percent complete on the Costa Azul LNG facility, which is another LNG export facility on the West Coast. The Costa Azul LNG facility is located in Baja California, Mexico and will liquefy 0.4 Bcf/day in phase one which is expected to be in service in the summer of 2026. Phase two would add 1.6 Bcf/day, but it has not reached final investment decision. An outage on the El Paso pipeline in 2022/23 decreased flows into California and that, plus cold weather, drove prices up to approximately $50/Dth in the West. The Costa Azul LNG facility could have a similar impact. Figure 7 below is a map showing how Costa Azul LNG connects to the natural gas system in the Southwest.

Figure 7. Costa Azul LNG and Southwest Regional Pipelines

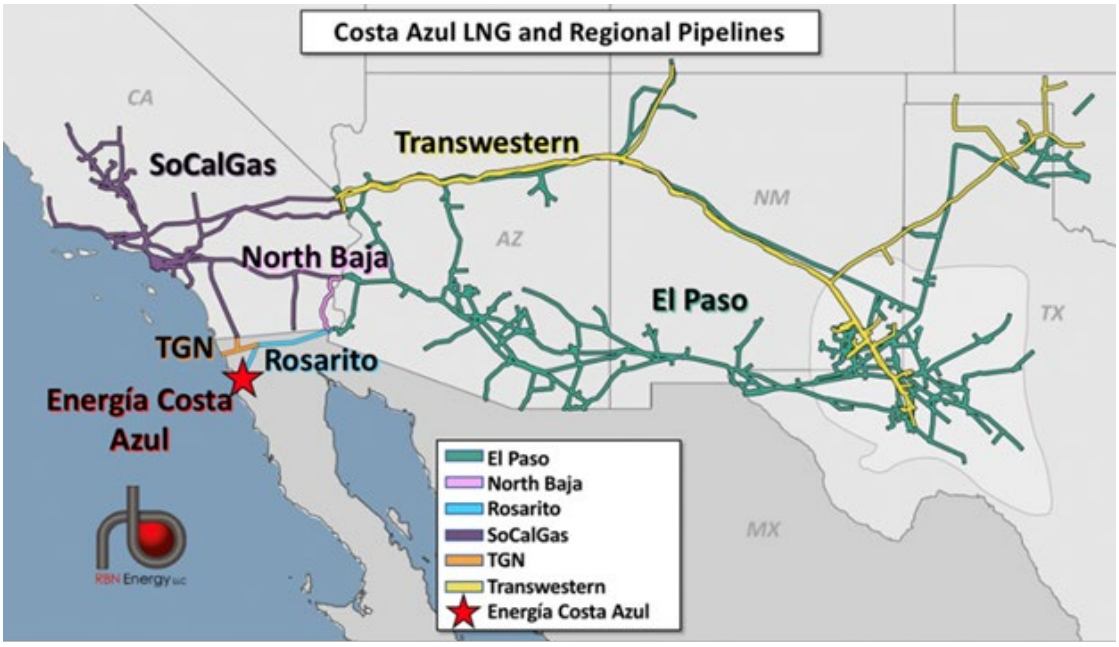


Figure 8 below is a spot market price map from December 9, 2022, that shows the impact of constrained infrastructure due to the outage on El Paso pipeline in 2022/23 in the West.

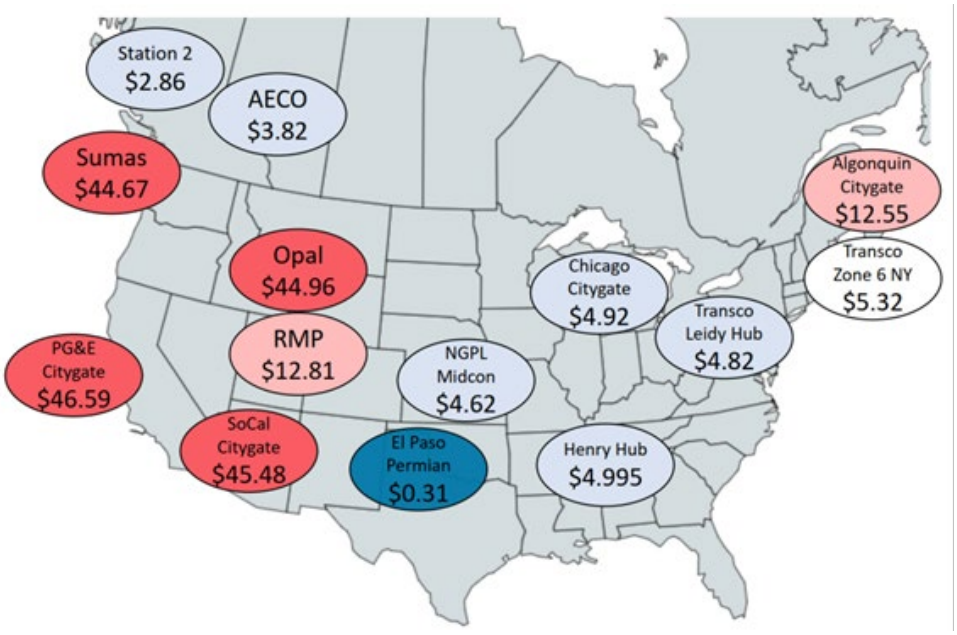
Figure 8. Spot Market Price Map December 9, 2022



Pricing in markets that NW Natural participates in, such as Sumas and Opal, are directly impacted by regional markets in California, while abundant gas supplies in Canada cannot be accessed in adequate quantities due to existing pipeline constraints.

c. Mist Projects

i. *Mist GC500 Turbine Compressor Replacement Project and Mist GC600 Turbine Compressor Replacement Project*

Q. Has the Company studied the Mist Storage Facility to identify areas of concern and needed improvements?

A. Yes. In June 2016, the Company completed an engineering facility assessment of the Mist Storage Facility ("2016 Mist Storage Facility Assessment") and identified a number of needed improvements to the facility to improve site reliability, resulting in the Mist Reliability Program.[8] The Company also completed a study of the compressor units in June 2020 ("2020 AECOM Compressor Study")[9] and a focused turbine compressor study in December 2022 ("2022 Burns and McDonnell Turbine Compressor Study" or "2022 Turbine Compressor Study").[10]

Q. Please describe the GC500 and GC600 compressor units at Miller Station of the Mist Storage Facility.

A. The GC500 unit (5,500 horsepower ("hp")) and GC600 unit (7,200 hp), installed in 1998 and 2001-2002, respectively, perform the bulk of the compressive work for withdrawal and injection activities when they are available for operation. Although

[8] Confidential Exhibit DBK-SSJ-8C is the 2016 Mist Storage Facility Assessment.

[9] Confidential Exhibit DBK-SSJ-9C is the 2020 AECOM Compressor Study.

[10] Confidential Exhibit DBK-SSJ-10C is the 2022 Burns and McDonnell Turbine Compressor Study.

each turbine compressor unit has the same three major components (i.e., a gas generator, a power turbine and a centrifugal compressor), they are not identical and have different operational strengths. The GC600 unit is more effective operating in lower compression ratios, such as early in the withdrawal season when gas reservoir pressures are higher. The GC600 unit also is used in connection with the Company's ISS; about one-third of its costs are allocated to core utility service and the other two-thirds of its costs are allocated to ISS. The GC500 unit is more effective operating in high compression ratios, such as later in the withdrawal season when the gas reservoir pressures are lower. The 2016 Mist Storage Facility Assessment recommended that the Company replace over a period of time the compressor units at Miller Station, which have exceeded their expected compressor core lifetime, in order to right-size the units for the facility's ongoing and future operations.

Q. How did the GC500 and GC600 compressor units perform after the Company completed the 2016 Mist Storage Facility Assessment?

A. The compressor units experienced multiple failures each year from the start of the 2018-2019 withdrawal season to present. The GC500 unit experienced several turbine engine failures, requiring complete removal of the unit for repair due to turbine blade fractures, oil leaks, gear failures and valve malfunctions, taking it out of operation for significant periods of time between Summer 2018 all the way up to the month prior to the planned GC500 unit's final decommissioning, where the unit experienced a power turbine failure. The GC600 unit experienced several turbine engine failures as well. A combustion chamber failure was found during an outage inspection in April 2019, resulting in a repair outage lasting 16 months. In order to meet operational needs for

two heating seasons, a leased turbine from Fortis BC was obtained. Since then, the GC600 unit had to be taken out of operation several times to address cracked vanes, failed combustion air seals, bleed valve failures, and oil leaks. Additionally, an ongoing problem with the acoustic-vibration harmonic response characteristics of the combustion chamber has plagued the small fleet of KC7 units, which is the GC600 unit's turbine engine model. These harmonics have resulted in field failures as soon as 10 days after returning to service, with a fleet outage of 67 percent.

Q. What caused those failures and outages?

A. The 2020 AECOM Compressor Study and the 2022 Burns and McDonnell Turbine Compressor Study found that the issues with the compressor units were caused by age, outdated and unsupported systems, mechanical fatigue, and non-ideal operation. The 2022 AECOM Compressor Study recommended modifying the GC500 turbine compressor and purchasing a GC600 turbine driver with upgrades to the latest service bulletins to be used as a cold spare. With three more years of operational experience with continued outages and reliance of the turbine compressor original equipment manufacturer ("OEM"), NW Natural became much more informed about the vulnerability associated with operating the existing turbine compressor units to supply storage gas to its customers. Based on that additional operational experience, the 2022 Turbine Compressor Study recommended replacing the end-of-life GC500 and GC600 turbines all together.

Q. Do you anticipate that the GC500 and GC600 turbine compressor units would continue to experience failures and outages without corrective action?

A. Yes. As both units have exceeded their useful life expectancy -- the GC500 unit currently has over 59,000 hours of operation and has been in service for over 27 years and the GC600 unit has over 48,700 hours of operation and has been in service for over 23 years – frequent failures and outages were expected to continue until corrective action was taken as many of the major core components are original and the OEM support for the two-shaft series turbine continues to diminish.

Q. What typically happens when the GC500 or GC600 units fail?

A. Failures commonly require the return of the turbine compressor core to the Maintenance Repair and Overhaul Center ("MROC") in Houston, Texas, consuming three to six months or more before it can be returned to service. The manufacturer, Siemens, does not offer any cores or core exchange program for the specific turbine configuration used at NW Natural, so during repair times there is no replacement compression at Miller Station. The absence of a core exchange program from Siemens became apparent in April 2019, when a combustion chamber failure was discovered resulting in a repair outage of 16 months. To ensure operational continuity for two heating seasons, NW Natural leased a turbine from Fortis BC. Siemens also does not carry substantial inventory to support the GC500 or GC600 turbine series. Parts are commonly made to order as needed, resulting in long lead times for parts and components. The make-to-order strategy can extend outages out past two years, as seen with other operators of the same series turbines found on NW Natural's GC500 and GC600 compressors. Due to the uniqueness of the GC500 and GC600 and make-

to-order strategy, an existing supply chain does not exist. In response to the poor OEM support, NW Natural in 2024 acquired two cold spares detailed further in this testimony.

Q. As a result of those continuing failures and outages, did the Company reevaluate and update the 2020 AECOM Compressor Study?

A. Yes. In December 2022, the Company completed the 2022 Turbine Compressor Study. Through the 2022 Turbine Compressor Study, NW Natural became much more informed about the vulnerability of operating the existing turbine compressor units to supply storage gas to its customers. As a result of the 2022 Turbine Compressor Study, the Company implemented the Mist GC500 Turbine Compressor Cold Spare Project and the Mist GC600 Turbine Compressor Cold Spare Project.

Q. Please describe the Mist GC500 and GC600 Turbine Compressors Cold Spare Projects.

A. The Company completed the Mist GC500 and GC600 Turbine Compressors Cold Spare Projects in 2024. Through those projects, the Company acquired a gas generator, a power turbine and standby spare parts from Siemens for each of the GC500 and GC600 turbine compressor units. The gas generator and power turbine operate at extreme conditions, such as high temperatures and speeds, which make those two components most at risk of major downtime. Acquiring these critical cold standby spares has mitigated the risk of prolonged outages down to less than a month (from a previous average downtime of three to six months) and has improved resiliency at Miller Station. It has been the most cost-effective and viable option for the most recent and upcoming winter seasons. Because many of the components are not new and

consist of multiple used out-of-service turbine packages to assemble a single serviceable cold spare, the acquisition of spare compressor components is a short-term, risk mitigation plan to extend the life of the GC500 and GC600 compressor units until the Mist GC500 and GC600 Turbine Compressors Replacement Projects are completed.

Q. Are the Mist GC500 and GC600 Turbine Compressors Cold Spare Projects a long-term solution for reliability at the Mist Storage Facility?

A. No. The Mist GC500 and GC600 Turbine Compressors Cold Spare Projects are necessary to ensure the immediate reliability of Mist only for the near term. This is evident as operational issues persist even with the GC500 and GC600 cold spares. For example, during an outage in Spring 2024, damage was found on the GC500 unit's gas generator that exceeded operating limits. Continued operation of the GC500 unit would have resulted in significant damage to the turbine end. Additionally at this time, it was identified that the GC600 unit was due for an overhaul of the cold section of its gas generator. Due to the historical frequency and lengthy outages of the GC500 unit, the utilization of the GC600 unit had increased significantly. With these discoveries during the Spring 2024 outage, the GC500 and GC600 units had their gas generator cold spares installed to allow operations to continue into the injection season. Without these cold spares, 82 percent of the compression horsepower would not have been available at the start of the injection season.

Within the first half of the injection season, the removed original GC500 gas generator was field-repaired, and the removed original GC600 gas generator was sent

to the MROC for an overhaul. In the latter half of the injection season, both gas generator cold spares installed during the Spring 2024 outage also experienced failures.

The cold spare GC500 unit failed in August 2024, but the repaired original GC500 gas generator was then available and reinstalled, enabling operations to complete the injection season. Although the GC600 unit was operational at this time, it is a high-flow, low-compression-ratio compressor and was not ideal for operation.

The cold spare GC600 unit was found to have failures during an outage in October 2024, as substantial damage was discovered in the combustion section of the cold spare GC600 unit's gas generator. The original GC600 gas generator removed in the Spring 2024 outage and sent for overhaul was still undergoing rework. To return the GC600 unit to service quickly, parts were taken from the original GC600 gas generator undergoing overhaul to field-repair the cold spare gas generator that is currently installed.

With continued operational failures, the Mist GC500 and GC600 Turbine Compressors Cold Spare Projects do not address the long-term viability of the GC500 and GC600 units. Namely, complete overall compressor skids have exceeded their operational lives, and failures and outages have already occurred and continue to occur. The existing turbine compressors are not supported by the OEM and there are several core components that are no longer able to be sourced globally even with the OEM's support.

Q. Has NW Natural's service territory recently experienced severe winter weather that highlights the importance of reliable operations at the Mist Storage Facility?

A. Yes. In mid-January 2024, NW Natural's service territory experienced severe winter weather, highlighting the importance of reliable operations at the Mist Storage Facility. On January 13, 2024, as temperatures dropped to 15°F in the Vancouver-Portland metro area, NW Natural delivered 9 million therms of natural gas to homes and businesses throughout its service territory, virtually matching its previous record set in December 2022 for a single gas day, and approximately doubling its average daily winter send out. NW Natural delivered approximately 8 million therms of natural gas for each of the following three days. In addition to matching a single gas day delivery record and sustaining high volumes of natural gas delivery to its customers, NW Natural also broke previous Mist Storage Facility send out records for five consecutive days and delivered over 4.5 million therms (421 MMscfd) of stored natural gas on January 13, 2024. During these types of cold weather events, the importance of the Mist Storage Facility cannot be overstated. It is absolutely crucial to ensuring that NW Natural can provide safe and reliable service to its customers throughout the winter months.

Q. What would be the impact on NW Natural customers if the GC500 unit or GC600 unit were to fail during such cold weather events?

A. During cold weather events, such as those the Company experienced in January 2024, NW Natural has estimated that the loss of the GC500 unit or GC600 unit would lead to a loss of gas service to approximately 200,000 customers (25 percent of its current customer count). Once NW Natural loses gas pressure to a customer, gas restoration

is a three-step process, with the third step of restoration only possible when system gas pressure is assured. The January 2024 cold weather would have caused repeated, daily low-pressure outages in the Company's distribution system and loss of service due to lack of pressure. It is estimated that the recent, January 2024 cold weather would have prohibited the start of service restoration for six days, should NW Natural have experienced failure of the GC500 unit or the GC600 unit at the beginning of the recent cold weather that the Company experienced.

The estimated time and resources required to complete service restoration for 200,000 customers, once weather warmed and system pressures were stabilized, is beyond any scale the Company has experienced. For reference, NW Natural has recent experience resourcing a smaller system outage. In that situation, after a Williams NWP gate station was damaged by a motor vehicle in White Salmon, Washington in December 2020, NW Natural lost service to nearly 5,600 customers in White Salmon and in Hood River and Odell, Oregon, and the restoration process took nearly one week with the mutual assistance of staff from neighboring utilities.

Q. Do the Mist GC500 and GC600 Turbine Compressors Replacement Projects address the long-term viability of the GC500 and GC600 units?

A. Yes.

Q. Please describe the Mist GC500 and GC600 Turbine Compressors Replacement Projects.

A. NW Natural is replacing the existing GC500 and GC600 compressors with two new turbine compressors with an established and active supply chain, with parts readily available to support the operational needs of NW Natural and the needs of its

customers. Removal of the existing GC500 and GC600 compressors also requires removal of their existing foundation, associated oil coolers, lube oil systems, gas coolers, gas scrubbers, piping and valves, intake filters, exhaust silencers, fuel gas filter, regulation and measurement equipment, electrical distribution and control panels and other associated items. As a replacement, NW Natural is installing a Solar Turbine ("Solar") Taurus 60 with two new turbine-driven compressors of approximately 15,400 brake horsepower ("BHP") (7,700 BHP each). The replacement work will include installing foundations for the new turbine/compressor packages, installing associated oil coolers, gas coolers, gas scrubbers, piping and valves, intake filters, exhaust silencers, electrical distribution and control panels, and other associated minor items.

NW Natural plans to replace the GC500 turbine compressor unit by October 2025 and the GC600 turbine compressor unit by December 2026. The Company will replace the GC500 unit first because it is the older unit and will use the GC600 unit to support injection operations during this time. During the next injection season (2026), the Company will replace the GC600 unit and will use the replacement GC500 unit to support operations during this time.

Q. Did the Company assess alternatives to the Mist GC500 and GC600 Turbine Compressors Replacement Projects?

A. Yes. The Company considered a variety of Solar turbine options; electric compression; and the 2020 AECOM Compressor Study's recommendation of modifying the GC500 turbine compressor package, installing the repaired original GC600 gas generator, and purchasing an identical GC600 gas generator with upgrades to the latest service bulletins to be used as a cold spare. The lack of available space for an expansion and

the wide range of operating pressures and flows drove careful consideration of each alternative. NW Natural immediately disqualified replacing the GC500 and/or GC600 with reciprocating compressors due to the lack of market availability of the needed unit size. The Company also disqualified using other turbine manufacturers such as Vericor, which offers lower horsepower one-off turbine packages that would have put the Company in the same predicament that it is trying to fix now, or Baker Hughes/GE, which offers well supported turbine package solutions in a much higher horsepower range that would have been oversized for NW Natural's needs.

Q. What Solar turbine options did the Company consider?

A. Solar originally suggested a Taurus 60 with a single compressor unit, but the maximum flow rate offered by a single compressor unit would have been below the flow rate required for multiple design cases and it would not have been able to achieve the necessary minimum flow rate.

The next option Solar turbine considered was a Taurus 70 with a singular compressor unit. The Taurus 70 solution faced similar constraints to that of the Taurus 60 when using a single compressor unit. Though the maximum flowrates could be met, it would have been oversized for the needed applications. Multiple minimum flow rate scenarios would not have been covered in the full range of design cases needed and would have required a new compressor building or an extension to the existing building.

Solar then proposed a tandem option using two compressors attached to a single gas turbine. This allowed the two compressors to operate in parallel or series, greatly

expanding the operational range to meet the full range of design case requirements. This became the selected option described above.

Q. Please explain why the Company did not select an electric compression option.

A. Although electric-driven compressors were evaluated as a potential option, it was not considered feasible for several reasons. First, any power outage would cause a complete shutdown of the units. Second, two power feeds from different sources would have likely been required to maintain power availability and reliability of the units during the peak seasons. Third, the cost of the electric driven compressor unit project at the needed size would have been comparable to the gas turbines. Fourth, to be able to maintain the electric driven compressor units running, a full-size back up power generator would have needed to be installed. Fifth, electric power rates in the area are some of the highest in the country.

Q. Why did the Company not select the 2020 AECOM Compressor Study recommendation of modifying the GC500 turbine compressor and purchasing a GC600 turbine driver with upgrades to the latest service bulletins to be used as a cold spare?

A. Simply stated, there were many notable disadvantages that far outweighed any interim and minimal improvement offered by the 2020 AECOM Compressor Study recommendation to replace the GC500 gas generator with a new Siemens SGT100 gas generator, rewheel the GC500 compressor for more efficiency and swap out the Fortis-owned gas generator of the GC600 unit with a NW Natural gas generator.

First, replacing the GC500's gas generator with a new Siemens SGT100 gas generator with the compressor rewheeled would have several long-term disadvantages.

Similar to the existing GC500's gas generator and overall package, a SGT100 gas generator installed in the GC500 package would be a one-of-a-kind solution. SGT100 gas generator fleets in the North/South American market do not exist. There are no field subject matter experts in the United States. SGT100 specific parts and cold spares do not have inventory in the North/South American market. Additionally, the rewheeling would not have any significant benefit to operations, the remainder of the skid would continue to be non-standard and supported poorly, and failure issues of auxiliary items would continue to occur.

Second, replacing the Fortis owned gas generator with the same newly repaired original NW Natural GC600 gas generator would have similar disadvantages to the SGT100 solution. This turbine compressor package is one of a kind, with only a few remaining units in operation in the world. NW Natural and the two other operators of this type of unit with the same model gas generator have had the same experiences with the lack of spare parts, reliability, support, and turnaround times of those units. The NW Natural gas generator for the GC600 unit has proven to be unreliable, and continued operations are unsustainable. Additionally, with the repeated failures of the GC500, the GC600 has been relied on more heavily. The GC600's run hours are approaching the same hours as the GC500. Based on the similarities of the two units and the track record of the GC500 unit, the same failures and reliability issues of the GC500 unit were expected and are being realized as the GC600 unit approaches the operating hours of the GC500 unit.

Third, the 2020 AECOM Compressor Study's recommendations rely on the existing turbine compressor vendor for support. The existing turbine compressor

vendor is a conglomeration of companies with no standards or asset management plan for legacy turbine compressor packages. This has proven to be a challenge for lifecycle support of the equipment, as every solution is a research and development exercise. This has led to more costly one-off experimental solutions and repeated failures to identify the true root cause corrective action.

Q. Please provide an overview and the status of the regulatory approval process before the Oregon Department of Energy's Energy Facility Siting Counsel ("EFSC").

A. On March 15, 2024, NW Natural filed an application with EFSC to amend the Company's current site certificate to allow for the replacement of the compressor units. Due to the need to complete this project as expeditiously as possible, NW Natural had already procured the GC500 compressor replacement and performed the final engineering in advance of site certificate approval. On August 15, 2024, EFSC issued a draft proposed order finding that NW Natural's application should be approved. A public comment period ensued through September 19, 2024, on which date EFSC held a public hearing. On November 21, 2024, EFSC issued a proposed order finding that NW Natural's application should be approved. On January 17, 2025, EFSC approved NW Natural's application to amend the Company's then-current site certificate to allow for the replacement of the entire GC500 and GC600 turbine compressor units.

Q. What is the status of the Mist GC500 and GC600 Turbine Compressors Replacement Projects?

A. The project is in the Execution phase. The alternatives analysis supporting the Mist GC500 and GC600 Turbine Compressors Replacement Projects is provided as Exh. DBK-SSJ-11.

Q. Do you have any additional updates on the status of the project?

A. Yes. The Company's Engineering, Procurement and Construction ("EPC") contractor began decommissioning, isolation and excavation activities early, on February 24, 2025, due to an unplanned GC500 failure. Currently, the GC500 unit and the balance of plant equipment has been decommissioned and removed from service. The GC700 unit, which is the new Solar turbine compressor replacing the GC500 unit, and the new balance of plant equipment have arrived at site and installation between the system and the integration to the existing facility is ongoing. Substantial completion of the GC700 unit is expected in early September 2025, with it being in-service and used and useful in early October 2025.

The GC600 unit is currently still in service and operational. Early procurement for the GC800 unit, which is the new Solar turbine compressor replacing the GC600 unit, is complete and is set to arrive on site in April 2026. The GC800 unit is expected to be installed, in service and used and useful by December 2026.

Q. What is the estimated total cost of the Mist GC500 and GC600 Turbine Compressors Replacement Projects?

A. The GC500 Replacement Project is a 100 percent utility asset. The total cost of the Mist GC500 Turbine Replacement Project (GC700) is expected to be approximately

\$6.6 million on a Washington-allocated basis. The GC600 Replacement Project (GC800) is currently a 33 percent utility asset. The total utility cost of the Mist GC600 Turbine Replacement Project is expected to be approximately \$1.6 million on a Washington-allocated basis.

ii. Mist Main Power Feed Replacement Project

Q. Please describe the Mist Main Power Feed Replacement Project.

A. Miller Station is currently fed from a substation with above-ground 12.5kV power lines that run along the highway to NW Natural's meter. From there, a NW Natural-owned 12.5kV power line is fed up to Miller Station. The conductors are end of life, use above-ground junction boxes, and have been damaged and repaired twice. For this project, the electric utility will construct a new substation located along the mainline near an existing electrical vault. The substation will connect Miller Station directly with the 115kV lines from Bonneville Power Administration, thus bypassing the 12.5kV lines that run along the highway. This work is being initiated and requested by NW Natural to improve reliability and resiliency of the Company's winter operations. The electric utility is requiring the Company to pay for this project.

Q. What is the status of the Mist Main Power Feed Replacement Project?

A. The Mist Main Power Feed Replacement Project is currently in the Assess phase with the Project Management Office. The Initial Project Charter is attached as Exh. DBK-SSJ-12. The Company is currently working on an alternatives analysis for this project.

Q. What is the timing of the Mist Main Power Feed Replacement Project?

A. The Company expects to complete the Mist Main Power Feed Replacement Project by October 2026, which would be moved into rates in Rate Year 2 because the Company is not seeking provisional capital in Rate Year 1.

Q. What is the estimated total cost of the Mist Main Power Feed Replacement Project?

A. The estimated total cost of the utility portion of the Mist Main Power Feed Replacement Project is approximately $0.5 million on a Washington-allocated basis.

iii. Mist Miller Bruer/Flora Gathering Separator Upgrades Project

Q. Please describe the Mist Miller Bruer/Flora Gathering Separator Upgrades Project.

A. At the inlet of Miller Station for the northern reservoirs—Flora, Bruer, and Meyer—four separators installed as early as 1988 were designed to remove free water, slugs, and particulates before gas enters the compression and dehydration systems. Over time, process conditions have changed, with increased liquid loading and higher flow rates leading to the existing separators becoming inadequate for current operating demands. As part of this project, the separators will be replaced with new separators that match the current process demands. This will ensure reliable operation and protect downstream equipment. Additionally, the scope includes replacing two end-of-life ultrasonic meters used for inventory and flow measurement, which are no longer supported by the OEM, do not meet NW Natural's metering accuracy requirements, and do not meet current industry best practices.

Q. What is the status of this project?

A. The Mist Miller Bruer/Flora Gathering Separator Upgrades Project is identified in the Company's 2025 Mist Gas Storage Facility 10-Year Plan, provided as Exh. DBK-SSJ-13. This project has not reached intake status with the Project Management Office.

Q. What is the timing of the Mist Miller Bruer/Flora Gathering Separator Upgrades Project?

A. The Company expects to complete the Mist Miller Bruer/Flora Gathering Separator Upgrades Project by August 2027, which would be classified as provisional capital in Rate Year 2.

Q. What is the preliminary total cost of the Mist Miller Bruer/Flora Gathering Separator Upgrades Project?

A. The preliminary total cost of the utility portion of the Mist Miller Bruer/Flora Gathering Separator Upgrades Project is approximately $0.4 million on a Washington-allocated basis.

iv. Mist Miller Bruer/Flora/Meyer Metering Upgrades Project

Q. Please describe the Mist Miller Bruer/Flora/Meyer Metering Upgrades Project.

A. The Mist Miller Bruer/Flora/Meyer Metering Upgrades Project involves the phased replacement of five ultrasonic meters and eight senior fitting orifice meters across the Bruer/Flora/Meyer wellpads due to end-of-life concerns. The existing ultrasonic meters are obsolete, no longer supported by the OEM, and do not meet NW Natural's metering accuracy requirements. Similarly, the eight Daniel Senior Orifice Fitting meters, located downstream of the wellhead separators, are several decades old with limited documentation and are showing signs of wear. The lack of traceability, aging

hardware, and observed degradation of the orifice meters warrant a full replacement. These replacements will ensure inventory accuracy and prevent the overflow of individual injection-withdrawal wells, leading to continued reliable and safe operations.

Q. What is the status of this project?

A. The Mist Miller Bruer/Flora/Meyer Metering Upgrades Project is identified in the Company's 2025 Mist Gas Storage Facility 10-Year Plan, provided as Exh. DBK-SSJ-13. This project has not reached intake status with the Project Management Office.

Q. What is the timing of the Mist Miller Bruer/Flora/Meyer Metering Upgrades Project?

A. The Company expects to complete the Mist Miller Bruer/Flora/Meyer Metering Upgrades Project by July 2027, which would be moved into rates in Rate Year 2 because the Company is not seeking provisional capital in Rate Year 1.

Q. What is the preliminary total cost of the Mist Miller Bruer/Flora/Meyer Metering Upgrades Project?

A. The preliminary total cost of the utility portion of the Mist Miller Bruer/Flora/Meyer Metering Upgrades Project is approximately $0.3 million on a Washington-allocated basis.

v. Mist Calvin Creek Gathering Separator Upgrades Project

Q. Please describe the Mist Calvin Creek Gathering Separator Upgrades Project.

A. At the inlet of Miller Station serving the southern reservoirs, no separators are currently installed to remove free water, slugs, and particulates before gas enters the compression and dehydration systems. Since the original installation, process conditions have

changed significantly, with increased liquid loading making the current configuration inadequate. In low-flow scenarios, free liquids can accumulate, and when flow increases, liquid slugging may occur, posing a risk of damage to upstream equipment. The Mist Calvin Creek Gathering Separator Upgrades Project addresses those risks by installing appropriate inlet separation to align with current operating conditions and protect downstream systems.

Q. What is the status of the Mist Calvin Creek Gathering Separator Upgrades Project?

A. The Mist Calvin Creek Gather Separator Upgrades Project is identified in the Company's 2025 Mist Gas Storage Facility 10-Year Plan, provided as Exh. DBK-SSJ-13. This project has not reached intake status with the Project Management Office.

Q. What is the timing of the Mist Calvin Creek Gathering Separator Upgrades Project?

A. The Company expects to complete the Mist Calvin Creek Gathering Separator Upgrades Project by October 2028 (Rate Year 3).

Q. What is the preliminary total cost of the Mist Calvin Creek Gathering Separator Upgrades Project?

A. The preliminary total cost of the utility portion of the Mist Calvin Creek Gathering Separator Upgrades Project is approximately $0.2 million on a Washington-allocated basis.

vi. Mist Miller Air Compressor and Receiver Tank Upgrades Project

Q. Please describe the Mist Miller Air Compressor and Receiver Tank Upgrades Project.

A. A compressed air usage study completed in 2024 confirmed that the current instrument air system can support existing emergency shutdown ("ESD") events and plant operations, but it lacks capacity for any future expansion beyond the Mist GC500 and GC600 Turbine Compressors Replacement Projects. Following the Mist GC500 and GC600 Turbine Compressors Replacement Projects, no margin will remain for additional equipment, valves or new air users. To address this limitation and ensure system reliability, especially during ESD events, this project will install a new air compressor system sized to accommodate both current and upcoming demands. A new air receiver will also be added to provide reserve capacity, enabling a full station ESD and safe transition during a power outage.

Q. What is the status of the Mist Miller Air Compressor and Receiver Tank Upgrades Project?

A. The Mist Miller Air Compressor and Receiver Tank Upgrades Project is identified in the Company's 2025 Mist Gas Storage Facility 10-Year Plan, provided as Exh. DBK-SSJ-13. This project has not reached intake status with the Project Management Office.

Q. What is the timing of the Mist Miller Air Compressor and Receiver Tank Upgrades Project?

A. The Company expects to complete the Mist Miller Air Compressor and Receiver Tank Upgrades Project by July 2027 (Rate Year 1).

Q. What is the preliminary total cost of the Mist Miller Air Compressor and Receiver Tank Upgrades Project?

A. The preliminary total cost of the Mist Miller Air Compressor and Receiver Tank Upgrades Project is approximately $0.2 million on a Washington-allocated basis.

d. Newport LNG Facility Projects

i. Newport LNG Pretreatment Improvements Project[11]

Q. Please describe the Newport LNG Pretreatment Improvements Project.

A. Following the completion of the Company's 2022 Newport LNG Pretreatment Regen Optimization Project, which coincided with the early planning phase of the Newport LNG Cold Box Replacement Project (discussed later in this testimony), the Company's engineering consultant recommended additional improvements to the pretreatment system prior to replacement of the Newport LNG Cold Box. The memorandum provided by consultant Sanborn, Head & Associates ("Sanborn Head"), dated May 5, 2023, is provided as confidential Exh. DBK-SSJ-14C.

The Newport LNG Cold Box Replacement Project was presented in the Company's 2018 IRP Update (UG-170911). Upon receipt of the recommendation to build more improvements to the Newport LNG pretreatment system, the Company updated the cost-of-service analysis for the Newport LNG Cold Box Replacement Project. The memorandum summarizing the updated cost of service analysis is provided as Exh. DBK-SSJ-15. The Newport LNG Pretreatment Improvements Project included two changes to the gas pretreatment system at the Newport LNG facility. The

[11] The Newport LNG Pretreatment Improvements Project previously was referred to as the Newport LNG Molecular Sieve Vessels Repair/Upgrade Project.

first change was a new thermal oxidizer system, in order to improve the efficiency of the existing regeneration gas system. The second change was the replacement of the molecular sieve media in the dehydration and carbon dioxide removal systems, as the molecular sieve was at end of life. In addition, small valve and piping changes were made to add safety features during the installation of the molecular sieve.

Q. What is the purpose of the Newport LNG Pretreatment Improvements Project?

A. As noted above, during the front-end engineering design phase of the Newport LNG Cold Box Replacement Project (discussed later in this testimony), the design contractor, Sanborn Head, recommended two modifications to the existing gas pretreatment system, prior to installing the new cold box. The recommendations were provided in a project memo, to ensure the quality of the natural gas being processed by the new cold box equipment was within the parameters of the new cold box. Ensuring the gas quality is within specifications reduces variability in contractor bids, reduces performance risk for the new cold box system, and allows the Company to secure a performance guarantee by the cold box vendor. The Newport LNG Pretreatment Improvements Project was designed to accomplish these recommendations by optimizing dehydration and carbon dioxide removal from the liquefaction gas stream. The pre-existing gas pretreatment system used a molecular sieve media to remove water and carbon dioxide from natural gas. That media had a finite lifetime and had to be replaced when it became no longer effective. This project replaced the media with new media that allows the system to perform to the specifications of the new cold box.

During liquefaction operations, the molecular sieve media also must be regenerated with high-temperature natural gas. The successful operation of the

regeneration system is a key concern in the design of the new cold box, as inadequate regeneration of the molecular sieve media would result in break-through of carbon dioxide or water, which would cause freezing and plugging in the new cold box. By installing the thermal oxidizer, the regeneration gas system increased flow through the gas pretreatment system, which enhances the regeneration capabilities. In addition, this system allows for regeneration of the media while the liquefaction process is offline, an ability that allows the plant to test systems, perform additional molecular sieve regeneration, and increase reliability without running the entire liquefaction process.

Q. What is the status of the Newport LNG Pretreatment Improvements Project?

A. The Newport LNG Pretreatment Improvements Project was completed in December 2024.

Q. What is the total cost of the Newport LNG Pretreatment Improvements Project?

A. The total cost of the Newport LNG Pretreatment Improvements Project was approximately $0.7 million on a Washington-allocated basis.

ii. Newport LNG Plant Supply Generator Project

Q. Please describe the current emergency generator configuration at the Newport LNG facility, and the need for emergency power.

A. A single 625kW natural gas standby generator is located at the Newport LNG facility. This generator is capable of powering the plant's critical electrical systems, safety systems and LNG tank boil-off compression during a power outage. During a power outage, the LNG tank pressure must be maintained below the maximum allowable operating pressure, which is accomplished using two boil-off compressor units that can be run using generator power. However, other systems, including the LNG

vaporization system, are unavailable when using emergency power due to the large electrical loads required by the LNG pumps and LNG vaporizers. During a power outage, the plant can safely stay in "holding mode," but is unable to deliver LNG gas from storage to customers in volumes larger than the tank boil-off, which is a minimal amount of supply. During a winter event in January 2024 when the Newport LNG facility should have been vaporizing LNG at maximum capacity to support customer loads, the facility experienced a multi-day power outage during which it stayed in "holding mode," and was not able to deliver storage gas.

Q. Please describe the Newport LNG Plant Supply Generator Project.

A. The Newport LNG Plant Supply Generator Project will evaluate several alternatives to provide backup electrical power, to allow the Newport LNG facility to operate the vaporization system during a power outage. Due to the large electrical loads required, it is expected that a new generator will be installed in parallel with the existing standby generator that is currently sized for the critical plant "holding" electrical loads. This project will install a new standby generator to supply power to the Newport LNG facility for the operation of vaporization equipment in the event of the loss of utility power. The ability to provide peak-shaving natural gas supply to utility customers, even when no utility power is available, will mitigate the higher costs otherwise paid by customers for spot gas supply to support the system during cold weather events.

Q. What is the status of this project?

A This project is in the Assess phase. The Initial Project Charter is included as Exh. DBK-SSJ-16. The Company is currently working on an alternatives analysis for this project.

Q. What is the timing of the Newport LNG Plant Supply Generator Project?

A. The Company expects to complete the Newport LNG Plant Supply Generator Project by December 2026, which will be included in rates in Rate Year 2.

Q. What is the estimated total cost of the Newport LNG Plant Supply Generator Project?

A. The total cost of the Newport LNG Plant Supply Generator Project is expected to be approximately $0.3 million on a Washington-allocated basis.

iii. Newport LNG Cold Box Replacement Project

Q. Please describe the purpose of the Newport LNG Cold Box.

A. The Newport LNG Cold Box is an essential component in the Newport LNG liquefaction plant, as it is where natural gas is cooled to cryogenic temperatures to convert the gas to liquid. Once liquefied, it is pumped from the Newport LNG Cold Box to the onsite insulated storage tank where it can later be used as wintertime peaking supply and also a source of supply for emergency situations and pipeline maintenance.

Q. What is the current status of the Newport LNG Cold Box?

A. The Cold Box at Newport LNG is more than 48 years old. This places it well past its nominal 25- to 30-year design life, and it is currently showing signs of its age through performance problems. In particular, contamination has fouled the interior of the heat exchangers, causing differential pressure in the system that is higher than design limits, reducing production capacity.

Q. Please describe the operation of the Newport LNG Cold Box leading up to its current performance problems.

A. While an initial consultant recommended replacing the Newport LNG Cold Box in a 2014 study, it was later determined the estimate they provided for the cost of replacement was drastically low. Additionally, in 2016 NW Natural installed a new pretreatment system to address high CO_2 in the supply of gas, which was making it through the liquefier and into the LNG tank. The new pretreatment process dramatically improved the quality of gas entering the Newport LNG Cold Box. However, the original pretreatment design required additives such as methanol to be injected ahead of the Newport LNG Cold Box to absorb moisture. The methanol was then removed after liquefaction. Although that was no longer required with the new pretreatment process, without the additive, contaminants were able to easily foul the Newport LNG Cold Box causing increased differential pressure in the system and reducing production. Inspections to understand this issue revealed contaminants on the interior surfaces within the Newport LNG Cold Box heat exchangers, which compound flow restriction issues caused by poor gas quality entering the system. The differential pressure is higher than design allows in the first two exchangers within the Newport LNG Cold Box. This is believed to be due to several issues, including internal contamination upon inspection. The Newport LNG Cold Box itself is not the only contributor to operational issues, as higher levels of heavy hydrocarbons are contained within the gas stream than were present at the time of the original design of the facility. Heavier hydrocarbons tend to freeze at higher temperatures and can create blockages

in the system, which also contribute to higher operating pressures within the Newport LNG Cold Box.

Q. Please describe the Newport LNG Cold Box Replacement Project.

A. The Company is replacing the Newport LNG Cold Box at the Newport LNG facility. NW Natural presented the Newport LNG Cold Box Replacement Project on pages 29-37 of its 2018 IRP Update filed in docket UG-170911 on March 1, 2021 (Exh. DBK-SSJ-17), documented its exemption from completing the alternatives analysis form in August 2022 (Exh. DBK-SSJ-18) and provided further update and analysis in a Company Memorandum dated September 13, 2023 (Exh. DBK-SSJ-15).

Q. Why is the Newport LNG Cold Box Replacement Project necessary?

A. The Newport LNG Cold Box Replacement Project is necessary to be able to continue to rely upon Newport LNG as a firm resource to serve NW Natural's current needs. Should the Newport LNG Cold Box fail, the ramifications to the plant would be significant. A replacement unit would require approximately two years to install. Repairs to this type of equipment can be very costly or even impractical. If a failure were to occur at the beginning of the production season, this would leave the facility without a reasonable means to refill the storage tank. As a result, all remaining LNG may boil off prior to equipment replacement (depending on the tank level at the time of failure), which in turn, would allow the large LNG tank to warm significantly, inducing stress on the tank due to thermal expansion. Customers would also be left

without the benefit of backup storage to support periods of peak demand during cold weather or other supply constraints.

Q. Did NW Natural assess alternatives to the Newport LNG Cold Box Replacement Project in its 2018 IRP Update?

A. Yes. The Company assessed two alternatives: (A) Contract with Williams NWP for additional pipeline capacity from Sumas south to city gates on Williams NWP's Grants Pass Lateral ("Alternative A"); and (B) Construct a 25-mile-high pressure transmission facility between Newburg and the Central Coast Feeder coupled with additional Mist Recall ("Alternative B"). As stated in its 2018 IRP Update, the Company determined that even the lower end of the *annual* costs of Alternative A was higher than the *total* capital costs of the Newport LNG Cold Box Replacement Project. The Company also determined that the total cost of the Newport LNG Cold Box Replacement Project was *multiple times less than* Alternative B from the perspective of the present value of revenue requirement of portfolios over the planning horizon.

Q. Did the Commission accept the 2018 IRP Update filing that included the Newport LNG Cold Box Replacement Project?

A. Yes. The Commission, by letter dated March 31, 2021, accepted the Company's filing that included the Newport LNG Cold Box Replacement Project.

Q. What is the status of the project?

A. The project is currently in the Planning Phase.

Q. What is the timing of the Newport LNG Cold Box Replacement Project?

A. The Company currently expects to complete the Newport LNG Cold Box Replacement Project by April 2027, which will be included in rates in Rate Year 2. The Company

had expected to complete the project in October 2026, but recently discovered that the pretreatment media vessels suffered insulation failures, thus allowing carbon dioxide and moisture to bypass the treatment media. This bypass results in inlet feed gas composition that does not satisfy the performance criteria for the cold box design. To ensure the cold box performance remains as designed, the vessels will be re-insulated with a new liner system and insulation to prevent the gas bypass and correct the feed gas composition. This work is described in the next project below.

Q. What is the estimated total cost of the Newport LNG Cold Box Replacement Project?

A. The total cost of the Newport LNG Cold Box Replacement Project is expected to be approximately $4.5 million on a Washington-allocated basis.

iv. Newport LNG Molecular Sieve Vessels Repair and Upgrades Project

Q. Please describe the function of the Newport LNG Molecular Sieve Vessels.

A. The molecular sieve vessels are part of the gas pretreatment process and their function is to scrub out impurities such as water, CO_2, and gas odorants from the natural gas flow stream before the gas is cryogenically cooled by the cold box equipment for storage in the LNG plant storage tank. If these impurities are not removed prior to the gas liquefaction process, they risk fouling or freezing within the heat exchangers in the cold box and thus shutting down or damaging the liquefaction process.

Q. Please describe the Newport LNG Molecular Sieve Vessels Repair and Upgrades Project.

A. The Company had experienced small amounts of CO_2 slipping by the molecular sieves for several years. After the vessels were emptied and new media installed in 2024, the CO_2 removal rate unexpectedly dropped and heat leakage through the insulated vessels to the outer shell of the vessels increased. The Company consulted owners' engineers and a consulting engineering firm, as well as a molecular sieve vendor, to perform a root cause analysis and develop a return to service plan. After inspecting the vessels, the Company was advised that the vessel internal insulation had failed, pulling back from the wall of the vessels and thereby allowing process gas to bypass contact with the molecular sieve media. To address this failure, the dehydration and CO_2 removal vessels need to be modified to repair the internal insulation failure and eliminate the ability for process gas to bypass the molecular sieve media. This project will remove the vessels from service, and a pressure vessel contractor will install internal steel liners and new insulation in the vessel. These modifications are designed to enhance the high-temperature regeneration performance and ensure that process gas cannot bypass the molecular sieve media.

Q. Did the Newport LNG Molecular Sieve Vessels Repair and Upgrades Project delay the schedule for the Newport LNG Cold Box Replacement Project discussed earlier in your testimony?

A. Yes. Due to the need to repair and upgrade the molecular sieve vessels, the Company informed the Newport LNG Cold Box Replacement Project contractor of the need to delay the replacement of the cold box by one year.

Q. Why was it necessary to delay the schedule for the Newport LNG Cold Box Replacement Project?

A. The Company was concerned that malfunctioning molecular sieve vessels could lead to the new cold box not performing as designed by the Company's EPC contractor, which could have voided the warranty of the new cold box equipment. As the Company is responsible for the process gas composition in the equipment warranty, if the process gas cannot be held within the specifications of the new cold box, the cold box vendor would be released from their equipment performance obligation.

Q. What is the status of the project?

A. The project is currently in the Planning Phase in the Project Management Office. The alternatives analysis supporting the Newport LNG Molecular Sieve Vessels Repair and Upgrades Project is provided as Exh. DBK-SSJ-19.

Q. What is the timing of the Newport LNG Molecular Sieve Vessels Repair and Upgrades Project?

A. The Company expects to complete the Newport LNG Molecular Sieve Vessels Repair and Upgrades Project by June 2026 (Proforma Period) for inclusion in rates in Rate Year 1.

Q. What is the estimated total cost of the Newport LNG Molecular Sieve Vessels Repair and Upgrades Project?

A. The total cost of the Newport LNG Molecular Sieve Vessels Repair and Upgrades Project is expected to be approximately $0.3 million on a Washington-allocated basis.

e. Portland LNG Facility Projects

i. Portland LNG Electrical Distribution Upgrades Project

Q. Please describe the function of the Portland LNG electrical distribution system.

A. The Portland LNG electrical distribution system consists of the electrical supply to the Portland LNG facility, including switchgear, circuit breakers, motor control center equipment and an electrical transformer. This system provides power to the plant from the electric utility to run critical motor loads, including boil-off compression to manage tank pressure, and the LNG pumps and vaporizers blowers, to deliver liquefied natural gas to the vaporization system for customer use.

Q. Please describe the Portland LNG Electrical Distribution Upgrades Project.

A. A third-party engineering load study found that operating both LNG pumps P-1 and P-2 and all three vaporizers (H-5, H-6 and H-7) simultaneously would result in a load of 1270A, which exceeds the Motor Control Center current rating of 1200A, risking a 480V electrical outage. The incoming switchgear that provides utility power is sized for 1000kVA, which is undersized for the full load condition. As a result, the Portland LNG facility is unable to run at full capacity, and vaporization capacity has been temporarily reduced from 133,920 Dth/day to 100,440 Dth/day. This project will update the 480V electrical distribution system at the Portland LNG facility, replacing the existing 1000kVA transformer and motor control center with a new 1500kVA transformer, manual transfer switch and incoming 480V switchgear. The new electrical infrastructure will allow the plant to return to its full vaporization capabilities of 133,920 Dth/day.

Q. Why is it necessary to complete the Portland LNG Electrical Distribution Upgrades Project prior to the completion of the Portland LNG Seismic Vulnerability Analysis?[12]

A. The reduction in vaporization capacity from 133,920 Dth/d to 100,440 Dth/day results in a reduction in total gas storage delivery capacity that would need to be balanced with the purchase of spot gas on days when the Portland LNG facility is required to vaporize to support the gas distribution system, if available. The cost of spot gas could potentially be much higher than the cost of LNG storage.

Q. What is the status of the project?

A. The project is currently in Planning Phase in the Project Management Office. The alternatives analysis supporting the Portland LNG Electrical Distribution Upgrades Project is provided as confidential Exh. DBK-SSJ-20C.

Q. What is the timing of the Portland LNG Electrical Distribution Upgrades Project?

A. The Company expects to complete the Portland LNG Electrical Distribution Upgrades Project by August 2026, which will be included in rates in Rate Year 2.

Q. What is the estimated total cost of the Portland LNG Electrical Distribution Upgrades Project?

A. The total cost of the Portland LNG Electrical Distribution Upgrades Project is expected to be approximately $0.3 million on a Washington-allocated basis.

[12] NW Natural submitted a Facility Seismic Vulnerability Assessment pursuant to OAR 340-300 for the Portland LNG facility to Oregon Department of Environmental Quality ("Oregon DEQ") on December 20, 2024. This study required an analysis of the plant, using current Codes and Standards, and a detailed geotechnical hazard analysis of the underlying soils and subsurface geology. As part of the plant analysis, the liquefaction system, which includes the cold box, was studied, along with the LNG tank, vaporization system and balance of the plant. The Assessment is currently under review by Oregon DEQ.

III. SAFETY-RELATED PROJECTS AND PROGRAMS

Q. Please describe the Company's Programmatic safety-related projects on its distribution system.

A. NW Natural manages several safety-related capital expenditures that are classified as Programmatic. NW Natural estimates for 2025 that it will invest approximately $18.8 million in capital to comply with PHMSA's TIMP, DIMP and other federal and state regulations.[13] For discussion in this testimony, significant projects and programs include:

- ILI Conversion Projects (including the discrete P04 Camas Trans ILI Project);
- Proactive EFV Installation Program; and
- Probabilistic Distribution Risk Model Project.

A. ILI Conversion Projects

Q. Please describe NW Natural's ILI Conversion Projects.

A. Federal regulation, 49 C.F.R. Part 192 Subpart O, requires natural gas operators to develop an integrity management program to assess natural gas transmission lines and address the threats to the natural gas transmission system. These assessment methods include but are not limited to: Inline Inspection (ILI), External Corrosion Direct Assessment ("ECDA"), or pressure testing. On balance, ILI represents the most complete assessment method to cover the largest number of threats. NW Natural has been proactively upgrading its transmission facilities based on risk to allow for increased use of ILI as the primary form of integrity assessment to address threats to

[13] The Company also expects to incur approximately $6.4 million of expenses to address and comply with DIMP, TIMP, damage prevention and public awareness.

the natural gas transmission system. For many of the Company's transmission pipelines, NW Natural will need to invest in pipeline facilities such as pipeline inspection gauges ("pig") launchers and receivers and removal of reduced port fittings that prevent passage of cleaning, sizing and inspection pigs for inline assessment. This is a one-time investment to upgrade these facilities to allow for inline inspection. Inline inspection tools have the advantage over direct assessment and pressure testing because they cover the largest number of threats to the transmission system and assess the entire pipeline segment, between the pig launcher and pig receiver, maintaining constant contact with the inner wall providing data allowing for the identification of interacting anomalies such as pipe deformation, corrosion, and manufacturing defects. As such, ILI is a more complete assessment of the pipeline, is able to detect more threats to the pipeline and provides a greater level of safety to the public as this assessment gives NW Natural a better view of the pipeline and the potential defects. Also, with the advancements in ILI technology, NW Natural is utilizing inspection tools that allow NW Natural a greater understanding of the material properties of the transmission pipeline system, which assures NW Natural that the transmission pipeline system is in alignment with original design records.

In contrast, ECDA is performed only in High Consequence Areas ("HCAs"), Moderate Consequence Areas ("MCAs") and identified sites, thus limiting the assessment to only certain sections of the pipeline. The threats identified by ECDA are limited to threats that are associated with coating damage. Therefore, ECDA assessment can miss defects such as third-party damage or natural forces damage where

the coating was not disturbed, and does not identify any threats outside of the HCAs, MCAs and identified sites.

Pressure testing is another method of assessment that can be utilized to comply with Code requirements for transmission line inspection. This methodology typically involves isolating a segment of transmission pipe and filling it with water to pressurize the pipe to 1.5 times the Maximum Allowable Operating Pressure (MAOP) to validate the integrity of the pipe. While this assessment method addresses most of the threats to the NW Natural transmission system, this assessment method is not preferred by NW Natural and other natural gas operators. The reason for this is that pressure testing requires a shutdown of the pipeline for an extended period resulting in a loss of supply for large number of customers.

NW Natural believes that its ILI conversion projects allow it to have a better understanding of the transmission pipeline system, which results in a safer and more reliable natural gas system.

Q. Can you provide an example showing the enhanced safety value of ILI conversion projects compared with ECDA?

A. Yes. In the past, the Company's S22 Albany to Corvallis ten-inch transmission pipeline in Oregon had been inspected by ECDA. In August 2024, the Company changed the ECDA assessment methodology to ILI for the approximately 12 miles of pipeline from the Albany Gate Station to the Corvallis Granger Regional Station, and then conducted an ILI inspection after that conversion. In September 2024, NW Natural received the preliminary report from the smart tool vendor stating the pipeline had five immediate anomalies (four dents with metal loss and one 77 percent metal loss anomaly). The

Company quickly mobilized crews to repair the anomalies within a few days, making that pipeline much safer than had been possible in the past with ECDA inspections.

Q. Which ILI Conversion Project are you addressing in your testimony?

A. In 2023, NW Natural changed the assessment methodology of the P04 Camas Transmission pipeline, which is the Company's only transmission main in Washington, from ECDA to ILI. Doing so required modifications to the pipeline that included installation of ILI facilities and replacement of fittings to allow for a successful ILI assessment. This project was included in the Company's 2023 ECDA to ILI Assessment 10-Year Plan, which is provided as Exh. DBK-SSJ-21. The alternatives analysis supporting the P04 Camas Trans ILI Project is provided as Exh. DBK-SSJ-22.

Q. Please describe the P04 Camas Trans ILI Project.

A. The P04 Camas Trans ILI Project changed the ECDA assessment methodology to ILI for this approximately 3.5 miles of the 8-inch transmission pipeline in Camas that starts at the Camas Gate Station and ends at NE Lake Road south of Lacamas Lake. The Company completed this project and placed it in service in October 2023, at a total cost of $4.9 million.

B. Proactive EFV Installation Program

Q. What are EFVs and how do they work?

A. An excess flow valve (EFV) is a device installed in a service line near the point of connection to the gas main. EFVs will "trip" and stop the flow of gas if there is a full line failure, such as a damaged or severed service line.

Q. Why is the installation of EFVs important to increase safety?

A. In the event of a damaged or severed service line, EFVs are effective in mitigating the escape of gas.

Q. How has NW Natural approached the installation of EFVs?

A. Consistent with federal pipeline safety requirements, NW Natural includes EFVs on all newly installed and fully replaced service lines to single family residences. In addition, the Company installs EFVs for multifamily residences and small commercial customers served by a single service line with a known customer load not exceeding 5,000 standard cubic feet/hour (50 therms/hour). To date, the Company has installed more than 56,000 EFVs on residential and commercial services in Washington. For customers with larger known loads, a shut-off valve, instead of an EFV, is installed on the service. Additionally, NW Natural provides notice to its customers of their right to request EFV installation, and they are currently installed at the requesting customer's cost. The Company provides this notice to customers via its website, annual safety notifications, and new customer welcome packets.

Q. Please describe the Company's program to proactively install EFVs on existing service lines.

A. Starting in 2020, as part of the Company's DIMP, NW Natural has been installing EFV retrofits on service lines based on the likelihood and potential consequence of damage. The 2025 DIMP is provided as Exhibit DBK-SSJ-23. Factors included in its analysis are population density, service pipe diameter, service material, business districts, and special buildings. In 2025, the Company expects to invest approximately $0.3 million

on a Washington-allocated basis, as part of the Company's DIMP budget on EFV retrofits in high consequence areas.

C. Probabilistic Distribution Risk Model Project

Q. What is a probabilistic risk model, and why is the Company undertaking this project for its distribution system?

A. A probabilistic risk model is a model that determines the probability of failure in the system and quantifies the consequences of a failure per threat. In 2023, NW Natural initiated a project to partner with a data analysis consultant, JANA, to implement a probabilistic risk model to assess NW Natural's distribution system. Probabilistic risk models have been identified by PHMSA as a best practice to proactively manage threats to the natural gas distribution system. A probabilistic risk model will allow the Company to rank threats, measure risk reduction with each threat mitigation, and determine the most cost-effective risk reduction actions. None of these benefits are available with the Company's current relativistic risk model. While this particular project is not a Programmatic capital expenditure, it is included here because this project is being pursued to strengthen the Company's analysis and forecasting for Programmatic distribution system capital expenditures. The confidential Direct Testimony of Brian E. Fellon (Exh. BEF-1CT) describes the Company's JANA Probabilistic Risk Model Project, provides its status, and quantifies its estimated cost.

IV. DISTRIBUTION SYSTEM AND GAS STORAGE PIPELINE SAFETY O&M EXPENSES

Q. Please describe the types of actions related to pipeline safety that the Company is required to perform each year as required by CFR 192.

A. The Company is required to comply with 49 C.F.R. 192 Subpart A, Subpart I, Subpart L, Subpart M and Subpart O to ensure distribution system pipeline safety and underground gas storage safety. The Company must take many actions to comply with these federal regulations. This testimony describes the non-payroll O&M expenses associated with some of these ongoing efforts related to pipeline safety, including gas facility locating and marking, leakage surveys, transmission pipeline assessments, and well integrity inspections.

Q. Please describe the Damage Prevention Program.

A. The Company is required by 49 C.F.R. Section 192.614 to carry out a written damage prevention program, which includes participation in a qualified one-call system that provides the pipeline operator (the Company) an opportunity to locate and mark its underground facilities in advance of excavation activities. The Company manages its Damage Prevention Program with Company personnel. The Company employs the services of a third-party contractor, Heath Consultants Incorporated ("Heath Consultants"), to provide locating and marking services to the Company.

Q. Please describe Right-of-Way Patrol and Leakage Survey Programs.

A. The Company is required by 49 C.F.R. 192 Subpart M to perform right-of-way patrols and leakage surveys for transmission and distribution system pipelines, services and above ground facilities at time intervals not to exceed the time limits specified in this

federal regulation. The Company performs right-of-way patrols and leakage surveys for its transmission system with Company personnel. The Company employs the services of a third-party contractor, Heath Consultants, to provide leakage surveys for the Company's distribution system mains and services.

Q. Please describe the Pipeline Inspection Integrity Program.

A. The Company is required by 49 C.F.R. 192 Subpart O to develop and maintain an integrity management program to address threats to the Company transmission pipeline system. The Company prioritizes the use of inline inspection (ILI) to assess the Company's 6-inch diameter through 24-inch diameter transmission pipe in the system. As noted above, inline inspection has proven to be a more complete assessment of the Company's transmission system and addresses the largest number of threats to the transmission system. Each year's inspections can vary by the transmission pipeline's diameter being inspected, the pipeline length being inspected, and the location of the pipeline such as in urban areas or rural areas. Each of these variables impacts the Company's transmission pipeline assessment vendor and internal labor costs. In summary, the Company's transmission assessment costs vary by year due to the variability in pipeline, size, length and location of pipeline to be assessed. The Company hires outside vendors to perform transmission pipeline assessments and Company crews will assist the inline inspection vendors with access to the Company's transmission pipelines.

Q. Please describe the Well Casing Inspection Program.

A. In December 2016, PHMSA published in the Federal Register an interim final rule that revised the federal pipeline safety regulations to address critical safety issues related to

downhole facilities, including wells, wellbore tubing, and casing, at underground natural gas storage facilities.

In accordance with 49 C.F.R. Section 192.12(d)(2), NW Natural initiated a rig-based casing inspection program in 2017 to satisfy the integrity management baseline risk assessment requirement. The current well-work schedule supports completing the baseline casing inspection program in 2025. The baseline casing inspection program work was capitalized and completed in 2024. Beginning in 2024, NW Natural began its first re-inspection program to perform re-assessments consistent with intervals established from the baseline casing inspection logs and updated risk analyses to satisfy the conditions of 49 CFR Section 192.12(d)(3). This reassessment work is an O&M expense. The expense each year is heavily dependent on the number of rig-based casing inspections being performed which can vary from every 5, 10 or 15 years based on the results of the individual well-risk assessments. Outside of the final baseline casing inspection in 2024, the Company performed zero rig-based interventions. In 2025, the Company will perform two rig-based interventions, and has planned two for 2026, three for 2027, one for 2028 and one for 2029.

Q. Where does the Company address the impact to O&M in this case related to these programs?

A. The confidential Direct Testimony of Tobin F. Davilla (Exh. TFD-1CT) quantifies the impact to O&M in this case related to the programs described above.

Q. Does this conclude your Direct Testimony?

A. Yes.

⊟ Basic History Update

Name	SE 1st St Grading Improvements Phase 2 – CO #1
ID	C-76610
CRI Status	Approved
CRI Priority	Medium
Description	**Project Name: SE 1st Street Grading Improvements Phase 2** **Project Overview:** The City of Vancouver initiated a public works project to improve SE 1st Street between SE 177th Ave and SE 192nd Ave. The scope includes full road reconstruction, widening, sidewalks, bike paths, and new water, storm, and sanitary utilities. NW Natural was required to relocate 3,700 feet of a 4" Class D main, replace it with a 12" Class D main per System Modeling, install 5,800 feet of Class B poly pipeline, and decommission one district regulator and three service regulators. The total approved budget for the project is $4,718,500, which includes a contingency of $708,000. The total actual cost of the project to date is $2,985,842. This change order requests the full use of the existing $708,000 contingency and an additional funding $1,794,605 to align the current authorized budget with the forecasted project costs. There are currently approximately $3.4 million in unpaid invoices. The estimated total cost of the project after the approval of this change order, will be $6,513,105 **Change Order Detail: ** During Construction, project encountered several unforeseen issues which significantly impacted the project's budget, schedule, and scope, resulting in a 34-day delay beyond the original 33-day timeline. Below is a summary of the issues, outlining their overall impact on the project. **1. Delays Due to City of Vancouver's GC, Colf Construction– $479,500** Location: SE 1st St between SE 177th Ave and SE 192nd Ave Colf Construction's grading delays slowed NW Natural's installation rate from 120 to 80 feet per day, extending the schedule by eight days resulting in added costs for labor, material, trucking, shoring and equipment. **2.Night work due to the delay by Colf Construction – $387,000** Location: SE 1st St between and SE 192nd Ave Colf Construction's delay in grading on SE 184th Ave forced NW Natural's contractor to shift to SE 192nd Ave, requiring night work per the city. Night work was not a part of the original city of Vancouver's permit requirements. This resulted in a six-day delay with added costs for labor, trucking, equipment, material imports, and shoring. **3.Delays Due to Slope Grading by Colf Construction – $202,700** Colf Construction's failure to complete slope grading far enough from NW Natural pipe alignment prevented NW Natural's contractor from safely excavating near the base of the slope, requiring the area to be stabilized and the excavation plan to be adjusted for safety. This resulted in a 4-day delay with added costs for labor, trucking, equipment, material, and shoring. **4.City Design Change for Water Line – $260,100** Location: SE 1st St between SE 177th Ave and SE 190th Ave The City of Vancouver revised water main depths without prior notice, resulting in NW Natural's contractor to have to install the 12" gas steel main deeper than planned. This adjustment delayed the project by four days, increasing costs for trucking, materials, shoring, labor, and equipment.

Target Date	12/13/2024
Type of Change Request Required	Will Be Tier 4 After CO:CO for Budget or >50% Cont

5.City's Plans Utility depth conflicts – $184,150
Location: SE 1st St between SE 177th Ave and SE 190th Ave
The City of Vancouver's design had conflicting utility depths that were not communicated to NW Natural prior to the start of construction. NW Natural's contractor had to temporarily halt trenching to resolve these conflicts. This resulted in a four-day delay with added costs for labor, equipment and shoring.

6.City Design Change to Stormwater Line – $124,950
Location: SE 1st St between SE 177th Ave and SE 190th Ave
The City of Vancouver's stormwater line was deeper than projected, requiring NW Natural's contractor to install a 45-degree offset at greater depth. This resulted in a three-day delay with added costs for trenching, material imports, and shoring.

7.Unmarked Power Conduit Strike – $45,830
Location: SE 1st St and SE 177th Ave
Clark Public Utilities (PUD) identified unmarked po wer conduits, prompting NW Natural's contractor to pothole and locate utilities. However, power utilities were not found. This was an inaccurate information from PUD. This resulted in a one-day delay, incurring additional labor and vacuum truck costs.

8.Fiber Optic Utility Strike – $42,800
Location: SE 1st St and SE 184th Ave
The City of Vancouver's as-built plans misrepresented fiber utility locations, resulting in an unintended strike. NW Natural's contractor installed an offset for proper clearance, causing a one-day delay with added co sts for labor, materials, trucking, and shoring.

9.4" Poly main As-Built Plan discrepancy – $48,120
Location: 17806 SE 1st St
The existing 4" poly main was installed at lower elevation shown on the as-builts. This created a clearance issue with the 12" steel gas main that needed to be installed below it, resulting in installing 12" steel gas main much deeper than anticipated. This resulted in a 1 day delay with added costs for labor, materials, trucking and shoring.

10. Pipeline Location discrepancy in As-Built Plans – $38,840
Location: SE 1st St between SE 177th Ave and SE 192nd Ave
The as-built plans did not clearly the locations of existing 6" and 4" gas mains, requiring NW Natural's contractor to use a vacuum truck to locate and verify pipeline positions. This resulted in a 1-day delay with added costs for labor, materials, trucking and shoring.

11.Poly Gas Service conflict – $35,000
Location: 17908 SE 1st St
The poly service gas line depth of installation coflicted with the proposed 12" steel main installation and did not meet clearance requirements. Depth adjustments resulted in a 1 day delay with added costs for labor and vacuum truck.

12.Additional unbudget costs – $185,513
The additional costs included approximately $20,000 for flagging, $15,505 for a street sweeper, $13,200 for a water tanker truck to dispose of hydrotest water, $19,950 for laydown yard rental, and $116,858 for additional paving.

**13.The total cost of this change order is $1,631,459.08 without contingency. **
The project team is requesting a 10% contingency of $163,145.92 to cover NW natural labor costs needed to close the project, along with construction trailing charges.

This change order requests a total of $1,794,605, including a 10% contingency.

System Reinforcement 10 Year Plan- Project Summary Document

Project Name: Vancouver HP Replacements **Year of Plan:** 2025

Expected Completion Year: 2027 or 2028 **Project Initiator:** E Thurman

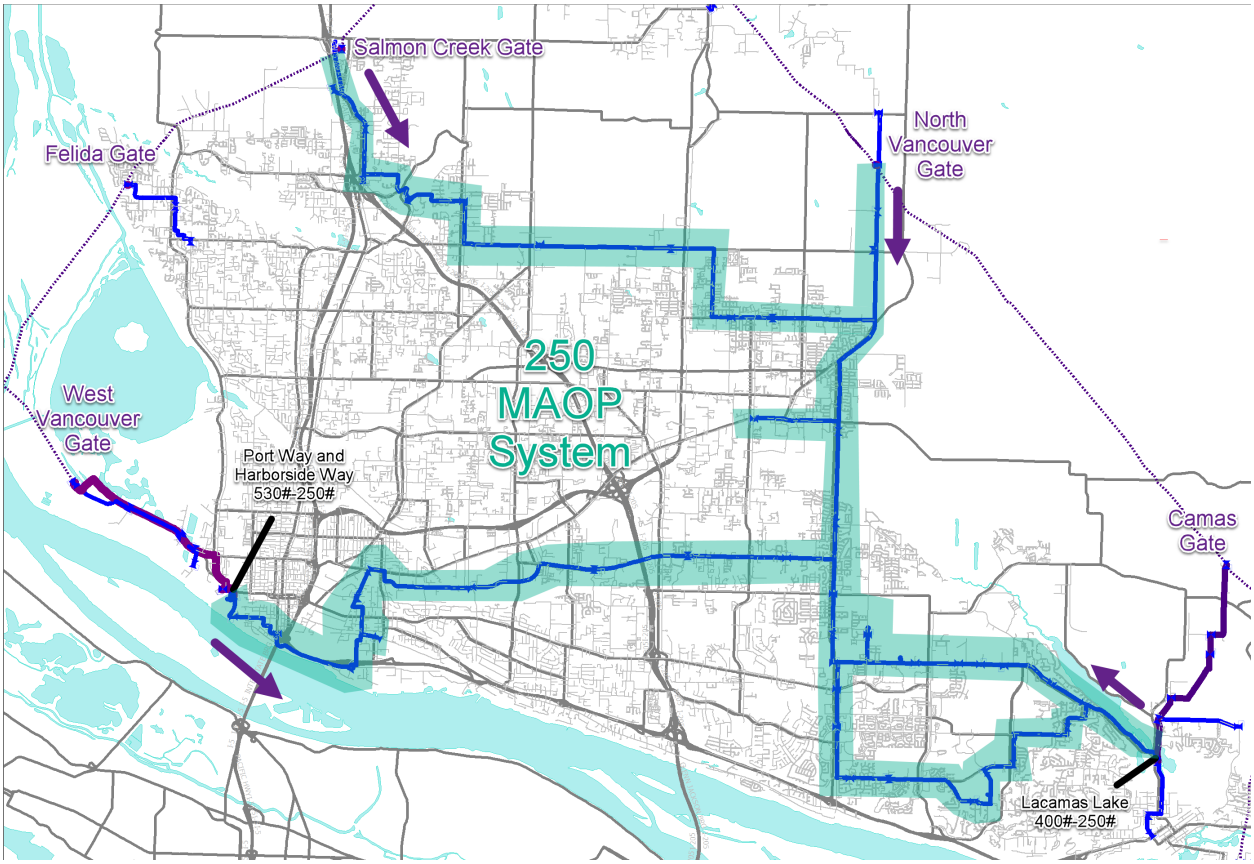
System Analysis and Issues:

Vancouver's 250 MAOP system serves as the high pressure backbone for the core of Vancouver, Washington. The system is highlighted in blue in Figure 1 below. The 250 MAOP system supplies gas to customers in Vancouver, Camas, Salmon Creek, Brush Prairie, and portions of Ridgefield. The system includes approximately 46 miles and includes 4"(W), 6"(W), 8"(W), and 12"(W) high pressure mains.

The 250 MAOP system is fed from four different locations:

1) Salmon Creek Gate
2) North Vancouver Gate
3) Port Way and Harborside District Regulator from West Vancouver Gate
4) Lacamas Lake Regional Station from Camas Gate

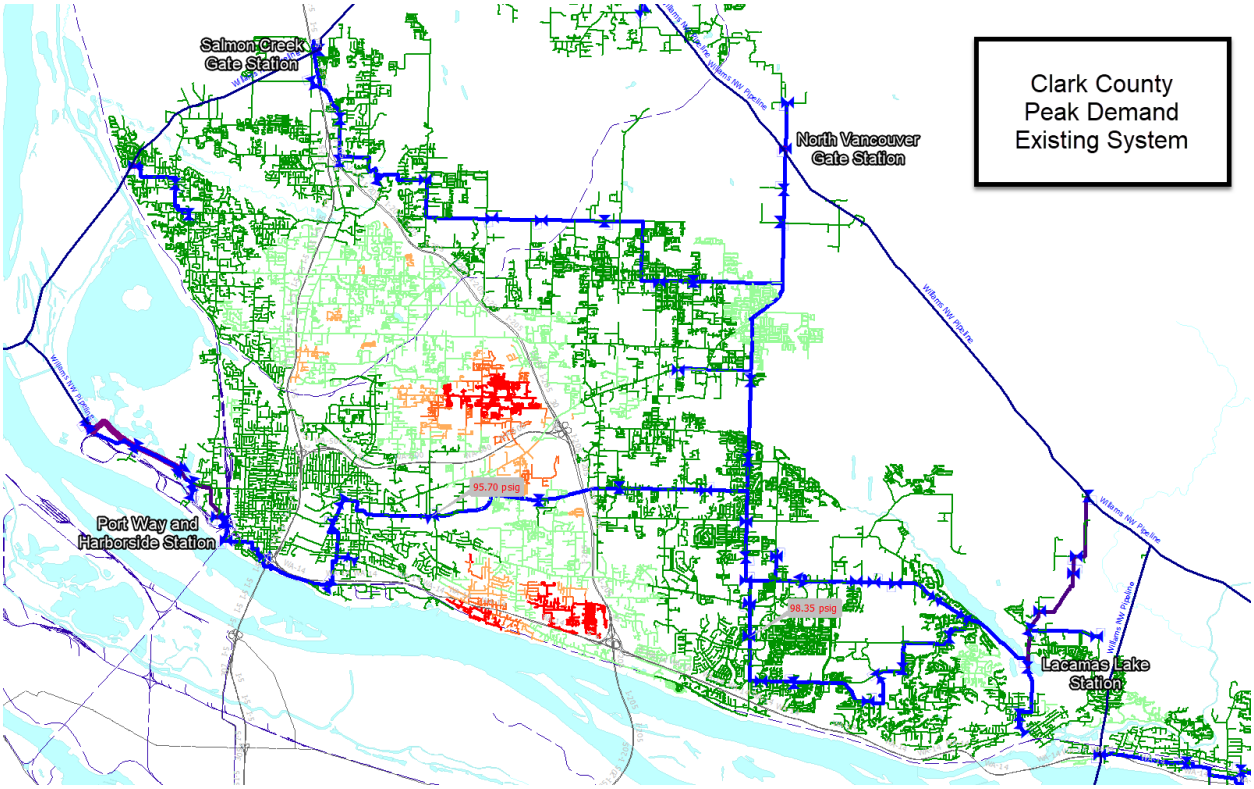
Figure 1 - 250 MAOP System



In 2022, a new Vancouver model was developed using Customer Management Module (CMM) predicted demands. CMM links Synergi with NW Natural's Customer Information System (CIS) and establishes a relationship between temperature and consumption to forecast customer demands used in the model. This approach provides more accurate demand estimates than the legacy method, which applied average Usage Per Customer (UPC) values by region for residential and small commercial customers. A benefit of CMM is the ability to incorporate new customer demands more seamlessly. New customers in legacy were added manually, leading to a lag when customer demands were added to the model. Because of the manual process growth was not accurately captured in Legacy models.

CMM modeling showed that the demands are higher than what was modeled in the legacy models. CMM modeling indicates that the system is operating beyond its design capacity during cold weather. Synergi results using CMM forecasted demands show pressures on the 250 MAOP system dropping to 95.7 psig, which has a corresponding 59.3% pressure drop. NW Natural's high pressure reinforcement criteria includes addressing pressure drops exceeding 40% from the source to the end of the system. A system with a pressure reduction of 40% equates to an 80% level of capacity utilization.

Figure 2 - Existing System Model



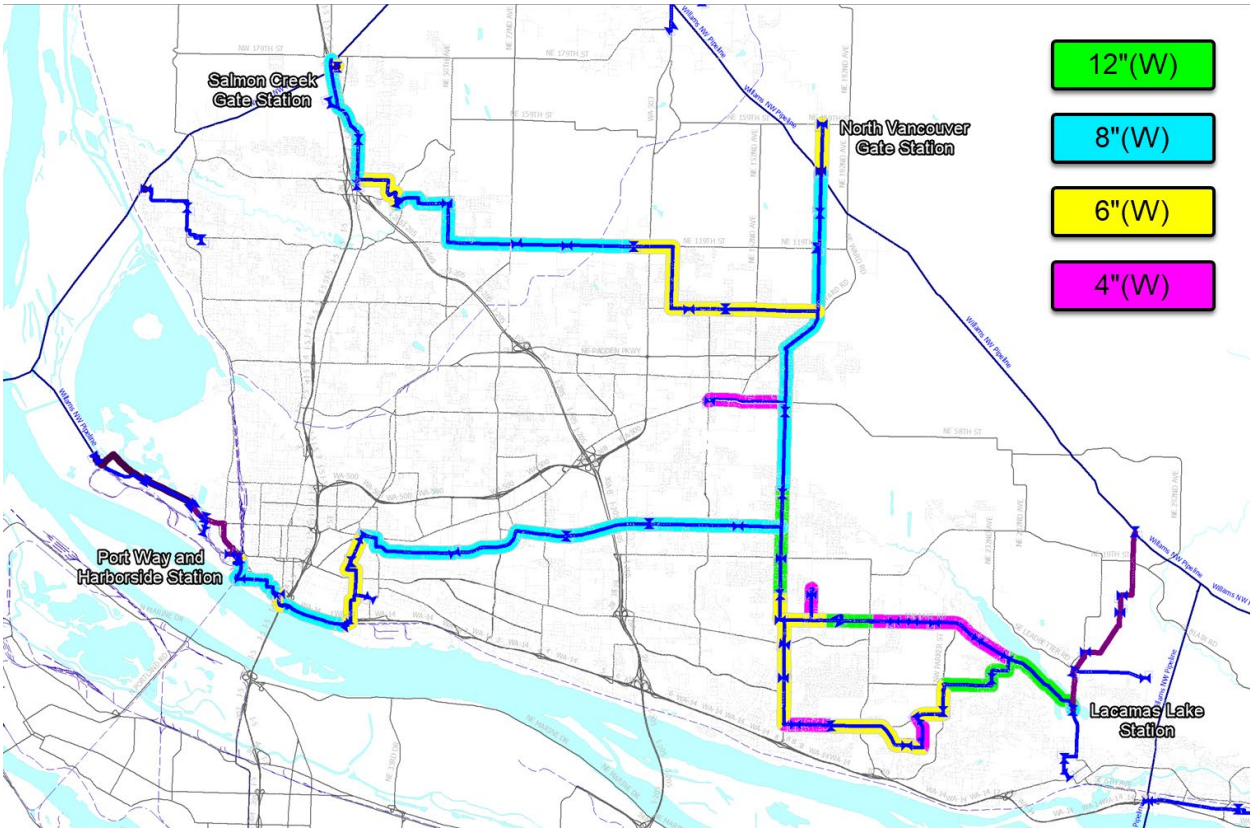
The low pressures found in the model are a result of pressures losses due to bottlenecks on the 250 MAOP system. A breakdown of the sizes and lengths of the pipe are provided below.

Size (in)	Length (mi)
4	5.5
6	13.6

8	21.7
12	5.4
Total	46.2

Modeling shows that the 6”(W) and 4”(W) creates significant losses on the system causing low pressures to be seen on the southern part of the 250 MAOP system. Figure 3 illustrates locations of the bottlenecks on the system. The magenta polygons indicate locations of 4”(W) while the yellow polygons show instances where 6”(W) is installed. The remaining portions of the system consist of 8”(W) and 12”(W).

Figure 3 - 250 MAOP System By Pipe Size



Recorded Pressures

Source Pressures:

The SCADA tags listed below provides the source pressures for the Vancouver 250 MAOP system.

0162A_PRESS_OUTLT_1 : North Vanc Gate Pressure Outlet 1
0195A_PRESS_OUTLT_1 : Salmon Creek Gate Pressure Outlet 1
0025A_PRESS_OUTLT_1 : Lacamas Lake Regs Pressure Outlet 1
0295A_PRESS_OUTLT_1 : Port of Vancouver Pressure Outlet 1

System Pressures:

Engineering has been recording pressures data through two Electronic Portable Pressure Recorders (EPPR) on the Vancouver 250 MAOP system since the 22/23 Heating Season. One located at DR DR 1-015-035-R02 and another at DR 1-015-045-R02. The lowest pressure captured by the EPPRs was 117.8 psig, which corresponds to a 41.3% pressure drop. This lowest pressure occurred while interruptible customers active and average daily temperature of 21.5 Deg F (43.5 HDD).

District Regulator 1-015-045-R02

Date/Time	Avg Pressure	Max Pressure	Min Pressure
1/16/2024 23:00	189.72	191.22	186.9

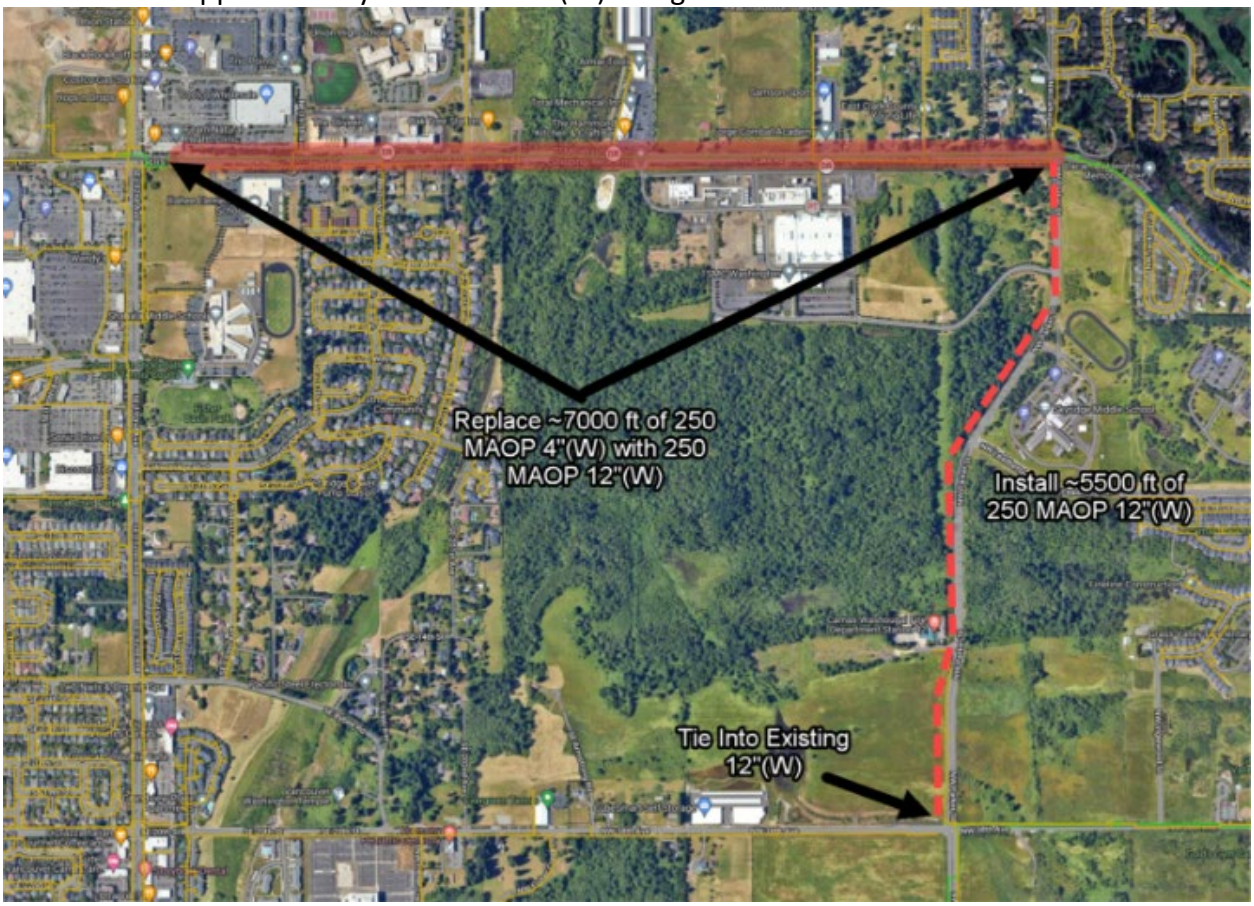
2/11/2025 4:00	167.31	169.53	163.73
2/11/2025 3:00	173.64	175.69	170.87
2/11/2025 2:00	178.49	180.12	176.86
2/11/2025 1:00	182.93	184.24	180.78
2/11/2025 0:00	183.63	184.03	183.32

Proposed Projects:

Option 1 - Installation of new 400 MAOP 12”(W) main and replacing existing 400 MAOP 4”(W) main with 400 MAOP 12”(W) main

The System Reinforcement Includes:

- Replace approximately 7000 ft of 4”(W) with 12”(W) on NW Lake Rd
- Install approximately 5500 ft of 12”(W) along NW Parker St.



Option 2 - Construct 6535’ of 8”(W) looping existing 6”(W) 530 MAOP line, starting at West Vancouver Gate and heading east on Lower River Rd.

The System Reinforcement Includes:

New 8” 530 MAOP line, approximately 6,355’ long

Location where new pressure control would be needed and uprate from 250 to 350 psig would begin.

Extents of 350 MAOP uprate:

Close-up of east end of 350 MAOP uprate section.

Option 3 – Uprate the Entire 250 MAOP System to 300 MAOP

The System Reinforcement Includes:

Uprate approximately 46 miles of high-pressure main from an MAOP of 250 psig to 300 psig
- Potentially uprate/replace 12 service regulator inlets
- Potentially uprate/replace 45 district regulator inlets

NW Natural
PROGRAM / PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: E-202729_Camas Gate Station Rebuild
Date: *01/30/2023*
Project Sponsor: Daniel Kizer
Executive Sponsor: Jon Huddleston
Project Manager: Jorge Souto
Preparer: Lindsey Robison, Jorge Souto

The purpose of the Alternative Analysis requirement is to choose the best solution for NWN's need and to make sure we are utilizing resources in the most efficient manner.

BUSINESS NEED/JUSTIFICATION *What is the issue intended to be addressed and why is it needed?*
The Camas Gate Station is a key delivery point for the East Vancouver, Camas, and Washougal areas. This site serves as a gate station, houses an odorizer, and contains a single-walled 2000-gallon bulk odorant storage tank. Replacement of the odorizer and bulk odorant storage tank were originally included in the Engineering 10-year plan for execution in 2025. However, due to proximity to recent vehicle damage, the age and condition of the bulk odorant storage tank, and an adjacent project to install a pig launcher, this project proposes to move the execution to 2023. Williams NW Pipeline will also be providing NW Natural with a credit due to valves that need to be replaced at the site. Williams NW Pipeline is also requesting NW Natural take over regulation and overpressure protection at Camas Gate Station due to a Williams policy requiring customers to install, own, and operate overpressure protection when a major upgrade exceeding $200,000 is required. This major upgrade is required due to work for the P04 ILI project and the relocation of the odorizer and bulk odorant storage tank.

OBJECTIVE *Clearly define the objective.*
The project aims to update the design standards of the Camas Gate Station, modernizing the station by removing the existing single-containment bulk odorant storage tank and odorizer. The station will be reconfigured to accommodate a new pig launcher and a modern odorizer. At the project's completion, vehicle protection will be installed to protect the station from vehicle damage.

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option.*	
Description	Modernize the station to meet current design standards, replacing the existing single containment bulk odorant storage tank with a smaller, fully contained tank. Replace the existing odorizer with a modern, zero-emission odorizer. To accommodate spacing for the odorizer and the new pig launcher (installed during a concurrent project), reconfigure the station and move the odorizer into the existing Williams building, which will be transferred by Facility Agreement to NW Natural. Install a new, billing-quality check meter downstream of the custody transfer meter for meter quality at custody transfer sites. Reconfigure station piping, take ownership of the over overpressure protection, regulation, and line heating by agreement with Williams Pipeline, and install new vehicle protection. Williams pipeline will build a new, modern meter run, eliminating the existing orifice meter run, to increase metering accuracy. The station design is being modified to incorporate the P04 ILI project, due by the end of October 2023.

Decision Criteria	The most cost effective, viable option.
Pros	Address contractual obligation, bring station to current standards, meet current demand.
Cons	Due to the single-fed system, design will need to be coordinated with the Williams team to provide a bypass to downstream customers while systems are switched over from Williams supply to NW Natural customers.

POTENTIAL COST			
Capital	**Direct + Contingency**	**COH (20%)**	**Total**
	$3,250,000	$650,000	$3,900,000
O&M	**Program/Project**	**Ongoing Maintenance & Support**	
	$0.00	No forecasted change from existing station	
Source/ Method of Cost Data	Williams' contract estimate and internal NWN cost estimates from recent gate station projects.		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option*	
Description	Satellite LNG Facility, providing alternate source of supply to reduce peak demands on existing Camas Gate Station.
Pros	Provides peak-shaving capacity and reduces peak demand requirements at Camas Gate Station.
Cons	High cost of construction and high operations and maintenance costs. Project contains significant siting difficulties and potential long permit timeline. These are significant schedule risks.

POTENTIAL COST			
Capital	**Direct + Contingency**	**COH (26%)**	**Total**
	$16,900,000	$4,394,000	$21,294,000
O&M	**Program/Project**	**Ongoing Maintenance & Support**	
		$373,000	
Source/ Method of Cost Data	Conceptual Design and Budget for Community Based LNG Satellite Stations spreadsheet, produced by Jenmar Concepts calculator, with inputs for these station design considerations by NW Natural Engineering		
Explain why this alternative is not recommended	Higher capital and O&M cost than recommended option, and higher constructability and schedule risk for construction.		

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 2	Do nothing	High operational risk for existing bulk odorant storage tank and odorizer. NWN is working to eliminate single-containment odorant tanks because they do not meet code today and are at a higher risk for spills. Relocating existing piping required to install vehicle protection. The site

		has been identified in Vehicle Protection study as a high priority for installation of new vehicle protection measures.
Alternative 3		

**Add rows for any additional alternatives considered not viable*

FURTHER ANALYSIS NOT REQUIRED *Describe why further analysis is not required. Please explain in enough detail that others can assess whether the existing justification is sufficient.*

PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: E203083 Camas Gate Station Building
Date: 4/10/2025
Project Sponsor: Joe Karney
Executive Sponsor: Dan Kizer
Project Manager: Abraham Jaimes
Preparer: Abraham Jaimes, Austin Garcia, Roland Buckner, Mike McKenzie

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Before the 2023 Camas Gate Station Rebuild Project, a regulator building dating from the Station's original construction in 1957 was installed to provide noise reduction at the regulator runs. During the 2023 Rebuild project, the regulator building was removed due to the asbestos material construction and conflict with the modern regulator design. With the installation of the new regulators, aerodynamic noise has been noted around the station and into the adjacent neighborhood, leading to customer inquiries and Sys Ops crew callouts. Camas Gate Station is located just outside the Camas, WA city limits in rural Clark County, and is subject to noise ordinances in Clark County Code and the Washington Administrative Code (WAC). These Codes specify a maximum noise level at property line of 60dBA. While typically Code would reduce the noise limitation to 50dBA in a Residential zone during the hours of 10pm to 7am, WAC 173.60 exempts natural gas utilities from this requirement. This exemption eases compliance for this Station but is easy to overlook or misunderstand from a customer perspective. There have been several years of concerns over noise and odor expressed by neighbors regarding Camas Gate operations. These concerns have been documented through regular complaints submitted to NW Natural, Clark County, and the Southwest Washington Clean Air Agency. In response to these complaints and to demonstrate our commitment to addressing community concerns, we have indicated the construction of a new building on the site. This development is intended to mitigate noise propagation and to serve as a visible indication of NW Natural as a responsible neighbor. In response to customer noise complaints, the Company performed a sound study in September 2024. The scientific noise study determined a maximum noise level of 59 dBA, indicating the station had not exceeded the Clark County/WAC 173-60 noise limitation of 60 dBA. In anticipation of larger Winter gas flow, temporary noise curtains were installed, and the noise study was performed again in December 2024. This study resulted in a maximum noise reading of 54 dBA outside of the noise curtains and determined that with high heating-season gas flows, the temporary noise curtains were required to stay within Clark County Code limits. These temporary noise curtains are not designed for permanent installation.

	This project aims to provide permanent noise mitigation by installing a building to reduce overall noise at the station and ensure compliance with Clark County Code. Additionally, a worker-monitor regulator run will be installed in parallel to the existing regulators to accommodate for lower flow conditions during summer months for operational efficiency and to further reduce noise.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	NW Natural has received numerous noise complaints from adjacent neighbors and we are proposing a solution to decrease noise pollution from the site. The existing regulator runs do not contain sufficient noise dampening. NW Natural has installed noise reducing insulation blankets and temporary noise curtains, but these methods are not a permanent solution. The Company needs a permanent solution that will ensure code compliance and result in noise reduction, reducing or eliminating customer complaints, while ensuring safety and ease of maintenance for Camas Gate Station.
Desired Deliverables What high level output / scope / deliverables are core to this project?	The preliminary scope of gas facility work includes requests for a new building design, ordering materials, requesting 3rd party engineering for foundation design, requesting permitting for new building, coordinating with contractors for installation, and installation of a worker monitor regulator run in parallel with existing regulators to accommodate lower flow conditions during summer months and reduce noise.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	The team has reviewed multiple options for reducing overall noise pollution at this site. The review process includes the installation of a building, the use of permanent sound walls/barriers around the site, utilizing noise reducing curtains, rebuilding the regulators in underground vaults, and or leaving the station in its current state.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Cost/Scope	This summary will review the costs and scope associated with each option analyzed. Lower cost options may not remediate the issues currently at hand.
Criteria: Building Construction	This summary will review the building materials available for attenuating sound and how they either meet or do not meet code requirements. New building construction must meet International Building Code, WAC 51-50 and International Fire Code, and other applicable Codes.
Criteria: Safety	This summary will review the safety aspects and how each option either meets or does not meet the requirements. Design requirements must include adequate ventilation, must meet electrical area classification requirements (NFPA 70, NFPA 497), and provide adequate building access for operations and maintenance.
Criteria: Risks/Benefits	This summary will review the risks and benefits associated with each option analyzed. Alternatives resulting in a beneficial noise reduction and lower overall audio/visual footprint will be ranked higher.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	Install New Building and Regulator Run	
In brief, why is this the recommended option?	The recommended option proposes installation of a new custom building, similar in footprint and scale to the original 1957 Regulator Building and the addition of a new regulator run to reduce noise at the site. The new building and regulator run will reduce noise pollution, improve efficiency of flow during summer months, and prolong life of station regulator equipment by utilizing a new Summer-season run to reduce low-flow conditions through the larger, heating-season sized regulator runs.	
Assessment	**Analysis Against Criteria:** Cost/Scope	There is a high cost associated with the implementation and installation of a new building over the regulators. The building will need to be custom to fit the design profile of the regulator runs and meet all area classification, ventilation, and safety requirements. Additionally, the installation of a new regulator run will require engineering and construction resources to install.
	Analysis For Criteria: Building Construction	The building will be custom to fit the current regulator configurations and meet the necessary local and fire code requirements. The custom building will be tailored to the site to avoid any conflicts with underground utilities.
	Analysis For Criteria: Safety	The new building will aid in noise attenuation by absorbing scattered and reflected sounds waves that are currently spreading to the neighboring communities. The building entry points will be in specified locations for ease of maintenance and access to equipment. Additionally, building materials will meet necessary electrical area classifications.
	Analysis Against Criteria: Risks	• It is possible that despite improvements, neighbors may continue to escalate noise concerns at the gate station. This risk will be mitigated by ensuring that the final design meets or exceeds all applicable noise ordinances and Local/County Codes. • Permitting with local jurisdictions may have additional requirements that could change the overall design of the project and increase scope and cost. Risk is mitigated – during Plan phase, building permit has been received and all permits are in hand. • The new building will need to be installed during busy summer construction months as the station will need to be shut-in. • Tariffs and Market impacts increase the risk of price hikes on materials.
	Analysis For Criteria: Benefits	• Noise attenuation at the site and overall noise reduction outside of the building by utilizing a noise-attenuating insulation assembly and physical noise barriers. • Improved working environment for operations and maintenance personnel. • Protection of equipment and pipe from the elements. • Overall improvement of site layout and aesthetics.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$750,000 - $1,250,000	$165,000 - $275,000	$1,015,000 - $1,525,000
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	

	$0	$0
Source/ Method of Cost Data	Project costs are based on material and contractor estimates for the construction and installation of the new building and regulator run.	

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Install Prefabricated Building	
In brief, why is this option not recommended?	A prefabricated building option was examined to investigate potential cost savings over a custom-build steel frame building. The prefabricated building alternative is not recommended because it does not allow for room to customize and change entry points for the building. Additionally, size constraints do not allow for the additional summer regulator run installation. The prefabricated buildings in the appropriate dimensions and configurations do not have the adequate electrical area classifications to be used for a gas facility.	
Assessment	**Analysis Against Criteria:** Cost/Scope	Although prefabricated buildings are generally more cost effective, the cost to install the building will be similar to that of a custom building. Additionally, the prefabricated buildings do not meet the scope requirements for this project.
	Analysis Against Criteria: Building Construction	The use of a prefabricated building is not an option because of the size requirements needed to fit around the regulators as well as the inability to make modifications to the building to fit NW Natural's needs. The building doors need to be in specific locations to provide necessary access to equipment inside the building and provide ease of maintenance.
	Analysis Against Criteria: Safety	An adequately sized prefabricated building does not have the Class 1, Div 2 specifications required for electrical code compliance. Modifications to meet Code would increase project cost and complexity.
	Risks	• Installation of a prefabricated building will require staging and rigging to set into place. The site is located near powerlines and could pose potential issues with install. • Lack of communication from manufacturer may pose risks in design and selection of the building required by NW Natural.
	Benefits	• Smaller scope and lower cost associated with the purchase of a prefabricated building. • Prefabricated buildings would have a much shorter lead time.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$500,000 - $750,000	$110,000 - $165,000	$610,000 - $915,000
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0	$0	
Source/ Method of Cost Data	Cost estimate is based on preliminary budgetary estimates from prefabricated building suppliers and construction costs associated with permitting, building foundation, rigging, and electrical install.		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	Permanent Sound Walls

In brief, why is this option not recommended?	The sound walls still leave the site open above the regulators, allowing sound to escape above the top of the sound walls. This alternative provides the equipment with no protection from the elements. The sound walls would be permanent but would require costly, deep foundations to account for wind and seismic loads. Sound wall foundations will cause conflicts with underground utilities, requiring relocating underground piping. This alternative is intended to be a concrete or CMU/masonry wall around the perimeter of the entire station. These walls will need to be greater than 8' tall and incorporate security elements to prevent unauthorized access. While the walls may stop the horizontal propagation of noise, they will not prevent noise from traveling over the walls, continuing to impact the adjacent neighborhood. This alternative incorporates construction risk in that material costs and bids may be higher than originally modeled in this alternative. Foundation designs will require extensive work with Williams, whose pipelines are also within the station, to determine if the foundations can be built over existing pipelines and around existing equipment. These design risks increase cost and schedule risks beyond the selected alternative.	
Assessment	**Analysis Against Criteria:** Cost/Scope	Installation of sound walls will include significant costs associated with installation of adequate foundations to account for wind loads. This may require relocating of underground utilities if the sound wall foundations interfere with existing underground gas or electrical utilities.
	Analysis Against Criteria: Building Construction	To make sound walls structurally sound, footings for walls will need to be wind load rated which may include considerable amounts of structural and construction costs. Construction would involve permitting, purchasing sound wall materials, and procuring construction contractor for the installation.
	Analysis Against Criteria: Safety	The sound walls still leave space above the regulators open and noise from the regulators will escape. Coverage required for noise attenuation limits access into and out of the regulator area in ways that are more restrictive than a permanent building, which has operable doors.
	Risks	• Noise may potentially leak out above the sound walls. • Reduced life equipment as they will still be exposed to the elements. • Sound panels will need to be replaced in the future, leading to on-going costs as the panels age and deteriorate. • Sound panels may also reduce station access for future construction and accessibility.
	Benefits	• Installation of sound walls would be the lowest cost option for materials and construction.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$400,000 - $600,000	$88,000 - $132,000	$488,000 - $732,000
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0	$0	
Source/ Method of Cost Data	Preliminary method of cost data includes materials estimate from the Sound Wall vendor and construction estimates for rigging, concrete, and sound wall material installation.		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Sound Curtains	The use of sound curtains is not a permanent option as they include the use of additional

		chain-link fencing around the regulators. This is not a long-term solution as they create an additional obstruction around the station equipment and are not designed for wind loads. Additionally, sound curtains decay with prolonged sun exposure.
Alternative 4	Rebuild Station Underground	The station was rebuilt in 2023 and cost for the station rebuild was $2.84MM. Rebuilding the station underground would include additional engineering design and construction which would exceed the cost of a building installation.
Alternative 5	Do Nothing	Doing nothing is not recommended, it does not address the noise complaints from the neighbors and provides no ability to maintain existing code compliance. Neighbors have already filed a Code Enforcement action, which was closed after the noise curtains were installed. There is a risk that during high flows, or with failure of the temporary noise curtains, the station will exceed noise limitations. With an active and engaged neighborhood monitoring noise levels, there is risk of compliance or regulatory action, up to and including Legal action.

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

Gate and Regional Station

Planning Document
2025 – 10 year plan
Date updated: 8/14/2025

Contents

Scope 3
Gate and Regional Station Criteria 3
Section One – 1 to 3 years (2025 to 2027) 3
2025 3
Rock Creek Regional Station Valve Replacement (E-202765) 3
Willamette Valley Odorizer – Chromatograph Install 4
Turner Gate System Metering 4
Camas Gate Building 4
KB Pipeline to North Coast Feeder Gate Rebuild 4
2026 5
Shaw and BPA Line Heater Replacement 5
Aurora Line Heater Replacement 5
North Vancouver Metering Installation 5
West Vancouver Metering Installation 5
Deer Island Kalama Metering 6
2027 6
McMinnville Amity Gate 6
West Vancouver Odorant Depot 6
Salmon Creek Line Heater Replacement 6
Molalla Gate Metering 6
Deer Island Gate Rebuild 7
Sauvie Island Gate 7
Section Two – 4 to 7 years (2028 to 2031) 7
2028 7
NE Gate Station Rebuild (202892) 7
Felida Gate Station Rebuild 8
Ridgefield Line Heater Replacement 8
Battleground Line Heater Replacement 8
Albany Gate Metering 8

Mid-Willamette Valley Feeder to Albany System Metering 8
2029 8
Creswell Gate Rebuild 8
Gasco Mixer Station Rebuild (E-202893) 9
Marquam Bridge Regional Station Rebuild 9
Gresham Gate Metering 9
2030 9
Johnson Creek Gate 9
Salem Gate Station Rebuild 9
Brownsville Halsey Gate Metering 10
South Eugene Gate Rebuild and Metering 10
Oregon City Gate Metering 10
La Center Metering 10
2031 10
Mt. Angel Metering 10
Section Three – 7 to 10 years (2032 to 2035) 10
2032 10
Rivergate Station Metering 10
2033 11
TBD Metering 11
2034 11
TBD Metering 11
2035 11
TBD Metering 11
Section Four – Projects Completed in Prior Year 11
2024 11
SE Gate Station Rebuild (E-202891) 11
Toledo Regional Station – Oil Slug Catcher (E-202841) 11
Cornell and BPA Line Heater Replacement (E-202896) 12
Columbia and Adriatic Line Heater Replacement (E-202894) 12
North Vancouver Line Heater Replacement (E-202990) 12
Molalla Line Heater Replacement (E-202898) 12
Sherwood Intertie System Metering / Brookman Rd (E-202900) 12
Brooks System Metering (E-202899) 12
West Linn Crossing Measurement (E-202901) 12
Rivergate Regional Station (E-202895) 12

Scope

This 10 year plan is for Gate and Regional Station projects. There are projects that have been identified in the IRP to serve load. Other projects have been identified based on supply, end of life obsolescence, projected growth or modernization.

Gate and Regional Station Criteria

Projects in this plan were selected utilizing the following criteria:

Gates and Regional Stations:

- Estimated cost w/o COH greater than $500K.
- Design parameters set to Peak Heating Day load requirements.
- Modeling shows that with potential growth components within the Gate or Regional Station such as regulators, meters, line heaters, odorizers or any other equipment could become undersized.
- Analysis of Williams contract or design capacity of Gate Station shows that Gate Station is undersized.
- End of life for critical components such as line heaters and odorizers where repair equipment may not be available
- System Reinforcement Projects which will impact flow from a Gate or Regional Station.
- Identified in the IRP for supply requirements or needs.
- Identified by Gas Control as necessary for operation of the gas distribution system.
- Identified as a station in need of vehicle protection upgrade.
- Cost estimate ranges reflect PMO Guidance of +100% / -50%

Note: Projects may move on the schedule depending on growth, winter operations, and other circumstances. Where systems are stable, special consideration may be determined prior to Gate or Regional Station modification

Section One – 1 to 3 years (2025 to 2027)

Projects in this category will follow current Engineering or Project Management Office processes to finalize design and refine the cost estimate.

2025

Rock Creek Regional Station Valve Replacement (E-202765)

- Plat 1-025-014, OR
- Replace existing undersized worker control valve with a larger valve to increase station flow capacity. The site is vital during winter operations to ensure the regional gas delivery meets peak demands necessary during critical cold weather days.
- $600K

Willamette Valley Odorizer – Chromatograph Install

- Plat 1-015-059, Fern Prairie, WA
- This station is the main gas odorant injection site for all gate stations on the Williams system south of Washougal, WA.
- Installation of chromatograph at site to improve regional metering data.
- Install new station controls to activate cold standby odorizer system so that it can be used as a hot standby to provide alternatives in the event of equipment failure.
- $150K

Turner Gate System Metering

- Plat 1-119-000, Turner, OR
- System Reinforcement 10-year plan includes a project to uprate the Santiam Valley Feeder. This project will provide the IRP and system modeling team with accurate flow demands for this potential IRP project.
- Allows Gas Control to determine flow to Salem to optimize Kuebler Blvd Reinforcement Project and add valves and piping facilities to separate the 400 MAOP and 225 MAOP systems.
- Station is ranked high risk for vehicle protection. Add vehicle protection barriers to protect gate station facilities.
- Gas Control monitoring, system modeling and IRP team will utilize this data for safety, BTU calculation, and modeling purposes. New meter will meet Internal Audit guidance to add check metering at gate stations when a gate station is rebuilt.
- $2.1M

Camas Gate Building

- Plat 1-013-057, Camas, WA
- During the 2023 Camas Gate Station Rebuild project, a 1956 vintage regulator building was removed to facilitate the station construction project, and due to asbestos remediation. This gate station requires noise mitigation methods to prevent aerodynamic regulator noise from exceeding Clark County Code requirements.
- This project will install a new building over regulator runs to mitigate station noise and ensure noise levels meet County Code requirements.
- $1.1M

KB Pipeline to North Coast Feeder Gate Rebuild

- Columbia County, OR
- An existing gate station exists between the KB Pipeline and the Company's North Coast Feeder pipeline, located in the PGE Beaver Meter Yard in Columbia County. NW Natural maintains a contractual delivery obligation of 20,000 Dth/d from KB Pipeline to the Utility at this station, however the station does not have automatic controls and cannot flow unless operated by on site personnel.
- This project will modernize the KB to North Coast Feeder Gate to allow for full remote operation by NW Natural Gas Control. New facilities will include a filter/separator, new meter, valves and controls, and a gas chromatograph to

ensure accurate measurement and reliable remote control to utilize this gas supply resource.
- $1.2M

2026

Shaw and BPA Line Heater Replacement
- Plat 1-034-013, Beaverton, OR
- Replace line heater reaching end of life which has been flagged as an operational liability. Project will evaluate whether the burner management system may be replaced to extend the life of the heater, or whether the heater requires a complete replacement. At this time the burner management system is obsolete and at end of life.
- $860k

Aurora Line Heater Replacement
- Plat 1-067-020, Aurora, OR
- Replace line heater reaching end of life which has been flagged as an operational liability. Project has evaluated whether the burner and burner management system may be replaced to extend the life of the heater, or whether the heater requires a complete replacement, and determined that the heater requires complete replacement.
- $860k

North Vancouver Metering Installation
- Plat 1-002-046, Vancouver, WA
- Installation of ultrasonic metering to replace existing end of life annubar meter which is no longer supported by the manufacturer. This annubar meter is critical to measure gas flow for odorant injection. A new meter will provide flow data for odorization and additional custody-transfer grade check metering through the station, a best practice and meeting Internal Audit guidance to add check metering at gate stations when a gate station is rebuilt.
- $750k

West Vancouver Metering Installation
- Plat 1-012-023, Vancouver, WA
- Phase 1: Installation of ultrasonic metering to replace existing end of life annubar meter which is no longer supported by the manufacturer. This annubar meter is critical to measure gas flow for odorant injection. A new meter will provide flow data for odorization and additional custody-transfer grade check metering through the station, a best practice and meeting Internal Audit guidance to add check metering at gate stations when a gate station is rebuilt.
- Installation of chromatograph at site to improve regional metering data, and a check against Williams gas quality data.
- Phase 2: Installation of a new low-emission, high-efficiency line heater to prevent icing downstream of regulation due to the Joule-Thomson effect in which the gas temperature decreases downstream of regulation from a higher pressure to a lower pressure. This station currently sees icing during high flow and/or cold

weather conditions, due to the gas temperature being below freezing. Icing can lead to physical damage, coating damage and frost heave.
- $1.5M

Deer Island Kalama Metering
- Plat 4-035-013, Kalama, WA
- Installation of ultrasonic metering by Williams Northwest Pipeline at Williams owned facility, which measures gas flows to NW Natural system. This is a contractual obligation for NW Natural to be financially responsible due to Passive Ownership of this station.
- $550k

2027

McMinnville Amity Gate
- Plat 1-097-015, Silverton, OR
- Installation of ultrasonic check metering and taking over pressure protection from Williams to increase station capacity based on downstream flows exceeding contractual limits for the gate station. Williams has reported the existing station is undersized for the current customer load, and will require NW Natural to improve capacity at the station to meet customer demand.
- Installation of high efficiency line heater and zero-emissions odorizer.
- $3M

West Vancouver Odorant Depot
- Plat 1-012-023, Vancouver, WA
- Installation of a large-scale odorant storage tank to increase NWN's resilience by expanding on-site odorant capacity. This need was identified as critical during a nationwide odorant shortage when long procurement lead times posed a risk to maintaining safe pipeline operations.
- $1M

Salmon Creek Line Heater Replacement
- Plat 4-002-031, Mt. Vista, WA
- Replace line heater reaching end of life which has been flagged as an operational liability. Project will evaluate whether the burner management system may be replaced to extend the life of the heater, or whether the heater requires a complete replacement. At this time the burner management system is obsolete and at end of life.
- $1.25M

Molalla Gate Metering
- Plat 1-078-031, Molalla, OR
- Installation of ultrasonic metering by Williams Northwest Pipeline at Williams owned facility, which measures gas flows to NW Natural system. This is a contractual obligation for NW Natural to be financially responsible due to Passive Ownership of this station.

- Installation of ultrasonic metering at NW Natural side of facility. New meter will meet Internal Audit guidance to add check metering at gate stations
- $1.5M

Deer Island Gate Rebuild

- Plat 4-035-10, Reuben, OR
- Installation of ultrasonic metering for odorant controls and stronger system modelling capabilities. Replace existing, end of life system meters and single-path ultrasonic meter that is no longer supported by the manufacturer. The new meter is critical to measure gas flow for odorant injection.
- Rebuild odorization system including replacement of odorization building, new tanks, and controls. New odorizer will meet zero-emissions standards.
- Replace inlet regulation to reduce maintenance requirements and increase reliability.
- $4.1M

Sauvie Island Gate

- Plat 1-016-016, Sauvie Island, Portland, OR
- Installation of ultrasonic metering. New meter will meet Internal Audit guidance to add check metering at gate stations when a gate station is rebuilt. Meter is critical to measure gas flow for odorant injection.
- Rebuild odorization system including replacement of odorization building, new tanks and controls. New odorizer will meet zero-emissions standards.
- Installation of chromatograph at site to improve regional metering data.
- Station is ranked high risk for vehicle protection. Rerouting piping and adding vehicle protection barriers will protect gate station facilities.
- $2M

Section Two – 4 to 7 years (2028 to 2031)

Each project in this category will include a high level cost estimate, project description, preliminary modeling documentation and preliminary schedule date.

2028

NE Gate Station Rebuild (202892)

- Plat 1-027-055, Portland, OR
- Installation of ultrasonic metering. New meter will meet Internal Audit guidance to add check metering at gate stations when a gate station is rebuilt.
- Replace hard-to-operate valves identified by operations and remediate associated slip-on flanges. Also includes replacing 150 feet of transmission main within the station that has insufficient test documentation based on modern requirements.
- $2M

Felida Gate Station Rebuild

- Plat 1-003-025, Felida, WA
- Replacement of line heater reaching end of life.
- Replacement of existing ultrasonic meter which is no longer supported by the manufacturer, and at end of life.
- Replace end of life odorizer flagged as operational liability. New odorizer will meet zero-emissions standards.
- $1.5M

Ridgefield Line Heater Replacement

- Plat 4-016-029, Ridgefield, WA
- Replacement of line heater that is undersized for current system load with a new, low-emission high-efficiency line heater.
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- $1.25M

Battleground Line Heater Replacement

- Plat 4-005-041, Battleground, WA
- Replacement of line heater that is undersized for current system load with a new, low-emission high-efficiency line heater.
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- $1.25M

Albany Gate Metering

- Plat 2-157-003, Albany, OR
- Replacement of regulation with remote setpoint capabilities.
- Installation of ultrasonic metering for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- Upgrade station vehicle protection barriers.
- $900k

Mid-Willamette Valley Feeder to Albany System Metering

- OR
- Installation of metering to measure from the 600 MAOP Central Coast Feeder to the 400 MAOP to Albany (near Albany)
- Gas Control monitoring, system modeling and IRP team will utilize this data for safety and modeling purposes
- $1M

2029

Creswell Gate Rebuild

- Plat 2-251-009, Creswell, OR
- This site is part of a proposed MAOP uprate from 150psi to 300psi as stated in the IRP.

- This rebuild will require taking over regulation and overpressure protection from Williams Northwest Pipeline. No change to gate capacity is expected, this project is to increase the takeaway capacity downstream due to pressure drop in the small diameter high pressure distribution system.
- $3.1M (Design: $100K)

Gasco Mixer Station Rebuild (E-202893)

- Plat 1-023-021, Portland, OR
- Rebuild of station to remove abandoned runs, install more efficient runs and cools.
- Building replacement or alternative noise abatement, asbestos remediation, and demolition of existing structures. Hazardous soils in the area will be addressed during permitting/design to manage project risk.
- Approximately $4M (AA: $250K, Design: $250K)

Marquam Bridge Regional Station Rebuild

- Plat 1-032-029, Portland, OR
- Rebuild the station and replace remote valve actuators. This site was identified as critical in a seismic risk study. Reliable valve actuation at this site is essential for isolating multiple pipeline systems during a major earthquake
- $1.5M

Gresham Gate Metering

- Plat 1-032-054, Gresham, OR
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- $1.5M

2030

Johnson Creek Gate

- Plat 1-035-049, Gresham, OR
- Due to expansion in east Portland this gate exceeds Williams contractual flow limits.
- This rebuild will require taking over regulation and overpressure protection, installation of a line heater, improved metering and controls. Gas Control monitoring, system modeling and IRP team will utilize this data for safety, BTU calculation, and modeling purposes.
- $3.25MM (Design: $250K)

Salem Gate Station Rebuild

- Plat 1-112-008, Salem, OR
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- Replace hard-to-operate valves identified by operations and remediate associated slip-on flanges.
- $1.5M

Brownsville Halsey Gate Metering
- Plat 2-189-010, Halsey, OR
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- $500K

South Eugene Gate Rebuild and Metering
- Plat 2-238-007, Eugene, OR
- Upgrade to site telemetry to modern standards.
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- Replace hard-to-operate valves identified by operations.
- $2M

Oregon City Gate Metering
- Plat 1-060-040, Oregon City, OR
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- $1M

La Center Metering
- Plat 4-019-027, LaCenter WA
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations.
- $500K

2031

Mt. Angel Metering
- Plat 1-096-016, Mt Angel, OR
- Installation of ultrasonic meter for check metering. New meter will meet Internal Audit guidance to add check metering at gate stations. Project will provide the IRP and system modeling team with accurate flow demands
- $500K

Section Three – 7 to 10 years (2032 to 2035)

Each project in this category will include a high level estimate and preliminary modeling documentation. Project planning is only conceptual for projects at this point.

2032

Rivergate Station Metering
- Plat 1-016-019, Portland, OR

- Installation of station metering to local the low pressure system. Additional metering will provide system modelling data for safety, BTU calculation, and modelling purposes.
- $500K

2033

TBD Metering

- OR
- Installation of ultrasonic meter for check metering.
- $500K

2034

TBD Metering

- OR
- Installation of ultrasonic meter for check metering.
- $500K

2035

TBD Metering

- OR
- Installation of ultrasonic meter for check metering.
- $500K

Section Four – Projects Completed in Prior Year

The following projects were completed last year. These projects were listed in prior 10 year planning documents accordingly.

2024

SE Gate Station Rebuild (E-202891)

- Portland, OR
- Replacement of difficult to operate/inoperable valves
- Replacement of end-of-life line heater
- Installation of ultrasonic check metering
- Relocation and tech refresh of telemetry
- $4.47M

Toledo Regional Station – Oil Slug Catcher (E-202841)

- OR
- Installation of an additional slug catcher upstream of regulation
- Oil slugs due to Newport LNG vaporization are migrating and overwhelming the existing coalescing filter at the station, and fouling downstream regulators
- $400k

Cornell and BPA Line Heater Replacement (E-202896)
- Cedar Mill, OR
- Replacement of end-of-life line heater
- $810k

Columbia and Adriatic Line Heater Replacement (E-202894)
- Portland, OR
- Replacement of end-of-life line heater
- $1.02M

North Vancouver Line Heater Replacement (E-202990)
- Vancouver, WA
- Replacement of end-of-life line heater with new, low emission high-efficiency line heater.
- $766k

Molalla Line Heater Replacement (E-202898)
- Molalla, OR
- Replacement of end-of-life line heater
- $375k

Sherwood Intertie System Metering / Brookman Rd (E-202900)
- Sherwood Intertie, Sherwood, OR
- Install metering for measurement of gas to West Portland and Newberg, 720 MAOP and 400 MAOP
- $1.75M

Brooks System Metering (E-202899)
- Brooks, OR
- Adds 2 system meters to measure Willamette Valley Feeder and Central Coast Feeder to Salem 400 MAOP
- Gas Control monitoring and IRP Team requirement
- $2.22M

West Linn Crossing Measurement (E-202901)
- West Linn, OR
- Installation of metering to measure gas crossing the Willamette River from the east into West Linn. Flow information will be used by Gas Control and IRP Team
- Will assist with IRP forecasting and Mist/PLNG flows to the East side of Portland.
- Provides situational awareness for Gas Control
- $1.35M

Rivergate Regional Station (E-202895)
- Portland, OR
- Original scope involved a minor station rebuild to address inoperable valves, remediate SOF, and installation of annubar metering
- Valve maintenance was performed to make onerous valves operable again and reduced scope to only install annubar metering. The scope reduction met

compliance and safety requirements, and a future project is potentially necessary.

- $40k

Title

West Vancouver Gate Metering

Owning Department

Engineering

Business Case

- The existing annubar meter is legacy and needs replaced. If we lose the existing meter, we lose the odorizer which can lead to larger issues with unknown levels of odorant injection. The old meter needs to be replaced to update to current standards and improve measurement accuracy.
- The West Vancouver Gate Station currently has no check metering.
- The installation of an Ultrasonic Flow meter will provide flow quantity measurements and contribute to Gas Control monitoring, System Modeling BTU calculations, and IRP modeling forecasting.
- The site additionally does not possess a chromatograph for gas quality measurements.

Program

Not associated with a program

Discipline

Engineering

Discretionary?

Discretionary

Does this address a Safety or High Risk issue?

High Risk Issue

If safety or high risk, Please Explain

If the annubar flow meter were to be lost, NWN would have to rely on Williams flow data for odorant injection which would lead to a single point of failure. The inability to correclty inject odorant into our pipelines poses great safey risks.

Time constraints to start or complete initiative?

Complete new ultrasonic meter installation by Q4 of 2026.

Requested Start Date

9/2/2025

Alignment

Is this initiative called out as an officer goal?

No

Officer Goals

Is this work on your departmental roadmap?

Yes

If yes, please describe roadmap alignment

The West Vancouver Gate Metering project is included in Station Design's 10-year engineering plan.

Solving This Problem will:

Name
Be necessary for us to maintain operations
Will improve the way we currently do things

If any, explain current or future capabilities

This project will provide quantifiable station flow data for System Modeling and IRP forecasting.

Primary Benefit

The primary benefit of the installation of a new station ultrasonic meter is for check metering and gas flow measurement. Additionally, the addition of a chromatograph will provide BTU content for system modeling and quality measurements.

Upside

Initiative will lead to

Name
None of the above

Please explain growth opportunity or cost savings

None at this time.

Risks of company not tackling this initiative

- The main risk of not tackling this initiative would include the potential risk of losing the existing flow meter and losing the ability to correctly inject odorant into the pipeline.
- The risk of not tackling this initiative is that no higher resolution metering data will be provided for System and IRP modeling.
- Additionally, we would continually be reliant on metering data from Williams/NW Pipeline.
- Would not provide gas quality measurements for the gas flowing at the station.

Triage

Unless this is an engineering project, the following questions are optional for the project requestor. If you can answer them, it will help the Business Analyst complete the triage effort. If this is an Engineering project, you'll want to complete the triage now, completing the below information and then noting any resources needed in the schedule set up.

Rough Order of Magnitude: Cost

<$1MM

Rough Order of Magnitude: Effort

2 - Medium

Rough Order of Magnitude: Benefits

1 - High

Rough Order of Magnitude: Timeline

>12 months

Risks Associated with This Project

The risks associated with this project may include the addition of scope during the assessment and planning phases of the project. Initial scope is to install an ultrasonic flow meter, tie into existing RTU panel, reconfigure station piping to accomodate new flow meter, and assess documentation of station piping if needing replaced. Additionally, long lead time for the ultrasonic meter may impact project scheduling. Also, there is an existing building at the West Vancouver Gate Station and working around the building may pose challenges for construction.

Known Assumptions at Initiation Phase

- It is assumed that any updates to the existing building at the site and are out of scope.
- Engineered pipe design will be completed by NWN Station Design Engineers.
  Work will be completed by internal northwest natural crews.
- The existing RTU panel will be utilized to tie in the new ultrasonic meter and flow conditioner.
- Assuming all work will be completed within the existing station fence and no permits will be required for construction.
- Station piping will be assessed for proper documentation and will be included in scope if documentation needs to be updated.

Triage - Effort

What teams would need to be involved in implementing this project?

Teams involved in implementation

Name	Please select (VH, H, M, L or VL)

Preliminary Scope of Gas Facility Work

The preliminary scope of the West Vancouver Metering project includes installation of a new ultrasonic check meter and chromatograph for gas quality measurements. This includes modifying existing gas piping to accomodate the new ultrasonc meter, installation of the new chromatograph, integrating new telemetry equipment into existing RTU panel, activating pipeline and commissioning equipment.

Is there an IT impact?

Yes

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: ***Mist GC500/GC600 Turbine Compressor Replacement***
Date: *01/21/2024*
Project Sponsor: *Daniel Kizer*
Executive Sponsor: *Dave Weber, Joe Karney*
Project Manager: *Brion Larson*
Preparer: *Michael Hwang, Brion Larson*
Was this project part of IRP: *NO*

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which routes we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	*NW Natural operates two Siemens turbine compressor units, which are critical to NW Natural's underground gas storage operations (GC500 and GC600 turbine compressor units).* *Without the availability of core and structural replacements from Siemens (The Original Equipment Manufacturer), the Mist Miller Compressor Station has faced operational and maintenance challenges due to the operation of turbine compressor assets beyond their useful life. As equipment approach the end of their useful life, operational and maintenance issues exponentially accelerate. This is being clearly witnessed in the field today and reliable service of these assets is no longer sustainable.* *The existing GC500 and GC600 turbines were installed in 1998 and 2001, respectively. Both units have an expected compressor core lifetime of 20 years which has been exceeded. Additionally the OEM no longer supports or produces parts for these specific units. As the GC 500 experienced more operations and equipment breakdown issues in recent years, the dependance on usage of the GC600 has dramatically increased. In 2016 the GC500 had 47,000hrs and the GC600 had 18,000hrs. Current day the GC500 has 56,500 hrs. and the GC600 has 42,500 hrs. Due to this sharp increase in utilization of the GC600, the GC600 has accelerated towards the end of its useful life.* *Despite efforts to repair and improve reliability of these assets and reduction of failure duration, failures are still occurring more frequently. The odds of a failure occurring during a winter event will only increase as the assets further age and outages become more frequent. Figure 1 illustrates the culmination of major outages of both NW Natural's turbine assets (GC500 and GC600). This chart does not capture maintenance events but is still an accurate indicator of the equipment's exponential decay.*

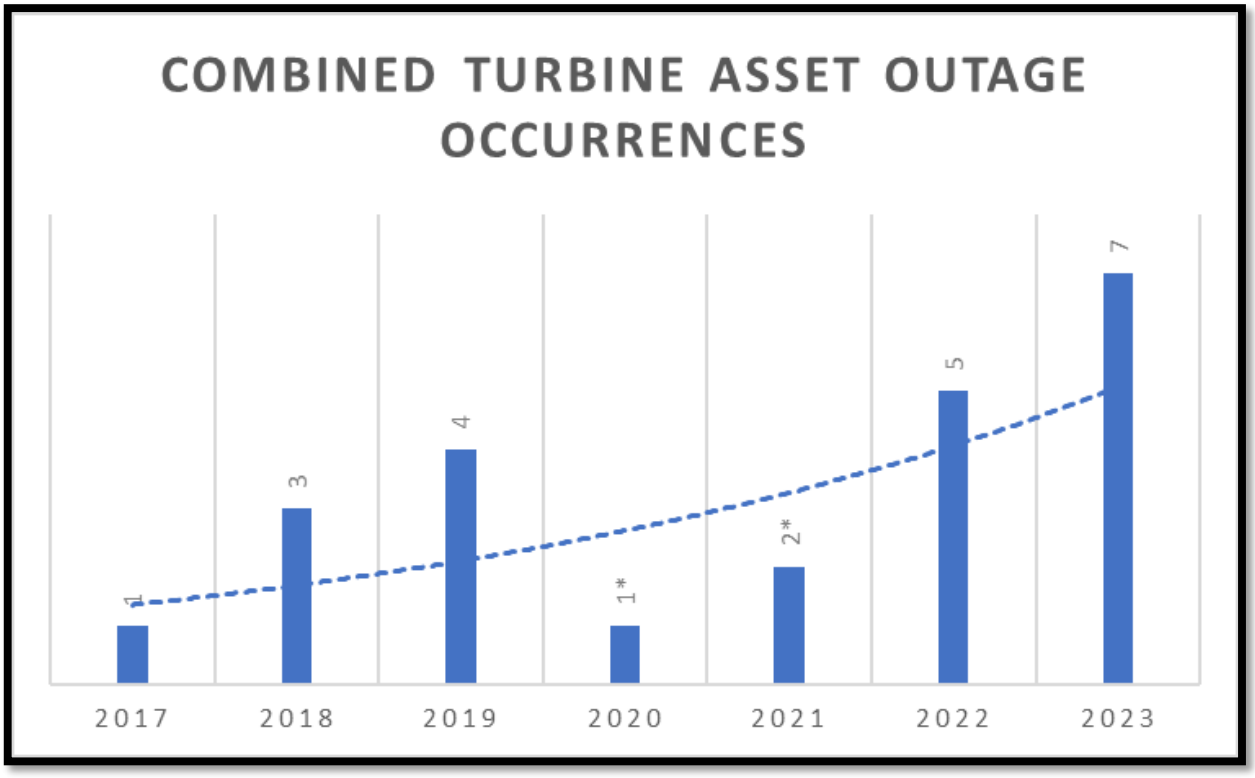

Figure 1: Turbine Asset Major Outages Cumulative Incidents by Year
**GC500 Turbine was not available for regular operations and was not utilized*

The importance of reliable storage gas delivery was demonstrated during the recent five record days of Mist withdrawal (between January 12 and 18, 2024). The age of the compressor equipment, high cost and potential limited availability of gas on the spot market as well as the inability to procure compressor parts in a timely manner, long lead times to manufacture parts, and the unknown reliability of the spare units has necessitated the urgency to replace the existing equipment as quickly as possible.

During cold weather events, such as those we experienced in January 2024, NW Natural has estimated that the loss of one turbine compressor would lead to a loss of gas service to approximately 200,000 customers (25% of our current customer count). Once NW Natural loses gas pressure to a customer, gas restoration is a 3-step process, with the third step of restoration only possible when system gas pressure is assured. The January 2024 cold weather would have caused repeated, daily low-pressure outages in our distribution system and loss of service due to lack of pressure. It's estimated that the recent, January 2024 cold weather would have prohibited the start of service restoration for six days, should NW Natural have experienced failure of one of the turbine compressors at the beginning of the recent cold weather that we experienced. The estimated time and resources required to complete service restoration for 200,000 customers, once weather warmed and system pressures were stabilized, is beyond any scale we've experienced.

NW Natural has recent experience resourcing a smaller, large system outage. After a Williams gate station was damaged by a motor vehicle in White Salmon, WA in December 2020, NW Natural lost service to nearly 5,000 customers in White Salmon, WA, Hood River and Odell, OR and the restoration process was nearly one week, which was achieved with the mutual assistance of staff from neighboring utilities. During the recent January 2024 cold weather our neighboring utilities experienced power supply and gas supply challenges that would have limited their ability to supply personnel resources to NW Natural should NW Natural have lost service to 200,000 customers. This fact presented a significant additional risk and increases the need for NW Natural to ensure reliability of our storage compression equipment.

The reliability risk extends beyond a peak-day event and involves many variables. A less severe winter event could still cause an outage affecting thousands, with the impact varying on a graduated scale depending on customer demand. NW Natural has a firm pipeline withdrawal allowance and relies on Mist storage as part of the baseline gas load. Without Mist Storage, NW Natural's pipeline withdrawal allowance would very likely be insufficient during any winter event. During a prolonged outage without NW Natural's turbine compressors in the heating season, it is almost certain that NW Natural will experience a large customer outage.

	Additional risk of outages outside of winter events exist, considering that the GC600 and GC500 turbine compressors were designed to operate at their peak during different times of the season due to their non-identical nature, NW Natural lacks full redundancy when one compressor is down. A single turbine compressor outage at our lower inventory levels could cause significant outages similar to losing both turbine compressors. *The GC600 is more effective when operating at lower compression ratios, such as early in the withdrawal season when gas reservoir pressures are higher. The GC500 is more effective at high compression ratios, such as later in the withdrawal season when gas reservoir pressures are lower. At the end of the withdrawal and injection season, an unplanned loss of one turbine compressor could leave Mist Miller without any available turbine compression, resulting in 83% of the compression horsepower being unavailable. The reduction of 83% of compression horsepower at 50% inventory would result in a 405 mmscfd reduction.* *A real scenario during the month of February 2023 highlights the high resiliency risk of NW Natural's existing turbine compressor assets. In that month, the GC500 experienced two consecutive showerhead failures. Faced with an impending winter event and only about a week to prepare, NW Natural had no choice but to reuse the non-serviceable combustion liners that lead to the overheating of our turbine and the reuse of non-serviceable first-stage blades, as seen in Figure 2. NW Natural managed to operate for around 72 hours successfully, getting past the winter storm, before experiencing another showerhead failure. This failure led to a 4-5 month outage.* *Figure 2: Borescope Image of the Non-Serviceable 1st Stage Blades* *Figure 2 shows metal deposition on the air-cooled 1st stage blades for the combustion liner showerhead failure. This metal deposition will cause cooling and balance issues. This level of metal deposition deemed the 1st stage blades as non-serviceable.*
Problem Statement In simple terms, what are we trying to solve? What is the	*Currently, the GC500 and GC600 have exceeded their operational useful life. Due to the age of the turbine equipment, Siemens engineering's lack of familiarity of these one-off legacy compressors, lack of spare parts available for purchase (globally), lead time to manufacture replacement parts, increasing major equipment outages, and the time to install a spare turbine increases the chances for failure of one or both existing turbines disrupting the supply of storage gas to our utility customers. Even with NW Natural owned cold spares, a gas generator failure could take one week, and a power turbine failure could take one month.*

business need this is tackling? Why is this a problem worth solving (e.g., why is the current state not working)?	*During the recent record Mist withdrawal days in January 2024, its estimated the loss of one turbine compressor could result in the potential loss of approximately 200,000 customers.* *Failures commonly require the return of the turbine compressor core to the Maintenance Repair and Overhaul Center (MROC) in Houston, Texas. The GC500 was sent to MROC in 2022 and 2023 for overhauls, consuming four to six months before it was returned to service each of those years.* *Additionally, very few of the same units exist and are operated regularly. Due to the one-off nature of these turbine compressor packages, common failure modes are unknown, true mean time statistical data between failures is limited, and replacement parts need to be reengineered and manufactured individually. This is evidenced by the GC500's overheating issues taking over three years to resolve, the GC500's showerhead failure taking one year to resolve, the GC500's combustion liner harmonics still under investigation, and the GC600's partial showerhead failure still under investigation. Furthermore, the GC500's rear turbine support case and power turbine shaft are needed critical spares. These components have been in process with Siemens engineering for over a year due to the supply chain and manufacturing processes needing to be redeveloped and engineered.*
Desired Deliverables What high level output / scope / deliverables are core to this project?	*The desired deliverable is to replace the two turbine units with Solar Taurus 60 units. These compressor units were identified during a recent Front End Engineering Study (FEED) performed by one of our engineering consultants of record. The FEED studied looked at past Mist operational send out records and system operational parameters and identified the compressor that best fits our operational requirements. There are 2000 like for like Solar units in operation and not only do these units have a track record of years of dependability, but also have statistical data to support their mean time between overhauls. Solar's mean time between overhauls prevents operators operating the units to failure. The two new turbine compressors will be identical allowing for flexibility for each unit to operate in all ranges of pressures and conditions independently. Thus, creating more flexibility, increasing resiliency, and reducing the quantity of spare part required in storage at NW Naturals operations.* *Recently NW Natural had procured spare compressor units for the GC600 and the GC500 to provide emergency backup should one of them experience a failure. The spares were purchased for backup purposes and the Company had decided to move forward with the replacement of the GC500 and GC600 in 2026 and 2027. 2026 and 2027 construction allowed the Company to procure the Oregon Department of Energy (ODOE) Energy Facility Siting Council (EFSC) permit before proceeding with compressor procurement, final engineering and construction. Recent weather events and five record setting Mist storage gas delivery days in January 2024, has increased the urgency to replace the existing units, accelerating construction by one year to the years 2025 and 2026. Under this new, accelerated schedule, the Company has elected to proceed with procurement of the GC500 compressor replacement and final engineering before the Oregon DOE EFSC permit is received.* *NW Natural will first begin construction on the older GC500 while keeping the GC600 online to support injection operations. During this time, the heavier dependence of the GC600 will further accelerate the end of life of this asset, hours on the GC600 are estimated to exceed 50,000hrs. Because of the heavier utilization in the recent years, the replacement of the GC600 will follow the GC500 the next injection season. During the construction of the GC600, the replacement GC500 will continue to support operations.*

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*

Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	*Burns & McDonnell, Michael Hwang, P.E., Brion Larson, and Miller Station operations were involved in choosing these options.* *Resiliency, time of implementation, equipment support, and costs were considered in the evaluation of options.* *Reference Burn & McDonnell's Sim and Unit Selection Report*
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality, that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Resiliency	*The project goal is to provide a unit with a proven track record of reliability and with plentiful field data to avoid operating until failure. Additionally, a unit that is diverse enough to independently work in all potential operational conditions existing at the Miller storage facilities.*
Criteria: Time of implementation	*The time of implementation of the recommended alternative is crucial for operational reliability.* *The existing GC500 and GC600 turbines were installed in 1998 and 2001, respectively. Both units have an expected compressor core lifetime of 20 years which has been exceeded, additionally the manufacture no longer supports or produces many parts for these units.* *Construction is scheduled for a two-year timeline, one unit per year to maintain the operation of the Mist Miller storage facility during the injection and withdrawal season. Construction is expected to begin post heating season and prior to February. This scope of work was originally scheduled for 2026 and 2027. However, with the five-record setting gas delivery days, availability of spare parts and the increasing trend of mechanical outages has increased the urgency to replace the existing units, accelerating construction years to 2025 and 2026.*
Criteria: Equipment Support	*The goal is to select a vendor/product with a proven track record of reliability and support. Including the availability of spare parts and technician availability to react to issues that may occur.*
Criteria: Cost /Benefit	*The analysis should be based on the most cost-effective, reliable and manufacturer supported option.*

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	*In the fourth quarter of 2022, Burns & McDonnell partnered with NW Natural to evaluate the existing Mist Miller Storage facility needs, specifically the replacement of the existing gas turbine compressors. Burns & McDonnell prepared a study that addressed operational issues and concerns related to the existing gas turbine compressors and proposed to the NW Natural team to acquire two new gas turbine compressors and associated equipment to replace the existing units.* *The report evaluated multiple unit and compressor combinations before coming up with the final replacement recommendation of the existing turbines in operation at the Mist Miller Compressor/Storage facility. Based on Burns & McDonnell's assessment the following modifications were recommended after evaluating the multiple scenarios:* • *Replace the existing GC500 and GC600 Siemens Gas Turbines and compressor units with new two Solar Turbine Taurus 60s with Tandem compressors.* • *Install a new fuel gas system to condition the fuel supply to the gas turbines.* • *Replace the existing gas aftercoolers with new coolers to improve the operational range of the turbine compressors*
In brief, why is this the recommended option?	*Local Service Support (Oregon): Solar Turbines has a regional office based in Irvine, CA to support customers in the Western US, including Oregon. Operating out of this facility and Simulation and Units strategically located in the area, Solar has personnel locally to ensure highest equipment availability and support:* • *District Service Manager* • *Aftermarket Account Manager* • *Two (2) Field Office Coordinators* • *Two (2) Field Service Supervisors* • *Regional Field Engineer* • *Fleet Manager(s)* • *Eighteen (18) Field Service Representatives* *On-Time Delivery: Solar understands that delivery is important to their clients and has developed a proven order execution strategy which has resulted in a > 99 % on-time delivery for customers in the past 11 years. This proven strategy also means quicker and more comprehensive production of engineering deliverables to support our customers.* *Expertise: Over 2,000 like for like units are in operations. Known failure modes have been eliminated and operators can reliably operate until the mean time between overhaul limits.* *Proven Performance & Emissions: With Solar's experience globally, they recognize the criticality of meeting environmental requirements. The Taurus 60's offered will meet 25 ppm NOx and 25 ppm CO, with an expansive range from 50% to 100% load, utilizing Solar's proven SoLoNOx technology. This provides significant operational flexibility, while still maintaining ultra-low emissions. The Taurus 60 compression solution meets all the site process conditions provided to Solar at an optimal efficiency.* *Total Lifecycle Support: Solar's commitment is to provide complete lifecycle support to our customer. Solar will ensure a seamless handover between business development, project management, and field service for a successful commissioning and startup. Throughout the life of operations Solar will provide comprehensive support for field service, spare parts, overhauls and upgrades, package system updates, asset optimization, and more. Solar also offers many comprehensive service programs which can be tailored to meet NW Natural's needs. Additionally, due to the large fleet of identical Taurus 60 units, Solar stocks turbine cores and provides a 14-day turnaround for emergency replacements. (Impeller of the centrifugal are application specific, spares will be purchased)*

<table>
<tr><td></td><td colspan="2">With a Solar Turbine Taurus 60 as the selected solution, current day challenges and risks will be greatly reduced.

The current day and problem statement synopses from above are as follows:
• Turbine Compressor Unit Reliability
• Between 2016 to 2023, 78 out of 96 months at least one turbine compressor has been out of service from unplanned outages.
• Major outage frequency is increasing
• Our ability to provide reliable service to our customers during peak cold weather events is becoming a greater unknown due to equipment unreliability.
• GC500 currently has 56,500 hrs. and the GC600 has 42,500 hrs.
• GC600's reliability is at risk as the usage approached the GC500's
• Lack of OEM support and knowledge of NW Naturals one of a kind compressor units
• Spot gas will need to be purchased, AECOM in 2020 estimates one day of downtime is $12m
• If spot gas is not available (Peak Day Event), outages exceeding 200,000 customers is possible</td></tr>
<tr><td rowspan="4">Assessment</td><td>Criteria: Resiliency</td><td>Solar Turbines has been an energy solutions provider for over 95 years. Solar has shipped over 16,000 gas turbines and 6,500 gas compressors which are supported globally by their Customer Services organization. The Taurus 60 was first introduced in 1987 and Solar has sold over 2000 Taurus 60 packages. Solar has proven durability and experience in critical applications, with an emphasis on low emissions. Solar also has extensive experience providing products and services for similar applications, with a proven track record, and ease of execution with North America based manufacturing. With such a large fleet of Taurus 60's, spare cores are available within 14 days in the event of an unplanned failure.</td></tr>
<tr><td>Criteria: Time of implementation</td><td>Solar understands that delivery is important to our clients and has developed a proven order execution strategy which has resulted in a > 99 % on-time delivery for our customers in the past 11 years. This proven strategy also means quicker and more comprehensive production of engineering deliverables to support our customers.</td></tr>
<tr><td>Criteria: Equipment Support</td><td>Solar's commitment is to provide complete lifecycle support to our customer. Solar will ensure a seamless handover between business development, project management, and field service for a successful commissioning and startup. Throughout the life of operations Solar will provide comprehensive support for field service, spare parts, overhauls and upgrades, package system updates, asset optimization, and more. Solar also offers many comprehensive service programs which can be tailored to meet NW Natural's needs.</td></tr>
<tr><td>Criteria: Cost</td><td>Having a reliable, original equipment manufacturer (OEM) supported equipment package that has a proven, successful operational track record is the most cost-effective option.

One form is the reduction of purchasing spot gas. When storage gas is unavailable, gas must be purchased at market price. At times of high demand, this cost can be in the magnitude of millions of dollars per day more.

The other form of cost offsets is the avoidance of major customer outages. The importance of reliable storage gas delivery is evidenced by the recent five record Mist withdraw days and during these recent record Mist withdraw days, the loss of one turbine compressor could be the loss of approximately 200,000 customers.</td></tr>
</table>

<table>
<tr><td rowspan="2">Assessment</td><td>Additional Risks</td><td>• Timely process approvals, negotiating terms and conditions, and procurement of the Taurus 60 package.
• Completing construction within the allotted schedule (weather delays, fire season,
• Supply chain delays beyond the quoted lead times
• Approval of the EFSC permit prior to May 1, 2025</td></tr>
<tr><td>Additional Benefits</td><td>• Construction 2025 mitigates the risk of failure one year earlier than the original schedule of 2026. One full heating season earlier than originally estimated.</td></tr>

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	*Do nothing.*
In brief, why is this option not recommended?	*By maintaining the status quo, the project team will not address the root causes of major structural component failures. With the existing units exceeding their operational usefulness due to the age of the turbine equipment, lack of spare parts available for purchase (globally), lead time to manufacture replacement parts, increasing number of major outages and the unknown reliability of the spare turbines, significantly increases the chances for failure of one or both existing turbines. Additionally, for the same reasons increasing the likelihood of failure, time to repair those failures will increase with each additional failure. Failures will continue to be unpredictable.* • *Age of existing equipment: The existing GC500 and GC600 turbines were originally installed in 1998 and 2001, respectively. Both units have an expected compressor core lifetime of 20 years which has been exceeded, additionally the manufacture no longer supports or produces parts for these specific units. Also, highlighting that since 2016 the GC500 has ran approximately 8,000 hours and the GC600 operated 24,000 hours. The importance of this consideration is that the GC600 is approaching the total hours the GC500 had in 2016, when the string of unplanned outages started to increase in frequency and duration.* • *Repair parts availability/ lead times/ expertise: Rebuilding the GC500 in 2022 and 2023, rendering the unit unavailable for 4 and 6 months respectively. This has emphasized the lack of knowledge at Siemens required for overhauls in addition to the lack of parts. The lack of knowledge and parts, combined with the frequency of unit failures has highlighted the urgency for replacement. During the most recent 2023 overhaul, the Maintenance Repair Overhaul Center (MROC) took over 10 bench tests to correctly pass factory acceptance. In 2018/19 the Siemens authorized MROC did not trim the 4th stage blades properly. This factory error identified post installation at the Mist Miller facility, resulted in immediate failure and the turbine was returned to MROC.* *With the low fleet numbers of identical units and the GC500 being the only of its kind regularly operated, Siemens does not have the expertise to support our turbine compressors. Common failure modes are unknown, true mean time statistical data between failures is limited, and replacement parts need to be reengineered and manufactured individually.* *This is further proven by the GC500's overheating issues taking over three years to resolve, the GC500's showerhead failure taking one year to resolve, the GC500's combustion liner harmonics still under investigation, and the GC600's partial showerhead failure still under investigation. Furthermore, the GC500's rear turbine support case and power turbine shaft are needed critical spares. These components have been in process with Siemens engineering for over a year due to the supply chain and manufacturing issues needing to be redeveloped and engineered.* • *Outage Frequency / Duration: As depicted in Figure 1 on Page 2, the frequency of major outages has increased over a 7-year period. Due to the anomalies in 2020 and 2021, the GC500 was mostly out of service for those two years. As stated above, as outage frequency increases the duration of the outage has decreased; however, with every repair to the units' spare parts have become less available and we expect that soon the durations will increase dramatically.* • *Spare Turbines: In 2022, NWN began researching the purchase of spare turbines. Two gas generators were identified and negotiated, and these units were purchased and rebuilt in 2023. units are in storage at the Mist Miller compressor station. However, these units are a combination of five decommissioned units sourced globally of unknown vintage, their reliability in our system is untested, and the availability of parts beyond what NW Natural owns today are not manufacturable without significant engineering of a new manufacturing process and supply chain. The power turbines are more unique and are still undergoing investigation with Siemens engineering.*

	Since 2017, approximately $15M has been spent to ensure reliability and maintain service to our customers. Combined with the uncertainty and reliability of the units has increased the urgency for replacement accelerating installation into the 2025 construction season. *Doing nothing as an alternative will result in extra cost to our customers due to compressor downtime. Spot gas will need to be purchased when compressors are unavailable. In the 2020 AECOM study, they estimate the additional cost of spot gas for one day of downtime to be $12M If spot gas is not available which is common during a peak day event, a force majeure will be required and outages which could exceed 200,000 customers is a possibility.*	
Assessment	**Analysis Against Criteria: Resiliency**	*Taking no action will not resolve operational issues or other issues related to OEM unresponsiveness, lack of spare parts, etc.*
	Analysis Against Criteria: Time of Implementation	*Taking no action will result in increasing risk of significant downtime, impacting Plant availability and reducing overall flow capacity.*
	Criteria: Equipment Support	*OEM support of the equipment will still be poor and will likely get worse as fleet numbers decrease.*
	Analysis Against Criteria: Cost	*This alternative will not require any funds.*
	Additional Risks	*Taking no action will not improve site resiliency.*
	Additional Benefits	*None.*

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$0.00	$0.00	$0.00
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0.00	$0.00	
Source/ Method of Cost Data	N/A.		

**Copy/Add table for any additional alternatives*

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	*Replace the existing GC500 with a Siemens SGT-100 equivalent driver and re-wheel the existing compressor. Continue to operate the GC600 as is. This was the original recommendation from the 2020 AECOM study. With 3 more years of operational experience, this option was no longer recommended as described in Burns & McDonnell's Turbine Study Report.*
In brief, why is this option not recommended?	*Replacing the existing GC500 with a Siemens SGT-100 equivalent driver will not provide a long-term solution to NWN due to the reliability and availability of the existing gas turbine compressor units, as well as lack of response from the original equipment manufacturer (OEM), lack of spare parts, and extended lead times. In North America, only one other SGT-100 is in operations.* *The GC600 unit is approaching the same usage as the GC500. The two units are near identical, except for the high compressor discharge pressure leading to more horsepower out of the GC600.*

	The GC600 will have the same issues as the GC500 as it ages with unplanned failures and OEM support. *This alternative only offers a partial solution. Maintenance and failure issues will continue based on the historical experience with the same model that the operations team has used for decades.*	
Assessment	**Criteria: Resiliency**	*This alternative will not offer a long-term solution to NWN, as operational issues are related to the reliability and availability of the existing gas turbine compressor units. The alternative will not remediate other issues related to the lack of response from the OEM, lack of spare parts, etc.* *Replacing the GC500 driver with a Siemens SGT-100 equivalent driver will potentially lead to the same issues Operations has been facing for years. There is only one SGT-100 in use in North America. Additionally, this alternative does not address the aging GC600 that soon could have reliability issues as it approaches the same usage as the GC500. Since 2016 the GC500 has ran approximately 8,000 hours and the GC600 operated 24,000 hours. The importance of this consideration is that the GC600 is approaching the total hours the GC500 had in 2016, when the string of unplanned outages started to increase in frequency and duration.*
	Criteria: Time of Implementation	*This alternative timeline is similar to the recommended option.*
	Criteria: Equipment Support	*OEM support of the equipment will still be poor*
	Criteria: Cost	*The cost of implementation of approximately $8.2MM, with minimal change to OEM support and limited availability to the parts does not improve the unit reliability enough to justify the cost.*
	Additional Risks	*This alternative does not consider redundancy of the units or increasing the flow rate of each gas turbine unit.*
	Additional Benefits	

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH (TBD)**	**Total**
	$8,200,000	**TBD**	**TBD**
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0,00	$0,00

ALTERNATIVE 3 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	*Replace the existing GC500 and GC600 with two Centaur 50L turbine compressors*
In brief, why is this option not recommended?	*The Centaur 50L turbine compressor, a considered lower horsepower alternative, presented operational challenges and did not meet NW Natural's resiliency requirements. The overall lower throughput of the Centaur 50L would worsen NW Naturals current state, due to lower daily send out capacity, as seen in Figure 3.*  *Figure 3: Site Resiliency, One Turbine Out of Service Max Deliverability at 50% Inventory* *The Centaur 50L is less common than the Taurus 60 and Centaur 50 (50L designates a different configuration) due to the utilization of a more unique power turbine. Although the Centaur 50L is currently supported, there is less business incentive, given the lower fleet number, to continue its lifecycle management. Additionally, because of the lower fleet numbers, obtaining spare parts may be more challenging, and technical expertise will be more limited compared to the Taurus 60 and Centaur 50. Currently there are no known Centaur 50L's in our service region. The Centaur 50L also offers no advantages over the Taurus 60, with the centrifugal compressor selection and overall package size remaining the same. The overall cost difference to the project would be less than 3%.* *Furthermore, a Centaur 50L would not have enough horsepower to stay out of surge at certain operating conditions, such as the end of NW Natural's injection season. At the tail end of NW Natural's injection season, ambient temperatures may reach 100f. As seen in Figure 4, the Centaur 50L would not be capable of operating in 100f conditions due to the reduced efficiency at the higher ambient temperature and would run out of horsepower. The Centaur 50L would need to stop operations until ambient temperatures drop.*

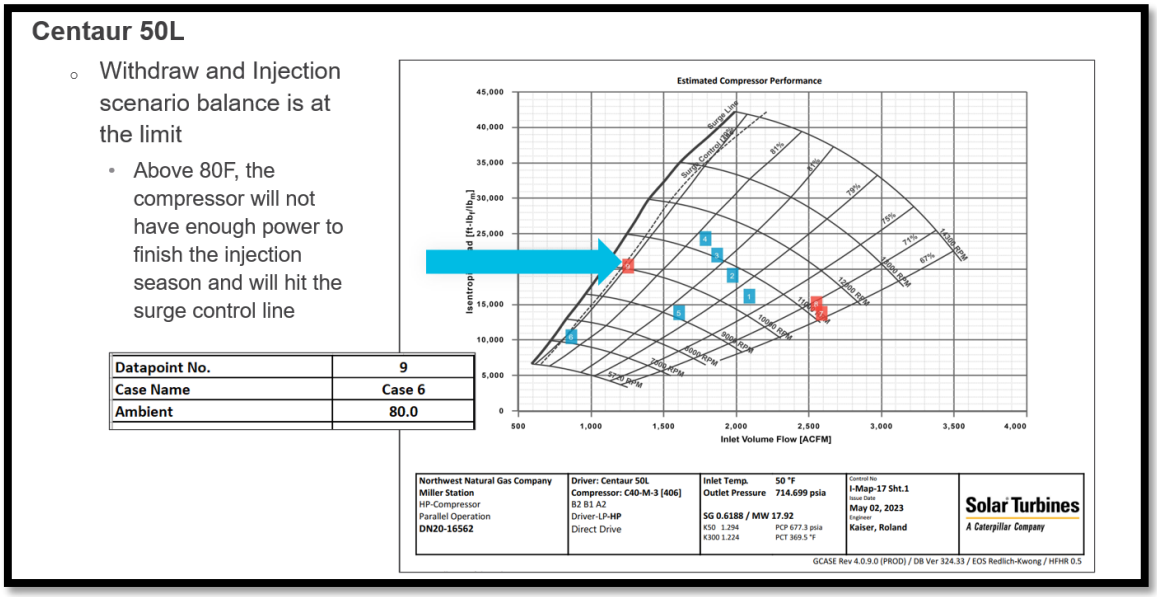

Figure 4: Centaur 50L Compressor Map

In summary, the Centaur 50L, being a more unique turbine, would expose NW Natural to greater future support risks, create a less resilient compressor station, and be unable to operate in high differential conditions at the end of our injection season. For these reasons, the Centaur 50L was not selected.

Assessment	**Analysis Against Criteria: Resiliency**	*The Centaur 50L turbine compressor did not meet NW Natural's resiliency requirements. The overall lower throughput of the Centaur 50L would worsen NW Naturals current state as seen in Figure 3. Additionally, the Centaur 50L, being a more unique turbine, would expose NW Natural to greater future support risks.*
	Analysis Against Criteria: Time of Implementation	*The duration would be the same as NW Naturals recommended option*
	Criteria: Equipment Support	*Currently there are no known Centaur 50L's in our service region. Obtaining spare parts may be more challenging, and technical expertise will be more limited compared to the Taurus 60 and Centaur 50. The Centaur 50L is less common than the Taurus 60 and Centaur 50 (50L designates a different configuration) due to the utilization of a more unique power turbine. Although the Centaur 50L is currently supported, there is less business incentive, given the lower fleet number, to continue its lifecycle management.*
	Analysis Against Criteria: Cost	*This alternative requires a lower cost of project implementation of about $60,352,000, mainly regarding the cost of the turbine compressor, design, material, and construction cost.*
	Additional Risks	*Long lead time for the permit approval process and OPUC acknowledgment.*
	Additional Benefits	
POTENTIAL COST (EXCLUDING CONTINGENCY)		

Capital Range	Direct	CURRENT COH	Total
	$60,082,000	TBD	TBD
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0.00	$0.00	
Source/ Method of Cost Data	*Burns & McDonnell - Simulation and Unit Selection report.* Solar Equipment Budgetary Estimates		

ALTERNATIVE 4 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	*Replace the existing GC500 and GC600 with a single Mars 90 turbine compressor*
In brief, why is this option not recommended?	*A singular Mars 90 turbine compressor would be oversized 99% of the time. Peak events represent extreme conditions. Sizing a single compressor for peak events would make it challenging to control and operate under normal conditions. A more recommended practice would be to stage compressors sized more closely to the median flow rates required in parallel and to bring them online sequentially as needed.* *Excessive recycling of gas from the discharge back into the suction of the compressor would be necessary with a singular Mars 90 turbine compressor. Figure 5 represents the daily quantity of withdrawn gas in mmscfd over 6 years. 75% of the time, the flow rate demand was less than 180mmscfd. Additionally, 25% of the time, the flow rate was below 55mmscfd. The minimum flow rate requirement at Mist Miller is 30mmscfd for the turbine compressors. To comply with NW Naturals' emission permit limits, a Mars 90 should not fall below 7,000-8,000 horsepower. Figure 6, a high-level simulation demonstrates that 320mmscfd of recycling would be necessary to keep the compressor adequately loaded to meet our minimum flow rate requirements due to emission regulations. This is not an industry best practice, and this alternative was not recommended by three independent engineering firms. The turbine compressor would operate at 50% load almost indefinitely, excluding peak events. This would be an abnormal operating condition that no other operators would have experience operating in for a prolonged period, and unplanned/unknown issues may arise when operating a turbine compressor in this manner.* *The Mars 90 compressor is 48' with a single centrifugal compressor. NW Natural's Mist Storage field has a wide operating range from 250psig to 1200psig. To accommodate this large operating range, a tandem centrifugal compressor configuration will be needed, reference Figure 8. This will further increase the length of the single Mars 90 turbine compressor to 55'-60'. NW Naturals' existing building is 75'x50'. The added room to comply with NEC 70 electrical code and room for rotor maintenance is beyond what the existing building could feasibly be expanded to. The unit must be installed 90 degrees from the existing compressor orientation. The existing compressor orientation can be seen in Figure 9. This would result in both turbine compressors being out of commission for the entire injection season. The reduction of 83% of compression horsepower at 50% inventory would result in a 405 mmscfd reduction. This would present major operational challenges and put Mist Miller at risk of not being able to fill the storage reservoirs sufficiently, leading to a shortage of storage gas and an increased need to purchase spot gas.* *Furthermore, being a singular large compressor making up 83% of the available compression horsepower, Mist Miller would be less resilient post project completion. This singular Mars 90 would essentially become a single point of failure, as seen in Figure 10.* *Considering the Mars 90 being greatly oversized 99% of the time, the abnormal unique operating conditions, the impact on operations during construction, the single point of failure, and the reduction in site resiliency, the Mars 90 is not a recommended solution.*

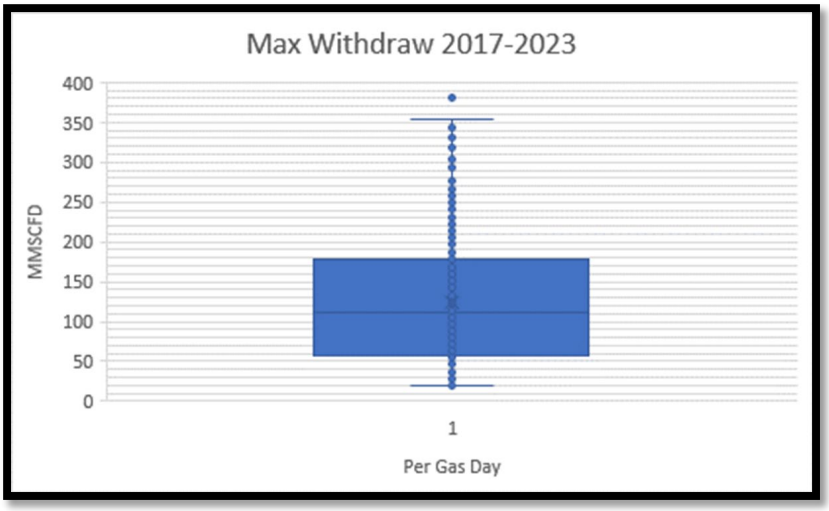

Figure 5: Box and Whisker of Withdrawn Gas by Day Rate

Figure 5 is a box and whisker plot; the outer whiskers represent 100% of the statistically significant data. The box represents the 25th and 75th quartile of the data set and the line the in middle of the box is the median.

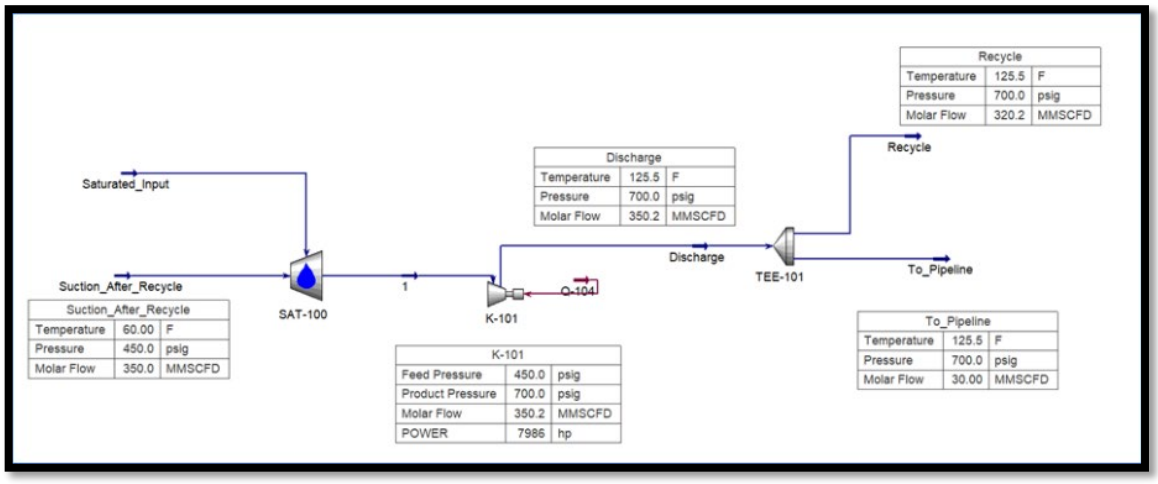

Figure 6: Mars 90 50% power Minimum Flow Rate Simulation

This simulation represents the minimum flow rate required to maintain 50% power at our 50% inventory level. 50% power is needed to maintain our emissions profile. Operating below this power threshold, emissions would no longer be guaranteed and would not be permitted.

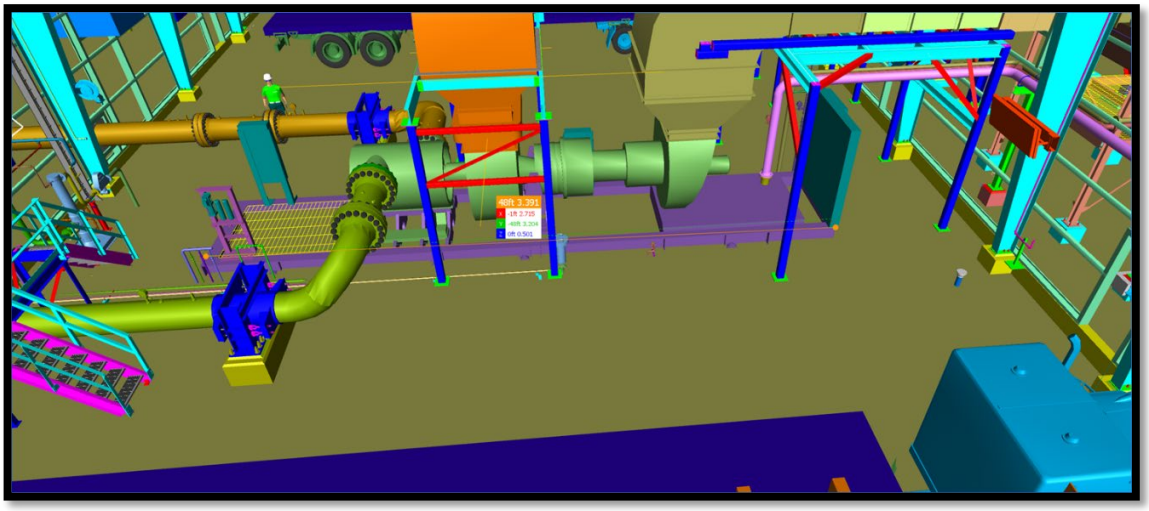

Figure 7: Mars 90 Skid Size, Single Compressor

The overall length of a Mars 90 is 48”, Figure 7 shows a model of a typical Mars 90 skid.

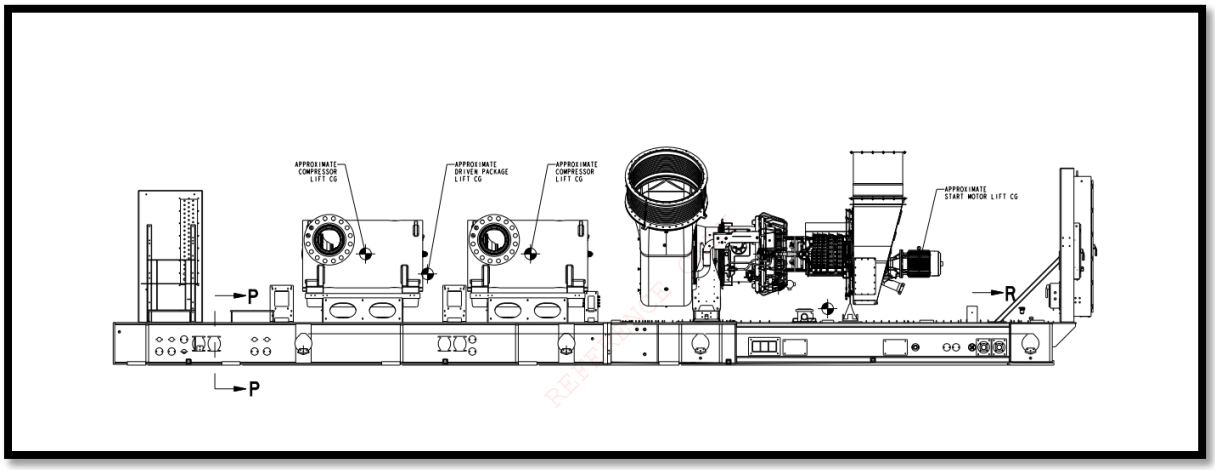

Figure 8: Solar Tandem Compressor Example

A tandem centrifugal compressor configuration is needed when more operational flexibility is needed. One centrifugal compressor is a high-pressure compressor and the other is a low-pressure centrifugal compressor. When compression ratios are low, the tandem compressors will operate in parallel. When compression ratios are high, the tandem compressors will operate in series.

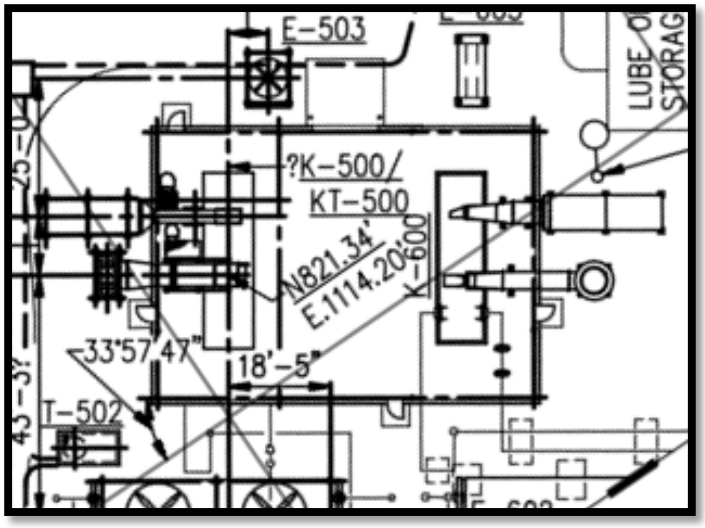

Figure 9: Mist Miller Compressor Building Existing Layout

Figure 9 is Mist Millers existing turbine building. The building is 75'x50'. A Mars 90 unit would need to be installed 90 degrees from the existing turbine compressors orientation. This would take both existing turbine compressors out of commission for the entirety of the injection season.

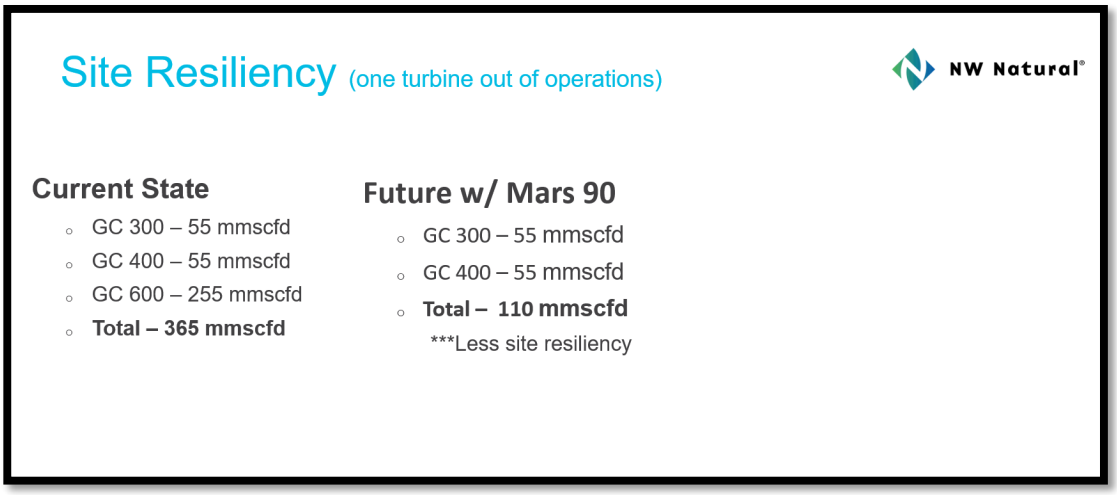

Figure 10: Site Resiliency, One Turbine Out of Service Max Deliverability at 50% Inventory

Assessment	**Analysis Against Criteria: Resiliency**	*Being a singular large compressor making up 83% of the available compression horsepower, Mist Miller would be in a less resilient state post project completion. This singular Mars 90 turbine compressor would essentially become a single point of failure as seen in Figure 10.*
	Analysis Against Criteria: Time of Implementation	*The unit must be installed 90 degrees from the existing compressor orientation. This would result in both existing turbine compressors being out of commission for the entire injection season.*

	Criteria: Equipment Support	*As stated in the recommended option, Solar's commitment is to provide complete lifecycle support to our customer, and they are well known for providing that service.*
	Analysis Against Criteria: Cost	*This alternative requires a lower cost of project implementation of about $47MM, mainly regarding the cost of the turbine compressor, design, material, and construction cost.*
	Additional Risks	*Long lead time for the permit approval process and OPUC acknowledgment.*
	Additional Benefits

BEFORE THE

WASHINGTON UTILITIES AND TRANSPORTATION COMMISSION

WASHINGTON UTILITIES AND TRANSPORTATION COMMISSION, Complainant, v. NORTHWEST NATURAL GAS COMPANY, Respondent.	Docket UG-250610

NORTHWEST NATURAL GAS COMPANY

Exhibit of Daniel B. Kizer and Scott S. Johnson

DISTRIBUTION SYSTEM AND STORAGE FACILITY PROJECTS

Exh. DBK-SSJ-12

August 29, 2025

Initial Project Charter

The initial project charter is intended to document the team's initial approach to analyzing the problem. Completed at the end of initiate, this will serve as the foundation for performing any studies or analysis as the project team weighs potential options for solving the underlying business case.

Initial

Project Description

Western Oregon Electric Co-Op will construct a new sub station located along the mainline at the 8-mile mark. This substation will be spliced into the existing feed between Miller Station and North Mist to individually feed both stations

or

Install a new feed parallel to the existing feed from Highway 202, up to Miller Station. An EFSC permit would need to be filed to proceed.

Project Cost will be split between North Mist App 564 (17%) and Miller App 18 (83%)

Business Case

NW Natural executed on a 2021 Miller Station Electrical Reliability Study with Harris Group identifying high level scopes of work recommended in tiers of priority.

NW Natural in 2023 executed on a front end engineering design (FEED) with Burns & McDonnell and determined the existing power feed was end of life and warranted a timely replacement due to the criticality and impact to Miller Station in the event of a failure.

The 2024 Burns & McDonnell Facility Assessment Study NW Natural will also include a recommendation to upgrade the end of life main power feed

The power feed to Miller Station, and subsequently to North Mist, needs to be replaced with a reliable solution to prevent any risk of failure. This will ensure that both facilities can maintain reliable operation and meet customer and contractual obligations.

Key Objectives and Outcomes

The power feed to Miller Station, and subsequently to North Mist, needs to be replaced with a reliable solution to prevent any risk of failure. This will ensure that both facilities can maintain reliable operation and meet customer and contractual obligations.

Rough Cost/Benefit Analysis Summary

Miller Station is currently fed by an underground cable circuit that runs from Highway 202 up to the station. The circuit consists of three single-conductor 1/0 cables, which terminate at Miller Station's switchgear. This switchgear also delivers power to North Mist and the well pads.

The existing cable is 29 years old and uses above-ground cable junction boxes located along the mainline. In the early 2000s, the cable was damaged by a dozer, which led to a subsequent failure several years later.

The power feed to Miller Station, and subsequently to North Mist, needs to be replaced with a reliable solution to prevent any risk of failure. This will ensure that both facilities can maintain reliable operation and meet customer and contractual obligations.

Rough Scope

Perform study to determine best path to install a new feed.

Third party engineering study will be performed to evaluate options for achieving a new power feed. This would include but not limited to:
-A new line ran along the access road up to Miller Station or Paying West O to drop a new sub station along the path between North Mist and Miller Station. This would feed North Mist and back feed to Miller Station.-Perform the engineering analysis and design (2025)
-This may include time and payment for West O company to install their facilities.

-Construction/Installation (2026)

Initial -Cont.

Known Constraints at Initiation Phase

Either option selected will have long lead materials that need to be ordered early,

Known Assumptions at Initiation Phase

Oregon DOE EFSC permit will be granted
This project will have Mixed Utility and Non-Utility Costs.
This project will have a portion allocated to North Mist

Mist Gas Storage Facility

Planning Document
2025 – 10-year plan
Date updated: February 24th, 2025.

Contents

Scope 4
Selection Criteria 5
Section One – 1 to 4 years (2025 to 2028) 5
Mist 2025 5
Mist Miller Custody Transfer Meters, Year 2 5
Mist Fuel Filtration, Year 3 5
Mist Well Pad Power Gas Hydrate Elimination 6
Mist Busch Manifold Flow Control Valve, Year 2 6
Mist GC500/GC600 Turbine Comp Replacement, Year 3 6
Mist Well Separator Replacements 2025-2029, Year 1 7
Mist Main Power Feed, Year 1 7
Mist-Birkenfeld Fire Pond Improvements 8
Mist/Miller Tier 1 & 2 Projects 2025 (Run Rate) 8
Mist 2026 8
Mist Miller Bruer/Flora/Meyer Metering Upgrade, Year 1 8
Mist GC500/GC600 Turbine Comp Replacement, Year 4 9
Mist Well Separator Replacements 2025-2029, Year 2 9
Mist/Miller Tier 1 & 2 Projects 2026 (Run Rate) 10
Mist Miller Bruer/Flora Gathering Separator, Year 1 10
Mist Main Power Feed, Year 2 10
Mist Miller Power Gas Elimination Assessment and Pilot, Year 1 11
Mist Miller Air Compressor and Receiver Tank Upgrades, Year 1 11
Mist 2027 12
Mist Miller Bruer/Flora Gathering Separator, Year 2 12
Mist Miller Power Gas Elimination Assessment and Pilot, Year 2 12
Mist Well Separator Replacements 2025-2029, Year 3 12
Mist Small Dehydration System Replacement (2028 IRP), Year 1 13
Mist/Miller Tier 1 & 2 Projects 2027 (Run Rate) 13
Mist Miller Bruer/Flora/Meyer Metering Upgrade, Year 2 13

Mist Miller Air Compressor and Receiver Tank Upgrades, Year 2 14
Mist Calvin Creek Gathering Separator 14
Mist 2028 15
Mist Miller Power Gas Elimination Assessment and Pilot, Year 2 15
Mist Oil Storage Secondary Containment 15
Mist Miller Controls Modernization 15
Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 1 16
Mist Small Dehydration System Replacement (2028 IRP), Year 2 16
Mist Well Separator Replacements 2025-2029, Year 4 17
Calvin Creek Area Meter Modernization-UT meter Replacement, Year 1 17
Mist Calvin Creek Gathering Separator, Year 2 17
Mist Miller Valve and Actuator Replacements 2028 18
Mist/Miller Tier 1 & 2 Projects 2028 (Run Rate) 18
Section Two – 5 to 6 years (2029 to 2030) 18
Mist 2029 18
Mist Diesel Generator, Year 1 18
Mist Miller Controls Modernization, Year 2 19
Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 2 19
Mist Well Separator Replacements 2025-2029, Year 5 20
Mist Miller Station Oily Wastewater Containment 20
Mist Small Dehydration System Replacement (2028 IRP), Year 3 20
Calvin Creek Area Meter Modernization-UT meter Replacement, Year 2 21
Mist/Miller Tier 1 & 2 Projects 2029 (Run Rate) 21
Mist 2030 21
Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 3 21
Mist Cathodic Protection, Year 1 22
Mist Small Dehydration System Replacement (2028 IRP), Year 4 22
Mist Diesel Generator, Year 2 23
Mist Compressor Fugitive Methane Capture, Year 1 23
Mist Miller Station Oily Wastewater Containment, Year 2 23
Mist/Miller Tier 1 & 2 Projects 2030 (Run Rate) 24
Section Three – 7 to 10 years (2031 to 2034) 24
Mist 2031 24
Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 4 24
Mist Cathodic Protection, Year 2 24
Mist Compressor Fugitive Methane Capture, Year 2 25

Mist Miller Valve and Actuator Replacements, 2031 25
Mist Miller North Facility Power 25
Mist/Miller Tier 1 & 2 Projects 2031 (Run Rate) 26
Mist 2032 26
Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 5 26
Mist Miller Large Dehy Modernization, Year 1 26
Mist/Miller Tier 1 & 2 Projects 2032 (Run Rate) 27
Mist 2033 27
Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 6 27
Mist Miller Large Dehy Modernization, Year 2 27
Mist Miller Main Flow Control Valve, Year 1 28
Mist Miller Air Compressors 28
Mist/Miller Tier 1 & 2 Projects 2033 (Run Rate) 28
Mist 2034 28
Mist Miller Valve and Actuator Replacements 2034 28
Mist Miller GC700 Overhaul 29
Mist Miller Main Flow Control Valve, Year 2 29
Mist Miller Flora/Bruer Flow Control Valve Replacement, Year 1 29
Mist/Miller Tier 1 & 2 Projects 2034 (Run Rate) 29
Mist 2035 30
Mist Miller GC700/800 Turbotronics Upgrade 30
Mist Miller GC800 Overhaul 30
Mist Miller Flora/Bruer Flow Control Valve Replacement 30
Mist/Miller Tier 1 & 2 Projects 2035 (Run Rate) 30
Section Four – Projects Completed in 2024 31
Mist 2024 31
Mist Miller Busch Schlicker 13B-11 Separator. 31
Mist GC600 Overhaul 31
Mist Fuel Filtration, Year 2 32
Mist GC500/GC600 Turbine Comp Replacement, Year 2 32
Mist GC 500 Cold Spare, Year 2 32
Mist GC 600 Cold Spare, Year 2 33
Mist Electrical System Upgrades Phase 2, Year 2 33
Mist Instrument and Controls Upgrade Phase 3, Year 2 33
Mist Methanol Injection Upgrade at Wellheads, Year 2 34
15 Year Plan, Mist Facility Assessment 34

Scope

This plan is for the Mist Gas Storage facility. Capital construction projects included in this plan are based upon projects identified in the 2016 EN Engineering Facility Assessment Study of the Mist Gas Storage Facility, a 2020 AECOM Mist Gas Storage Compression Assessment of all four compressors, a 2022 Burns and McDonnell Mist Gas Storage Turbine Compressor Assessment, and a 2024 Burns and McDonnell Mist Gas Storage15-Year Facility Assessment.

End-of-life assets may include and have several determinants, such as functional degradation, failure risks, or regulatory requirements. End-of-life indicators include:

- Severe corrosion within a component or system due to atmospheric, galvanic corrosion, or minor issues with insulation over time.
- Mechanical wear effects of any of the rotating equipment onsite.
- Fatigue caused by cycling in materials, particularly in systems with significant temperature changes.
- Technology that has become unsupported and at risk for failure without the ability to support a repair.

All required projects going forward will be constructed to contemporaneous seismic standards. This may require replacement of an original foundation with foundation systems designed to accommodate updated standards and ground liquefaction issues.

All required projects going forward will be constructed to contemporaneous cathodic protection standards. This usually requires isolation of above ground piping and the addition of jumper bonds to continue the cathodic protection of sub surface piping.

Project execution dates may be required to vary in the future from those identified due to:

- Unplanned failure of the gas storage systems and assets.
- New information obtained on the facility/component condition, resulting in a change to the urgency of the project.
- An opportunity to improve execution efficiency.
- The need to prevent and/or reduce interruptions to facility distribution system operations.
- Permitting.
- Loss of resources redirected to issues which require near term resolutions.
- The IRP processes.

Estimated or actual costs specified in this document do not include construction overhead (COH). These costs are also assumed to be in the current year of the plan and do not include escalation.

Selection Criteria

Each project is included in the plan for one or more of the following reasons:

- Replacement of equipment is at end-of-life.
- Refurbishment or preventative maintenance to extend the asset's useful life.
- Compliance with environmental or safety regulations or concerns.
- Identified within the reliability program

Section 1– 1 to 4 years (2025 to 2028)

Mist 2025

Mist Miller Custody Transfer Meters, Year 2

- The 15-year facility assessment performed by Burns and McDonnell identified the Custody transfer meter as an end-of-life asset due to support from the original manufacturer. This scope includes replacing the meter tubes and associated electrical components.
- Upgrading to NWN standard meters promotes operational resiliency and safety through maintenance, design practices, and standard functions.
- Accurate measurement of Injection/Withdrawal is critical for operational functions as well as billing and financial planning.
- Cost in 2025: $385,000 (Construction)
- Total project cost (2024/2025) $516,500. (+50%/-25%, $.75M/$0.387M)
- 100% Utility asset

Mist Fuel Filtration, Year 3

- In 2020 and 2023, NW Natural executed on an internal Root Cause Analysis (RCA) for the multiple turbine combustion system failures. A separate RCA was also performed by Siemens Energy (Original Equipment Manufacturer)
- Found liquids in the fuel supply for all fuel burning equipment have been identified as a contributor to the many outages and service interruptions.
- NW Natural performed an additional detailed assessment with Norwest summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- The 15-year facility assessment performed by Burns and McDonnell also identified this fuel supply to our fuel burning equipment as a risk to reliability. Burns and McDonnell recommends a fuel filtration system immediately downstream of the fuel supply tie in due to the significant elevation change further reducing risk of liquid accumulation slugs.
- Cost in 2025: $830,000 (Construction)
- Total project cost (2023-2025) $1,240,000. (+10%/-10%, $1.36M/$1.16M)
- 100% Utility Asset

Mist Well Pad Power Gas Hydrate Elimination

- NW Natural executed a project in 2023 and 2024 upgrading 13 Methanol injection systems. This includes new tanks and pump injection systems to mitigate hydrate formation on the control and metering equipment.
    - After installation and commissioning of this new equipment, an additional risk of hydrate formation has been identified in the power gas lines through the facilities, requiring modifications within the power gas lines that were not in included in the previous scope. Hydrates on these lines could cause valve failure to operate as designed.
    - This project is being categorized as "Break Fix" to maintain consistent operation of the injection system.
- Cost in 2025: $525,000 (+100%/-50%, $1.05M/$262K)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $351K
    - Non-Utility $173K

Mist Busch Manifold Flow Control Valve, Year 2

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonell identifying high level scopes of work recommended for plant reliability. The Busch Manifold Flow Control Valves replacements were included as a recommended project to replace end of life equipment.
- When initiated, NW Natural will utilize a third-party engineering service provider to perform a detailed Basis of Design report containing technology selection justification.
    - During the assessment phase of the project launched in 2024, the existing control valves began to operate in a non-reliable manner and failed. A temporary installation of an on-hand control valve was executed to maintain operation through withdrawal season.
- NW Natural will procure and replace Busch Manifold Flow Control Valves.
- Cost in 2025: $1,384,600 (Construction)
- Total project cost (2024/2025) $1,536,000. (+50%/-25%, $2.3M/$1.15M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $399K
    - Non-Utility $1.136M

Mist GC500/GC600 Turbine Comp Replacement, Year 3

- In response to the discovery that the 2020 AECOM Compressor Study had feasibility issues, a restudy of the turbine compressors was warranted. The frequency of part and equipment failures has accelerated since the study was performed.
- NW Natural performed a 2022 Turbine Compressor Assessment Study with Burns and McDonnell. Within this study it identified the lack of sustainability of the existing turbine compressors and highlighted the operational risks.
    - The GC500 has 55,000 hours and is past end of life.
    - The GC600 has 47,000 hours and is past end of life.

- The continued increase in the frequency of part and equipment failures has justified a more accelerated timeline since the 2022 Turbine Compressor Assessment Study with Burns and McDonnell.
    - GC500 replacement in 2025
    - GC600 replacement in 2026
- NW Natural utilized a third-party engineering service provider to perform a detailed Basis of Design report containing technology selection justification.
- Oregon DOE EFSC and Oregon DEQ air permits are required for both new compressors.
- Execution completed by Q3 2025 and 2026
- Cost in 2025: $43,983,000 (Construction)
- Total project cost (2023-2027) $86,017,000. (+10%/-10%, $94.6M/$77.4M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $60.8M
    - Non-Utility $25.2M

Mist Well Separator Replacements 2025-2029, Year 1

- In 2021, NW Natural identified new process conditions from the reworked wells posing risk to site deliverability and compliance (192.165).
    - Liquid loading of the process gas has increased due to the well rework program.
    - NW Natural executed on a 2021 Miller Station Filtration Engineering Assessment with Harris Group identifying high level scopes of work recommended for immediate risks and further investigation to be performed.

- In 2022, NW Natural identified more risk associated with the separators. Separators were inspected per API recommendations and significant wall loss was found.
    - Separators found beyond the corrosion allowance were immediately removed out of service.

- NW Natural has remediated the immediate reliability and compliance risks.
- The Burns and McDonnell 15-year Facility Assessment included a detailed Basis of Design report containing technology selection justification with a recommended schedule of replacement.
- Cost in 2025: $840,000 (Construction)
- Total project cost $11,695,000. (+50%/-25%, $17.5M/$8.77M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $7.367M
    - Non-Utility $4.327M

Mist Main Power Feed, Year 1

- NW Natural executed on a 2021 Miller Station Electrical Reliability Study with Harris Group identifying high level scopes of work recommended in tiers of priority.
- NW Natural in 2023 executed on a front-end engineering design (FEED) with Burns & McDonnell and determined the existing power feed was end of life and warranted a timely replacement due to the criticality and impact to Miller Station in

the event of a failure. This analysis will be referenced in the 2024 Facility Assessment Study with Burns and McDonell
- The 2024 Burns & McDonnell Facility Assessment Study NW Natural also included a recommendation to upgrade the end-of-life main power feed.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and alternative selection justification.
- Oregon DOE EFSC permit is required for this work. NW Natural is pursuing options that would not require an EFSC permit.
- Execution completed by Q3 2026
- Cost in 2025: $50,000 (Engineering/Design)
- Total project cost (2025-2026) $3,800,000. (+100%/-50%, $7.6M/$1.9M)
- 100% Utility asset

Mist-Birkenfeld Fire Pond Improvements
- This project will include replacement of the pumping facility as well as the associated equipment necessary to operate in the event of a power failure.
- This is an investment into the rural fire department as a prerequisite for the North Mist expansion EFSC permit.
- A signed agreement with the rural fire department is necessary to proceed with the permitting for the new station.
- Cost in 2025: $525,000. (+100%/-50%, $.787M/$0.393M).
- Mix of Utility and Interstate Gas Storage Assets, and North Mist Costs
    - Utility $310K
    - Non-Utility $215K
    - North Mist $99K

Mist/Miller Tier 1 & 2 Projects 2025 (Run Rate)
- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2025 for Tier 1 and 2 Projects: $500,000. (+100%/-50%, $1M/$0.25M).
- 100% Utility asset.

Mist 2026

Mist Miller Bruer/Flora/Meyer Metering Upgrade, Year 1
- The 15-year facility assessment performed by Burns and McDonnell identified these reservoir inventory meters as an end-of-life asset due to support from the original manufacturer. This scope only includes replacing the meter tubes and associated electrical components.
- The 15-year facility assessment performed by Burns and McDonnell also identified the individual IW well meters as end of life due to their age and wear and tear.
- Upgrading to NWN standard meters promotes resiliency and safety through maintenance, design practices, and standard functions.

- Accurate measurement of Injection/Withdrawal is critical for operational functions, safety, and as well as financial planning.
- Evaluate elimination of Meyer/Flora Math Meter
- Metering and IW well connectivity upgrade from copper to fiber with controls IO upgrade
- Cost in 2026: $120,000 (Engineering/Design)
- Total project cost (2025-2026) $3,360,000. (+100%/-50%, $6M/$1.5M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $1.89M
    - Non-Utility $472K

Mist GC500/GC600 Turbine Comp Replacement, Year 4

- In response to the discovery that the 2020 AECOM Compressor Study had feasibility issues, a restudy of the turbine compressors was warranted. The frequency of part and equipment failures has accelerated since the study was performed.
- NW Natural performed a 2022 Turbine Compressor Assessment Study with Burns and McDonnell. Within this study it identified the lack of sustainability of the existing turbine compressors and highlighted the operational risks.
    - The GC500 has 55,000 hours and is past end of life.
    - The GC600 has 47,000 hours and is past end of life.
- The continued increase in the frequency of part and equipment failures has justified a more accelerated timeline since the 2022 Turbine Compressor Assessment Study with Burns and McDonnell.
    - GC500 replacement in 2025
    - GC600 replacement in 2026
- NW Natural utilized a third-party engineering service provider to perform a detailed Basis of Design report containing technology selection justification.
- Oregon DOE EFSC and Oregon DEQ air permits are required for both new compressors.
- Execution completed by Q3 2025 and 2027 (TBD)
- Cost in 2026: $28,840,000 (Engineering/Design)
- Total project cost (2023-2027) $86,017,000. (+10%/-10%, $94.6M/$77.4M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility cost $60.817M
    - Non-Utility $25.199M

Mist Well Separator Replacements 2025-2029, Year 2

- In 2021, NW Natural identified new process conditions from the reworked wells posing risk to site deliverability and compliance (192.165).
    - Liquid loading of the process gas has greatly increased due to the well rework program.
    - NW Natural executed on a 2021 Miller Station Filtration Engineering Assessment with Harris Group identifying high level scopes of work recommended for immediate risks and further investigation to be performed.

- In 2022, NW Natural identified more risk associated with the separators. Separators were inspected per API recommendations and significant wall loss was found.
    - Separators found beyond the corrosion allowance were immediately removed out of service.
- NW Natural has remediated the immediate reliability and compliance risks.
- The Burns and McDonnell 15-year Facility Assessment included a detailed Basis of Design report containing technology selection justification with a recommended schedule of replacement.
- Cost in 2026: $2,875,000
- Total project cost $11,695,000. (+100%/-50%, $23M/$5.75M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $7.367M
    - Non-Utility $4.327M

Mist/Miller Tier 1 & 2 Projects 2026 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2026 for Tier 1 and 2 Projects: $500,000. (+100%/-50%, $1M/$0.25M).
- 100% Utility asset.

Mist Miller Bruer/Flora Gathering Separator, Year 1

- The 15-year facility assessment performed by Burns and McDonnell identified separators at the Flora and Bruer separators to be at their end of life and undersized as evidenced from the produced liquids infiltrating Mist Compression equipment.
- This assessment produced the following recommendations:
    - Removal of water from the wells by installing more efficient filters
    - Catch slugs, solid and water removal of 0.3 microns and larger at the inlet of Miller Station.
    - Protect the equipment and valves at Miller station
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2026 $700,000
- Total project cost (2026/2027) $3,900,000. (+100%/-50%, $8M/$2M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $3.326M
    - Non-Utility $573K

Mist Main Power Feed, Year 2

- NW Natural executed on a 2021 Miller Station Electrical Reliability Study with Harris Group identifying high level scopes of work recommended in tiers of priority.
- NW Natural in 2023 executed on a front-end engineering design (FEED) with Burns & McDonnell and determined the existing power feed was end of life and warranted a timely replacement due to the criticality and impact to Miller Station in

the event of a failure. This analysis will be referenced in the 2024 Facility Assessment Study with Burns and McDonell

- The 2024 Burns & McDonnell Facility Assessment Study NW Natural also included a recommendation to upgrade the end-of-life main power feed.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Oregon DOE EFSC permit is required for this work. NW Natural is pursuing options that would not require an EFSC permit.
- Execution completed by Q3 2026
- Cost in 2026: $3,750,000 (Construction)
- Total project cost (2025-2026) $3,800,000. (+100%/-50%, $6M/$1.5M)
- 100% Utility asset

Mist Miller Power Gas Elimination Assessment and Pilot, Year 1

- NW Natural has historically operated above and beyond regulatory requirements. Though the Utilities are exempt from the proposed ban of natural gas driven pneumatic devices, NW Natural would like to pilot opportunities to reduce natural gas fugitive emissions for future technology selection best practices.
- The 15-year facility assessment performed by Burns and McDonnell identified areas of opportunities and potential pilot sites to reduce fugitive emission from pneumatically driven devices.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Planning/Design and Project execution will be performed in 2027.
- Final report and assessment will be performed in 2028.
- Cost in 2026: $200,000 (Construction)
- Total project cost (2027-2028) $1,000,000. (+100%/-50%, $2M/$.5M)
- 100% utility asset

Mist Miller Air Compressor and Receiver Tank Upgrades, Year 1

- A compressed air usage study was performed in 2024, and the current Instrument air system has enough capacity for the current system demand for ESD and plant operations. After the GC500/600 replacement projects, the air system will have no additional capacity for any new equipment that would be added or upgraded to the facility.
- The back up air compressor will be needed for ESD events.
- This project will address this shortage of capacity for ESD events and add enough capacity to cover all current demand as well as anticipated future needs.
- Additionally, a receiver will act as an accumulator, in the event of a power outage, the accumulator will be sized to allow for the facility to ESD and move to a safe state.
- Cost in 2026: $100,000 (Engineering/Design)
- Total Project Cost: $1,100,000 (+100%/-50%, $2.2M/$0.505M)

Mist 2027

Mist Miller Bruer/Flora Gathering Separator, Year 2

- The 15-year facility assessment performed by Burns and McDonnell identified separators at the Flora and Bruer separators to be at their end of life and undersized as evidenced from the produced liquids infiltrating Mist Compression equipment.
- This assessment produced the following recommendations:
    - Removal of water from the wells by installing more efficient filters
    - Catch slugs, solid and water removal of 0.3 microns and larger at the inlet of Miller Station.
    - Protect the equipment and valves at Miller station
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2027: $3,200,000 (Construction)
- Total project cost (2026/2027) $3,900,000. (+100%/-50%, $8M/$2M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $3.326M
    - Non-Utility $573K

Mist Miller Power Gas Elimination Assessment and Pilot, Year 2

- NW Natural has historically operated beyond regulatory requirements. Though the Utilities are exempt from the proposed ban of natural gas driven pneumatic devices, NW Natural would like to pilot opportunities to reduce natural gas fugitive emissions for future technology selection best practices.
- The 15-year facility assessment performed by Burns and McDonnell identified areas of opportunities and potential pilot sites to reduce fugitive emission from pneumatically driven devices.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Planning/Design and Project execution will be performed in 2026.
- Final report and assessment will be performed in 2027.
- Cost in 2027: $700,000 (Construction)
- Total project cost (2026/2027) $1,100,000. (+100%/-50%, $2M/$0.505M)
- 100% utility asset

Mist Well Separator Replacements 2025-2029, Year 3

- In 2021, NW Natural identified new process conditions from the reworked wells posing risk to site deliverability and compliance (192.165).
    - Liquid loading of the process gas has greatly increased due to the well rework program.
    - NW Natural executed on a 2021 Miller Station Filtration Engineering Assessment with Harris Group identifying high

level scopes of work recommended for immediate risks and further investigation to be performed.

- In 2022, NW Natural identified more risk associated with the separators. Separators were inspected per API recommendation and significant wall loss was found.
    - Separators found beyond the corrosion allowance were immediately removed out of service.

- NW Natural has remediated the immediate reliability and compliance risks.
- The Burns and McDonnell 15-year Facility Assessment included a detailed Basis of Design report containing technology selection justification with a recommended schedule of replacement.
- Cost in 2027: $2,990,000
- Total project cost (2027) $11,695,000. (+100%/-50%, $23M/$5.75M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $7.367M
    - Non-Utility $4.237M

Mist Small Dehydration System Replacement (2028 IRP), Year 1

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was Miller Stations Small Dehydration System.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with considerations from the new assessment of the equipment's health and changes in process conditions.
- In response to the 2016 and 2024 Facility Assessment Study recommendations, NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the small dehydration system.
- Cost in 2027: $700,000 (Engineering/Design)
- Total project cost (2027-2030) $18,650,000. (+100%/-50%, $37.3M/$9.3M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility cost $6.154M
    - Non-Utility $12.495M

Mist/Miller Tier 1 & 2 Projects 2027 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2027 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$0.75M).
- 100% Utility asset.

Mist Miller Bruer/Flora/Meyer Metering Upgrade, Year 2

- The 15-year facility assessment performed by Burns and McDonnell identified these Reservoir inventory meters as an end-of-life asset due to support from the

original manufacturer. This scope only included replacing the meter tubes and associated electrical components.
- The 15-year facility assessment performed by Burns and McDonnell also identified the individual IW well meters as end of life due to their age and wear and tear.
- Upgrading to NWN standard meters promotes safety through maintenance, design practices, and operational functions.
- Accurate measurement of Injection/Withdrawal is critical for operational functions as well as billing and financial planning.
- Evaluate elimination of Meyer/Flora Math Meter
- Metering and IW well connectivity upgrade from copper to fiber with controls IO upgrade
- Cost in 2027: $2,240,000 (Construction)
- Total project cost (2026-2027) $2,360,000. (+100%/-50%, $4.6M/$1.15M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility cost $1.888M
    - Non-Utility $472K

Mist Miller Air Compressor and Receiver Tank Upgrades, Year 2
- A compressed air usage study was performed in 2024, and the current Instrument air system has enough capacity for the current system demand for ESD and plant operations. After the GC500/600 replacement projects, the air system will have no additional capacity for any new equipment that would be added or upgraded to the facility.
- The back up air compressor will be needed for ESD events.
- This project will address this shortage of capacity for ESD events and add enough capacity to cover all current demand as well as anticipated future needs.
- Additionally, a receiver will act as an accumulator, in the event of a power outage, the accumulator will be sized to allow for the facility to move to a safe state.
- Cost in 2027: $1,000,000 (Construction)
- Total Project Cost: $1,100,000 (+100%/-50%, $2.2M/$0.505M)
- 100% Utility asset.

Mist Calvin Creek Gathering Separator
- The 15-year facility assessment performed by Burns and McDonnell identified separators are needed from the Calvin Creek/Twin 16 feed. Separators existing at the pools but do not exist at the plant inlet.
- These are needed for residual liquids that may be left within the line between the pools and the station due to low flow.
- The separator performance needs to be the following:
    - Removal of water from the wells by installing more efficient filters
    - Catch slugs, solid and water removal of 0.3 microns and larger at the inlet of Miller Station.
    - Protect the equipment and valves at Miller station
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.

- Cost in 2027: $200,000 (Engineering/Design)
- Total project cost (2027-2028) $1,900,000. (+100%/-50%, $4M/$1M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $1.324M
    - Non-Utility $575K

Mist 2028

Mist Miller Power Gas Elimination Assessment and Pilot, Year 2

- NW Natural has historically operated beyond regulatory requirements. Though the Utilities are exempt from the proposed ban of natural gas driven pneumatic devices, NW Natural would like to pilot opportunities to reduce natural gas fugitive emissions for future technology selection best practices.
- The 15-year facility assessment performed by Burns and McDonnell identified areas of opportunities and potential pilot sites to reduce fugitive emission from pneumatically driven devices.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Planning/Design to be performed in 2026.
- Project execution will be performed in 2027.
- Final report and assessment will be performed in 2028.
- Cost in 2028: $100,000 (Trailing costs)
- Total project cost (2026-2028) $1,000,000. (+100%/-50%, $2M/$0.5M)
- 100% Utility Asset

Mist Oil Storage Secondary Containment

- NW Natural developed a Spill Prevention, Control, and Countermeasure (SPCC) Plan in 2013. Within this plan, several plant upgrades were needed for compliance to the SPCC plan.
- The 15-year facility assessment performed by Burns and McDonnell reidentified the oil drums, totes, and other misc. liquids as a spill and contamination risk and will make recommendation to remedy these risks.
- NW Natural will execute on the construction of secondary containment for the fuel tanks and fueling locations.
- Total project cost (2028) $550,000. (+100%/-50%, $1.1M/$0.275M)
- 100% Utility asset

Mist Miller Controls Modernization

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of significant risk highlighted was Miller Stations Control System. This system was upgraded and modernized in 2019.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with

considerations of the new control systems health and changes in the industry best practices.
- NW Natural will perform an updated 3rd party focused assessment of the Instrument and Controls summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2028: $500,000 (Engineering/Design)
- Total project cost (2028/2029) $2,000,000. (+100%/-50%, $4M/$1M)
- 100% Utility

Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 1
- NW Natural executed on a 2020 Compressor Assessment with AECOM. An area of significant risk highlighted was Miller Stations Recip Control System. This system was upgraded and modernized in 2021.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed AECOM's 3-year-old study with modern recommendations with considerations of the new control systems health and changes in the industry best practices.
- The 15-year Facility Assessment Study performed by Burns and McDonnell extrapolated the usage of the recip to make recommendations ensuring long term reliability.
- NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2028: $500,000 (Engineering/Design)
- Total project cost (2028-2032) $28,700,000. (+100%/-50%, $57.4M/$14.4M)
- 100% Utility

Mist Small Dehydration System Replacement (2028 IRP), Year 2
- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was Miller Stations Small Dehydration System.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with considerations from the new assessment of the equipment's health and changes in process conditions.
- In response to the 2016 and 2024 Facility Assessment Study recommendations, NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the small dehydration system.
- Cost in 2028: $1,950,000
- Total project cost (2027-2030) $18,650,000. (+100%/-50%, $37.2M/$9.3M)
- Mix of Utility and Gas Storage Assets
    - Utility cost $0.64 M
    - Non-Utility $1.35M

Mist Well Separator Replacements 2025-2029, Year 4

- In 2021, NW Natural identified new process conditions from the reworked wells posing risk to site deliverability and compliance (192.165).
    - Liquid loading of the process gas has increased due to the well rework program.
    - NW Natural executed on a 2021 Miller Station Filtration Engineering Assessment with Harris Group identifying high level scopes of work recommended for immediate risks and further investigation to be performed.

- In 2022, NW Natural identified more risk associated with the separators. Separators were inspected per API recommendation and significant wall loss was found.
    - Separators found beyond the corrosion allowance were immediately removed out of service.

- NW Natural has remediated the immediate reliability and compliance risks.
- The Burns and McDonnell 15-year Facility Assessment included a detailed Basis of Design report containing technology selection justification with a recommended schedule of replacement.
- Cost in 2028: $2,990,000
- Total Project Cost $11,695,000 (+100%/-50%, $6M/$1.5M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $7.367M
    - Non-Utility $4.327M

Calvin Creek Area Meter Modernization-UT meter Replacement, Year 1

- The 15-year facility assessment performed by Burns and McDonnell identified these Reservoir inventory meters as an end-of-life asset due to support from the original manufacturer. This scope only included replacing the meter tubes and associated electrical components.
- Upgrading to NWN standard meters promotes safety through maintenance, design practices, and operational functions.
- Accurate measurement of Injection/Withdrawal is critical for operational functions as well as billing and financial planning.
- Cost in 2028: $200,000 (Engineering/Design)
- Total project cost (2028/2029) $1,450,000. (+100%/-50%, $2.8M/$0.725M)
- Mix of Utility and Gas Storage Assets
    - Utility cost $1.01M
    - Non-Utility $439K

Mist Calvin Creek Gathering Separator, Year 2

- The 15-year facility assessment performed by Burns and McDonnell identified separators are needed from the Calvin Creek/Twin 16 feed. Separators existing at the pools but do not exist at the plant inlet.
- These are needed for residual liquids that may be left within the line between the pools and the station due to low flow.

- The separator performance needs to be the following:
    - Removal of water at the wells by installing more efficient filters
    - Catch slugs, solid and water removal of 0.3 microns and larger at the inlet of Miller Station.
    - Protect the equipment and valves at Miller Station
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2028: $1,700,000 (Construction)
- Total project cost (2027/2028) $1,900,000. (+100%/-50%, $4M/$1M)
- Mix of Utility and Gas Storage Assets
    - Utility $1.324M
    - Non-Utility $575K

Mist Miller Valve and Actuator Replacements 2028

- The 15-year facility assessment performed by Burns and McDonnell identified a need to budget to replace valves and actuators at a regular interval. This scope includes replacing valves and associated actuators if applicable. Burns and McDonnell noted some valves are leaking by, have leaks in the stem, or do not operate as intended.
- The recommendation includes performing an assessment of the existing valves and actuators within the facility to assess the operation of the actuators and observe any leaks to prioritize the order of replacement.
- Cost in 2028: $700,000 (+100%/-50%, $1.4M/$0.35M)
- 100% Utility Asset

Mist/Miller Tier 1 & 2 Projects 2028 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2028 for Tier 1 and 2 Projects: $2,000,000. (+100%/-50%, $4M/$1M).
- 100% Utility asset.

Section Two – 5 to 6 years (2029 to 2030)

Mist 2029

Mist Diesel Generator, Year 1

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was Miller Stations Diesel Generator.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with considerations from the new assessment of the equipment's health and changes in electrical load.

- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the Diesel generator system.
- Cost in 2029: $1,100,000 (Design/Material Purchase)
- Total project cost (2029/2030) $2,100,000. (+100%/-50%, $4.2M/$1.05M)
- 100% Utility

Mist Miller Controls Modernization, Year 2

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of significant risk highlighted was Miller Stations Control System. This system was upgraded and modernized in 2019.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with considerations of the new control systems health and changes in the industry best practices.
- NW Natural will perform an updated 3rd party focused assessment of the Instrument and Controls summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2029: $1,500,000 (Construction)
- Total project cost (2028/2029) $2,000,000. (+100%/-50%, $4M/$1M)
- 100% Utility Asset

Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 2

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was 300/400 Compressors.
- NW Natural executed on a 2020 Compressor Assessment with AECOM in response to En Engineering's 2016 Facility Assessment Study. Recommendations were made to extend the useful life of the existing Miller Stations Recip were made and executed on in 2021.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's and AECOM's studies with modern recommendations with considerations of the refurbished equipment's health and changes in the industry best practices.
- The 15-year Facility Assessment Study performed by Burns and McDonnell also extrapolated the usage of the recips to make recommendations ensuring long term reliability.
- NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the 300/400 Compressors.
- Cost in 2029: $100,000 (Engineering/Design)
- Total project cost (2028-2032) $28,700,000. (+100%/-50%, $57.4M/$14.4M)
- 100% Utility Cost

Mist Well Separator Replacements 2025-2029, Year 5

- In 2021, NW Natural identified new process conditions from the reworked wells posing risk to site deliverability and compliance (192.165).
    - Liquid loading of the process gas has greatly increased due to the well rework program.
    - NW Natural executed on a 2021 Miller Station Filtration Engineering Assessment with Harris Group identifying high level scopes of work recommended for immediate risks and further investigation to be performed.

- In 2022, NW Natural identified more risk associated with the separators. Separators were inspected per API recommendation and significant wall loss was found.
    - Separators found beyond the corrosion allowance were immediately removed out of service.

- NW Natural has remediated the immediate reliability and compliance risks.
- The Burns and McDonnell 15-year Facility Assessment included a detailed Basis of Design report containing technology selection justification with a recommended schedule of replacement.
- Cost in 2029: $2,070,000. (Construction)
- Total Project Cost $11,695,000 (+100%/-50%, $6M/$1.5M)
    - Mix of Utility and Interstate Gas Storage Assets
    - Utility $7.367M
    - Non-Utility $4.327M

Mist Miller Station Oily Wastewater Containment

- NW Natural developed a Spill Prevention, Control, and Countermeasure (SPCC) Plan in 2013. Within this plan, several plant upgrades were needed for compliance to the SPCC plan.
- The 15-year facility assessment performed by Burns and McDonnell reidentified these as a spill and contamination risk and will make recommendation to remedy these risks.
- NW Natural will execute on the construction of secondary containment for the Oily Wastewater tanks.
- Cost in 2029: $350,000 (Engineering)
- Total project cost (2029/2030) $850,000. (+100%/-50%, $1.7M/$0.425M)
- 100% Utility asset

Mist Small Dehydration System Replacement (2028 IRP), Year 3

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was Miller Stations Small Dehydration System.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with considerations from the new assessment of the equipment's health and changes in process conditions.

- In response to the 2016 and 2024 Facility Assessment Study recommendations, NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the small dehydration system.
- Cost in 2029: $5,000,000 (Construction)
- Total project cost (2027-2030) $18,650,000. (+100%/-50%, $36.3M/$9.3M)
    - Mix of Utility and Interstate Gas Storage Assets
    - Utility cost $6.154M
    - Non-Utility $12.495M

Mist Calvin Creek Area Meter Modernization-UT meter Replacement, Year 2

- The 15-year facility assessment performed by Burns and McDonnell identified these Reservoir inventory meters as an end-of-life asset due to support from the original manufacturer. This scope only included replacing the meter tubes and associated electrical components.
- Upgrading to NWN standard meters promotes safety through maintenance, design practices, and operational functions.
- Accurate measurement of Injection/Withdrawal is critical for operational functions as well as billing and financial planning.
- Cost in 2029: $1,250,000 (Construction)
- Total project cost (2028-2029) $1,450,000. (+100%/-50%, $2.8M/$0.725M)
    - Mix of Utility and Interstate Gas Storage Assets
    - Utility cost $1.01M
    - Non-Utility $493K

Mist/Miller Tier 1 & 2 Projects 2029 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2029 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$0.75M).
- 100% Utility asset.

Mist 2030

Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 3

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was 300/400 Compressors.
- NW Natural executed on a 2020 Compressor Assessment with AECOM in response to En Engineering's 2016 Facility Assessment Study. Recommendations were made to extend the useful life of the existing Miller Stations Recip were made and executed on in 2021.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering and AECOM's studies with modern recommendations with considerations of the refurbished equipment's health and changes in the industry best practices.

- The 15-year Facility Assessment Study performed by Burns and McDonnell also extrapolated the usage of the recips to make recommendations ensuring long term reliability.
- NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the 300/400 Compressors.
- Cost in 2030: $100,000 (Engineering/Design)
- Total project cost (2028-2032) $28,700,000. (+100%/-50%, $57.4M/$14.4M)
- 100% Utility Cost

Mist Cathodic Protection, Year 1

- In 2023, during the construction of the new GC300/400 discharge filters, significant underground coating damage was found. The pipe coating exhibited significant blistering and peeling. A more thorough inspection was conducted by the integrity engineering group, and it was determined that the damage was not caused by cathodic disbondment. However, during the more thorough inspection, it was discovered that the cathodic protection is not properly isolated within the fence line of Miller Station. There is stray current affecting electrical conduit, above ground pipe, steel structures, and the buildings. This poses an electrical shock risk.
- The 15-year facility assessment (Specific to Cathodic Protection) performed by Entrust made high level recommendations to remedy the stray current issue and other reliability end of life related issues.
- NW Natural will implement an immediate short term safety plan to protect personnel from electrical shock.
- NW Natural will perform a detailed assessment summarized by an engineering memo on the developed the scope of work, technology selection, and justification.
- NW Natural will execute to the developed scope of work.
- Cost in 2030: $250,000
- Total project cost $2,000,000. (+100%/-50%, $4M/$1M)
- 100% Utility asset

Mist Small Dehydration System Replacement (2028 IRP), Year 4

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was Miller Stations Small Dehydration System.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with considerations from the new assessment of the equipment's health and changes in process conditions.
- In response to the 2016 and 2024 Facility Assessment Study recommendations, NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the small dehydration system.
- Cost in 2030: $11,000,000 (Construction)
- Total project cost (2027-2030) $18,650,000. (+100%/-50%, $36.3M/$9.3M)

- Mix of Utility and Interstate Gas Storage Assets
    - Utility cost $6.154M
    - Non-Utility $12.495M

Mist Diesel Generator, Year 2

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was Miller Stations Diesel Generator and the studies recommendations were implemented in 2020.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering's 8-year-old study with modern recommendations with considerations from the new assessment of the equipment's health and changes in electrical load.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the Diesel Generator system.
- Cost in 2030: $1,100,000 (Construction)
- Total project cost (2029/2030) $2,100,000. (+100%/-50%, $4.2M/$1.05M)
- 100% Utility

Mist Compressor Fugitive Methane Capture, Year 1

- Mist Miller is designed to have minimal fuel and natural power gas emissions by utilizing air systems, recent EPA regulations have been approved and are more stringent on emissions.
    - The 15-year Facility Assessment Study performed by Burns and McDonnell made recommendations to assess the fugitive methane emissions from the station equipment.
    - Technologies will be recommended after this assessment, but some may include process gas recovery, seal gas recompression, enhanced instrument air systems and upgraded air receiver.
- Cost in 2030: $550,000 (Engineering/Design)
- Total Project Cost: $2,050,000 (+100%/-50%, $4M/$1M)
- 100% Utility Asset

Mist Miller Station Oily Wastewater Containment, Year 2

- NW Natural developed a Spill Prevention, Control, and Countermeasure (SPCC) Plan in 2013. Within this plan, several plant upgrades were needed for compliance to the SPCC plan.
- The 15-year facility assessment performed by Burns and McDonnell reidentified these as a spill and contamination risk and will make recommendation to remedy these risks.
- NW Natural will execute on the construction of secondary containment for the Oily Wastewater tanks.
- Cost in 2030: $500,000
- Total project cost (2029/2030) $850,000. (+100%/-50%, $1.7M/$0.425M)
- 100% Utility asset

Mist/Miller Tier 1 & 2 Projects 2030 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2030 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$0.75M).
- 100% Utility asset.

Section Three – 7 to 10 years (2031 to 2034)

Mist 2031

Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 4

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was 300/400 Compressors.
- NW Natural executed on a 2020 Compressor Assessment with AECOM in response to En Engineering's 2016 Facility Assessment Study. Recommendations were made to extend the useful life of the existing Miller Stations Recip were made and executed on in 2021.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering and AECOM's studies with modern recommendations with considerations of the refurbished equipment's health and changes in the industry best practices.
- The 15-year Facility Assessment Study performed by Burns and McDonnell also extrapolated the usage of the recips to make recommendations ensuring long term reliability.
- NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the 300/400 Compressors.
- Cost in 2031: $5,000,000 (Construction)
- Total project cost (2028-2032) $28,700,000. (+100%/-50%, $57.4M/$14.4M)
- 100% Utility asset.

Mist Cathodic Protection, Year 2

- In 2023, during the construction of the new GC300/400 discharge filters, significant underground coating damage was found. The pipe coating exhibited significant blistering and peeling. A more thorough inspection was conducted by the integrity engineering group, and it was determined that the damage was not caused by cathodic disbondment. However, during the more thorough inspection, it was discovered that the cathodic protection is not properly isolated within the fence line of Miller Station. There is stray current affecting electrical conduit, above ground pipe, steel structures, and the buildings. This poses an electrical shock risk.
- The 15-year facility assessment (Specific to Cathodic Protection) performed by Entrust made high level recommendations to remedy the stray current issue and other reliability end of life related issues.

- NW Natural will implement an immediate short term safety plan to protect personnel from electrical shock.
- NW Natural performed a detailed assessment summarized by an engineering memo on the developed the scope of work, technology selection, and justification.
- NW Natural will execute to the developed scope of work.
- Execution completed by Q2 2027
- Cost in 2031: $1,750,000 (Construction)
- Total project cost (2030-2031) $2,000,000. (+100%/-50%, $4M/$1M)
- 100% Utility asset

Mist Compressor Fugitive Methane Capture, Year 2

- Mist Miller is designed to have minimal fuel and natural power gas emissions by utilizing air systems, recent EPA regulations have been approved and are more stringent on emissions.
  - The 15-year Facility Assessment Study performed by Burns and McDonnell made recommendations to assess the fugitive methane emissions from the station equipment.
  - Technologies will be recommended after this assessment, but some may include process gas recovery, seal gas recompression, enhanced instrument air systems and upgraded air receiver.
- Cost in 2031: $1,500,000 (Construction)
- Total Project Cost: $2,050,000 (+100%/-50%, $4M/$1M)
- 100% Utility Asset

Mist Miller Valve and Actuator Replacements, 2031 (Run Rate)

- The 15-year facility assessment performed by Burns and McDonnell identified a need to budget to replace valves and actuators at a regular interval. This scope includes replacing valves and associated actuators if applicable. Burns and McDonnell noted some valves are leaking by, have leaks in the stem, or do not operate as intended.
- The recommendation includes performing an assessment of the existing valves and actuators within the facility to assess the operation of the actuators and observe any leaks to prioritize the order of replacement.
- Cost in 2031: $1,400,000
- Total Project Cost: $ 3,500,000 (+100%/-50%, $7M/$1.75M)
- 100% Utility Asset

Mist Miller North Facility Power

- Land acquisition to the North of Miller station will require power for equipment operation and development.
- This project will provide a power drop from the existing power feed to Miller Station and any infrastructure upgrades needed to electrify the site.
- The recommendation includes performing an assessment of the site to develop the full project scope and power demand for the site.
- Cost in 2028: $850,000 (+100%/-50%, $1.6M/$0.425M)
- 100% Utility Asset

Mist/Miller Tier 1 & 2 Projects 2031 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2031 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$1.75M).
- 100% Utility asset.

Mist 2032

Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 5

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was 300/400 Compressors.
- NW Natural executed on a 2020 Compressor Assessment with AECOM in response to En Engineering's 2016 Facility Assessment Study. Recommendations were made to extend the useful life of the existing Miller Stations Recip were made and executed on in 2021.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering and AECOM's studies with modern recommendations with considerations of the refurbished equipment's health and changes in the industry best practices.
- The 15-year Facility Assessment Study performed by Burns and McDonnell also extrapolated the usage of the recips to make recommendations ensuring long term reliability.
- NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the 300/400 Compressors.
- Cost in 2032: $13,000,000 (Construction)
- Total project cost (2028-2032) $28,700,000. (+100%/-50%, $57.4M/$14.4M)
- 100% Utility asset.

Mist Miller Large Dehy Modernization, Year 1

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonnell identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was the Large Dehy.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- The burner management system and large thermal oxidizer will need to be upgraded and/or replaced.
- Planning/Design to be performed in 2032.
- Project execution will be performed in 2033.
- Cost in 2032: $250,000 (Engineering/Design)
- Total project cost (2032-2033) $1,450,000. (+100%/-50%, $3M/$.75M)
- 100% Utility Asset

Mist/Miller Tier 1 & 2 Projects 2032 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2032 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$0.75M).
- 100% Utility asset.

Mist 2033

Mist Miller 300/400 Compressor Replacement (2030 IRP), Year 6

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was 300/400 Compressors.
- NW Natural executed on a 2020 Compressor Assessment with AECOM in response to En Engineering's 2016 Facility Assessment Study. Recommendations were made to extend the useful life of the existing Miller Stations Recip were made and executed on in 2021.
- The 15-year Facility Assessment Study performed by Burns and McDonnell refreshed EN Engineering and AECOM's studies with modern recommendations with considerations of the refurbished equipment's health and changes in the industry best practices.
- The 15-year Facility Assessment Study performed by Burns and McDonnell also extrapolated the usage of the recips to make recommendations ensuring long term reliability.
- NW Natural will perform an additional updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- NW Natural will replace the 300/400 Compressors.
- Cost in 2033: $10,000,000 (Construction)
- Total project cost (2028-2032) $28,700,000. (+100%/-50%, $57.4M/$14.4M)
- 100% Utility asset.

Mist Miller Large Dehy Modernization, Year 2

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonnell identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was the Large Dehy.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- The burner management system and large thermal oxidizer will need to be upgraded and/or replaced.
- Planning/Design to be performed in 2032.
- Project execution will be performed in 2033.
- Cost in 2033: $1,200,000 (Construction)
- Total project cost (2032/2033) $1,450,000. (+100%/-50%, $3M/$.75M)
- 100% Utility Asset

Mist Miller Main Flow Control Valve, Year 1

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonnell identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was the general valve reliability and operation. By 2033 the main control valve for Miller Station will be at its end of life and a replacement will need to be identified.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2033: $500,000 (Engineering/Design)
- Total Project Cost: $1,750,000 (+100%/-50%, $3.5M/$0.875M)
- 100% Utility Asset

Mist Miller Air Compressors

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonnell identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was the Air Compressors.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Air compressors will be at or near their end of life in 2033. Replacement and upgrade will facilitate increased reliability as well as scale to current facility requirements.
- Cost in 2033: $500,000 (Construction)
- 100% Utility Asset

Mist/Miller Tier 1 & 2 Projects 2033 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2033 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$0.75M).
- 100% Utility asset.

Mist 2034

Mist Miller Valve and Actuator Replacements 2034 (Run Rate)

- The 15-year facility assessment performed by Burns and McDonnell identified a need to budget to replace valves and actuators at a regular interval. This scope includes replacing valves and associated actuators if applicable. Burns and McDonnell noted some valves are leaking by, have leaks in the stem, or do not operate as intended.
- The recommendation includes performing an assessment of the existing valves and actuators within the facility to assess the operation of the actuators and observe any leaks to prioritize the order of replacement.
- Cost in 2034: $1,400,000 (+100%/-50%, $2.8M/$0.700M)
- 100% Utility Asset

Mist Miller GC700 Overhaul

- The GC500 and GC600 account for approximately 82% of the compression capacity at Miller Station. AECOM's 2020 compressor studies estimate a $12m loss per day if compression at Miller Station is unavailable during withdraw season. With a loss of 82% of compression capacity during withdraw season this would be estimated at $9.84M loss per day.
    - The GC700 will be installed for the GC500 in 2025,
- An overhaul project in anticipation of the GC700 engine hours that would require a scheduled overhaul to prevent an unscheduled outage.
- Cost in 2034: $2,000,000 (+100%/-50%, $4M/$1M)
- 100% Utility Asset

Mist Miller Main Flow Control Valve, Year 2

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonnell identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was the general valve reliability and operation. By 2033 the main control valve for Miller Station will be at its end of life and a replacement will need to be identified.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Cost in 2034: $1,250,000 (Engineering/Design)
- Total Project Cost: $1,750,000 (+100%/-50%, $3.5M/$0.875M)
- 100% Utility Asset

Mist Miller Flora/Bruer Flow Control Valve Replacement, Year 1

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonnell identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was the general valve reliability and operation. By 2034 the control valves for Flora/Bruer will be at their end of life and replacements will need to be identified.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification
- Cost in 2034: $100,000
- Total Project Cost: $850,000 (+100%/-50%, $1.7M/$0.425M)
- Mix of Utility and Interstate Gas Storage Asset
    - Utility $725K
    - Non-Utility $125K

Mist/Miller Tier 1 & 2 Projects 2034 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.
- Cost in 2034 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$0.75M).
- 100% Utility asset.

Mist 2035

Mist Miller GC700/800 Turbotronics Upgrade

- The GC700/800 turbines installed in 2025/2026 will have been in service for over 10 years going into 2035.
- At that time, the control system of the turbines will be due for an overhaul and integration work will also need to be performed in the control room to accommodate new functionality.
- Main benefit with help operators maintain efficient operation and minimize risk of unplanned outage due to improper operation.
- Cost in 2035: $2,000,000 (+100%/-50%, $4M/$1M)
- Mix of Utility and Interstate Gas Storage Asset
    - Utility $1.32M
    - Non-Utility $660K

Mist Miller GC800 Overhaul

- The GC500 and GC600 account for approximately 82% of the compression capacity at Miller Station. AECOM's 2020 compressor studies estimate a $12m loss per day if compression at Miller Station is unavailable during withdraw season. With a loss of 82% of compression capacity during withdraw season this would be estimated at $9.84M loss per day.
    - The GC800 will be installed for the GC600 in 2026.
- An overhaul project in anticipation of the GC700 engine hours that would require a scheduled overhaul to prevent an unscheduled outage.
- Cost in 2035: $2,000,000 (+100%/-50%, $4M/$1M)
- Mix of Utility and Interstate Gas Storage Assets
    - Utility $660K
    - Non-Utility $1.34M

Mist Miller Flora/Bruer Flow Control Valve Replacement

- NW Natural executed on a 2024 Facility Assessment Study with Burns and McDonnell identifying high level scopes of work recommended for plant reliability. An area of risk highlighted was the general valve reliability and operation. By 2034 the control valves for Flora/Bruer will be at their end of life and replacements will need to be identified.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification
- Cost in 2034: $750,000
- Total Project Cost: $850,000 (+100%/-50%, $1.7M/$0.425M)
- Mix of Utility and Interstate Gas Storage Asset
    - Utility $725K
    - Non-Utility $125K

Mist/Miller Tier 1 & 2 Projects 2035 (Run Rate)

- Tier 1 projects have expenditures up to $250k while Tier 2 projects have expenditures ranging from $250k-$500k.

- Cost in 2035 for Tier 1 and 2 Projects: $1,500,000. (+100%/-50%, $3M/$0.75M).
- 100% Utility asset.

Section Four – Projects Completed in 2024

Mist 2024

Mist Miller Busch Schlicker 13B-11 Separator.

- The 15-year facility assessment performed by Burns and McDonnell identified areas of opportunities and potential pilot sites to reduce fugitive emission from pneumatically driven devices.
- In 2021, NW Natural identified new process conditions from the reworked wells posing risk to site deliverability and compliance (192.165).
    - Liquid loading of the process gas has increased due to the well rework program.
    - NW Natural executed on a 2021 Miller Station Filtration Engineering Assessment with Harris Group identifying high level scopes of work recommended for immediate risks and further investigation to be performed.
    - Larger separators needed to intercept the increased liquid loading coming from wells post well rework.
- NW Natural will perform an updated detailed assessment summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Actuals in 2024: $1.27M
- 100% Utility asset

Mist GC600 Overhaul

- The GC600 accounts for approximately 47% of the compression capacity at Miller Station. AECOM's 2020 compressor studies estimate a $12m loss per day if compression at Miller Station is unavailable during withdraw season. With a loss of 47% of compression capacity during withdraw season this would be estimated at $5.6m loss per day
- An overhaul project completed in 2022 and resulted in a failure. The result of the failure will require a second overhaul.
  The GC600 accounts for approximately 47% of the compression capacity at Miller Station. AECOM's 2020 compressor studies estimate a $12m loss per day if compression at Miller Station is unavailable during withdraw season. With a loss of 38% of compression capacity during withdraw season this would be estimated at $5.6m loss per day
- Actuals in 2024: $126K
- Mix of Utility and Interstate Gas Storage Assets

Mist Fuel Filtration, Year 2

- In 2020 and 2023, NW Natural executed on an internal Root Cause Analysis (RCA) for the multiple turbine combustion system failures. A separate RCA was also performed by Siemens Energy (Original Equipment Manufacturer)
- Found liquids in the fuel supply for all fuel burning equipment have been identified as a contributor to the many outages and service interruptions.
- The 15-year facility assessment performed by Burns and McDonnell also identified this fuel supply to our fuel burning equipment as a risk to reliability. Burns and McDonnell will recommend a fuel filtration system immediately downstream of the fuel supply tie in due to the significant elevation change further reducing risk of liquid accumulation.
- NW Natural performed an additional detailed assessment with Norwest summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Actuals in 2024: 125K
- 100% Utility asset

Mist GC500/GC600 Turbine Comp Replacement, Year 2

- In response to the discovery that the 2020 AECOM Compressor Study had feasibility issues, a restudy of the turbine compressors was warranted. The frequency of part and equipment failures has accelerated since the study was performed.
- NW Natural performed a 2022 Turbine Compressor Assessment Study with Burns and McDonnell. Within this study it identified the lack of sustainability of the existing turbine compressors and highlighted the operational risks.
    - The GC 500 has 55,000 hours and is past end of life.
    - The GC 600 has 47,000 hours and is past end of life.
- The continued increase in the frequency of part and equipment failures has justified a more accelerated timeline since the 2022 Turbine Compressor Assessment Study with Burns and McDonnell.
    - GC500 replacement in 2025
    - GC600 replacement in 2027
- NW Natural will complete the 30% detailed design to support permit, scope, and cost finalization.
- When initiated, NW Natural will utilize a third-party engineering service provider to perform a detailed Basis of Design report containing technology selection justification.
- Oregon DOE EFSC and Oregon DEQ air permits are required for both new compressors.
- Execution completed by Q3 2025 and 2027 (TBD)
- Actuals in 2024: $12.95M
- Mix of Utility and Interstate Gas Storage Assets

Mist GC 500 Cold Spare, Year 2

- NW Natural performed a 2022 Turbine Compressor Assessment Study with Burns and McDonnell. It was discovered that the 2020 AECOM Compressor Study had feasibility issues that warranted a restudy of the turbine compressors.

Within this study it identified the lack of sustainability of the existing turbine compressors. EX. Replacement parts must be custom manufactured through new supply chain avenues, as they were not stocked or regularly produced by compressor part suppliers. The 2022 study noted that the GC500 was past typical end of life (55,000 hours).

- NW Natural will acquire an NWN-owned turbine compressor cores as a short-term stop gap to ensure reliable deliverability of storage gas to customers until the GC500 can be replaced.
- Actuals in 2024: $197K
- 100% Utility asset

Mist GC 600 Cold Spare, Year 2

- NW Natural performed a 2022 Turbine Compressor Assessment Study with Burns and McDonnell. It was discovered that the 2020 AECOM Compressor Study had feasibility issues that warranted a restudy of the turbine compressors. Within this study it identified the lack of sustainability of the existing turbine compressors. EX. Replacement parts must be custom manufactured through new supply chain avenues, as they were not stocked or regularly produced by compressor part suppliers. The 2022 study that the GC600 was approaching end of life (47,000 hours).
- NW Natural will acquire NWN-owned turbine compressor cores as a short-term stop gap to ensure reliability deliverability of storage gas to customers until the GC600 can be replaced.
- Actuals in 2024: $2.45M
- Mix of Utility and Interstate Gas Storage Assets

Mist Electrical System Upgrades Phase 2, Year 2

- NW Natural executed on a 2021 Miller Station Electrical Reliability Study with Harris Group identifying high level scopes of work recommended in tiers of priority.
- As identified high level in the 2021 Harris Group Study, NW Natural will upgrade end of life components such as the Mechanical MCC, South MCC, refeed Bruer, and add disconnects to 100/200/300/400 buildings.
- NW Natural performed an additional updated detailed assessment with JHI in 2023 summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- Phase 1 was completed in 2022.
- Phase 2 execution scheduled for Q3 2024
- Actuals in 2024: $2.24M
- Mix of Utility and Interstate Gas Storage Assets

Mist Instrument and Controls Upgrade Phase 3, Year 2

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of significant risk highlighted was Miller Stations Instrument and Controls.

- In response to the 2016 Facility Assessment Study, NW Natural has performed an additional updated detailed assessment with JHI in 2023 summarized by an engineering memo on the final refinement of the scope of work and technology selection justification.
- As identified, NW Natural will upgrade end of life components such as moisture analyzers, flow transmitters, pressure transmitters, chromatographs, etc.
- NW Natural will make instrumentation upgrades (switches, connectors, etc...).
- Phase 2 was completed in 2020.
- Actuals in 2024: $1.62M
- Mix of Utility and Interstate Gas Storage Assets

Mist Methanol Injection Upgrade at Wellheads, Year 2

- NW Natural executed on a 2016 Facility Assessment Study with EN Engineering identifying high level scopes of work recommended for plant reliability. An area of highlighted risk was the methanol injection system's level gauge. After a more thorough internal investigation of the methanol injection system and tracking of the location of hydrate formations, the entire methanol injection system was identified as end of life and a reliability risk.
- In 2023 NW Natural hired Norwest and 3rd party engineering service provider to perform a reassessment of the methanol injection system at the wellheads. The scope of work since 2016 has evolved as signs of corrosion and vapor locking have appeared. Through this updated 3rd party engineering service provider assessment, an engineering memo on the final refinement of the scope of work and technology selection justification was developed.
- In 2017 NW Natural began the well inspection program as required by code. After a well inspection has been performed, the increased gas moisture content has led to an increase in hydrate formation downstream of reworked well.
- NW Natural in recent years has operated the underground storage reservoirs at higher pressures closer to the native reservoir pressure increasing the formation of hydrates.
- NW Natural will replace as recommended the methanol injection system at 14 IW Wells.
- NW Natural will procure a mobile methanol injection system to address hydrate issues outside of the wellheads, likely to target pipelines downstream of reworked wells.
- Actuals in 2024: $4.6M
- Mix of Utility and Interstate Gas Storage Assets

15 Year Plan, Mist Facility Assessment

- To ensure the safe and reliable supply of Mist Storage Gas to our customers, a holistic reassessment of the original 10-year plan is required, looking 15 years forward.
- The capital construction projects outlined in this 10-year plan are based on projects identified in the 2016 EN Engineering Facility Assessment. These recommendations have either been implemented or modified. As the 2016 original facility assessment ages, recommendations are becoming obsolete and out of date. Follow-up reassessments are becoming increasingly common at an

individual project level due to the ever-changing condition of field equipment. Additionally, the study is nearing the end of its scope of work, as the study is nearly 8 years old.

- A third-party engineering firm will conduct a new facility assessment of the Mist Miller Compressor Station, including surface equipment at the IW wells. This assessment will investigate the activities required to maintain the plant's reliability, safety, and efficiency over the next 10-15 years.
- The assessment will include a review of the condition of critical plant equipment through visual inspection and a review of facility operation and maintenance records. It will also involve gathering information related to equipment operation (run time, failures, and repair costs), reviewing manufacturer operation and maintenance recommendations, recommending a path forward, and establishing a timeline for needed reassessment of individual pieces of equipment.
- The priority of activities will depend on the current systems condition and the ranking of criticality from Tier 1 through 3, with Tier 3 being the most critical.
- Long-term lifecycle asset management plans will be developed, and procedures will be included.
- A follow up assessment will be performed every 8 to 10 years.
- Actuals in 2024: $290K
- 100% Utility asset

Re: 2022 NLNG Pretreatment Performance Post System Modifications, Rev 1

cc: Chris Finnegan, Charles King

Executive Summary

Northwest (NW) Natural completed a successful modification of the pretreatment system at the Newport LNG Facility. The system was commissioned and performance tested in May and June 2022. A summary of the performance test results is provided within this document and resulted in the following recommendations. The System Performance Summary provides additional information to support the recommendations.

1. Replace the dehydration vessel LNG-5 molecular sieve with RK-34 molecular sieve.
2. Replace the CO_2 adsorber vessel LNG-5 molecular sieve with new LNG-5 molecular sieve.
3. Install a flare, thermal oxidizer, or other fuel-consuming equipment to increase the CO_2 Adsorber regen fresh makeup flow. An added benefit of the fuel-consuming equipment is that it would allow for the pretreatment system to be regenerated without the liquefaction system operating.
4. Resolve E-H501 performance with the heat exchanger vendor.
5. Install an automated valve at F-504 liquids drain and a new level transmitter or level switch to allow for automatic draining of the vessel as required.
6. Replace the hot oil expansion tank or add an additional tank in parallel to provide the expansion capacity required for the hot oil system from cold start to hot operating temperatures.

NW Natural has developed plans to replace this facility's cold box. To ensure the performance and warrantability of the new cold box, it is highly recommended that the first three recommendations above be completed prior to its installation.

Background

NW Natural completed modification of the pretreatment system at the Newport LNG Facility in Spring of 2022 to address the following performance challenges:

1. Water and Carbon Dioxide (CO_2) were present in the cold box inlet gas due to limitations of the previous system design. This resulted in plugging of the cold box heat exchanger passes due to freezing of the water and CO_2. The plugging led to

liquefier plant shutdowns after 1.5-2 weeks of liquefier operation when the system should be capable of operating for the entire liquefaction season without shutdown. The limitations of the original design included:

   a. Drier Regen Cooling Outlet Gas was mixed with the dehydrated gas to the CO_2 adsorber which carries water to the downstream CO_2 adsorber.
   b. CO_2 adsorber cooling gas was mixed with the clean gas (CO_2 free gas) to the cold box which added contaminants (CO_2 and water) to the clean gas.

2. Cold Box Inlet Temperature swing after a pretreatment bed switch due to a portion of warm sieve remaining within the bed after cooling. This resulted in MRL refrigeration loop imbalance after every bed switch.
3. Dehydration regen heating and CO_2 regen heating utilized the same heat exchanger, limiting the available heat and flexibility for regen heating adjustments for the two systems.
4. Boiloff gas was recirculated into the plant feed gas or cold box inlet feed gas stream via C-1/C-2, causing nitrogen buildup in the cold box feed gas due to the nitrogen flashing at the LNG tank and exiting the tank in the boiloff vapor. This phenomenon would eventually cause the need for a plant shutdown.
5. Dehydration Tail Gas Separator S-A01 appeared to carry over liquids as liquids had been found downstream at the F-A02 filter and in the fuel gas system supply. Liquid carryover in the fuel gas could cause damage to the gas turbine.

System Performance Summary

The following system performance was observed after commissioning completion of the pretreatment system modifications on June 13, 2022.

1. Dehydration
   a. Design vs. Observed Performance

	Design [1]	Observed	Notes
Adsorption			
Time (hours)	48	48	
Flow (MMSCFD)	7.4	6.9	
Pressure (psig)	335	333	
Temperature (F)	50	54	
Inlet H_2O (ppm)	150	Not Available	Normal pipeline gas moisture levels, typically 30-105 ppm, 150 ppm is tariff limit (7 lb/MMSCF)
Outlet H_2O (ppm)	0.1	0 - 0.03	Success. Prior to modifications, outlet water ranged from 0.3 – 5 ppm per 10/22/2020 data.
Regen Heating			
Time (hours)	2.5	~7.5	This is longer than design. See findings/discussion below.
Flow (MMSCFD)	0.9	0.89	

	Design [1]	Observed	Notes
Pressure (psig)	316	316	
Inlet Temp (F)	500	575	Inlet temperature can be lowered to 500 F or the temperature required to achieve 450 F outlet temperature minimum at the end of the cycle.
Outlet Temp (F), @ End of Cycle	450 (or >400 F for 2 hrs)	470	
Regen Cooling			
Time (hours)	1.5	~5	This is longer than design. See findings/discussion below.
Flow (MMSCFD)	0.9	0.89	
Pressure (psig)	316	316	
Inlet Temp (F)	100	83	
Outlet Temp (F), @ End of Cycle	110	93	Goal = 10 F differential from inlet temp.
[1] Design values per attached UOP Design Summary Sheet for V-A03, V-A04, and V-A05. [2] Refer to attached pretreatment screen shots-trends, 6-13-22, to support observed data.			

b. Findings/Discussion
   i. Dehydration system is removing water from the incoming gas as designed and required. It is not evident that water is carrying over to the CO_2 adsorbers anymore.
   ii. The regen heating and cooling times are longer than design.
      1. Causes: This may be due to the slightly lower design flow which is limited by the plant fuel gas system. Another cause may be due to the vessel internal insulation which is insufficient. The vessels were in the process of being externally insulated at the time which will offer improvement.
      2. Path Forward: The longer than design cycle times can be accommodated by the available standby time so as long as the regeneration design heating and cooling temperatures are achieved, the extended time is acceptable.
      3. Recommendations:
         a. Consider limiting the cooling time to the minimum needed to achieve the required cooling temperatures. This is due to the regen gas supply containing CO_2 and heavy hydrocarbons from the CO_2 adsorber regen heating process. Limiting the extended cooling time will

limit the adsorption of the contaminants during the cooling cycle.

b. Consider replacing the LNG-5 molecular sieve with RK-34 molecular sieve designed for water and mercaptan removal. This will further limit the adsorption of the contaminants during the regen cooling cycle.

iii. Regen heating temperatures to the dehydrator are more consistent due to new separate heat exchanger E-H501. However, there appears to be a performance issue with E-H501 as it is using more hot oil flow than design to achieve the outlet gas temperature setpoint. This causes the hot oil system capacity to be exceeded after a CO_2 adsorber bed switch when the CO_2 regen heat requirement is at its highest which then causes the dehy regen heating temperature to fall to 500-510 F.

1. Recommendations: Resolve E-H501 performance with vendor.

2. CO_2 Vessels

a. Design vs. Observed Performance

	Design [3]	Observed	Notes
Adsorption			
Time (hours)	2.3	0.5-0.75	Set time to 3 hours to extend regeneration heating time to work to drive out water of molecular sieve. However, CO_2 breakthrough observed early in cycle. See discussion below.
Flow (MMSCFD)	7.4	6.9	
Pressure (psig)	330	329	
Temperature (F)	50	54	
Inlet CO_2 (ppm)	20000	3590	
Outlet CO_2 (ppm)	<50	>100	Exceeded 50 ppm at 30 mins for V-A03 and V-A05, 45 mins for V-A04. See discussion below.
Regen Makeup			
Flow (MMSCFD)	1.1	0.89-0.91	Not enough fresh makeup flow. See discussion below.
Regen Heating			
Time (hours)	1.9	1.6	
Flow (MMSCFD)	3.5	3.5-4.76	Varies as B-A01 suction temperature rises throughout the cycle.

	Design [3]	Observed	Notes
Pressure (psig)	306	306	
Inlet Temp (F)	550	580	Ran higher temperature to work to drive out the water in the molecular sieve
Outlet Temp (F), @ End of Cycle	450	515	Success. Achieved 65 F difference between inlet and outlet temperature prior to design regen heating time. Design is 50-100 F.
Regen Cooling			
Time (hours)	1.9	1.9	
Flow (MMSCFD)	4.9	5.23-5.32	
Pressure (psig)	327	327	
Inlet Temp (F)	109	88	
Outlet Temp (F), @ End of Cycle	120	95	Success. Achieved 7 F difference between inlet and outlet temperature by regen cooling time. Design is 10 F.

[3] Design values per attached UOP Design Summary Sheet for V-A03, V-A04, and V-A05.
[4] Refer to attached pretreatment screen shots-trends, 6-13-22, to support observed data.

b. Findings/Discussion
   i. CO_2 adsorption is not meeting design CO_2 removal performance:
      1. Causes: Molecular sieve is expected to be contaminated by water due to the previous issue with water carryover from the dehydrators. The water is taking up adsorption capacity within the bed, preventing CO_2 from being adsorbed in a large portion of the bed. Unfortunately, once water is adsorbed into molecular sieve reserved for CO_2 removal, it is difficult to fully regenerate, drive the water out, and free up the space for CO_2.
      2. Recommendation: Replace the molecular sieve in the CO2 adsorbers now that the upstream performance issues with water carryover have been resolved.
   ii. Regen heating and cooling flows, temperatures, and time meet or exceed design.
   iii. Regen makeup flow is not achieving design which is driven by fuel gas (regen tail gas) consumption. Lack of sufficient regen makeup flow will prevent full regeneration of the CO_2 adsorber beds which will reduce design adsorption capability over time and could shorten the life cycle of the molecular sieve product.
      1. Project Efforts to Achieve Design Makeup Flow

a. Hot oil heater burner tuning to allow consumption of varying quality fuel gas. This was successful but the burner only burns ~ 0.004 MMSCFD so has minimal effect on consumption.
b. B system controls installed to allow consumption of the fuel gas when the quality falls within tariff values. This provided the additional fuel gas consumption to achieve design makeup flow. However, the fuel gas (regen tail gas) exceeds the tariff limits after 15-20 minutes into the regen cycle, requiring flow to be stopped to the B system. This prevents the added flow consumption from being consistently available.

2. Recommendation:
   a. Install a flare, thermal oxidizer or other fuel consuming equipment that will provide the following benefits:
      i. Increase Regen Fresh Makeup Flow to Meet or Exceed Design.
      ii. Allow for the pretreatment system to be operated for regeneration purposes only prior to and after liquefaction operation, which is recommended for successful performance, especially if the liquefaction system trips off when a bed is in the middle of a regeneration cycle. Currently, the plant needs to startup on a partially used bed while the regen heating bed restarts its regen heating cycle.

3. Other System Enhancements and Performance
   a. Pretreatment After Cooler, E-A503
      i. Successfully provides consistent inlet gas temperature to the cold box at +/- 5 F of water/glycol supply temperature which eliminates the previous temperature swing after a pretreatment bed switch which caused MRL refrigeration loop imbalance.
   b. Boiloff Use for CO_2 Regen Fresh Makeup Supply
      i. Successful use of boiloff for regen fresh makeup supply via new F-505, reducing the amount of boiloff recirculated to the cold box inlet gas stream.
   c. Dehydration Liquids Removal at S-500 and F-504
      i. Liquids removal from the fuel gas is successful. However, it was found that F-504 captured more liquids than expected requiring operations to open the manual valve to drain the liquids to V-10 more often than expected.
         1. Recommendation: Consider addition of automated valve at F-504 liquids drain and addition of level transmitter or level switch to allow for automatic draining of the vessel as required. This would eliminate continuous manual valve

operation by operations which, if left unattended, could cause carryover of liquids into the fuel gas system.

d. Hot Oil System
   i. The hot oil heater temperature controls were tuned to respond to system load changes and prevent overshoot. Heater outlet temperature overshoot causes the heater to shutdown and then go through purge cycles to restart which causes a drop in system supply temperatures. Additional heater outlet temperature tuning may be required once the E-H501 performance issues are resolved.
   ii. The existing hot oil expansion tank was found to be undersized as the level would often rise to the high-level switch during operation which would trip the heater offline. Operations would reduce the liquid level to allow restart of the heater. However, if the system was shutdown and system temperatures dropped, hot oil addition was required to achieve the minimum liquid level to start.
      1. Recommendation: Consider replacing the hot oil expansion tank or adding an additional tank in parallel to provide the expansion capacity required for the system from cold start to hot operating temperatures.
   iii. Cold Box Performance
   - Refer to attached Liquefaction Performance Tends, 2021 vs. 2022
      1. Under the previous pretreatment system design, the E-2 Heat Exchanger B Pass differential pressure would increase from ~7 psi on liquefaction operation day 1 to 12.4 psi by day 5.
      2. Although the adsorber molecular sieve requires replacement and the CO_2 levels to the cold box are better but still higher than design, the E-2 Heat Exchanger B Pass differential pressure is consistent around 6 psid. This is a good sign of decreased contaminants to the cold box, including elimination of water.

MEMORANDUM

9/13/2023

Background:

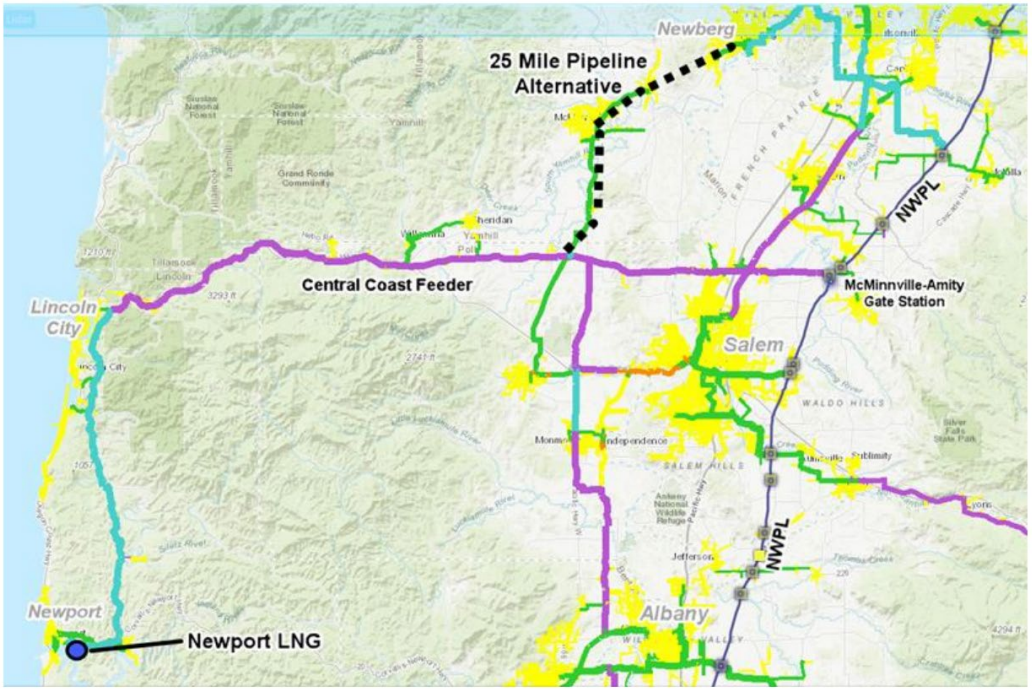
On March 1, 2021, NW Natural filed the 2018 IRP Update #3. In this update we evaluated an investment in the Newport cold box relative to alternative options that would be needed to reliably serve customers. As described in the 2018 IRP update #3, Newport is a critical source of gas supply needed to deliver 60,000 Mcf/day (64,500 Dth/day) of gas into the system to meet peak day requirements. Without replacing the cold box the Newport facility would not be able to fill the tank with LNG during summer months reliably and could terminate to function at any point. This would effectively decommission the LNG facility and removes 60,000 Mcf of firm gas delivery from NW Natural's resource stack to meet peak day resource requirements.

Two alternatives to the Newport Cold box were considered in the IRP Update #3.

> Alternative A: Contract with NWP for additional pipeline capacity from Sumas south to city gates on NWP's Grants Pass Lateral
>
> Alternative B: Construct a 25-mile-high pressure transmission facility between Newburg and the Central Coast Feeder coupled with additional Mist Recall

Alternative B is the lower cost option of these two alternatives and would require a 25-mile pipeline to be constructed in order to deliver the Mist gas onto the central coast feeder in order to reliably serve customers that Newport LNG current supports during a extreme cold event (i.e., West Salem, Dallas, Lincoln City, and Newport). It must be coupled with Mist Recall to replace the daily deliverability for a peak day requirement currently being served by the Newport LNG facility. This pipeline alternative was evaluated in the 2018 IRP Update #3 (shown in Figure 21 from the filing).

Figure 21: Alternative Pipeline Route



Since the 2018 IRP Update #3 we've experienced an increase in the cost of the Newport Cold Box project dues to two primary reasons.

1) Increase in costs due to inflation
2) Additional scope of the project identified as necessary investments after the IRP Update #3 was filed. The additional scope was identified in our Newport LNG 10-year plan and during detailed project planning. This additional scope added $5.5 million to the Current Estimate.

Table 1 shows the costs estimated in the 2018 IRP Update #3 in 2019 dollars, what those costs would be today after adjusting for inflation (2022 $) and the current build cost estimates for the Newport Cold Box project and the 25-miles pipeline need to bring Mist gas to the central coast feeder.

Table 1: Build Costs

		IRP Update #3 Cost Estimate		Current Estimate
		2019$	2022$	2022$
1	Newport Cold Box Project	$18,154,000	$20,222,000	$27,100,000
2	25-mile Pipeline Alternative	$170,830,000	$190,479,000	$190,479,000

When evaluating long-term investment decisions, build costs are not the only metric to consider. Newport is a critical resource to be able to serve system capacity during extreme cold events both today and in the future. If system peak requirements continue to grow, the absence of the Newport LNG facility, could increase the costs of alternative system capacity resources needed in the future. The analysis below considers the current cost estimates for the Newport cold box project and examines 4 scenarios:

1) Expected cold box cost estimates; Continued peak growth over the planning horizon
2) Expected cold box cost estimates; Declining peak growth starting in 2024
3) High cold box cost estimates; Continued peak growth over the planning horizon
4) High cold box cost estimates; Declining peak growth starting in 2024

These scenarios are evaluated on the net present value revenue requirement that each option requires taking into consideration the benefits and additional costs (besides build costs) that each option is forecasted to incur.

Analysis:

The Newport Cold box project and the pipeline alternative are different types of investments and are categorized under different FERC accounts as well as receiving different rates for cost-of-overhead (COH). For a full picture, we analyze these costs using a cost-of-service model, which accounts for the full cost that would filter into customer rates, including but not limited to taxes, COH, cost-of-debt, and O&M costs.

In addition, to the costs associated with the Newport Cold box project, there are other forecasted costs associated with continuing to operate the Newport Facility over the next 10 years. These costs would not be incurred if the Newport facility were decommissioned. We use a cost-of-service model to account for the full costs of these additional expenses.

For the pipeline alternative option, NW Natural would look to mothball or fully decommission the Newport facility. The costs to decommission the Newport facility would be significant and could vary drastically. We did not attempt to estimate these costs as it would only add additional costs to the

pipeline alternative option, which we show to be the more expensive alternative across the four scenarios, even without considering these cost. Table 2 show the net present value cost-of-service for all associated costs from 2025-2050 for option 1, keep operating the Newport facility.

Table 2: Net present value 2025-2050 cost-of-service for option 1, Keep Newport Facility Operating

	Expected Cost-of-Service	High Cost-of-Service Estimate
Newport Cold Box Project	$45,144,000	$56,429,000
Other Newport	$28,815,000	$46,655,000
Total Cost	$73,959,000	$103,085,000

There are both cost and benefits that are considered for option 2, build a 25-mile pipeline coupled with Mist Recall. The costs include the cost-of-service for the 25-mile pipeline and cost-of-service for Mist Recall. Additionally, if Newport LNG is decommissioned and we continue to see continued peak growth then Mist Recall is exhausted in 2034 and we would need additional system capacity resources to meet the peak demand requirement. If Newport LNG is decommissioned, the marginal system capacity resource after Mist Recall would be a Mist expansion. There are gas commodity savings from additional storage capacity from both Mist Recall and a Mist expansion. Additional storage capacity provides a benefit to customers through increased seasonal arbitrage of summer and winter gas prices spreads. This analysis uses the resources optimization planning model (i.e., PLEXOS) to estimate the value of commodity cost savings from the additional Mist capacity over the planning horizon. Table 3 provides the net present value cost estimates for each of these components for two peak demand growth scenarios.

Table 3: Net present value 2025-2050 cost-of-service for option 2, 25-mile pipeline coupled with Mist Recall

	Continued peak growth	Declining Peak Growth
25-mile pipeline	$564,126,000	$564,126,000
Mist Recall to Replace Newport LNG peak deliverability (64,500 Dth/day)	$34,937,000	$34,937,000
Additional Future Peak Day Capacity Need (i.e., Mist Expansion)	$218,727,000	$0
Decommissioning Newport LNG	Not Estimated	Not Estimated
Commodity Costs Savings	-$36,383,000	-$26,940,000
Total Cost	$781,407,000	$572,123,000

Table 4 combines the total cost from Table 2 and Table 3 into 4 rows see the difference across the 4 scenarios

Table 4: Net present value 2025-2050 total cost comparison

	Newport Facility Cost Assumption	Peak Assumption	Option 1: Keep Newport Facility Operating	Option 2: 25-mile pipeline coupled with Mist Recall	Delta[1]
1	Expected	Continued peak growth	$73,959,000	$781,407,000	>$707,448,000
2	Expected	Declining Peak Growth	$73,959,000	$572,123,000	>$498,164,000
3	High	Continued peak growth	$103,085,000	$781,407,000	>$678,322,000
4	High	Declining Peak Growth	$103,085,000	$572,123,000	>$469,038,000

[1] Does not reflect decommissioning costs which would only increase this delta. The greater than symbol ">" is used to represent this cost exclusion.

Recommendation:

Given the analysis across these four-scenarios indicates that cold box investment is lower cost relative to the pipeline alternative, we recommend moving forward with the Newport Cold box project.

Initial Project Charter

The initial project charter is intended to document the team's initial approach to analyzing the problem. Completed at the end of initiate, this will serve as the foundation for performing any studies or analysis as the project team weighs potential options for solving the underlying business case.

Initial

Project Description

Newport LNG has experienced electricity outages that prevent operation of the production or vaporization send-out systems. Most recently, Newport LNG had such an outage and was unable to supply gas to customers during a peak winter event. The risk of being unable to send gas to the system during winter storms is untenable to customers. Winter weather typically coincides with vaporization needs, which also correspond to likely power outages.

This project would solve this operational problem by installing a generator that meets all of the facility's electrical demand.

Business Case

Newport LNG has experienced electricity outages that prevent operation of the production or vaporization send-out systems. Most recently, Newport LNG had such an outage and was unable to supply gas to customers during a peak winter event. The risk of being unable to send gas to the system during winter storms is untenable to customers. Winter weather typically coincides with vaporization needs, which also correspond to likely power outages.

Key Objectives and Outcomes

- Increase the reliability of Newport LNG's electricity supply.
- Potentially, convert waste gas to electricity (instead of flaring it).

Rough Cost/Benefit Analysis Summary

By implementing the new generation operation at the Newport LNG facility, which will be capable of supporting vaporization operations, this project will offset the potential of purchasing "penalty" gas in the event of simultaneous utility power loss and vaporization requirement.

Rough Scope

- Survey and assess generation alternatives.
- Analyze alternatives.
- Perform process, electrical, and detailed engineering design.
- Permit new generator(s).
- Buy a generator.
- Contract one or more installation contractors.
- Install the generator(s).
- Create procedures and manuals.
- Commission the generator(s).

Initial -Cont.

Known Constraints at Initiation Phase

- Generators have long lead times.
- Generators are expensive.
- Newport LNG's permitted air emissions are almost at a threshold that would shift this facility's classification.

Known Assumptions at Initiation Phase

N/A

Change Control Plan

We would manage changes in Planview.

estimated cost of the project - far exceed that of the proposed pipeline uprate project. Table 5 summarizes the costs of the proposed project and satellite LNG option.

Table 5: North Coast Feeder System Reinforcement Alternatives Costs

Alternative	Estimated Cost (with COH)	20-year PVRR
Feeder Uprate	$4.6M - $9.1M	$5.1M - $10.2M
Satellite LNG Alternative	$19.6M	$26.3M

3.B Newport Cold Box

Newport LNG Background

The Newport LNG Plant (Newport) is located in Newport Oregon at the western end of NW Natural's Central Coast Feeder Pipeline (See Figure 9). The Central Coast Feeder Pipeline runs approximately 90 miles from Williams NW Pipeline McMinnville-Amity Gate Station to Lincoln City and south to Newport. This pipeline serves as the sole source of natural gas to the towns of Lincoln City, Newport and the surrounding communities and the primary source of gas for McMinnville, Sheridan, Willamina, Dallas, Independence, Monmouth and many other smaller communities during peak events.

It consists of a 1,008,500 Dth capacity storage tank, liquefaction facilities capable of processing about 6,000 Dth/day, and vaporization capacity of up to 108,500 Dth/day. Due to CO_2 and seismic constraints the maximum fill level of the plant is at 90% full, or 976,500 Dth. Because the Company's pipeline system limits Newport to serving the central coast and Salem market areas, the full 108,500 Dth/day vaporization rate is not achievable. Instead, 65,100 Dth/day is the effective limit on vaporization at Newport.[16] The Newport LNG plant (Newport) was constructed by Chicago Bridge and Iron and commissioned in 1977. The facilities and major process components of the Newport LNG plant were designed for a nominal 25-30-year life and Newport is now 44 years old. The Company has replaced many of the primary components of the facility over the last few years.

Primary Role Played by Newport LNG

Newport is a valuable resource for meeting our customer's peak needs. To understand the operational significance of the Newport LNG facility, it is important to first provide background information about the Company's storage facilities. NW Natural relies on four existing storage facilities to augment the supplies transported from British Columbia, Alberta and the Rockies. These consist of underground storage at Mist and Jackson Prairie, along with LNG plants located in Portland (referred to as PDX-LNG) and Newport, Oregon. The Company owns and operates Mist, PDX-LNG, and Newport LNG, all of which reside within the Company's service territory. These three storage facilities are considered 'on-system'

[16] All of the values listed are based on a gas heat content of 1,085 Btu/cf

gas supply resources. Gas is typically placed into storage at these facilities during off-peak periods, which is also known as 'injecting' (for underground storage) or 'liquefaction' (for the LNG facilities). When needed, these on-system resources do not require further transportation on the NW Pipeline interstate pipeline system, but rather use 'withdrawal' or 'vaporization' from Mist or the LNG facilities, respectively, to supply gas directly to NW Natural's system.

In contrast, Jackson Prairie storage is located about 80 miles north of Portland near Centralia, Washington, i.e., outside the Company's service territory. Jackson Prairie has been owned and operated by other parties since its commissioning in the 1970s. The Company contracts for Jackson Prairie storage service from NW Pipeline, which also contracts separately for the transportation service from Jackson Prairie to the citygates to NW Natural's system.

Table 6 shows the daily supply capacity of these resources.

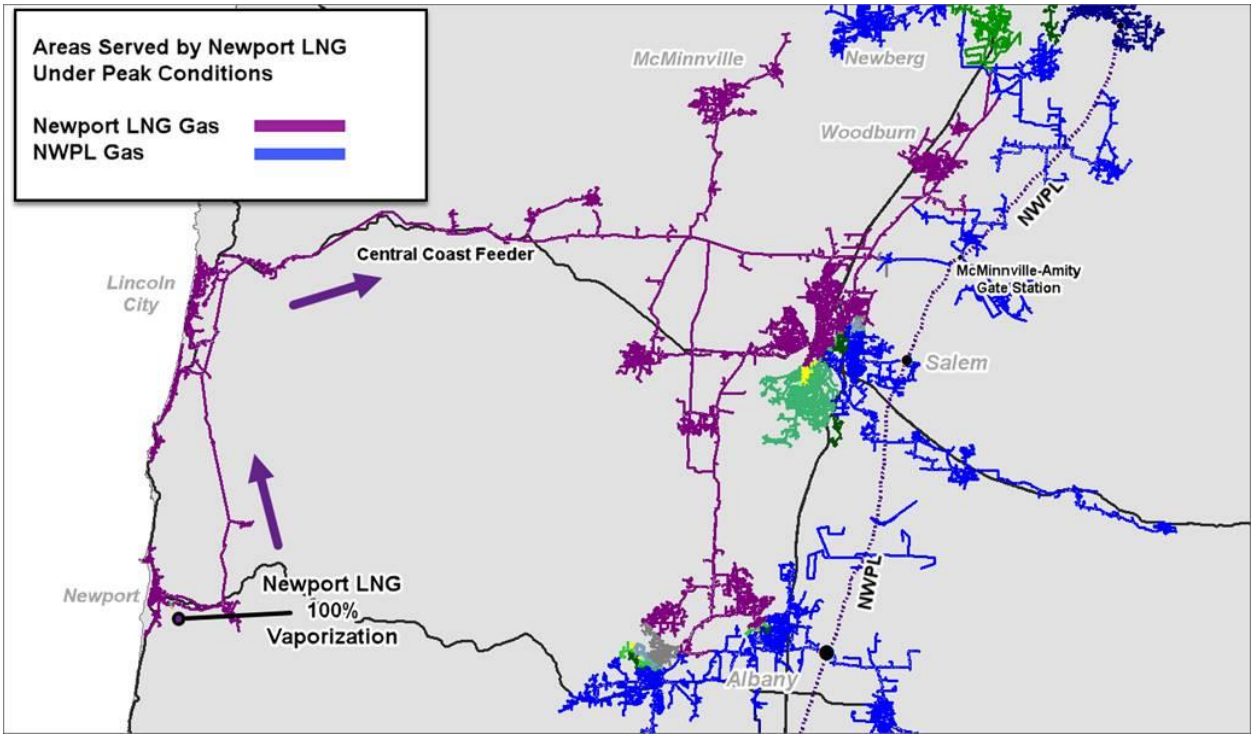
Table 6: Firm Storage Resources[17]

Facility	Maximum Daily Rate (Dth/day)
Jackson Prairie	46,030
Mist (reserved for core)	305,000
Newport LNG	65,100 *
PDX-LNG	129,480 *

Figure 17 shows how the gas from the facility flows under peak conditions to the coastal and southern service area of NW Natural's system.

[17] The numbers in Table 6 with an asterisk originated from volumetric units (e.g., Bcf) that have been converted to energy units (Dth) using the current heat content (Btu per cf) of the applicable facility. The other numbers included do not need to be adjusted for heat content because they originate from contracts (Jackson Prairie) or deliverability calculations (Mist) that are specified in energy units.

Figure 17: Newport LNG Gas Flows



Additional Roles the Newport LNG Facility Plays

The Newport plant serves as not just a wintertime peaking supply but as a source of supply for emergency situations and pipeline maintenance. Any significant damage or event along the 90-mile-long pipeline length can interrupt gas flow which could cause outages to thousands of customers downstream of the event if an alternate supply (Newport LNG) were not available. The Newport LNG plant represents a source of supply that can be used to maintain reliable service to customers.

The Echo Mountain Wildfire in September 2020 served as an example of this capability as it damaged the primary district regulator station serving Lincoln City. To safely operate NW Natural's high-pressure system, a portion the Central Coast Feeder pipeline was shut down near Lincoln City to reduce risk and damage. While the segment of the Central Coast Feeder was shut down, the primary gas feed from the Williams NWPL McMinnville-Amity gate station was severed. During the shutdown, the Newport LNG plant was used to continue serving approximately 10,000 customers in Newport, Toledo and Lincoln City. Newport LNG gas was used to serve affected customers from September 9, 2020 through September 16, 2020. The Central Coast Feeder was reestablished to regular operations on September 16 after state fire managers determined it was safe to do so.

Cold Box Project Background

The Cold Box is an essential component in an LNG liquefaction plant, it is where natural gas is cooled to cryogenic temperatures to convert the gas to liquid. Once liquefied, it is pumped from the Cold Box to the onsite insulated storage tank where it can later be used in the winter. A Cold Box, see Figure 18, is

made up of multiple aluminum heat exchangers, which are stacked on top of each other and encased in a single unit measuring approximately 30 feet in height. The Cold Box at Newport LNG is 44 years old. This places it well past its design life and it is currently showing signs of its age through performance problems.

Figure 18: Cold Box Illustration

While an initial consultant recommended replacing the Cold Box in a 2014 study, it was later determined the estimate they provided for the cost of replacement was drastically low. Additionally, in 2016 NW Natural installed a new pretreatment system to address high CO_2 in the supply of gas, which was making it through the liquefier and into the LNG tank. The new pretreatment process dramatically improved the quality of gas entering the Cold Box. However, the original pretreatment design required additives such as methanol to be injected ahead of the Cold Box to absorb moisture. The methanol was then removed after liquefaction. This is no longer required. Nevertheless, Without the additive, contaminants were able to easily foul the Cold Box causing increased differential pressure in the system and reducing production. Inspections to understand this issue revealed contaminants on the interior surfaces within the Cold Box heat exchangers, which compound flow restriction issues caused by poor gas quality entering the system. The differential pressure is higher than design allows in the first two exchangers within the Cold Box. This is believed to be due to several issues, including internal contamination as shown in Figure 19 upon inspection. The Cold Box itself is not the only contributor to operational issues, as higher levels of heavy hydrocarbons are contained within the gas stream than were present at the time of the original design of the facility. Heavier hydrocarbons tend to freeze at higher temperatures and can create blockages in the system, which also contribute to higher operating pressures within the Cold Box.

Figure 19: Contaminated Heat Exchanger

After learning the original cost estimate from the consultant for Cold Box replacement was quite low NW Natural's engineering team reviewed a lower-cost alternative: to clean the Cold Box to improve its near-term operation and possibly extend its life. A consultant was engaged to perform the cleaning. After discussion with the consultant (a vendor of the manufacturer), an agreement could not be made to have the Cold Box cleaned that did not seem to introduce more risk to damaging the Cold Box, and it was not guaranteed to fix the problem.

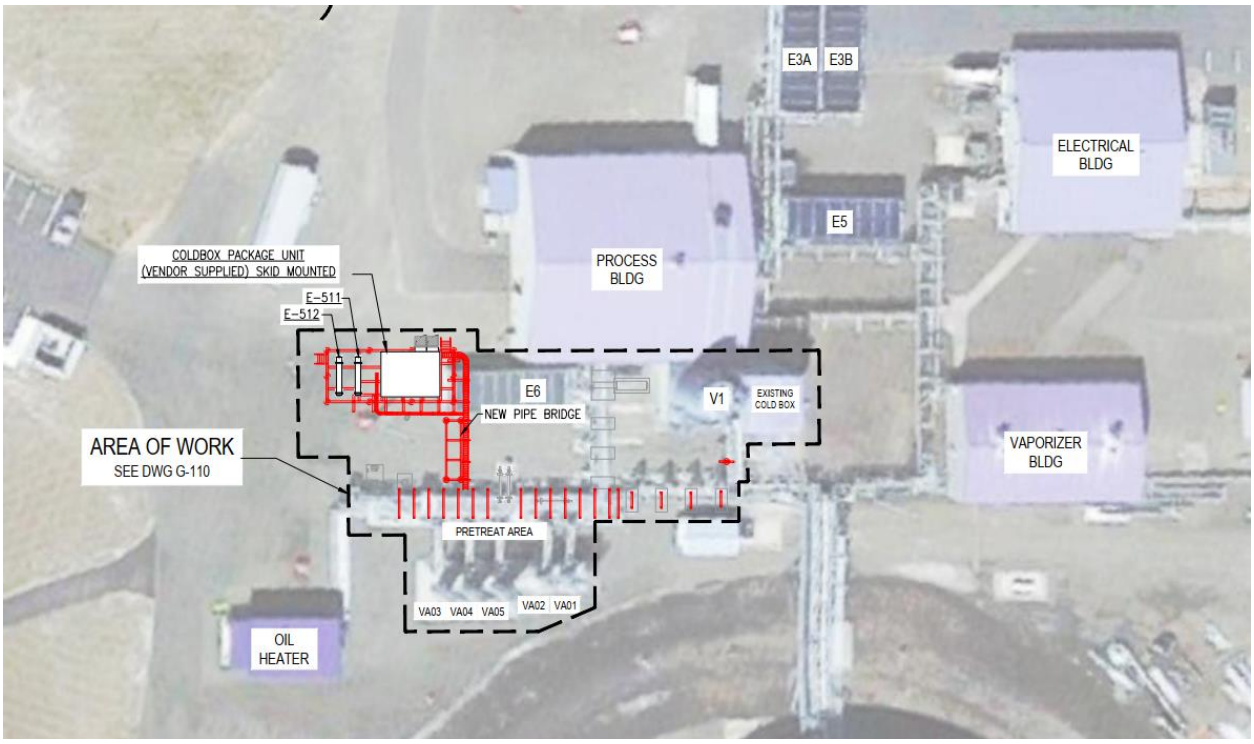
At this time NW Natural engaged another consultant that specializes in LNG to provide a report and recommendation specific to the Cold Box at the Newport facility. This study, completed by Sanborn, Head, and Associates determined that continued operation of the Newport LNG facility without replacement of the Cold Box and upgrading the pretreatment system equipment is not recommended and provided the following conclusions[18]:

> *Aging equipment – The design and construction of the existing Cold Box heat exchangers are outdated. Industry experience with this type of equipment has demonstrated that it is significantly more prone to failure than newer designs. This Cold Box has reached its end of life and should it fail, repair is most likely not possible. A failure and replacement could cause significant downtime for the facility, at least 1.5 years on the most accelerated schedule.*
>
> *Reliability - The current liquefaction system at Newport is unreliable. Ongoing issues with Cold Box freezing, and carbon dioxide (CO2) build-up in the storage tank require that upgrades including new equipment and system modifications be implemented.*
>
> *Modernization - Replacement of the Cold Box with a modern design would allow one heat exchanger to be installed in place of the existing two exchangers. This would improve system reliability and minimize downtime. It would also allow removal of the aging Cryex CO2 removal vessel. This vessel is a remnant of the previous (original) pretreatment system. Its removal would eliminate an original, 10,000-gallon LNG pressure vessel, which was installed in 1977, without any secondary containment.*

[18] From page 3 of the Sanborn Head NWN Cold Box Replacement Engineering Study

At this point the Cold Box replacement is necessary to be able to continue to rely upon Newport LNG as a firm resource to serve NW Natural's current needs. Should the Cold Box fail, the ramifications to the plant would be significant. A replacement unit would require approximately two years to install. Repairs to this type of equipment can be very costly or even impractical. If a failure occurred at the beginning of the production season, this would leave the facility without a reasonable means to refill the storage tank. As a result, all remaining LNG may boil off prior to equipment replacement (depending on the tank level at the time of failure), which in turn, would allow the large LNG tank to warm significantly, inducing stress on the tank due to thermal expansion. Customers would also be left without the benefit of backup storage to support periods of peak demand during cold weather or other supply constraints.

Figure 20: Overview Map of Project Area



Sanborn Head also identified potential improvements in the pretreatment system which could be implemented to ultimately aid in reducing stresses on the Cold Box. These suggested improvements are being addressed now. This project and a broader update on activities at the Newport LNG facility can be found in Appendix E.

Cost Estimate of Cold Box Replacement

Table 7 lists the major project components as well as their costs. These capital costs include a 30% contingency. For the total costs for the cost-of-service modeling there are also additions for allowance for funds used during construction (AFUDC) and associated taxes. There is also a 3% cost of overhead adder bring the total for COS modeling to just over $18 million.

Table 7: Newport Cold Box Cost Estimates

Project Components	Cost (includes 30% Contingency)
Engineering & Overhead	$4,275,793
Major Equipment	$4,384,600
Demolition	$594,935
Civil/Site Construction	$1,166,853
Structural Construction	$1,348,780
Mechanical Construction	$2,953,791
Electrical Construction	$734,563
Instrumentation/Control	$1,490,819
Startup and Commissioning	$318,500
Training	$71,500
Freight	$260,694
Subtotal	$ 17,600,827
COH 3%	$528,750
AFUDC/Taxes	$24,172
Total	$ 18,153,747

Alternatives Analysis

For the alternative to replacing the Cold Box the Company looked at solutions similar to those in the 2014 IRP. The alternatives examined then are still the alternatives most appropriate to examine today. These alternatives are discussed below.

Alternative A: Contract with NWP for additional pipeline capacity from Sumas south to city gates on NWP's Grants Pass Lateral

Alternative B: Construct a 25-mile-high pressure transmission facility between Newburg and the Central Coast Feeder coupled with additional Mist Recall

To receive the same capacity benefit of Newport, Alternative A would require annual demand payments of $23-$43 million, in addition to potential gate station and distribution upgrades. Table 8 shows the potential costs associated with additional capacity additions.

There are two possibilities for securing additional pipeline capacity, with the least expensive option being a regional expansion from Sumas to Molalla. This would occur in the event NW Pipeline held an open season and could justify the expansion based upon demand from multiple parties in addition to NW Natural (i.e. this option in not in NW Natural's control and is unlikely to be a viable option in the near term). An estimated cost for capacity under this option is $0.98/Dth/day. The higher cost option

would require NW Natural to contract with NW Pipeline for a NW Natural-specific buildout. Estimated costs here are nearly double the regional expansion at $1.80/Dth/day.

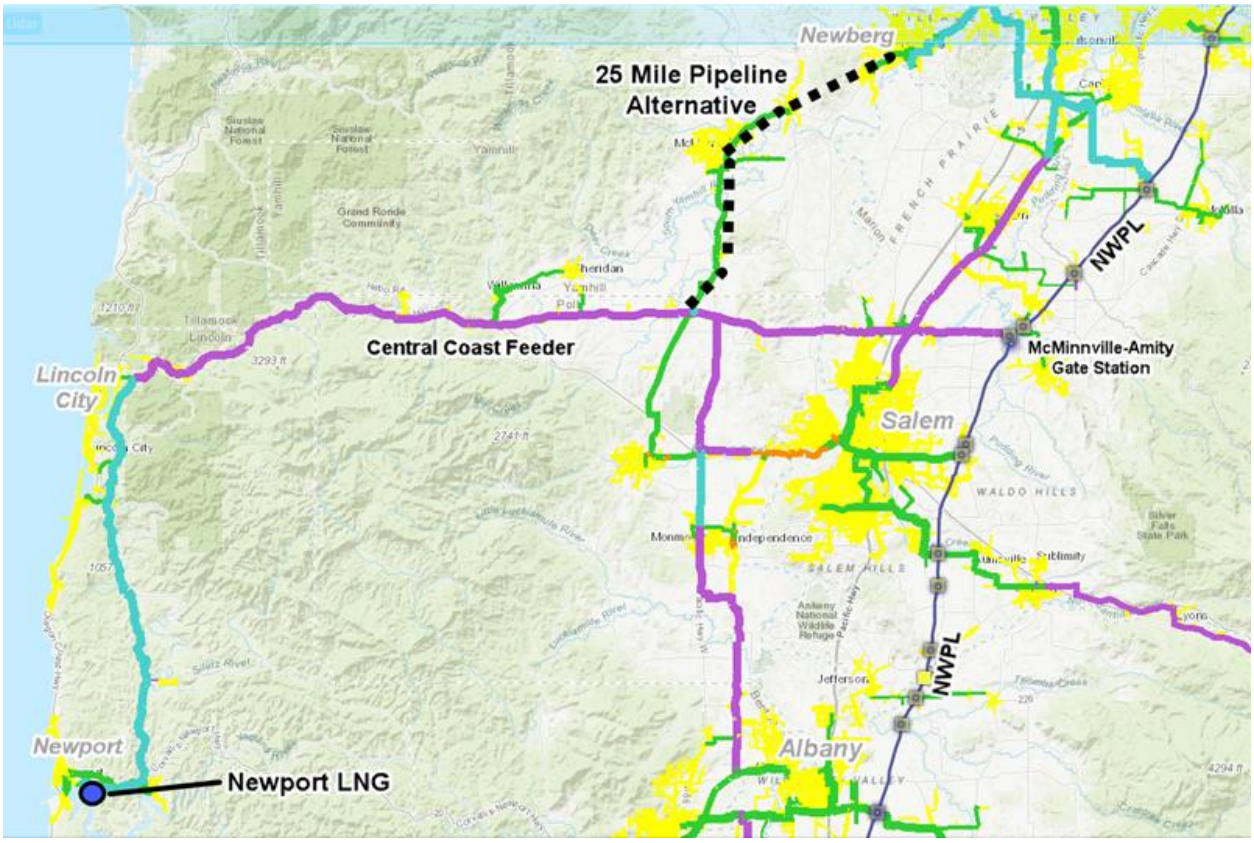
Table 8: Pipeline Expansion Cost Estimates

	$/Dth/day	Dth	Annual Cost
Regional Expansion from Sumas to Molalla	$0.98	65,000	$23,250,500
Local Expansion from Sumas to Molalla	$1.80	65,000	$42,705,000

Alternative A was not considered to be cost-effective option following the initial analysis, given that the annual costs, even at the lower end (for an option that NW Natural cannot control), are higher than the total capital costs associated with the Cold Box of approximately $18 million. As such this option was not analyzed further.

Alternative B, a new 25-mile pipeline, is less expensive, but still much costlier with an installed cost of approximately $171 million. Figure 21 shows the potential route, highlighted in blue.

Figure 21: Alternative Pipeline Route



For the final cost analysis, NW Natural used SENDOUT® to determine whether the Company should replace the Newport Cold Box or pursue Alternative B. Table 9 shows the present value of revenue requirement (PVRR) of portfolios over the planning horizon (2021-2050) associated with each of the two courses of action.

Table 9: Portfolio Cost Comparison

	Fixed Storage Costs	Fixed Pipeline Costs	Supply Variable Costs	Other Variable Costs	Total Portfolio Costs
Cold Box Replacement	$63 M	$1,162 M	$10,548 M	$69 M	$11,841 M
Alternative Pipeline	≥$58 M	≥$1,312 M	$10,542 M	$70 M	≥$11,986 M
Delta	-$5 M	$150 M	-$2 M	$1 M	≥$145 M

As shown, the portfolio including Newport after the $18 million Cold Box replacement project has a NPVRR savings of approximately $145 million versus the next best option.

PROGRAM / PROJECT ALTERNATIVES EXEMPTION

Program/Project Name: Newport LNG Cold Box
Date: 08/30/2022
Preparer: Shane Melski (PMO)

DESCRIPTION	
ISSUE TO BE ADDRESSED BY PROGRAM/ PROJECT	Replacement of the Cold Box at Newport facility due to its end of useful life.
OBJECTIVE	Replacement of the Cold Box at Newport facility to extend useful life, and ensure deliverability.
BUSINESS CASE	The Newport LNG cold box equipment has been in service since 1977. A 2021 study by Sanborn Head concluded that the existing cold box should be replaced given: 1) Aging equipment – The design and construction of the existing cold box heat exchangers are outdated. Industry experience with this type of equipment has demonstrated that it is significantly more prone to failure than newer designs. This cold box has reached its end of life and should it fail, repair is most likely not possible. A failure and replacement could cause significant downtime for the facility, at least 1.5 years on the most accelerated schedule. 2) Reliability - The current liquefaction system at Newport is unreliable. Ongoing issues with cold box freezing and carbon dioxide (CO2) build-up in the storage tank require that upgrades including new equipment and system modifications be implemented. 3) Modernization - Replacement of the cold box with a modern design would allow one heat exchanger to be installed in place of the existing two exchangers. This would improve system reliability and minimize downtime. It would also allow removal of the aging Cryex CO2 removal vessel. This vessel is a remnant of the previous (original) pretreatment system. Its removal would eliminate an original, 10,000-gallon LNG pressure vessel, which was installed in 1977, without any secondary containment.

POTENTIAL COST

PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: NLNG Molecular Sieve Vessels repair/upgrade (E-203361)
Date: 6/3/2025
Project Sponsor: Dan Kizer
Executive Sponsor: Joe Karney
Project Manager: Andrew Chin-Shreffler/Tim Murphy
Preparer: Andrew Chin-Shreffler

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	The Newport LNG Pre-Treatment System removes Carbon Dioxide (CO_2) and entrained water (H_2O) from the natural gas stream before liquefaction. This process is critical to the liquefaction process, as CO_2 and H_2O freeze at a higher temperature than the natural gas liquefies. If not removed successfully, the liquefaction system can become plugged with frozen solids and fail, and/or CO_2 can build up in solid form in the LNG tank. After having issues with removal of CO_2 and H_2O during pretreatment operation in 2024, a team consisting of NW Natural operations and engineering, Sanborn Head, CB&I (owners and consulting engineers) and UOP (molecular sieve media vendor) conferred and reviewed process data over the course of several months. Based on this review, the troubleshooting team assigned the issues with CO_2 and H_2O to deficiencies in the molecular sieve vessel internal insulation pulling back from itself and from the shell of the vessel, allowing process gas to bypass contact with the molecular sieve media and preventing complete regeneration. These vessels will need to be upgraded for implementation of a stainless steel liner to restore functionality and ensure proper operation in place of existing blankets supported by wire mesh. Addressing these issues is critical to maintaining normal liquefaction operations and meeting the performance requirements for the upcoming Cold Box Replacement project.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	Address the deficiencies in the molecular sieve vessels' ability to scrub CO_2 and H_2O. This is required to be completed to execute on the installation of the new Cold Box unit. The design basis that CB&I has been working off is <50ppm CO2 and 0.1ppm H2O. Failure to meet these requirements could result in plugging of the cold box passes or sending solids to cold box. Additionally, these values are called out by CB&I as part of performance guarantee
Desired Deliverables What high level output / scope / deliverables are core to this project?	The project goal will modify the pretreatment vessels to prevent the bypassing scenario, thus returning pretreatment system to desired performance (<50ppm CO_2 and 0.1ppm H_2O) to ensure that the facility can return to normal liquefaction operations in 1st quarter 2026 and meet feed gas requirements for CB&I.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated.	In consultation with NWN Plant Operations, Engineering and 3rd Party subject matter experts (SMEs), the list of potential solutions was created. The 3rd party SME evaluated the viability, cost, and schedule of each option. This information was compiled by the team and is summarized below.

If some criteria were considered more important based on the type of project, please explain here.	
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Safety	The solution provides the highest level of safety for employees both during construction and in operation.
Criteria: System integrity and reliability	The solution will permanently address the system integrity and reliability issues for the lifespan of the equipment selected.
Criteria: Schedule	The solution can be constructed during the allowable window of November 2025 through March 2026, which ensures availability of the plant for the liquefaction season.
Criteria: Cost	The solution is the lowest cost option that meets the gas quality requirements of the pretreatment system.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	The desired option will be to perform a shop modification for installation of stainless steel liner in place of the blanket insulation. This will keep inner diameter (ID) the same for flow characteristics, but a solid liner will mitigate the ability for the gas stream to bypass the molecular sieve media. This will be executed for all five vessels offsite, which will then be recertified and shipped back to site for installation on existing foundation/anchors and loading of molecular sieve.	
In brief, why is this the recommended option?	This option is recommended due to combination of cost and efficacy. Based on analysis with the team, a solid, stainless steel liner will be required to prevent this bypassing. By shipping offsite, we can perform the work in a controlled, certified environment while avoiding the costs of new vessels. Due to window between T-1 top-off in fall 2025 and desired startup in April 2026, we will be able to achieve this in the "normal" liquefaction window, without affecting plant availability.	
	Analysis Against Criteria: Safety	Wet winter weather conditions are prevalent between November and April each year and attempting to repair the vessels on-site creates mitigatable risks of slips, trips, and falls and a work product that is more prone to errors. This option removes the vessels and ships them to a manufacturer for indoor work which is a safer work environment for the shop fabricator and ensures a better work product from the vendor. Additionally, this option avoids potential safety issues related to a large welding project with substantial hot work within the LNG fence line.
	Analysis Against Criteria: System Integrity and Reliability	This option provides a system that is sound and will have integrity and reliability for decades to come. Upgrading the design and repairing the vessels in an offsite location with a controlled environment will ensure the vessels are repaired satisfactorily and allow for the effectiveness of the new Cold Box unit which is pending installation. Wet winter weather conditions are prevalent between November and April each year and attempting to repair the vessels on-site creates challenges with hardening the work site against the weather elements and leads to slower work production and a work product that is more prone to errors. Removing the vessels and shipping them to a manufacturer for indoor work creates a better controlled work environment for the shop fabricator and ensures a higher quality product from the vendor.
Assessment	**Analysis Against Criteria: Schedule**	Longest downtime duration, but still within acceptable window for work. Construction window opens in November after liquefaction operations are complete. Installation of the liners will take 12-16 weeks for modifications, resulting in the vessels returning for the month of March for vessel install and reloading the molecular sieve media.

	Analysis Against Criteria: Cost	This is the lower cost option due to savings vs new vessels.
	Additional Benefits	Warranty for work performed at factory

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.4M	$625k	$3.025M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0 - $0	$0 -	
Source/ Method of Cost Data	Budgetary quotes for shop work and logistics, quote for molecular sieve media, engineering estimate for mechanical scope. Budget level estimates plus 2023 COH rates for Applicant 529 (26%)		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	This option would purchase five new vessels matching the height and diameter of existing vessels + nozzle locations and anchoring, with new stainless steel liners in place of blankets. The old vessels would be unloaded following liquefaction 2025 and vessels would be swapped out and reloaded. This is high-cost option and if unable to meet anchor plan, may require geotechnical and structural modifications. This option also addresses the deficiencies in the pretreatment system so that it is sound and will remove CO2 and water as per the pretreatment specifications necessary to ensure the reliable performance of the existing and new Cold Box and prevent the buildup of frozen CO2 and water in the liquefaction system and LNG tank. This alternative was evaluated to reduce plant liquefaction system downtime, however due to the need to reevaluate geotechnical and structural designs, could potentially carry schedule risk. This option would require the highest level of up-front design.	
In brief, why is this option not recommended?	This will be the highest cost option with potential for additional structural scope required for structural. While this option may potentially reduce the liquefaction system downtime, the high cost and additional design risks for the structural design resulted in this option not being recommended.	
Assessment	**Analysis Against Criteria: Safety**	No substantive difference to recommended option.
	Analysis Against Criteria: System Integrity and Reliability	No substantive difference to recommended option.
	Analysis Against Criteria: Cost	Highest cost option due to procuring new vessels vs. modifying existing vessels. Foundation pads may need to be upgraded, both structurally and geotechnically, adding to cost and schedule risk.
	Analysis Against Criteria: Schedule	Geotech and modifications to the foundations have potential to extend the duration of the overall schedule.
	Additional Risks	Potentially highest lead time option but can be implemented with shortest window.
	Additional Benefits	All new equipment.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$3.0M to $3.5M	$780k to $910k	$3.78M to $4.41M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0	$0	
Source/ Method of Cost Data	Budget level estimate plus 2023 COH rates for Applicant 529 (26%) Price range for replacement vessels comes from similar vessel price provided by owners engineers, quote for molecular sieve media, engineering estimate for mechanical scope.		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*

Description	Do nothing. Leave the system as-is	
In brief, why is this option not recommended?	This will continue to allow for gas bypass and inefficient scrubbing of the product. It is likely to continue to degrade over time. Without addressing this issue, this lower gas quality will impact the new Cold Box performance and performance guarantee. This work is scheduled for 2026/2027. The design basis for the Cold Box Replacement project (which will remove the CryEx system) requires a better gas quality for CO_2 and H_2O concentrations the Pre-Treatment System is currently able to provide, resulting in potential clogging and damage to Cold Box, and will impact NW Natural's ability to hold CB&I to the contractual performance guarantee.	
Assessment	**Analysis Against Criteria: Cost**	Least costly from a capital standpoint but will continue to result in reliability issues and inability to meet gas quality requirements laid out in CB&I performance guarantee.
	Analysis Against Criteria: Safety	This is the safest option in the near term due to no construction activities. There is potential for unknown safety issues in the long term due to poor gas quality.
	Analysis Against Criteria: Schedule	There will be no effect on schedule. Normal LNG top off and startup will be unaffected by the do-nothing option.
	Analysis Against Criteria: System Integrity and Reliability	There was a significant decrease in performance of the system when molecular sieve media was removed and replaced in 2024. It appears that the insulation was de-laminating or broken during this process. At current schedule, the media will be replaced in 2031 and a similar step change may result in liquefaction system reliability issues. This option will void the performance guarantee for the Cold Box project.
	Additional Risks	As noted above, if performance continues to worsen, it may require this work to interfere with normal operating windows and create issues producing LNG during the spring/summer months.
	Additional Benefits	No planned downtime (although increases likelihood of unplanned downtime)

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$0	$0	$0
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0	Unknown	
Source/ Method of Cost Data	No capital costs, unable to quantify the O&M costs for ongoing performance issues.		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Remove insulation blankets, wire mesh and clips. In its place, install a poured non-porous refractory at same thickness as blankets that will not allow gas bypassing or "pull back" from wall.	Conversations with refractory companies do not indicate this is a viable solution, a non-porous cast refractory is not available for this application. This can not be considered further.
Alternative 4	Remove blankets that are pulling back from wall and separating from other blankets and return to "design" conditions.	When reviewing this alternative, even if the insulation was returned to design condition, performance of the media would be insufficient to meet the requirements of the Cold Box performance guarantee, thus, removal and replacement of the blankets is insufficient to address the failure of the pretreatment system performance. Previous removal and replacement of the media led to worsened performance of the pretreatment system, which indicates that the issue with the pretreatment system is due to gas bypassing the blankets rather than failed molecular sieve media. Gas bypassing the blankets indicates that the root cause of the issue is due to a faulty design which will not be resolved by the replacement of the blankets.

		Additionally, this option carries further risks, including: - Voiding performance guarantees for future Cold Box project due to not meeting gas quality requirements. - Safety risks due to performing hot work in a confined space. - This work will occur during winter at Newport, creating high likelihood of water ingress to insulation causing potential to wet the media and/or affect adhesive, causing failure of this alternative. - The base cost of molecular sieve media removal and replacement is present in all alternatives, including the selected alternative, which results in reduced savings for this alternative.
Alternative 5	Leave vessels in place and install new shell on outside of vessels, removing the failed blankets and allowing the outer shell to become the liner and the new shell becomes the exterior of the vessel.	This was not recommended by ASME vessel shop, too many variables for performing code vessel work in field. From a safety standpoint, doing work vertically was not recommended. Marine environment makes extended "open" vessel time undesirable Additionally, this will affect the flow characteristics of the gas through the vessels. The height/inner diameter ratio will be changed in this option, as will the gas distribution, resulting in potential for additional modifications to the system to achieve recommended flow dynamics.

**Add rows for any additional alternatives considered not viable*

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: E203010 _AA - PLNG Elect Distribution Upgrade
Date: *04/24/2024*
Project Sponsor: *Daniel Kizer*
Executive Sponsor: *Joe Karney*
Project Manager: *Jorge Souto*
Preparer: *Tim Murphy, Jorge Souto*
Was this project part of IRP: NO

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which routes we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	*This project is part of the Portland LNG 10-year plan refurbishment efforts, and the overall business objective is to deliver safe, reliable firm gas supplies for NW Natural customers.* *The incoming switchgear trip is set at 1200A, so attempts to operate this way will result in 480V outage at PLNG until condition is corrected and breaker is reset. It is currently not possible to operate this way.* *A third-party engineering load study found that operating both LNG pumps (P1 and P2) and all three vaporizers (H5, H6, H7) simultaneously would exceed MCC-1 current rating of 1200A, risking a 480V outage. The Plant incoming switchgear trip setpoint is 1200A and attempts to operate in this configuration will result in the breaker tripping and a complete 480V system outage, preventing PLNG from vaporizing. Additionally, the incoming transformer is sized for 1000kVA, which is undersized for the full load condition, and will need to be replaced with a transformer with increased to accommodate desired plant output. The undersized MCC current rating, coupled with the undersized incoming transformer, reduced overall Plant vaporization capacity from 120 MMSCF/D to 90 MMSCF/D.*
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g., why is the current state not working)?	*To mitigate the overcurrent scenarios associated with MCC-1 frame rating of 1200A, PLNG is unable to operate 2 LNG pumps and 3 vaporizers simultaneously, reducing Plant vaporization capacity from 120 MMSCF/D to 90 MMSCF/D.* *Per an engineering load study performed by Sanborn Head as part of C4 Detailed Design, this operating scenario requires 1270A, and would trip incoming switchgear breaker set at 1200A. Therefore, only two LNG pumps and two vaporizers can run simultaneously due to the 1270A required for operating loads above, surpassing the 1200A switchgear trip setting and causing a 480V outage.*
Desired Deliverables What high level output / scope / deliverables are core to this project?	*The project aims to update the PLNG 480V electrical distribution system, replacing the existing 1000kVA transformer and MCC-1 with a new 1500kVA transformer (capable of 1800A of 3-phase 480V), manual transfer switch, and incoming 480V switchgear. The new electrical infrastructure will allow the Plant to return to its full availability of 120 MMSCF/D, allowing two LNG pumps and three vaporizers simultaneously. The new system will also be designed for planned expansion of MCC capabilities for the PLNG Boiloff Compressor project, as both MCC-1 and MCC-2 are physically limited for new starters and drives*

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	*Project Engineer, Tim Murphy and PLNG operations were involved in choosing these options from a FEED study completed by Norwest Engineering.* *Reliability, time of implementation, and costs were considered in the evaluation of options.*
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality, that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Reliability	*The Recommended Option will update the PLNG electrical distribution system, enabling the facility to operate without equipment damage or power outage, and return the Plant to its design vaporization capacity of 120 MMSCF/D.*
Criteria: Time of implementation	*Acquiring the switchgear and associated MCC equipment includes lead times of up to one (1) year, so purchasing them now will facilitate project implementation in the summer next year, ensuring availability for commissioning by winter 2025.*
Criteria: Cost /Benefit	*The analysis should also be based on the most cost-effective and viable option.*

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	*PLNG is unable to operate at its full capacity of 120 MMSCF/D, using both LNG pumps and three vaporizers simultaneously. Only two LNG pumps and two vaporizers can run simultaneously due to the 1270A required for operating loads above, surpassing the 1200A switchgear trip setting and causing a 480V outage. Per engineering load study, this operating scenario (Case 5 in attached file) requires 1270A and would trip incoming switchgear breaker set at 1200. This option will install new electrical switchgear, transformer, and manual transfer switch to ensure the Plant can supply the 1270A required load to operate both LNG pumps and all three vaporizers simultaneously.*	
In brief, why is this the recommended option?	*The preliminary analysis has concluded that enhancing the PLNG electrical distribution system is the best alternative. The upgrade will enable the facility to operate without any equipment damage or power outage at its full nameplate capacity of 120 MMSCF/D.*	
Assessment	**Criteria: Reliability**	*The upgrade will empower the facility to handle power levels of 1270A or more without causing equipment damage or power outages. This enhancement will enable the simultaneous operation of two LNG pumps and three vaporizers, returning plant to 120 MMSCFD of vaporization capability with capability for enhanced data quality and expansion that meets the requirements of the PLNG Boiloff Compressor project.*
	Criteria: Time of implementation	*The electrical equipment has an estimated lead time of one year. Therefore, the acquisition process must commence early in the project's lifecycle to ensure expanded capabilities by Winter 2025. Ordering the equipment promptly is imperative.*
	Criteria: Cost	*This is not the low-cost option, although it does increase power distribution capability and reliability, while making operations safer and reducing 480V downtime during power cutover.*
Assessment	**Additional Risks**	*Due to lead time of equipment, the plant will operate at a reduced capacity of 90 MMSCF/D during winter 2024 and risk of electrical equipment failure is still possible.*
	Additional Benefits	*Despite its higher cost, this option stands out as the best and preferred choice recommended by the consultants, and it has received approval from both engineering and operations.*

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH (26%)**	**Total**
	$1,540,000	$400,400	$1,940,400
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$000	$0.00	
Source/ Method of Cost Data	*Total cost is based on the Norwest Engineering report and estimate, attached to this AA, plus internally produced engineering estimate.*		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	*Alternative 1 proposes to install a new 1200A breaker into the first section of MCC-1 and demolish existing cables from MCC-1 bus tap to the 600A MCC-2 main breaker. New cables would be installed from the incoming switchgear to the MCC-2 600A main circuit breaker.* *The cables for the new 1200A MCC-1 main circuit breaker will be spliced in the vault underneath the main switchboard with the existing MCC-1 feeder cables.* *This would eliminate the 600A load feeding MCC-2 from MCC-1, allowing us to operate the electrical systems independently, but not operating at full capacity without upsizing transformer.*	
In brief, why is this option not recommended?	*This does not eliminate the kVa limitations, simply divorces the MCC-1 from MCC-2. This was investigated before incoming transfer limit was discovered and only will mitigate MCC-1 frame rating issue.* *The proposed location for the new 1200A main breaker for MCC-1 has two available sections, neither of which are sized appropriately for new breaker gear. MCC-1 could be rearranged to create new space, but this would eliminate all spare MCC sections. This also assumes that the 1200A breaker section will fit in 12" MCC section.* *When implemented, the alternative will fix the problem with the small 1200A breaker in the switchgear. However, the full vaporization load will be too much for the transformer, so it won't solve the transformer size issue. As a result, PLNG won't be able to run 2 LNG pumps and 3 vaporizers at the same time, limiting the plant to only 90 MM capacity.*	
Assessment	**Criteria: Reliability**	*If one or more of the assumptions mentioned above are not valid, Alternative 1 is likely not feasible.*
	Criteria: Time of Implementation	*This option offers a quicker solution, targeting smaller modifications to enhance the current electrical system.*
	Criteria: Cost	*It is a cheaper option but does not include an overall update of the PLNG electrical distribution system for addition kVa capacity.*
	Additional Risks	*The full vaporization load will exceed the transformer rating, so it won't resolve the transformer sizing issue, and PLNG will be unable to operate 2 LNG pumps and 3 vaporizers simultaneously.*
	Additional Benefits	*N/A*

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH (26%)**	**Total**
	$375,000	$97,500	$472,500
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0,00	$0,00	
Source/ Method of Cost Data	*Total cost is based on the Norwest Engineering report and estimate, attached to this AA, plus internally produced engineering estimate.*		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	*Alternative 2 will install a new main service switchboard with an incoming 1600A breaker with a downstream 1200A breaker for MCC-1 and a 600A for MCC-2. The existing feeder conductors for MCC-1 will be spliced in the new vault if required and new conduits and conductors will be installed over the building to feed MCC-2.* *For the new equipment's installation, the existing main service switchboard will be demolished along with the existing vault and any associated above-ground conduits.* *This will eliminate one downside in Alternative 1 on limited MCC-1 space but does not resolve the kVa limitation.*	
In brief, why is this option not recommended?	*This does not eliminate the kVa limitations, simply divorces the MCC-1 from MCC-2. This was investigated before incoming transfer limit was discovered and only will mitigate MCC-1 frame rating issue and MCC-1 space issues IDed in Alternative 1.*	
Assessment	**Analysis Against Criteria: Reliability**	*Alternative 2 will eliminate the connection from MCC-1 and MCC-2 and help with space in MCC-1. It will not allow for full vaporization.*
	Analysis Against Criteria: Time of Implementation	*Like Alternative 1, this option offers a quicker solution, targeting punctual changes to enhance the current electrical system.*
	Analysis Against Criteria: Cost	*It is a cheaper option but does not include an overall update of the PLNG electrical distribution system for addition kVa capacity.*
	Additional Risks	*If implemented, full vaporization load will exceed the transformer rating, so it won't resolve the transformer sizing issue, and PLNG will be unable to operate 2 LNG pumps and 3 vaporizers simultaneously.*
	Additional Benefits	*None.*

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$580,000.00	$150,800.00	$730,800.00
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0.00	$0.00	
Source/ Method of Cost Data	*Total cost is based on the Norwest Engineering report and estimate, attached to this AA, plus internally produced engineering estimate.*		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	*Do nothing.*	*By maintaining the status quo, PLNG is unable to operate 2 LNG pumps and 3 vaporizers simultaneously. If we attempted to operate out of range of limitation, there is potential to damage MCC-1 or incoming transformer at which point the plant will require significant repairs before returning to operation. This limitation and potential arc flash safety issue would be addressed with continuing procedural limitations.*

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

Service to Cascade Steel - McMinnville (P75.01) 6
Section Three – 7 to 10 years (2030 to 2032) 6
2030 - 2032 6
Utilize Robot Technology 6
Section Four – Projects Completed in 2022 7
2022 7
Springfield Trans (E08) 7
McMinnville (P31) 7

Scope

Develop a 10 year plan for discretionary System Integrity work related to Inspection of Transmission and High Pressure Distribution Feeders using Inline Inspection (ILI).

Transmission Assessment Criteria

Projects in this plan were selected utilizing the following criteria:

- Transmission or High Pressure Distribution System
- High Risk Ranking using the risk Rank Tool described below
- Estimated cost for ILI modifications w/o COH greater than $750k.
- ILI tool availability (currently 6” diameter or greater).
- Other pipelines deemed necessary through independent evaluation.

Note: Project order is subject to change based on risk score or other requirements, regulations, and rules that may be imposed upon NW Natural by regulatory agencies. In some instances site conditions or other outside factors may necessitate a change in the schedule.

Section One – 1 to 3 years (2023 to 2025)

Each project in this category will include a project planning document including a high level cost estimate, system modeling documents, initial route selection, and an alternative analysis. Projects in this category will follow current process to finalize design and refine the cost estimate. Projects are anticipated to be completed in the year listed – preliminary design may start up to 2 years before construction.

2023

SP Newsprint (P83)

- ILI of 7.1 miles of 12” & 16” transmission pipeline from Sherwood Intertie to SP Newsprint
- Rebuild will include installation of launchers/receivers and assessment of 12” to 16” transition.
- Cost $2M (+100%/-50%).
- In 2023 it was determined that this pipe could not be assessed using in line technology due to lack of flow. Pipe will be reassessed in 2030 to determine assessment process.

Camas (P04)

- ILI of 3.5 miles of 8” transmission pipeline from the Camas Gate to LaCamas Regional Station
- Installation of launcher, receiver and removal of two known plug valves.
- Cost $2M (+100%/-50%).

North Eugene Trans (E04)

- ILI of approximately 5.8 miles of 6” and 8” transmission pipe between Crescent Rd. and River Rd. in NE Eugene
- Work to inspect this line includes installation of launcher and receivers on both ends of the pipeline.
- Work also includes inspection of 5 valves and one bridge crossing to verify ability to inspect these sections. If areas are unpiggible they will be modified to allow for inline inspection.
- Cost $3M (+100%/-50%) 5.8 miles of 6” & 8” inspection in North Eugene

2024

Albany – Corvallis Trans (S22)

- ILI 12.7 miles of 10” transmission pipeline from Albany Gate to HWY 20.
- According to the transmission risk model this line is the fifth highest risk pipeline that has not been assessed with ILI.
- Work to inspect this line includes cutout of an unpiggable tee, removal of a bridle at the Willamette River, installation of a launcher at Albany Gate and installation of a temporary receiver at HWY 20.
- Cost $1.5M (+100%/-50%).

Granger Independence Trans (S24)

- ILI 5 miles of 6” transmission pipeline from Granger Station to valve station east of Independence Hwy on HWY 20.
- Work to inspect this line includes cutout of an unpiggable Mueller fittings and installation of launcher/receiver on Hwy 20.
- Cost $1.5M (+100%/-50%).

Mid-Willamette Valley Feeder (S36)

- ILI of 12” from Christensen Bridle to Independence Hwy
- Rebuild will involve installation of launcher and receiver.
- Cost $2M (+100%/-50%).

2025

Salem Bypass (S03)

- ILI of 5.5 miles of 8" transmission pipeline from Hwy 99E and Blossom Dr. to Center St. Regional Station in Salem
- Installation of launcher, receiver and removal of one known plug valve and Mueller fittings
- Cost $2M (+100%/-50%).

Salem Trans (S06)

- ILI of 3 miles of 12" transmission pipeline from Salem Gate to Bethel Station in Salem
- Installation of launcher, receiver, and analysis to remove any unpiggable fittings.
- Cost $2M (+100%/-50%).

Willamette Valley Trans (S18)

- ILI of 4.2 miles of 12" transmission pipeline from Brooks Regional Station to Hwy 99 and Blossom Rd. NE.
- Installation of launcher, receiver and potential unpiggable fittings to be replaced in order to facilitate in line inspection.
- Cost $2M (+100%/-50%).

Review of ILI facilities at NE 74th and Jonesmore – I-84 crossing (P48)

- Review of pigging facilities located on the north and south side of the I-84 crossing at NE 74th and Jonesmore to determine if the I-84 crossing can be included in a reassessment run for P48
- Cost $1M (+100%/-50%)

Section Two – 4 to 7 years (2026 to 2029)

Each project in this category will include a high level cost estimate, project description, preliminary modeling documentation and preliminary schedule date.

2026

Columbia City/St. Helens Trans (P09.04,.05,.06,.07)

- ILI of 19 miles of 6" & 8" transmission pipeline from 12th and Columbia St. in St. Helens to Sauvie Island Gate.
- Rebuild of station at 12th & Columbia in St. Helen's, installation of receiver at Sauvie Island, removal of 3 plug valve, removal of 2 Mueller line stopper fitting and unpiggable fittings in order facilitate in line inspection
- Need to address 2000' of 12" pipe installed in 1980 to facilitate complete 6" x 8" ILI run
- Cost $5M (+100%/-50%).

St. Helens Columbia Trans (P08.01)

- ILI of 1.6 miles of 16" transmission pipeline from Columbia City Regional Station to "E" St. and Hwy 30 in Columbia City
- Installation and launcher and receiver stations at Columbia City Regional Station and "E" St. and Hwy 30 in Columbia City. Assess pipe to determine if use of robotic assessment is more cost effective
- Cost $1M (+100%/-50%).

Columbia City Trans (P09.02,.03)

- ILI of 1.7 miles of 6" transmission pipeline from Columbia City Regional Station to "E" St. and Hwy 30 in Columbia City .
- Installation and launcher and receiver stations at Columbia City Regional Station and "E" St. and Hwy 30 in Columbia City. Assess pipe to determine if use of robotic assessment is more cost effective
- Cost $1M (+100%/-50%).

Dyno Nobel (P09.01)

- Assess 800' of 10" unodorized Transmission Main near the Columbia City near the Columbia City Regional Station utilizing robotic technology.
- Cost $1M (+100%/-50%)

2027

NE Division-LSI/Fujitsu (Cleveland & Division) (P81)

- ILI of approximately 2.5 miles of 10" transmission pipe from Gresham Gate to SE 212th and Stark
- Will require installation of launchers and receivers with assessment and rebuild of tee at NE Division and NE Cleveland.
- Cost $2M (+100%/-50%)

Front Ave Trans (Rvr to Harborway) (P53.03)

- Assess 1000 ft. of 16" transmission main from River Pkwy to the Marquam bridge station utilizing inline robotic technology
- Cost $1M (+100%/-50%)

181st and Sandy Blvd Lateral to DR (P25.09)

- Replace 300 ft. of 8" transmission main on NE 181st St. from Sandy Blvd to regulator station to higher grade pipe such that pipe is no longer classified as transmission.
- Cost $1M (+100%/-50%)

Rivergate – Columbia Blvd (P25.03, 04, 06, 07, 08)

- Review of approximately 2.5 miles of 10" and 12" transmission main along Killingsworth and Wygant Blvd to see if it can be incorporated as part of the P25.02 reassessment .
- Cost $2M (+100%/-50%)

West Linn 10" (P11.02, 03)

- Review of approximately 1 mile of 10" transmission main from Skyline to Broadway and I-205 to see if it can be incorporated as part of the P11.02 reassessment.
- Cost $2M (+100%/-50%)

2028

Harrisburg Trans (E33)

- ILI of approximately 13 miles of 6" transmission pipe from the Brownsville Gate to Harrisburg
- Will require installation of launchers and receivers with assessment and replacement of unpiggable fittings.
- Cost $4M (+100%/-50%)

North Eugene Trans (E04)

- ILI of approximately 11 miles of 6" transmission pipe between Clear Lake Rd. in north Eugene to the west bank of the Willamette River north of Junction City

- Work to inspect this line includes installation of launchers and receivers on both ends of the pipeline.
- Work also includes inspection of valves and fittings to verify ability to in line inspection these sections. If areas are unpiggible they will be modified to allow for in line inspection.
- Cost $3M (+100%/-50%)11 miles of 6” inspection from North Eugene to Junction City

2029

At this time all pipelines to be assessed are not capable of being assessed using ILI based on ILI technology in 2023 due to the pressure and flow profiles of these pipelines. Below are the pipelines due to be assessed using ECDA and potential options for assessment

SW Intertie (P68.02)

- Approximately 1 mile of 10” transmission main routed along Virginia Ave. between Slavin and Boones Ferry in SW Portland
- This pipe currently operates at 125 psig but has an MAOP of 400 psig which qualifies this pipe as transmission main.
- Decision to be made as to whether to downrate the pipe to 125 psig or inspect this section using robot technology
- Cost for robot technology $1M (+100%/-50%)

SE Trans (SE Clatsop St.) (P20.02.17)

- Approximately ¼ mile
- Study in 2023 determined that this line and regulator at SE Clatsop and SE Flavel (DR 1-038-036-R-01) is required to support load in SE Portland
- Decision to inspect line utilizing robotic technology or replace line with higher grade pipe
- Cost $1M (+100%/-50%) for robot technology or replacement

SW Intertie Trans (P69.01)

- Replace 100 ft. of 6” transmission main at Barbur and Bancroft to higher grade pipe such that pipe is no longer classified as transmission.
- Cost $1M (+100%/-50%)

Service to Cascade Steel - McMinnville (P75.01)

- Replace 100 ft. of 6” transmission main which serves as a lateral to the service for Cascade Steel in McMinnville to higher grade pipe such that pipe is no longer classified as transmission.
- Cost $1M (+100%/-50%)

Section Three – 7 to 10 years (2030 to 2032)

Each project in this category will include a high level estimate and preliminary modeling documentation. Project planning is only conceptual for projects at this point.

2030 - 2032

Utilize Robot Technology

- At this time a majority of the major pipelines would have been converted from ECDA to ILI per 2022 technology would have been completed.

- It is anticipated that regulations and improved robot tool technology will increase the assessment scope at this time.
- Locations that will be investigated for use of robot technology or improved assessment technology are:
    - SP Newsprint (P83)
    - Coos Bay (E34)
    - Halsey-Harrisburg Trans (La Salle to James River) (S33.01, .02)
    - Philomath Trans (3rd St. to Reservoir Rd.) (S26.01)
    - Willamette Valley – Hubbard Hwy to Aurora 12" (S02.01.35)
    - Uprated pipelines to transmission.

Section Four – Projects Completed in 2022

2022

Springfield Trans (E08)

- ILI 2.7 miles of 8" transmission pipeline from Coburg road to Springfield Hwy and Q street.
- According to the transmission risk model this line is the third highest risk pipeline that has not been assessed by ILI.
- Work to inspect this line includes construction and installation of temporary launcher and receivers and the removal of a plug valve.
- Actual Cost $2M

McMinnville (P31)

- ILI 12.2 miles of 6-5/8" Grade B Class D pipe from Perrydale to McMinnville
- Installation of launchers/receivers.
- Removal of 9 known plug valves and Mueller fittings
- Actual Cost $4.5M

NW Natural
PROGRAM ALTERNATIVES ANALYSIS NARRATIVE

Program/Project Name: System Integrity ECDA to ILI Assessment Program
Date: 11/11/2021
Project Sponsor: Scott Lundgren
Executive Sponsor: Jon Huddleston
Project Manager: Jorge Souto
Preparer: Jorge Souto

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES Why are we tackling this Program?	
Current State What is happening now? Where are we starting?	NW Natural complies with the Federal Pipeline Safety Regulations Guidelines regarding pipeline integrity assessment by implementing the Integrity Management (IM) program. The Program uses the Direct Assessment (DA) method, specifically the External Corrosion Direct Assessment (ECDA) to inspect transmission pipelines within High Consequences Areas (HCA's). The IM program has identified potential threats and risk ranked the transmission pipelines using factors including, but not limited to, the pipeline's age, operating system pressure, the likelihood of third-party damages, prior leaks, etc. Based on this risk ranking, NW Natural has progressively expanded the assessment of these pipelines seeking to increase the level of safety associated with the transportation of gas, including the In-Line Inspection (ILI) method since the initiation of the Pipeline Integrity Rule in 2006.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	Based upon the PG&E incident in San Bruno, PHMSA addressed on July 1st, 2020, the 49 CFR Part 192, also known as the Final Rule, requiring operators to perform integrity assessments on the pipelines outside of HCA's. Before this rule's publication, integrity assessments were only required for pipelines in HCA's. The Final Rule also recommends operators to "expand the range of permissible assessment methods, as well as promote the use of ILI technologies, combined with further research and development by PHMSA and stakeholders to make ILI testing more accurate to drive innovation in pipeline integrity testing technologies that lead to improved safety and system reliability through better data collection and assessment." The current ECDA method does not provide a complete assessment of the entire pipeline. It can only be used to validate specific threats related to internal and external corrosion only. According to 49 CFR Ch. I Part 192.710 "Use of direct assessment for threats other than the threat for which the direct assessment method is suitable is not allowed." ILI is the industry-preferred assessment method for transmission pipelines. NW Natural is committed to improving the safety of the Natural gas system by exceeding code requirements such as the elimination of bare steel and cast iron, when able. The next step in NWN safety commitment is to implement a defined program to inspect transmission pipelines outside HCA's and expand the use of the In-Line Inspection method.
Desired Deliverables What high level output / scope / deliverables are core to this Program?	• Projects covered in this Alternative Analysis Program are defined in the System Integrity ECDA to ILI 10-year plan which was initiated in 2016 and is updated annually. • The projects in the System Integrity ECDA to ILI 10-year plan are projects that identify pipelines to be converted from ECDA to ILI assessment per the Compliance year that the assessment is due. • The scope of the projects in the 10-year plan involves 2 to 3 pipelines per year with an estimate project cost of $2M - $5M per pipeline • The general scope of the ECDA to ILI projects require upgrades to the pipelines, that include installing launchers and receivers to allow the use of the ILI smart tools and removal of unpiggable fittings to allow for inline inspection.

	• After the full inspection is complete, the project will include the repair of all detected anomalies meeting NW Natural TIMP Plan requirements.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW How did we review these options?	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	Options were chosen according to PHMSA requirements, stated on 49 CFR Part 192. According to the rule, operators generally choose between three pipeline testing methods to evaluate a pipeline's integrity. • In-Line Inspection (ILI) • Direct Assessment (in this case ECDA) • Hydrostatic Pressure Testing (Hydrostatic test) Options were evaluated according to: • Compliance with Federal Regulations • Accurate level of the integrity assessment • Cost and Implementation approach
DECISION CRITERIA Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.	
Criteria: <Compliance with Federal Regulations**>**	ILI meets regulatory requirements, and PHMSA has addressed the 49 CFR Part 192 recommending and encouraging operators to "expand the range of permissible assessment methods, as well as, promote the use of ILI technologies, combined with further research and development by PHMSA as well as stakeholders to make ILI testing more accurate to drive innovation in pipeline integrity testing technologies that leads to improved safety and system reliability through better data collection and assessment."
Criteria: < Accurate level of the integrity assessment>	The ECDA is the current assessment method to inspect the pipe integrity, but it is only performed on selected segments or sections of the entire pipeline, especially within the HCAs. According to the Final Rule, page 22 "Direct Assessment may not give an accurate representation of the condition of lengths of entire pipeline segments" and "can only be used to validate specific threats, an operator that relies solely on a DA without performing a thorough risk analysis or running multiple tools specific to multiple threats might be leaving other threats unremediated in their pipelines." ILI assessment provides a more detailed data of physical damage on the pipeline and allows the inspection of the entire extension of the pipeline, including Moderate Consequence Areas (MCA's) meeting the new Federal Regulation. In previous ILI assessments, NW Natural has identified defects outside of HCA's that, in the event of a rupture, had the potential to have a significant impact on property and the NW Natural transmission system. More information can be found on the Supplementary Information Section

Criteria: < Costs + Implementation Approach >	ECDA and Hydrostatic tests will not require any implementation. In the short term, the cost of implementing ILI inspections will be higher due to the required installation of smart tool launchers and receivers. After the implementation, the ILI inspection method will not require any further investment. For future assessment, when including HCA's and MCAs to meet new Federal Requirements, ILI would be as cost-effective as ECDA.

SECTION 3: ALTERNATIVES DETAIL

<table>
<tr><th colspan="3">RECOMMENDED OPTION
Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A</th></tr>
<tr><td>Description</td><td colspan="2">In-line Inspection (ILI) refers to the process of evaluating pipes or pipelines using smart ILI tools, also referred to as "smart pigs." The smart tools are usually pushed through a pipeline by the pressure of the gas being transported. As it travels through the pipeline, it identifies and records potential pipe defects and record irregularities, including internal and external corrosion, deformations, or manufacturing defects.

ILI tools utilize nondestructive examination procedures to accurately detect and determine the size of internal damage in pipes and metal loss. The in-line inspection technologies are invaluable in the gas industry, and most pipeline operators prefer them as they are cost-effective.</td></tr>
<tr><td>In brief, why is this the recommended option?</td><td colspan="2">The proposed ILI method will provide more detailed and assessment data of physical damage on the pipeline. In addition, with the excessive costs of performing ECDA, especially in HCA's, converting pipeline to ILI will put future assessment costs more in line with the ECDA costs.

The evaluation of pipelines using other techniques, such as EDCA, can be more expensive and time-consuming when used on a wide scale as well as associated costs due to permitting requirements, traffic control plans, potential repair of paved roads, and noise ordinances during pre-assessment.

According to the Final Rule, pg 22 "Direct assessment can be prohibitively expensive to use on a wide scale and may not give an accurate representation of the condition of lengths of entire pipeline segments when the high expense leads the operator to select an insufficient number of observations."

This Program includes a high-pressure distribution pipeline that contains at least one MCA's. In following industry best practices, NW Natural is pursuing ILI assessment of MCA's of transmission pipelines.</td></tr>
<tr><td rowspan="2">Assessment</td><td>Analysis Against Criteria:
<Compliance with Federal Regulations></td><td>Pros:
ILI meets 49 CFR 192 Federal Pipeline Safety Regulations. PHMSA recommends pipeline operators increase the use of ILI tools on future integrity tests since it is a more thorough and effective method to detect potential defects and/or damages on this line than the other assessment methods.
The industry-accepted interpretation of newly added federal code (commonly referred to as The Mega Rule) 49 CFR 192.710 regarding the assessment of MCA's that operate over 30% Specified Minimum Yield Strength (SMYS) In that condition, the pipeline's operator should make efforts to allow ILI assessment of those transmission pipelines.
This option presents opportunities to replace transmission pipe where material certifications are no longer available and replace it with transmission pipe with material certifications.
Cons: (None)</td></tr>
<tr><td>Analysis Against Criteria:
<Accurate level of the integrity assessment></td><td>Pros:</td></tr>
</table>

		• ILI method provides a very detailed records of potential threats on the covered pipeline segment, including metal loss, third party damages, manufacturing, and construction defects • ILI inspection provides a fully accurate location, pointing out where and how large all anomalies on a pipeline are. Cons: • ILI technology cannot reliably detect coating damage that is not associated with pipeline defects.
	Analysis Against Criteria: <Costs + Implementation Approach >	Pros: • During ILI assessment, this work can be performed with the pipeline in service, unlike pressure testing, where the pipeline has to be taken out of service for testing to occur. This can lead to high costs to the operator and possible service disruptions to consumers. • Unlike Pressure Testing, ILI does not risk destroying the pipe, and it is typically less costly to perform on a per-unit basis than other assessment methods. • Future assessments will be cost-equivalent to the ECDA method since it requires modifications to the existing pipeline will already be completed. Cons: • In the short term, the cost of implementing ILI inspections will be higher than the ECDA inspection costs since the transmission pipeline has multiple non-piggable fittings that need to be remediated or removed to make the pipeline able to be in-line inspected. • Requires the installation of launcher or receiver facilities to safely relieve pressure in the barrel before inserting or removing ILI tools.
	Additional Risks	Unknown previous damage may require additional repairs in the pipeline to run the ILI smart tools.
	Additional Benefits	PMI material testing tasks shall also be performed throughout the remediation of the non-piggable fitting digs, contributing to more completed records of material certs for the NW Natural transmission pipeline.

POTENTIAL COST OF ILI ASSESSMENT (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$160,000	$25,200	$185,200
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$	$160,000 (Direct cost, once every 7 years)	
Source/ Method of Cost Data	The direct cost includes mobilization, inspection and report cost for ILI inspection costs, based on the E15 S Eugene Trans ILI project. The cost of the In-Line Inspection itself is about $100 thousand plus about $60,000 of NWN internal costs.		

<table>
<tr><th colspan="3">ALTERNATIVE 1
Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.</th></tr>
<tr><td>Description</td><td colspan="2">External Corrosion Direct Assessment (ECDA) is a structured process that identifies coating defects that ultimately impact a pipeline’s structural integrity. The ECDA involves four phases: Pre-assessment, Indirect inspection, Direct examination, and Post assessment.</td></tr>
<tr><td>In brief, why is this option not recommended?</td><td colspan="2">The ECDA is the appropriate method to identify that the cathodic protection (CP) and coating are performing as intended at all points. However, it won’t detect damage that might have occurred in the past, or if recent upgrades to a CP system have been implemented, it may conceal past deficiencies.

The data produced from ECDA inspections are not as detailed as the data produced from ILI inspections. ECDA inspections call out where possible coating anomalies are. Still, it cannot confirm the type of anomaly (dent, gouge, corrosion, milling errors, internal metal loss, etc.) or exact dimensions of the anomaly like an ILI inspection can.

Since ECDA inspections are performed in High Consequence Areas (HCA’s) and Identified Sites as defined in our TIMP manual, it will trigger high costs related to City Permits, Traffic Control Plans, public impact, etc.</td></tr>
<tr><td rowspan="2">Assessment</td><td>Analysis Against Criteria: <Compliance with Federal Regulations></td><td>Pros:
ECDA meets regulatory requirements and can be a powerful tool for pipelines unable to be accessed by other means.
Cons:
49 CFR 192 recommends operators to expand the range of permissible assessment methods, as well as promote the use of ILI technologies.
Based on conversations with other operators NW Natural’s interpretation of recent comments made in the documentation submitted by PHMSA in the Final Rule, ILI assessment is the preferred method of assessing natural gas transmission pipelines.</td></tr>
<tr><td>Analysis Against Criteria:<Accurate level of the integrity assessment></td><td>Pros:
ECDA assessment is the best method to detect if the cathodic protection (CP) and coating are performing as intended of lengths of entire pipeline segments.
Cons:
ECDA does not provide a complete analysis of the pipeline, and hidden anomalies may exist based on the performance of the CP system therefore introducing unforeseen risks to the pipeline in the future. ECDA cannot measure the exact dimensions or severity of an anomaly like an ILI, which helps determine which anomalies can be monitored versus which ones should be repaired.
ECDA methods can show where CP and coating issues are present but cannot detect physical damage to a pipeline.
49 CFR 192, pg. 22 states that “as ECDA can only be used to validate specific threats, an operator that relies solely on a ECDA without performing a thorough risk analysis or running multiple tools specific to multiple threats might leave other threats unremediated in their pipelines.”</td></tr>
</table>

	Analysis Against Criteria: < Costs + Implementation Approach >	Pros: • Persevering with ECDA inspections can be, in the short term, a low-cost method, as it will not require any investment for its implementation. Cons: • The inclusion of MCA's on future assessment will trigger higher cost for ECDA inspections since more lengths of entire pipeline segments will be added to the inspection. • Higher costs associated during ECDA inspections due to permitting requirements, traffic control plans, potential repair of paved roads, and noise ordinances during pre-assessment. • High cost within segments considered hard surface due to the required drillings to perform the tests.
	Additional Risks	• NWN's transmission pipelines have had past damages since its 1960 installation. There are likely many unidentified damages that an ECDA method won't be able to detect. • Permitting restrictions, Traffic Control implementation, and Public Impact.
	Additional Benefits	• No implementation costs

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$	$	$
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$	$155,000 (Direct costs, once every 7 years)	
Source/ Method of Cost Data	It was estimated by looking at previous ECDA inspection costs with similar pipeline lengths and a similar amount of hard surface inspection, including city permits and traffic control costs.		

<table>
<tr><th colspan="3">ALTERNATIVE 2
Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.</th></tr>
<tr><td>Description</td><td colspan="2">Hydrostatic Pressure Testing (Hydrostatic test) is a way in which pressure pipeline systems can be tested for strength and leaks, and involves filling the vessel or pipe system with a liquid, usually water, and pressurization of the vessel to the specified test pressure for a Code defined duration.</td></tr>
<tr><td>In brief, why is this option not recommended?</td><td colspan="2">Hydrostatic pressure testing can result in substantial costs, disruptions in service, methane emissions due to the routine evacuation of natural gas from pipelines before tests and can be a destructive method. Although the Hydrostatic test is considered a non-destructive testing method, if defects on a component are severe, then the component may rupture during the testing
According to the 49 CFR Part 92, page 22 “Regulators and operators agree that improving ILI methods as an alternative to hydrostatic testing is better for risk evaluation and management of pipeline safety.”</td></tr>
<tr><td rowspan="4">Assessment</td><td>Analysis Against Criteria:
<Compliance with Federal Regulations></td><td>Pros:
• Hydrostatic test meets regulatory requirements and can be a powerful tool for pipelines unable to be assessed by other means.
Cons:
• ILI is a preferred alternative to hydrostatic testing is better for risk evaluation and management of pipeline safety.
• Hydrostatic testing method of defect identification is the failure of the pipe.</td></tr>
<tr><td>Analysis Against Criteria:
<Accurate level of the integrity assessment></td><td>Pros:
• Hydrostatic test is more effective than ECDA for identifying pipe conditions that are related to stress corrosion cracking defects.
Cons:
• Hydrostatic test does not provide an accurate pipeline analysis and associated anomalies when compared to ILI assessment.
• Hydrostatic tests utilize failure to determine the defects in the pipeline. There may be defects in the pipeline that passes a hydrotest but are potentially harmful defects that need to be addressed to make the pipeline safer.</td></tr>
<tr><td>Analysis Against Criteria:
< Costs + Implementation Approach ></td><td>Pros:
• This method would prove that the line can support the current MAOP and that no leaks or weak points were found in the pipeline.
Cons:
• Hydrostatic test is costly since it requires excavating, access, and cutting several pipeline sections to perform the procedure.
• Operationally it is not a feasible option while maintaining deliveries in the area.
• Hydrostatic test will generate a large amount of wastewater that would have to be disposed of with special permitting conditions.
• Hydrostatic test can be a destructive testing method, so that pipeline can rupture and fail if the inspection exceeds a specified test pressure, or a small crack propagates rapidly.</td></tr>
<tr><td>Analysis Against Criteria:
<insert></td><td></td></tr>
</table>

	Additional Risks	• Disposing of the contaminated wastewater will be expensive • If there is a failure in the pipeline, then the failed section will have to be repaired, replaced, and the hydro test procedure shall be repeated. • Failure during the hydrostatic test could be dangerous/disruptive if the test is performed in high consequence areas (HCA's) • Failure of the test can result in various main artillery roads to be closed due to the release of contaminated water and odor calls
	Additional Benefits	NA.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$1,200,000	$504,000 (42%)	$1,704,000
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$	$1,200,000 (Direct costs, once every 7 years)	
Source/ Method of Cost Data	Rough estimate from typical water costs and an unknown amount of sections to cutout and remove for performing the hydrostatic tests. Note: As stated, this is a rough estimate, and not a "not to exceed amount". The total cost could easily surpass $1.5M depending non the number of failures in the pipeline during tests.

NW Natural

Distribution Integrity Management Program
Program Plan

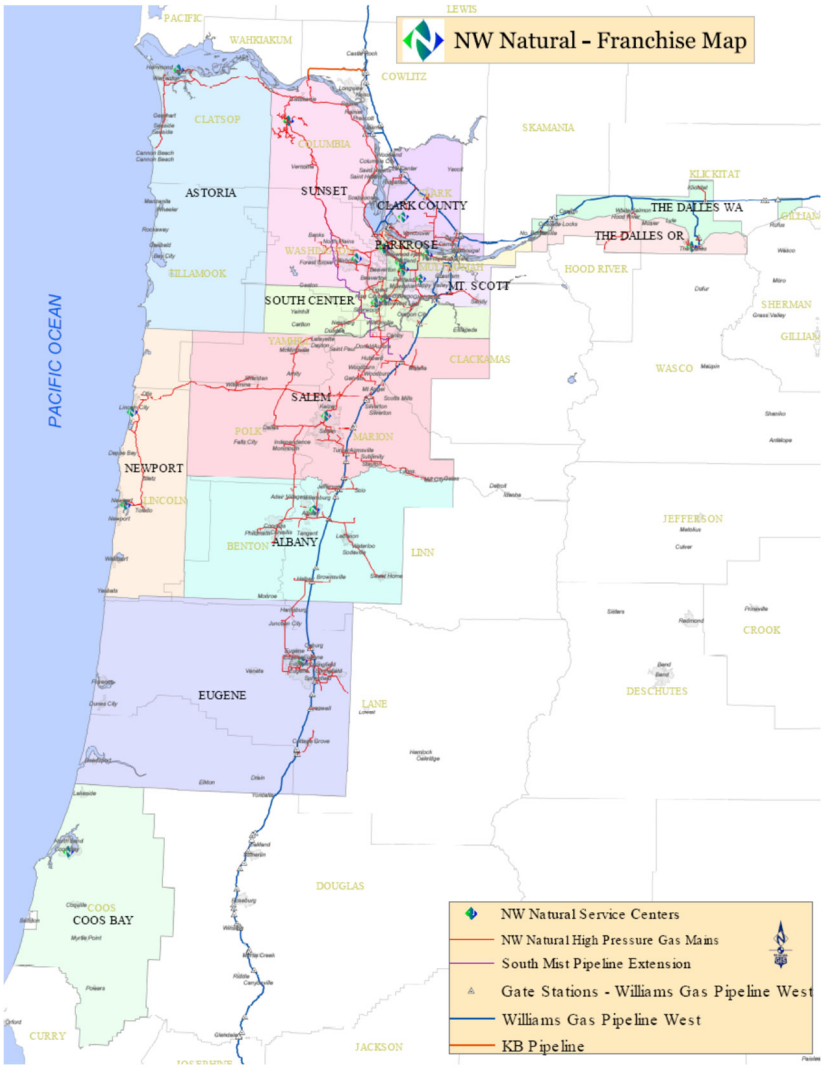
1. COMPANY OVERVIEW

Headquartered in Portland, Oregon, NW Natural delivers natural gas to approximately 800,000 residential, commercial and industrial customers. The service territory is depicted in Figure 1-0 below.

Figure 1-0: NW Natural Service Terrirory



2. SCOPE

This document is the Distribution Integrity Management Program Plan for NW Natural and is intended to meet the requirements of 49 CFR, Part 192, Subpart P, Distribution Integrity Management Programs (DIMP). This written plan addresses the seven following required elements of DIMP:

- Knowledge
- Identify Threats
- Evaluate and Rank Risk
- Identify and Implement Measures to Address Risks
- Measure Performance, Monitor Results, and Evaluate Effectiveness
- Periodic Evaluation and Improvement
- Report Results

This written plan applies to gas distribution facilities operated by NW Natural in Oregon and Washington and was initially implemented on August 1, 2011. Gas distribution facilities include the associated mains, services and other appurtenances not meeting the definition of gathering line or transmission line and under jurisdiction of 49 CFR, Part 192.

This plan does not cover:

Gathering lines – pipelines and associated facilities that transport gas from a current production facility to a transmission line or main. (NW Natural does not currently own nor operate gathering lines).

Transmission lines – as defined by SPO/SPW 001. Although the processes and procedures defined in this written plan may be used on transmission pipelines outside an HCA.

LNG Facilities – as defined by SPO/SPW 001 and covered under the jurisdiction of 49 CFR, Part 193.

2.1 Correlation with Other NW Natural Programs and Documentation

This IMP plan describes the processes of NW Natural's program for distribution integrity management but does not repeat elements of the program that are already in place as existing documented procedures. Sections of the following NW Natural manuals are relevant to some of the processes and procedures of the Integrity Management Program.

- Standard Practices (SPO/SPW)—includes written policies for conducting pipeline operations and maintenance activities and handling abnormal operations and emergencies. The policies are in accordance with 49 CFR 192. A committee reviews the Standard Practices manual once each calendar year and updates it as necessary. A set of Standard Practices are written for both Oregon (SPO) and Washington (SPW).
- Field Operations Manual (FOM)—includes written procedures for conducting pipeline construction, operations, and maintenance activities. The procedures are in accordance with 49 CFR 192. A committee reviews the FOM once each calendar year and updates it as necessary.

- Operator Qualifications (OQ) Procedures and Abnormal Operating Conditions (AOCs)—include procedures for performing all OQ covered tasks in accordance with 49 CFR 192, Subpart M.
- NW Natural Engineering Specifications – Engineering Specifications that provide detailed descriptions of materials purchased by NW Natural. A committee reviews these specifications every 3 years
- NW Natural Engineering Standards – Engineering Standards for approved parts and materials used in the NW Natural Distribution System. A committee reviews these standards every 3 years.
- NW Natural Engineering Procedures – Field and design procedures that document processes implemented by NW Natural Engineers. A committee reviews these procedures every 3 years.

3. PURPOSE AND OBJECTIVES

The purpose of the DIMP is to enhance safety by identifying and reducing gas distribution integrity risks. Managing the integrity and reliability of the gas distribution pipeline has always been a primary goal for NW Natural; with design, construction, operations and maintenance activities performed in compliance with CFR 49, Part 192 requirements. The objective of this written DIMP Plan is to establish the minimum requirements to comply with the Code of Federal Regulations (CFR 49) Subpart P, pertaining to integrity management for gas distribution pipelines.

This written plan does not address how NW Natural may deviate from the required periodic inspections as provided for in §192.1013.

3.1 Company Roles

Integrity management is a company-wide program that involves the entire NW Natural organization. The Integrity Management Group (IMG) is charged with the development of the IMP Plan and for the accomplishment of its processes. The key team members involved in the development and distribution of this program are listed in Table 1.

Table 1. IMP Organization Chart

Name	Title	Function
Justin Palfreyman	President and CEO NW Natural Holdings	Chief Executive
Kim Rush	President NW Natural Gas Company	Chief Executive
Joe Karney	Vice President, Engineering and Utility Operations	Project Sponsor
Dan Kizer	Senior Director, Engineering	Steering Committee Member
Scott Lundgren	Manager of System Integrity	Program Manager, Steering Committee Member
Ryan Van Gordon	Corrosion Supervisor	Corrosion Engineer
Lindsey Robison	Integrity Management Engineer	Integrity Management Engineer
Christian Ching	Integrity Management Engineer	Integrity Management Engineer
Jonathan Kopp	Integrity Management Engineer	Integrity Management Engineer
Matthew Knapik	Integrity Management Engineer	Integrity Management Engineer
Jordan Carabajal-Johnson	Materials Engineer	Materials Engineer

Willy Druig	Engineering Specialist	Integrity Management Specialist
Deane Poirier	Engineering Specialist	Integrity Management Specialist
Ryan Pemberton	GIS Analyst	GIS Analyst
Laurel Garrett	GIS Analyst	GIS Analyst
Ryan Truair	Senior Manager, Code Compliance	Steering Committee Member

3.1.1 Vice President, Engineering and Utility Operations

The Vice President, Utility Operations has overall responsibility to assure that the DIMP Plan processes are implemented by the organization in accordance with this DIMP Plan and associated regulatory requirements. The Vice President, Engineering and Utility Operations, may delegate some or all of these responsibilities to others within the organization.

3.1.2 Manager of System Integrity

The Manager of System Integrity has the responsibility for day-to-day program oversight and responsibility to assure that the plan is implemented effectively. This Plan assigns authority to the Manager of System Integrity for approval of documents and plans. The Manager of System Integrity may delegate some or all of these responsibilities. Roles for this position include:

- Monitors and controls costs and scheduling
- Determines DIMP budget requirements and makes associated Capital and O&M budget requests

- Assures effective implementation of the seven elements of the DIMP process
- Authorizes and approves changes and revisions to the DIMP Plan
- Initiates communication with other departments within the Company
- Participates in annual effectiveness reviews and complete plan re-evaluations
- Gathers data for annual reports to PHMSA and State Safety Regulators

Reviews and approves Exception Requests

3.2 Personnel Qualifications

The IMG (Integrity Management Group) is charged with the development, implementation, and maintenance of the DIMP Plan. The authority for this charge is imparted with the acceptance of a candidate for the described job. NW Natural maintains specific job descriptions and organizational charts for integrity management positions that outline the specific responsibilities and lines of reporting for personnel that perform integrity management activities.

4. DEFINITIONS

The following definitions and acronyms shall apply to this DIMP Plan. This section supplements SPO/SPW 001 – Definitions, as found in the Standard Practice Manual.

COF: Consequence of Failure

DIRT (Damage Information Reporting Tool): Reporting tool mangaged by the Common Ground Alliance (CGA) for excavation damages. An annual DIRT report is issued each year that documents and provides analysis for damages to below ground facilities in the Unites States and Canada.

DIMP (Distribution Integrity Management Program): an overall approach used by NW Natural to ensure the integrity of its gas distribution system (reference §192.1001)

DIMP Files: NW Natural's records, databases, and/or files that contain either material incorporated by reference in the Appendices of the DIMP Plan or outdated material that was once contained in the DIMP Plan Appendices but is being retained in order to comply with record keeping requirements.

DIMP Plan (Distribution Integrity Management Program Plan): a written explanation of the mechanisms or procedures NW Natural will use to implement its integrity management program and to ensure compliance with subpart P of CFR 49, Part 192(reference §192.1001)

DIMP Rule: CFR 49, Part 192, Subpart P

Distribution Line: as defined in SPO/SPW 001

DOGAMI: Oregon Department of Geology and Mineral Industries

Excavation Damage: as defined in SPO/SPW 001

EFV (Excess Flow Valve): as defined in SPO/SPW 001

ERV (Engineering Records Viewer): Intranet based pipeline records search tool and viewer.

FOF (Frequency of Failure): synonymous with Likelihood of Failure

Hazardous Leak: a leak that represents an existing or probable hazard to persons or property, and requires immediate repair or continuous action until the conditions are no longer hazardous (reference §192.1001)

Main: as defined in SPO/SPW 001

MDPE: Medium Density Polyethylene

NTSB: The National Transportation Safety Board

PHMSA: The U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration

Pipeline: as defined in SPO/SPW 001

Region: areas within a distribution system consisting of mains, services, and other appurtenances with similar characteristics and reasonably consistent risk.

Risk: a relative measure of the likelihood of a failure associated with a threat and the potential consequences of such a failure

Risk Model: the integration of facility data, operational data, SME input, and established algorithms to estimate the relative risk associated with a gas distribution system threat

Service Line: as defined in SPO/SPW 001

SLIDO: Statewide Landslide Information Database for Oregon

SME (Subject Matter Expert): A SME is an individual who is judged by NW Natural to have specialized knowledge based on their expertise or training. Typically the individual will have firsthand experience or knowledge of a topic under consideration. The background and experience will vary with the information that is requested.

SPO: Standard Practice – Oregon

SPW: Standard Practice - Washington

Sub-Threat: a threat type within one of the primary threat categories specified in §192.1007(b)

Ticket: a notification from the one-call notification center to NW Natural, providing information of pending excavation activity for which NW Natural is to locate and mark its facilities.

5. KNOWLEDGE OF FACILITIES

This section describes NW Natural's methodology for demonstrating an understanding of its gas distribution system. NW Natural uses reasonably available information as the foundation for DIMP. This section will include, at minimum, the following:

- NW Natural will identify the characteristics of the distribution pipeline's design and operations and the environmental factors that are necessary to assess the applicable threats and risks to its gas distribution pipeline.
- NW Natural will consider the information gained from past designs, operations and maintenance.
- NW Natural will identify additional information needed and provide a plan for gaining that information over time through normal activities conducted on the pipeline (for example, design, construction, operations or maintenance activities).
- NW Natural will develop and implement a process by which the DIMP will be reviewed once per calendar year, and will be refined and improved as needed per section 10 of this plan.
- NW Natural will provide for the capture and retention of data on any new distribution pipeline installed. The data must include, at a minimum, the location where the new pipeline is installed and the material of which it is constructed. An attribute list of current information gathered on new distribution pipelines can be found in Appendix A-2.

The requirements of this section will be met using the design and construction records stored in the GIS (Geographic Information System) and compliance inspection records

including leak history, corrosion control records and continuing surveillance records stored in SAP. When applicable, NW Natural will utilize the collective judgment of SMEs to fill in gaps for missing and inaccurate or incomplete records. NW Natural will also use available external data sets to identify the characteristics of the distribution system's environmental factors (for example, census data, FEMA flood plain, DOGAMI and SLIDO). NW Natural will continually evaluate and may gather additional information as appropriate to improve system knowledge.

The knowledge of the distribution system will be used to evaluate each threat and prioritize risks as listed in Section 6.0 (Threat Identification) and Section 7.0 (Evaluation and Ranking of Risk) in this Plan.

Figure 5-0 illustrates the procedure to confirm Knowledge of the System.

Figure 5-0 illustrates the procedure to confirm Knowledge of the System.

Process to Confirm Knowledge of the System

The purpose of this process is to verify complete and current knowledge of the gas distribution system, to identify gaps in knowledge and to fill those gaps to meet the requirements of "Know Your System". This process can be initiated by any member of the Integrity Management Group at any time.

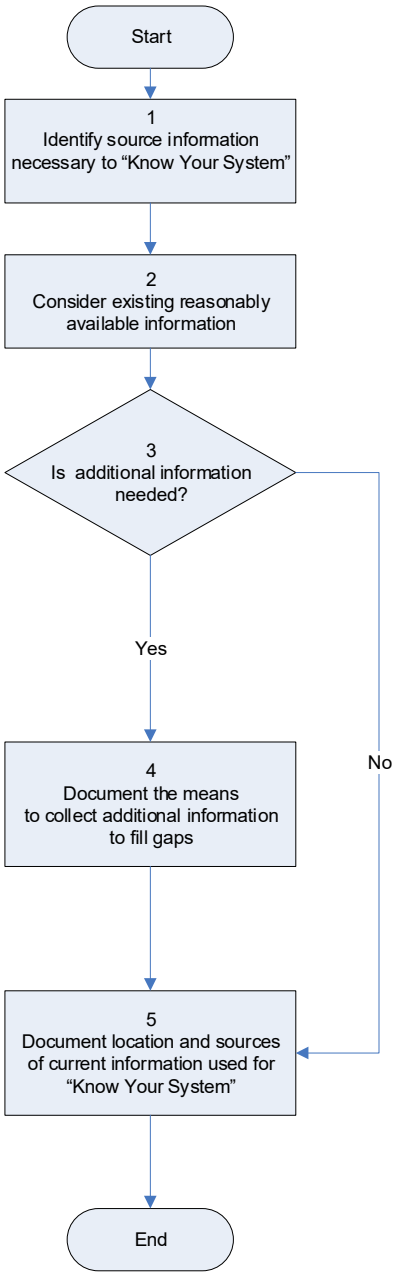
1. The Integrity Management Group identifies the records necessary to "Know Your System", and demonstrate an understanding of its gas distribution system developed from reasonably available information.

2. Consider existing reasonably available information including data contained in GIS, SAP, Sharepoint, ERV, Clevest, Annual Report and SME knowledge. Data considered will include information gained from past design, operations and maintenance activities.

3. Determine if records provide the most current data and information available. Also, does the information identify the characteristics of the distribution pipeline's design and operations and the environmental factors that are necessary to assess the applicable threats and risks to its gas distribution pipeline? Is the information gained from past designs, operations and maintenance considered? Is information needed to fill gaps?

4. Provide a plan for gaining information over time through normal activities conducted on the pipeline (for example, design, construction, operations or maintenance activities).

5. Document location and sources of existing records, including electronic (ERV, GIS), paper and subject matter experts.



5.1 Type and Location of Records

5.1.1 GIS (Geographic Information System)

- The primary record of NW Natural's distribution system resides in the GIS, which is a map of the entire NW Natural system, Approx. 2,000 sq. miles of above ground and underground facilities. It includes specific records of pipe size, material, installation date, location, MAOP (Maximum Allowable Operating Pressure), business district and other information as available. The platform allows for external records to be overlaid, such as census data, FEMA flood plain, DOGAMI and SLIDO. A summary of the data sets used to demonstrate an understanding of its gas distribution system is found in Appendix A, and an attribute table for Distribution and HP Distribution is shown in Appendix A-2. Operations and Engineering personnel utilize IQGeo Asset Map Viewer to access information stored in GIS.
- In some cases, NW Natural may be unable to determine the materials or characteristics of some of the components of the system. This is due to earlier practices not capturing this information or inaccurate, incomplete or missing records. This will be accomplished by using Section 5.2 Missing Data and will be documented and kept within Integrity Management files.
- Information about an existing system will be updated when new or better information becomes available. NW Natural will not dig up its facilities for the purpose of gathering data. This information will be gathered during existing operating or maintenance activities and installation of new facilities on an existing infrastructure. NW Natural will rely on existing processes to accomplish this, such as the data gathered by the Pipe Inspection Report (PIR).

- NW Natural's continual improvement efforts may include capturing facility information and the development of a process for notating "assumed values", based on information provided by SMEs.

5.1.2 SAP

- NW Natural uses the electronic database SAP to schedule, track and record compliance programs for leakage, corrosion, valve maintenance, district regulators, service regulators, meter sets, odorometer sites, long couplings, flex lines for houseboats, water crossings and bridge line inspections.
- The SAP data is referenced into the GIS to overlay on the existing system data.

5.1.3 SharePoint - ERV

- NW Natural uses SharePoint - ERV, to store procedures, pressure test documents and as-built's. This information is archived from paper and electronic records created at the time of installation. These files contain additional information that may be used in the future. In 2013 remaining microfilm and some original paper records were digitized/scanned and archived in ERV. Additional records may be scanned into ERV as NW Natural deems necessary. The pertinent information for identifying the characteristics of the pipeline's design is stored in the GIS.

5.1.4 Damage Prevention Records Sharepoint/SQL /RLMAN (Risk and Land Management System)

- NW Natural stores historical information related to damages in the Damage Prevention Audit Site which pulls from the Damage Prevention Forms that

are saved on SharePoint. For damages prior to 2012 this historical information is stored on RLMAN, accessed through the SQL server. This information includes the date, location, responsible party and reason for the damage. Reports related to damages including locates received, locates completed and third party damages are stored on Sharepoint and are used to determine a damage ratio, damages per 1000 locates.

5.1.5 Clevest

- Clevest is a dispatch tool, used to gather information and manage field construction and compliance activities. The data collected in Clevest is stored and accessible through the SQL server. Clevest collects data from field activity to better define system characteristics.

5.1.6 Annual Report

- The annual report to DOT summarizes the basic knowledge of what is in NW Natural's distribution system, including a breakdown of the mains and service lines by material, diameter and installation decade. This report is electronically filed for Oregon and Washington annually with PHMSA and is stored with Compliance Management. The information contained in this report is used to complement the understanding and knowledge of the system. Beginning in 2010, the report includes the following sections:
    - Part A- Operator Information.
    - Part B - System Description, which reports the miles and number of services in the NW Natural system at the end of the year.
    - Part C - Total Leaks and Hazardous Leaks Eliminated/Repaired During Year provides a breakdown of eliminated/repaired leaks by

leak cause for mains and for service lines, and the number of known system leaks scheduled for repair. Includes number of leaks due to mechanical fitting failure.

- Part D - Excavation Damage reports the total number of excavation damages and the total number of locate tickets.
- Part E - Reserved
- Part F - Total Number of Leaks on Federal Lands Repaired or Scheduled for Repair
- Part G - Percent of Unaccounted for Gas as a percent of total input for the 12 months ending June 30 of the reporting year.
- Part H - Additional Information
- Part I - Preparer and Authorized Signature

5.2 Missing Data

The Integrity Management team has reviewed and evaluated the aggregated data to identify areas where data may be insufficient or missing. Based on the evaluation, there is no need to actively research missing or insufficient data for the initial implementation of this plan, as documented in Appendix A-3.

The current Pipe Inspection Report process requirements supplement the Knowledge of the System. Pipe Inspection Reports are completed by NW Natural personnel and historical information is stored in the SQL server. Errors discovered in the mapping system are corrected by using the Add Object tool in IQGeo and creating a Map Correction.

When additional information is required, the Integrity Management team will develop the methods necessary to gather the appropriate information. New Additional or Accelerated (A/A) actions may require additional data to be gathered. The missing data and the process to gather that data will be identified as part of the A/A action.

5.3 Review

The process for periodic review, refinement, and improvement is discussed in Section 10.

5.4 Data Capture for New Construction and Ongoing Operations & Maintenance

Records for all piping systems installed after the effective date of this plan will be captured and retained by NW Natural. Records shall include newly installed facilities and facilities that are abandoned or taken out of service as a result of the newly installed facilities. This will include the location where new piping and appurtenances are installed,the material of which they are constructed and location of abandoned or taken out of service facilities as a result of the newly installed facilities. For material specifications of newly installed pipe refer to “Engineering Specification MTS-003” and “Engineering Standard 19-001 for Poly Pipe” and “Engineering Specification MTS-00” and “Engineering Standard 27-001 for Steel Pipe.” This shall be accomplished on electronic as builds through Clevest, and IQ-Geo. For larger projects information may be obtained from paper as-builts and documents. An attribute list of current information gathered on new distribution pipelines can be found in Appendix A-2.

6. THREAT IDENTIFICATION

This section describes NW Natural's methodology for identifying existing and potential threats to the gas distribution pipeline. The following categories of threats shall be considered for each gas distribution pipeline (trailing # equals threat order):

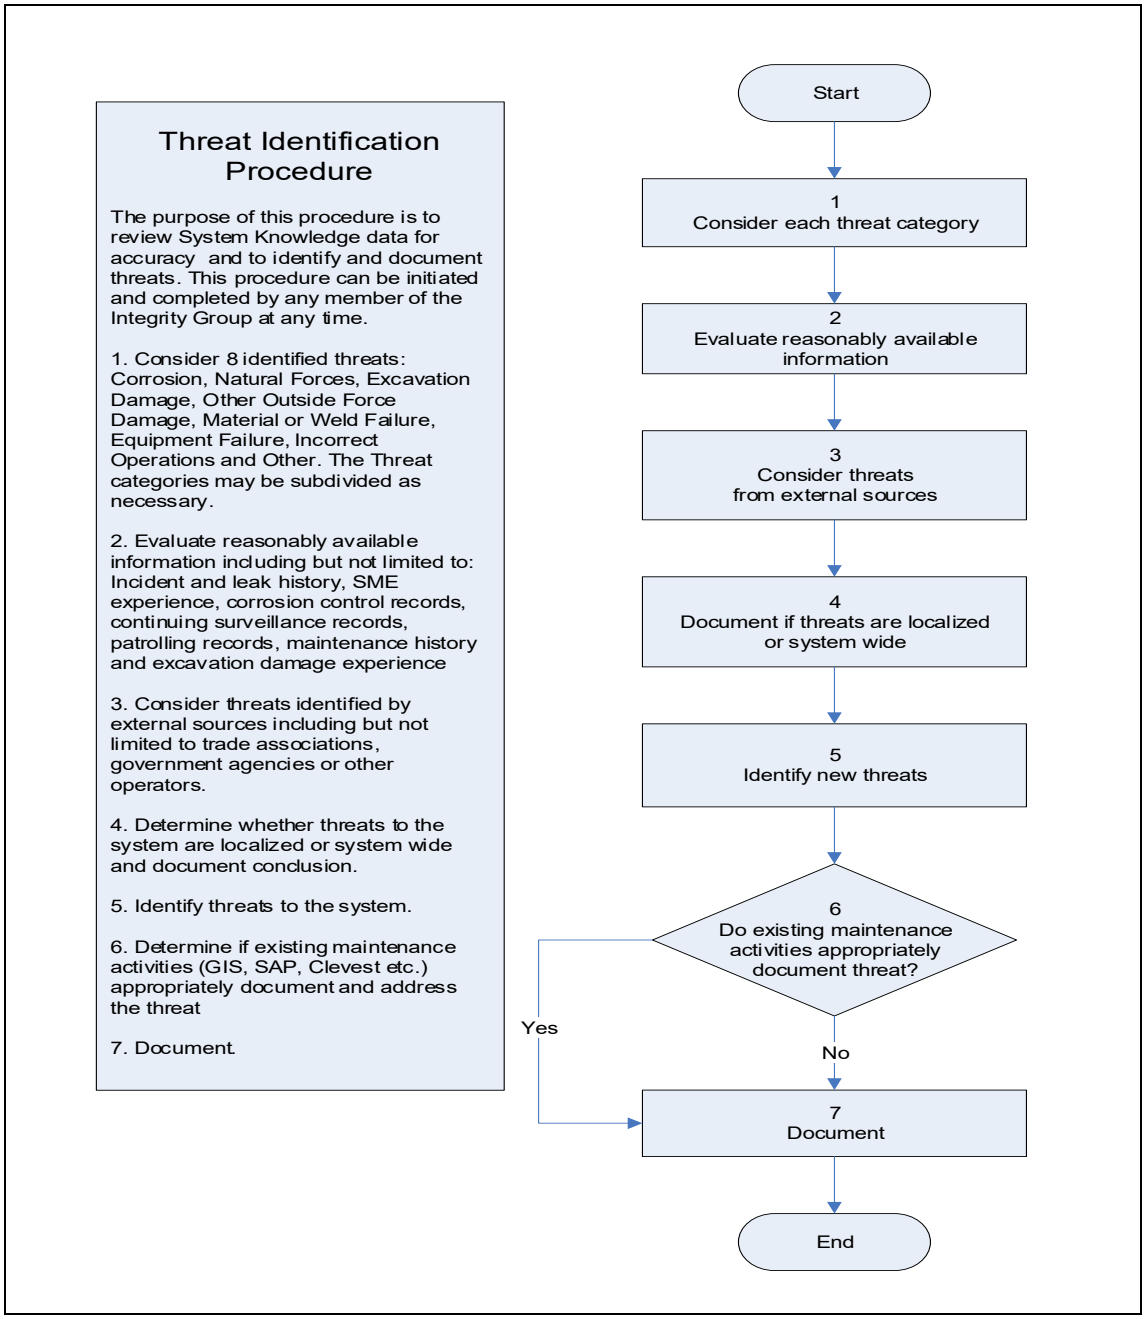
- Corrosion (3)
- Natural Forces (7)
- Excavation Damage (1)
- Other Outside Force (8)
- Material, Weld or Joint Failure (2)
- Equipment Failure (4)
- Incorrect Operation (6)
- Other concerns that could threaten the integrity of the gas distribution pipeline. (5)

NW Natural will review information gathered for Section 5.0 and reasonably available information to identify existing and potential threats. Sources of data may include, but are not limited to, incident and leak history, corrosion control records, continuing surveillance records, patrolling records, maintenance history, and excavation damage experience.

NW Natural

Distribution Integrity Management Program
Program Plan

Figure 6-0 illustrates the procedure used to identify threats.



6.1 Threat Identification

NW Natural relies on over 165 years of operating experience and actively participates in industry and PHMSA integrity forums. Where possible, NW Natural uses a data centric approach, supplemented with SME and industry data.

6.1.1 Data Centric Approach to Existing Threat Identification

NW Natural will use the best information available in order to understand the system and identify threats. The data centric approach is a Threat Identification methodology that uses available leak repair and incident data to identify threats that have a known history. The results are then reviewed by the SME(s) to make a final conclusion as to which threats are applicable. NW Natural will document the Threat Identification results in the written DIMP Plan.

If it is found that the level of detail available from leak repair and incidents does not fully support this approach, NW Natural will consider the SME Centric approach outlined in Section 6.1.2. NW Natural may also wish to combine the data centric and SME centric approaches in order to have as complete an evaluation as possible.

6.1.2 SME Centric Approach to Threat Identification

NW Natural may not have leak repair or other key data that is detailed enough to support the threat identification approach described in Section 6.1.1 and/or may wish to leverage the knowledge and experience of SMEs to perform threat identification. The available SME centric approach to Threat Identification uses SME input to identify threats that have a known history to NW Natural’s personnel.

6.1.3 Threat Identification from External Sources

Additionally, NW Natural may become aware of potential new threats by routinely monitoring information from sources that include:

- National Transportation and Safety Board (NTSB) Reports and Recommendations applicable to Pipeline Accidents.
- Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) Advisory Bulletins
- Membership in American Gas Association, Western Energy Institute, Gas Technology Institute and Northwest Operators Group.
- Involvement in Association workshops and forums that share knowledge regarding distribution pipeline threats
- Review of trade journals and magazines that publish material regarding gas distribution

As Integrity Management group becomes aware of new threats from external sources the team will utilize the procedure documented in Figure 6-0 to document the threat.

6.2 Corrosion

Corrosion is the 3rd largest threat in the NW Natural gas distribution system, representing approximately 1% of all recorded leak repairs from 2010 to 2020.

Corrosion is a systematic threat. The Integrity Management Group evaluated the corrosion threat and determined the following sub-threats were applicable for the NW Natural Distribution system. The results of these threat assessments are discussed

below. Leak data is used to identify areas where isolated localized issues may occur. Pipe condition gathered during normal system maintenance identifies potential future issues.

6.2.1 Pipe Material

The primary potential driver for external corrosion system-wide is installed pipe material. The NW Natural Distribution main system is approximately 55% poly, 45% coated and cathodically protected steel. There is no corrosion threat associated with poly pipe. A corrosion threat exists for coated and cathodically protected steel, but existing code compliance and current system practices adequately mitigate the threat system-wide. Isolated localized issues may occur. NW Natural has completed a cast iron mitigation program, eliminating all cast iron within the system as of 1998. NW Natural has also completed the Bare Steel mitigation program, eliminating all known bare steel mains within the system as of 2015.

6.2.2 Casings

Casings are primarily used to protect or facilitate installation of mains and services. Casings are typically equipped with vents for air circulation, casing spacers to provide isolation between the carrier pipe and casing, test leads for monitoring electrical isolation effectiveness and end seals to prevent water from accumulating in the casing.

NW Natural has coated steel pipe installed in casing system-wide and monitors for the electrical isolation between the distribution main and the casing annually, per the corrosion procedures(Standard Practices 465 and 467). While there have been no corrosion related failures in casing, the threat of corrosion can exist under certain conditions.

Properly installed and maintained steel pipe in steel casing has a slightly higher threat than non-cased pipeline installations. Steel pipe installed in plastic casing has a slightly elevated threat of corrosion than direct buried pipeline installation. Cased crossings that have an identified or confirmed short (electrolytic or contact) are considered to have an elevated threat of corrosion.

NW Natural is aware of areas where coated steel pipe was inserted into abandoned steel pipe without spacers. While no corrosion leaks have been associated with this steel-in-steel installation, NW Natural considers this area to have an elevated threat of corrosion compared to direct buried steel main.

6.2.3 Atmospheric Corrosion

NW Natural's system includes facilities that may be subject to the threat of atmospheric corrosion. Steel pipe with inadequate coating that is exposed to marine atmospheres, may be particularly vulnerable to atmospheric corrosion. These regions are stored in the GIS.

Risers, regulators, station piping, bridge crossings and other above ground facilities are all subject to the threat of atmospheric corrosion. NW Natural's atmospheric corrosion survey frequency is based upon Standard Practice 480.

NW Natural's atmospheric corrosion mitigation plan includes protective coating applications (epoxy/paint), the use of corrosion resistant materials and replacement as required.

6.2.4 Corrosion Factors Discussed But Not Considered a Threat

There is no ductile iron or copper pipe within the NW Natural system and NW Natural has not identified in its operating history the results of internal corrosion in any distribution pipeline. Issues with the cathodic protection system are fixed upon discovery and are not used for threat identification at this time.

6.3 Natural Forces

Damage by Natural Forces is the 7th largest threat to the NW Natural gas distribution system, representing less than 1% of all recorded leak repairs from 2010 to 2020. Natural Forces is a localized threat.

6.3.1 Seismically Active Zones

NW Natural's system is in a seismically active zone and the threat exists throughout the system. The primary risks associated with this threat are considered to be earth movement or landslides triggered by seismic activity, and differential settlement at bridge crossings. Earth movement/landslides are addressed in Section 6.3.2. Bridge crossings are identified in the GIS system.

6.3.2 Areas Susceptible to Earth Movement/Landslide

Earth movement due to landslides may damage gas distribution facilities and result in gas leaks. The NW Natural system exists in areas known to be susceptible to earth movement as identified by state, local and federal agencies, patrolling and NW Natural's historical records. These areas may warrant mitigative measures such as increased monitoring and valve installation.

6.3.3 Heavy Rains / Floods/Water Crossings

Areas of NW Natural's system are susceptible to flooding. NW Natural has identified flood zones throughout the system using FEMA Flood Plain maps.

Water crossings have an increased risk of failure due to washouts. Water crossings are identified in the GIS system.

6.3.4 Natural Forces Discussed But Not Considered a Threat

Frost heave is not a threat within the NW Natural system.

6.4 Excavation Damage

Excavation damage is the largest threat to the NW Natural gas distribution system, representing approximately 86% of all recorded leak repairs from 2010 to 2020. Excavation damage is a system wide threat. The most significant root-cause factors are discussed below.

6.4.1 Improper Excavation Practice

NW Natural actively engages in educating employees and contractors about excavation procedures, using state dig laws and industry best practices. NW Natural employees are trained per OP101-01. Contractors and third party excavators are monitored per the requirements of OP102-01. NW Natural risk ranks locate tickets as they are entered into the system which allows NW Natural to appropriately engage with excavators to ensure that proper excavation practices are followed.

6.4.2 Facility Not Located or Marked

NW Natural is a participating member in the one call state system and responds to all one call tickets received. NW Natural experiences a low volume of this type of incident, which is due to a failure to request locates, locates requested in the wrong location or locates not completed on time.

6.4.3 One Call Notification Center Error

Locates may not be completed due to errors that occur at the one call notification center. NW Natural tracks one call activity and there have been no damages caused by one call notification center error in the past 15 years.

6.4.4 Mis-marked Facilities

Mis-marked facilities may be due to deficiencies in training, job execution, or equipment. NW Natural investigates every mis-mark.

If a NW Natural employee is responsible for a mis-mark, their direct supervisor and the Damage Prevention Department are notified. An investigation by the Damage Prevention Department and a Quality Assurance review are completed and the results are shared with the supervisor for further follow up and training if needed. NW Natural follows the same procedure for a contracted locating company.

6.4.5 Incorrect Facility Records

Gas Distribution facilities may be mis-marked or left unmarked due to inaccurate facility maps. NW Natural has a process in place within the IQGeo Asset Map Viewer to allow Operations and Engineering personnel to correct and update facility maps as any inaccuracies are identified.

6.4.6 Other

Other root causes include difficult to locate facilities (e.g. broken wire on plastic main or interference due to congested Right-of-Ways).

6.5 Other Outside Force Damage

Other Outside Force Damage is the 8th largest threat to the NW Natural gas distribution system, representing less than 1% of all recorded leak repairs from 2010 to 2020. Other Outside Force Damage is a localized threat.

6.5.1 Vehicle Damage to Risers and Meters

When installing new services or relocating service facilities, NW Natural employs protective measures on new construction to protect the gas riser and gas meter from vehicular damage. NW Natural retroactively employs protective measures to protect or to relocate the riser/meter when changes made by the property owner or historic design requirements do not sufficiently protect the meter/riser. NW Natural employs additional protection or relocation to mitigate the risk of damage that could result in a gas leak or damage to a meter per Standard Practice 361.

6.5.2 Vehicle Damage to Above-Ground Equipment / Stations

NW Natural employs protective measures to protect above-ground sections of gas mains, gas services, and regulator station piping which may be subject to damage by vehicular traffic.

6.5.3 Vandalism

NW Natural employs protective measures to protect gas valves and station equipment from vandalism that could result in the unsafe operation of a gas distribution system and measures to prevent or reduce the likelihood of such vandalism.

6.5.4 Fire or Explosion

NW Natural employs scenario-based and classroom training to educate internal and external first responders to mitigate this risk.

6.6 Material, Weld or Joint Failure

Material, weld, or joint failure is the 2nd largest threat to the Northwest Natural gas distribution system, representing approximately 9% of all recorded leak repairs from 2010 to 2020. Material, Weld or Joint Failure is a system wide threat.

6.6.1 Plastic Pipe Installed from 1960s to 1980s

NW Natural makes every effort to identify all pre-1982 plastic pipe installations, analyze leak histories, evaluate any conditions that may impose high stresses on the pipe, and take appropriate remedial action, including replacement, to mitigate any risks to public safety.

6.6.2 PVC

Polyvinylchloride (PVC) plastic pipe has not been installed for transportation of natural gas by NW Natural. PVC is used as a sleeve and conduit by NW Natural.

6.6.3 ABS

NW Natural installed Acrylonitrile-Butadiene-Styrene (ABS) services from the late 1950s through the early 1970s. All know ABS services were removed from NW Natural's system in 2022.

6.6.4 Plexco Service Tee Celcon Caps

NW Natural is aware of industry issues regarding Plexco Service Tee Celcon Caps possibly leaking when over-tightened during installation. These caps exist within the NW Natural system and are scheduled for replacement if leaks are identified.

6.6.5 PE Fusion Failure

NW Natural has a robust training and QA/QC program in place to ensure proper poly fusion quality. This is achieved by annual testing, qualification and ongoing training. Poly-fusions are visually inspected and pressure tested per Engineering SPO/SPW 511, and installed per OP130-01.

6.6.6 Material, Weld or Joint Discussed But Not Considered a Threat

HDPE pipe and Delrin Insert Tap Tees are not used within the NW Natural System.

6.6.7 Aldyl A

NW Natural installed Century Products MDPE 2306, Aldyl A services from the late 1950s through the early 1970s. All known Aldyl A services were removed from NW Natural's system in 2013.

6.7 Equipment Failure

Equipment Failure is the 4th largest threat to the NW Natural gas distribution system, representing approximately 1% of all recorded leak repairs from 2010 to 2020. Equipment Failure is a system wide threat.

6.7.1 Valves

Many valves are vital to the safe operation of a gas distribution system. NW Natural has in place a key operating valve inspection and maintenance program, per SPO/SPW 405 and OP831-01. Key valves that are inoperable, inaccessible, and/or paved over are identified and maintained as needed.

6.7.2 Pressure Control / Relief Equipment

NW Natural has an established inspection and maintenance program in place for Pressure Control/Relief Equipment, per SPO/SPW 743 and OP800-01.

6.7.3 Mechanical Couplings

Pipe may pull out from compression couplings due to pullout forces that could include cyclic fatigue from changes in the temperature of the natural gas as a result of the Joule-Thomson effect, ground movement from earthquakes or after heavy rains, improper installation, and deterioration of the coupling. Mechanical couplings may also leak through the seal between the coupling and the pipe. Contributing factors may include a degradation of the seal over time or a change in the gas quality in the distribution system.

6.7.4 Other

Other types of equipment failure may occur in the gas distribution system. Failure reports may be reviewed to detect trends of equipment failure occurring within the distribution system.

6.8 Incorrect Operation

Incorrect operation is the 6th largest threat to the NW Natural gas distribution system, representing less than 1% of all recorded leak repairs from 2010 to 2020. Incorrect Operations is a system wide threat.

6.8.1 Operating Errors

NW Natural has qualification and training programs in place to prevent operating errors, found in the Operator Qualifications manual, established in 2004. The procedures and AOCs are part of NW Natural's O&M Manual.

6.8.2 Gas lines cross-bored through Sewer Laterals

NW Natural recognizes the industry issue associated with cross-boring through sewer pipelines and takes immediate action upon discovery. NW Natural interacts with sewer municipalities within its region to minimize the incidents of boring through sewers. No historical incidents from this issue have been identified, but NW Natural recognizes the threat to its system. In 2013 NW Natural implemented a sewer cross-bore program to identify areas and facilities that are at a higher risk of sewer cross-bores and perform inspections of those facilities to address risk.

6.9 Other

Leaks classified as Other represent 1% of total reported leaks, the 5th largest amount within the NW Natural Distribution system.

Pending a full investigation of an incident or leak, NW Natural may initially classify an incident as “other” until an actual cause can be determined.

6.9.1 Build-Over

Build-overs are when a building is built on top of an existing pipeline facility and are classified as an Other threat. NW Natural has developed procedure to identify these build-overs and remediate them (NW Natural General Procedure G-42 Build-Over Compliance).

7. EVALUATION AND RANKING OF RISK

Objective

This section describes NW Natural's methodology for evaluating and ranking the risks associated with its distribution pipelines. In this evaluation, NW Natural will determine the relative importance of each threat and estimate and rank the risks posed to its distribution pipeline. To complete this evaluation, NW Natural will:

- Consider each applicable current and potential threat
- Consider the likelihood of failure associated with each threat
- Consider the potential consequences of such a failure
- Estimate and rank the risks (i.e. determine the relative importance) posed to the distribution pipeline
- Consider the relevance of threats in one location to other areas

7.1 Risk Assessment Process

Information from the GIS, Annual Reports, written documentation, SME knowledge and other electronic database data is used to populate NW Natural's DIMP risk model. The foundation is a mathematical or algorithm model with SME data added as appropriate. The data used includes pipe diameter, material and coating, installation date, MAOP, leak data, scheduled inspections, presence of EFVs, geographical area and population density/business districts.

NW Natural groups facilities by common traits and problems, which allows each group to be risk-ranked as a unit. The process is an analysis that assigns a relative risk value and may result in recommendation for action. "Relative risk" does not indicate an absolute measure of risk; it only indicates a comparative value relative to other NW

Natural facilities. It may be determined that facilities or groups of facilities that do not experience problems can be removed from the risk evaluation and no further action necessary.

The risk model assigns values to each facility or group of facilities based on the data gathered by threat and considers two factors to determine risk: Likelihood and Consequence.

7.1.1 Likelihood

Likelihood refers to the possibility of an issue occurring within NW Natural's Distribution system and is modeled using data from three sources: Past incidents or failures, near-misses or partial failures, and facilities susceptible to failure. Past incidents or failure data is gathered typically from leak data, near misses are gathered from normal maintenance activities and facilities susceptible to failure data is based on industry knowledge.

In this risk evaluation system, the likelihood of an event occurring is addressed by the relative scoring of the items within each index. The score of each item reflects the importance of that item relative to the other items in the index. This importance is based upon NW Natural's experience and general industry knowledge.

NW Natural created a likelihood of failure risk value for each of the eight threats listed in Section 6.0.

The foundation for this risk assessment was the DIMP Tool Set, developed by ESRI, using the ArcGIS ModelBuilder environment. Using the GIS environment allows NW Natural to overlay internal and external data sets on the distribution system. This is accomplished by segmenting the service territory into user

defined grids or raster's, which facilitate linking internal and external data to distribution facilities. NW Natural uses a 50'x 50' raster size, which is common practice for ESRI users.

Adequate information was readily available for this process, and as applicable in the future, NW Natural will capture additional relevant information during routine operations and maintenance activities.

The current algorithm used for Risk Assessment (the evaluation and ranking of risk) shall be documented and included by reference in Appendix C. Prior risk assessment algorithms shall be retained and stored in the Integrity Management files.

7.2.1 Consequence

Consequence refers to the potential impact an incident or failure may have on the area surrounding a pipeline facility. Consequence is modeled using data from two primary sources: Number of people impacted and the amount of gas that could potentially escape as the result of a failure.

NW Natural created one consequence score, which is used system wide to evaluate each of the eight likelihood threats.

To determine Consequence, census data (representative of where people live and work) and business districts (representative of where people work) were used to evaluate the number of people impacted, which is then combined with MAOP, pipe diameter and the presence of EFVs to determine the amount of gas that could escape. The value created represents the relative consequence score if failure occurs.

7.3 Total Relative Risk

Total relative risk is equal to the weighted average of the likelihoods multiplied by the consequence. Risk can be analyzed by total relative risk or by individual threat risk or by sub-threat risk.

The current risk assessment (likelihood, consequence, and resultant risk ranking) shall be stored in the GIS. Prior risk assessment results shall be retained and stored in the Integrity Management files.

7.4 Risk Assessment Validation

The Integrity Management team validates that the results of the risk assessment are valid and accurately represent the NW Natural distribution system. The results of the risk assessment and the operations and maintenance records focus on the same facilities or groups of facilities, and the results agree with the experiences of NW Natural's SMEs and if they are reasonable in comparison to historical leak repair data for the threat type.

NW Natural

Distribution Integrity Management Program
Program Plan

Figure 7-0 illustrates the procedure to validate the DIMP Risk Model

Process to Validate the DIMP Risk Model Results

The purpose of this process is to validate the DIMP Risk Model results. This process can be initiated by any member of the Integrity Management Group at any time.

1. The Integrity Management Group manages the process to populate the ArcGIS DIMP Risk Model, using data sources shown in Appendix C-1 "DIMP Risk Model Architecture".

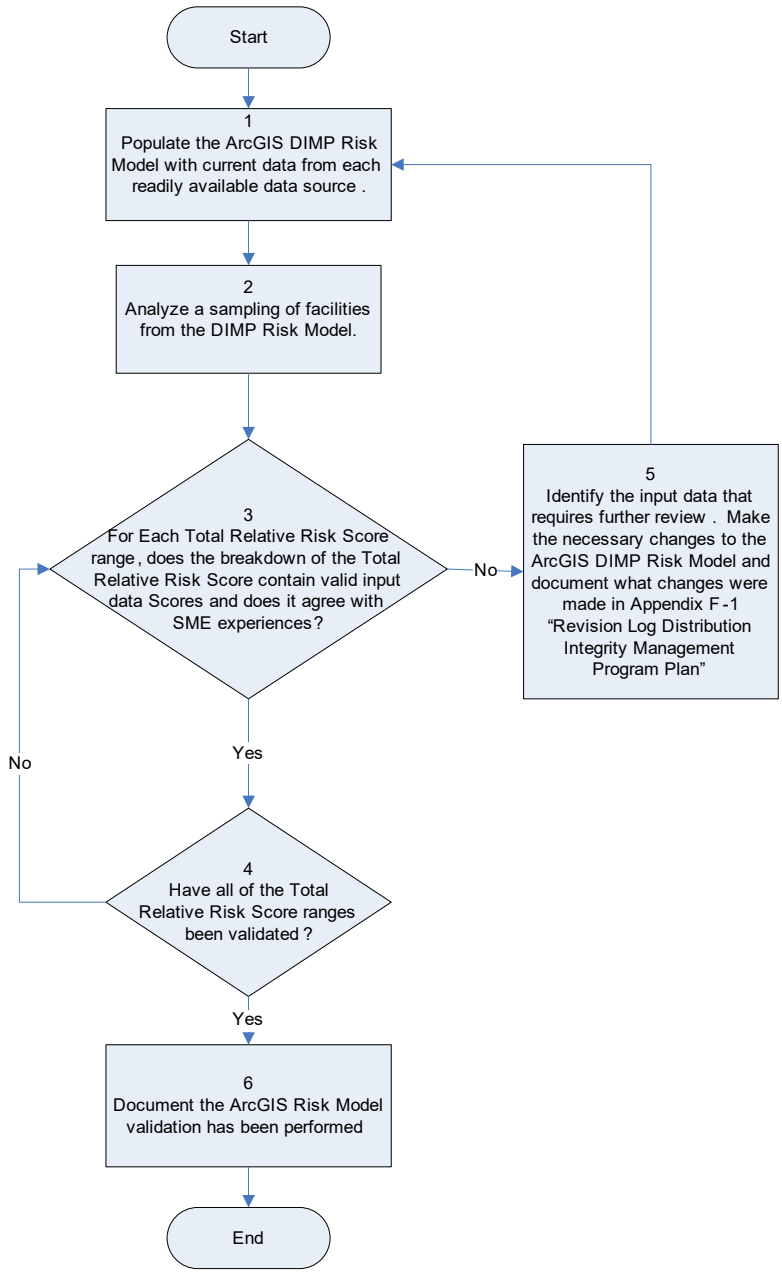
2. Analyze a small sampling of facilities from the Risk Model. The sample should include locations with low and high risk scores and areas of the system with in-depth SME knowledge.

3. Analyze each Primary and/or Sub Threat Score included in the Total Relative Risk Score for the facility segments being reviewed. Refer to Appendix C-2 "Risk Algorithm" to check for valid Scores for the Threats that are shown applicable to the facility segment being reviewed. Do the results agree with the experiences of NW Natural's SMEs and are they reasonable in comparison to historical leak repair data?

4. Ensure that each Total Relative Risk Score range has been sampled and analyzed.

5. When a modification to the DIMP Risk Model Algorithm is determined to be needed, make the necessary changes to the Risk Model and document the changes that were made in Appendix F-1 "Revision Log Distribution Integrity Management Program Plan". After making the changes, repeat Step #1 to ensure that the changes are applied to the entire Risk Model.

6. After completing the sampling for the DIMP Risk Model document that the validation has been completed in the DIMP files.



7.5 Risk Assessment Process Improvement

Risk Evaluation and Ranking is an ongoing process that responds to changes in the distribution system and continuous improvements in risk evaluation and ranking methodology will be necessary. NW Natural's Integrity team will evaluate the Risk Model annually. As new threats arise, system knowledge evolves, or as potential improvements are identified, the Risk Model will be updated. Changes to the Risk Model will be documented in Appendix C – Evaluating and Ranking Risk and in Appendix F – Revision Log.

8. IDENTIFICATION AND IMPLEMENTATION OF MEASURES TO ADDRESS RISKS

This section describes NW Natural's existing and proposed measures to address the threats that have been identified in Section 6.0 and the resulting risks that have been evaluated and prioritized in Section 7.0.

The general purpose of this section is to determine and implement measures designed to reduce the risks from failures of its gas distribution pipeline. NW Natural Integrity Management group uses this process to first evaluate whether existing safety related compliance activities and standard operating procedures adequately address risks to NW Natural distribution facilities. Where existing compliance activities and procedures need to be supplemented to address risks, an A/A (Additional and Accelerated) Action will be identified to mitigate the risk. The risk can be managed by eliminating or reducing the likelihood or by lessening the consequence of a potential issue. A/A Actions may address one or more identified threats. Analysis of the risk data may be by total risk or by individual threats within the risk model.

Figure 8-0 illustrates the procedure to address risks

Process to Identify and Implement Measures to Address Risk

The purpose of this process is to identify high risk areas evaluated for Accelerated Actions. This process is typically completed annually or as necessary and can be initiated by any member of the Integrity Management Group. High risk areas are selected according to the Risk Model or as identified by SMEs.

1. The Integrity Management Group identifies high risk facilities using the Risk Model and /or SME input.

2. Identify and document the compliance activities currently performed at high risk facilities. (leakage, corrosion, water crossing surveys, etc).

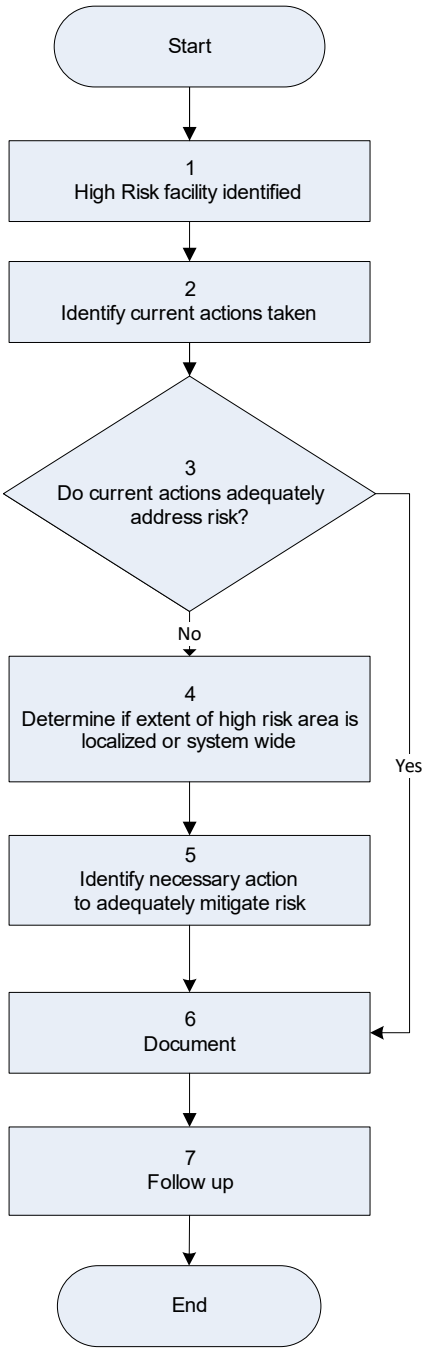
3. Do current compliance activities adequately address risk?

4. Determine if implementation of Accelerated Actions should be isolated or system wide

5. Identify the necessary Accelerated Actions to adequately mitigate risk (gather more information, schedule more frequent inspections, replace pipe, etc).

6. Document A/A Action including analysis of high risk area measure selected, how it will be implemented, and risk it is addressing.

7. Follow up to determine that Accelerated Actions have been completed.



8.1 Additional or Accelerated Actions

Using the process shown in Figure 8-0, the A/A actions have been identified and are documented in Appendix D.

8.1.1 A/A Action Documentation

When A/A actions are implemented as a result of DIMP, they shall be documented using form “Additional or Accelerated Action Implementation” found in Appendix D-2. The documentation will contain at a minimum:

- Description of A/A action being implemented
- Threat(s) that the A/A action addresses
- Description of the location that the A/A action is being implemented
- A/A action duration and/or schedule
- Date that the A/A action is to be implemented
- Date the A/A action will be completed (if applicable)

This form will be attached to the Project charter if the Project Charter is required. All forms will be kept in the Integrity Management files.

8.2 Leak Management Program

The Leak Management program is established in SPO/SPW 707 and 709. Additionally, the Field Operations Manual – Investigating Leaks and Odors, outlines the procedures of the existing program.

NW Natural uses this program to maintain the integrity of its distribution system. Many factors specific to NW Natural’s geographic location and Distribution system are

considered to evaluate the severity of leaks and determine the appropriate actions to mitigate the risk associated with the leaks.

NW Natural's program contains the following basic elements:

Locate the leaks in the distribution system;

Evaluate the actual or potential hazards associated with these leaks;

Act appropriately to mitigate these hazards;

Keep records; and

Self-assess to determine if additional actions are necessary to keep people and property safe.

8.2.1 Locate the Leaks

NW Natural detects and locates leaks through the use of leak detection equipment when conducting leak surveys and investigating notifications of gas odors. Leak surveys are performed per SPO/SPW 707.

8.2.2 Evaluate Leaks

When located, the hazards associated with the leaks are evaluated according to established classification criteria, per SPO/SPW 709. These classification criteria take into consideration the safety risk posed by each leak:

- Class A – A leak that represents an existing or probable hazard to persons or property and requires immediate repair or continuous action until safe conditions are restored.
- Class B – A leak that is non-hazardous but justifies scheduled repair.
- Class C – A leak that is non-hazardous and can reasonably be expected to remain unchanged until the next scheduled check.

8.2.3 Act Appropriately

Once a leak has been located and classified, NW Natural takes actions that are consistent with the classification of that leak, per SPO/SPW 709. This may include temporary or permanent repair of non-hazardous leaks. NW Natural takes immediate action to repair hazardous leaks.

8.2.4 Keep Records

NW Natural collects and records data to evaluate the effectiveness of the leak management program, per SPO/SPW 709. These records provide sufficient data to allow all regulatory reports to be filed and to allow for continual leakage program improvements. NW Natural uses historical leak data as an indicator of potential future hazards. These records are stored in DNV-GL Essentials.

8.2.5 Self-Assess Key Performance Metrics & Analysis of Effectiveness

The Leak Management Program key performance metrics (those that establish program effectiveness) shall be documented, or included by reference, in Appendix D. Prior documentation shall be retained and stored in the DIMP files. The current performance metric evaluates the number of overall leaks as reported on the PHMSA Annual Distribution Report.

9. MEASUREMENT OF PERFORMANCE, MONITORING RESULTS, AND EVALUATING EFFECTIVENESS

This section of the plan establishes performance measures that NW Natural will monitor from an established baseline in order to evaluate the effectiveness of the DIMP. The performance measures detailed in Sections 9.1 through 9.10, summarized in the bullets below, have been established in order to monitor performance and assist in the ongoing evaluation of threats.

- Number of hazardous leaks either eliminated or repaired (or total number of leaks if all leaks are repaired when found), categorized by cause;
- Number of excavation damages;
- Number of excavation tickets (receipt of information by NW Natural from the notification center);
- Total number of leaks either eliminated or repaired, categorized by cause;
- Number of hazardous leaks either eliminated or repaired (or total number of leaks if all leaks are repaired when found); categorized by material
- Number of known system leaks at end of year scheduled for repair
- Number of Vintage Plastic services in system at end of year and;
- Any additional measures to evaluate the effectiveness of NW Natural's DIMP in controlling each identified threat.

Using the current, representative data, the initial baselines for these performance measures were created by a member of the Integrity Management Team at the time the DIMP was established or at the time the corresponding A/A Action was created. Baselines for each performance measure and A/A Action are documented in Appendix E of this plan. The Distribution Annual Report, used to track select performance

measures, is filled out and submitted per SPO/SPW 003. A reference copy of that report is in Appendix E of this plan.

9.1 Number of Hazardous Leaks either Eliminated or Repaired, per §192.703(c), Categorized by Cause

The baseline and ongoing performance of the number of hazardous leaks either eliminated or repaired, per §192.703(c), categorized by cause, shall be documented in the Distribution Annual Report.

9.2 Number of Excavation Damages

The baseline and ongoing performance of the number of excavation damages shall be documented in the Distribution Annual Report.

9.3 Number of Excavation Tickets (received from the notification center)

The baseline and ongoing performance of the number of excavation tickets received from the notification center(s) shall be documented in the Distribution Annual Report.

9.4 Total Number of Leaks either Eliminated or Repaired, Categorized by Cause

The baseline and ongoing performance of the total number of leaks either eliminated or repaired, categorized by cause, shall be documented in the Distribution Annual Report.

9.5 Number of Hazardous Leaks Either Eliminated or Repaired, per §192.703(c), Categorized by Material

The baseline and ongoing performance of the number of hazardous leaks either eliminated or repaired, per §192.703(c), categorized by material, shall be documented in the Hazardous Leaks Repaired, Categorized by Material, (HLR-M) Reports. Data for

the HLR-M Reports is collected via NW Natural's leak report forms. Reference copies of the HLR-M Reports are in Appendix E.

9.6 Number of Miles of Bare Steel Main in the System at End of Year

The baseline and ongoing performance of the number of miles of bare steel main at end of year shall be documented in the Distribution Annual Report. Completed in 2015.

9.7 Number of Bare Steel Services in the System at End of Year

The baseline and ongoing performance of the number of bare steel services at end of year shall be documented in the Distribution Annual Report.

9.8 Number of Known System Leaks at End of Year Scheduled for Repair

The baseline and ongoing performance of the number of known system leaks at end of year scheduled for repair shall be documented in the Distribution Annual Report.

Also see chart in Appendix D-3.

9.9 Number of ABS Services in System at End of Year

The baseline and ongoing performance of the number of ABS services in system at end of year shall be documented in the Distribution Annual Report.

9.10 Additional Performance Measures

If it is determined that additional performance measures are needed to evaluate the effectiveness of the DIMP in controlling an identified threat, the performance measures shall be documented, or included by reference in Appendix E.

9.11 Effectiveness Measures

A member of the Integrity Management Team created each Effectiveness Measure, seen in Appendix E-1, by determining what trends or results accurately represent the

intent or expectation of a Performance Measure or A/A Action. Effectiveness Measures were either created at the time the DIMP was established or at the time the corresponding A/A Action was created. Effectiveness Measures are subject to change if the Integrity Management Team determines that they are no longer appropriate representations of performance.

9.12 Monitoring Performance Measures and Effectiveness Review

The data collected for a Performance Measure will be reviewed by NW Natural once per calendar year to determine if the risk management technique or practice (A/A action) implemented is effective. The effectiveness review shall include the following:

- During review, the data that supports the Effectiveness Measure, defined in Appendix E-1, for a risk management technique or practice (A/A action) will be collected and analyzed. The analysis will examine whether the data indicates the practice or action is, or is not, managing the targeted task by comparing it to the desired trend, as described by the corresponding Effectiveness Measure. NW Natural will then decide whether to continue or discontinue with the action, accelerate or decelerate its pace, modify how it is being implemented, or choose another action. NW Natural may conclude that it is too early to tell or that currently there is insufficient data to tell how well an action is working.
- Through analysis, NW Natural will examine if the performance measure selected is providing information useful in analyzing the impact of the practice or action. If the impact is unclear, NW Natural will include other data in the review or select a different performance measure.

The effectiveness review shall be documented in Appendix E of this plan with charts and or data.

10. PERIODIC EVALUATION AND IMPROVEMENT

This section describes NW Natural's periodic re-evaluation of the program.

10.1 Plan Updating, Review Frequency and Documentation

The process for comprehensive review of DIMP Operations is outlined in Figure 10-0 and will be performed once per calendar year. The process will be utilized to reflect changes and improvements that have occurred in process, procedures and analysis for each element of the program. A complete program re-evaluation will be completed at least every 5 years or sooner if required. The review will include at a minimum:

- Verification of general information (e.g. contact information, form names, action schedules, etc)
- Incorporation of new system information (per Section 5 of this plan)
- Determine if there are new federal regulations, state enforcement or other guidelines provided by regulatory bodies in effect which would affect the plan and require revision to the plan.
- Determine if any continual improvements, best practices or industry driven changes need to be incorporated into the plan.
- Re-evaluation of threats and risk (per Section 6 of this plan)
- Re-evaluation of A/A Actions and Implementation Schedules (per Table D-1 of this plan)
- Review the frequency of the measures to reduce risk (per Section 9 of this plan) Review performance measures and baseline measurements for completeness to ensure that all threats and risk are monitored.
- Review the effectiveness of the measures to reduce risk (per Section 9 of this plan) Modify the A/A Actions, Implementation Schedules, and/or measures to reduce risk and refine/improve as needed (per Section 9 of this plan)

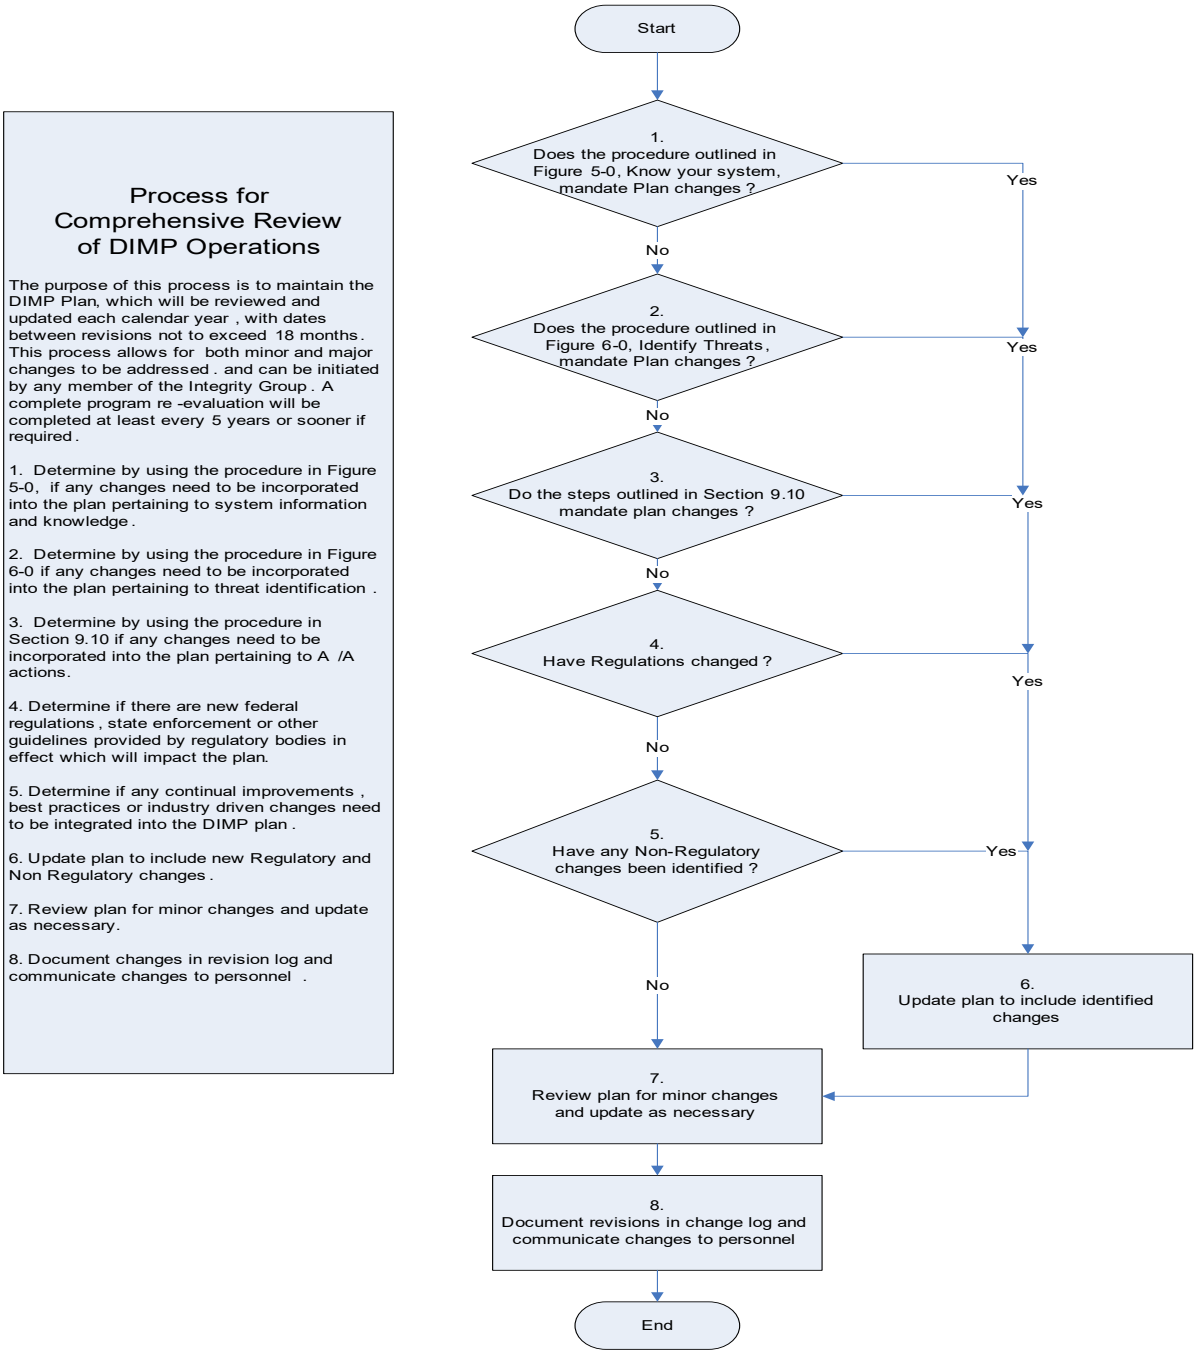
Review performance measures, their effectiveness, and if they are not appropriate, refine/improve (per Section 9 of this plan). NW Natural will maintain a record demonstrating that the plan review was performed even if no changes were made. All changes to the written plan, inclusive of material from the appendices, shall be recorded on the Revision Log in Appendix F.

However, changes to material in the appendices that is included by reference need not be recorded on the Revision Log.

NW Natural

Distribution Integrity Management Program
Program Plan

Figure 10-0 illustrates the procedure to review DIMP Operations.



10.2 Notification of Plan Changes

Plan changes that may impact other work groups shall be communicated to the appropriate operating personnel. Changes that may require internal communications include but are not limited to modifications to data captured in the field, operating procedures, new A/A actions and/or reporting requirements.

Local state regulatory agencies will be provided an updated plan once per calendar year with all other company O&M manuals as detailed in Section 11 of this plan.

11. REPORTING RESULTS

11.1 State & Federal Annual Reporting Requirements

The following five measures shall be reported, annually by March 15, to PHMSA as part of the annual report required by CFR 49, § 191.11 and submitted per SPO/SPW 003:

- Number of hazardous leaks either eliminated or repaired (or total number of leaks if all leaks are repaired when found), per § 192.703(c), categorized by cause
- Number of excavation damages
- Number of excavation tickets (receipt of information by NW Natural from the notification center)
- Total number of leaks either eliminated or repaired, categorized by cause
- Number of Hazardous leaks involved mechanical joint failure.

If a State exercises jurisdiction over the pipeline, these five measures shall also be reported to the State Pipeline Safety Authority in the State where the gas distribution pipeline is located. A copy of the reports shall be maintained in the Integrity Management files.

12. DOCUMENT AND RECORD RETENTION

The following records shall be retained in the DIMP files.

- The most current as well as prior versions of this written DIMP Plan
- Documents supporting Knowledge of Facilities (material supporting Appendix A of the DIMP Plan)
- Documents supporting threat identification(material supporting Appendix B of the DIMP Plan)
- Documents supporting risk evaluation and ranking (material supporting Appendix C of the DIMP Plan)
- Documents supporting the identification and implementation of measures to address risks (material supporting Appendix D of the DIMP Plan)
- Documents supporting measurement of performance, monitoring results and evaluating effectiveness (material supporting Appendix E of the DIMP Plan)
- Effectiveness Reviews (material supporting Appendix F of the DIMP Plan)
- Annual Reports to PHMSA (as required by §191.11) and State pipeline safety authorities
- Mechanical Fitting Failure Reports submitted between 2011 and 2020.

Documentation demonstrating compliance with the requirements of CFR 49, Part 192, Subpart P shall be retained for at least 10 years or longer per NW Natural's Document Retention Schedule.

APPENDIX A-2

Chapter 5.0

Knowledge of Facilities

Attributes list.

Attributes required for new Distribution Mains and Services.

1. Work Order ID
2. Project Number (if applicable)
3. Material
4. Installation Date
5. Nominal Diameter
6. Operating Pressure
7. Wall Thickness
8. Installation Method
9. Pipe Grade
10. Bonded Indicator (for CP system/if applicable)
11. Physical Location of Facility

Attributes required for new High Pressure Distribution Mains and Services.

1. Work Order ID
2. Project Number (if applicable)
3. Material
4. Installation Date
5. Nominal Diameter
6. Design Pressure
7. MAOP
8. Operating Pressure
9. Wall Thickness
10. Installation Method
11. Pipe Grade
12. Segment ID (if applicable)
13. Segment Name (if applicable)
14. Line name (if applicable)
15. Pressure Test Date*
16. Pressure Test Duration*
17. Pressure Test Min Pressure Actual*
18. Pressure Test Medium (Hydro, Nitro, Gas)*
19. Pressure Test #*
20. Physical Location of Facility

* For High pressure services pressure test information is verified, but not an attribute in GIS

APPENDIX D

Chapter 8.0

Identification and Implementation of Measures to Address Risks

NW Natural

Distribution Integrity Management Program
Program Plan

Table D-1: DIMP A/A Actions

Dimp A/A Actions

Threat	A/A Action	Implementation Schedule	Effectiveness Measure	Est. Completion Year
Corrosion				
Bare Steel	Replace all Bare Steel	Replace all known Bare Steel mains and svc's by 2015	A reduction in the number of open leaks reported annually. Also given the industry accepted best practice to remove bare steel from the system a measurement of miles of main and a count of services in service at year end with a goal of zero by 2015.	2015/ Completed
Sunshields	Remove Sunshields	Create and implement mitigation plan to remove all known shields through normal inspection	Reduce corrosion to risers within the NWN Distribution System.	2030
Inside Service Lines	Assement and repair of inside service lines	Perform baseline assessment of inside service lines in 2019	A remediation of corrosion on service lines located in buildings	2025
Natural Forces				
Land Movement	Specific mitigation plans for identified high risk active areas on land movement	Create and implement mitigation plan within one year of identifying high risk area	Maintain low (near zero) leak rate for natural force leaks as reported on PHMSA Annual Report.	

NW Natural

Distribution Integrity Management Program

Program Plan

Threat	A/A Action	Implementation Schedule	Effectiveness Measure	Est. Completion Year
Excavation Damage				
Damage Prevent Action	Actively reduce damages through training, education, and enforcement as implemented by Damage Prevention Team.	Continuous improvement	Measure of damages per 1000 locates.	
HP Dist Markers	Investigate the current state of pipeline markers on HP Dist. Pipelines and bring to current standards	Identify areas of concern and remediate high risk areas by end of 2013	Measure of damages per 1000 locates	2015/ Completed
Other Outside Forces Damage				
Meter Protection	Guard Posts	Install guard posts on new installations per company procedures. Continue program to identify areas of poor installation and bring to current standards.	Maintain low (near zero) leak rate for other outside force damage leaks as reported on PHMSA Annual Report.	
Regulator protection	District regulator Relocate	Relocate Dist reg. by end of 2014	History of vehicle damage to this facility, relocate to reduce risk.	2014
Threat	**A/A Action**	**Implementation Schedule**	**Effectiveness Measure**	**Est. Completion Year**

Material, Weld or Joint Failure				
Vintage Plastic	Replace ABS/Vintage services	Identify all likely locations by the end of 2011. Create replacement schedule by end of 2012.	A decrease of ABS services in service at years end as reported on Annual Report with a goal of zero.	2022/Completed
Service Tee Caps	Service Tee caps	Identify areas of increased service tee cap failure by end of 2012. Create monitoring and replacement program by end of 2013	A decrease in the number of Hazardous leaks associated with Material, Weld or Joint Failure.	Upon Discovery
In-effective Coating	Evaluate NWN known coatings	review and identify pipeline coating that could be in-effective or failing Future Project	Reduce the amount of in-effective coating with-in system.	Upon Discovery
Steel in Steel pipe	Evaluate NWN's known Steel in Steel piping.	review and identify piping that has been installed in steel casing. On going	Decrease issues that could arise from steel in steel installations.	2025
Dithiazine	Evaluate regulators that have the potential of being impacted by Dithiazine	Annual maintenance of district regulator stations.	Decrease issues on regulators where performance could be impacted by Dithiazine	Upon Discovery
Equipment Failure				
Coastal Riser Valves	Replace riser valve in Coastal areas that have had historic issues	Identify all likely problematic riser valves by end of 2015 and systematically replace.	A decrease in the number of Hazardous leaks associated with Equipment Failure.	
Difficult to Turn Valves	Reduce or replace valves that have operational issues.	review pipeline system and implement plan to repair or replace valves.	Reduce the number of valves in the system that are hard to operate by repairing or replacing. Increasing effectiveness of valves.	Upon Discovery
Wayne Manf. Risers	Replace risers manufactured by Wayne Manf.	review system installation records to reduce failing risers.	Reduce leaks associated with riser fails in the system	Upon Discovery

Class B to Class A Service Regulator Remediation	Remediation of existing Class B to Class A service regulators to NW Natural Standards	Review of the 62 Class B to Class A service regulators. Remove and rebuild these services as necessary to eliminate the regulator	Remove Class B to Class A service regulators to remove the threat of equipment failure on these regulators	2025
Incorrect Operations				
Facility Hazard	Sewer Cross Bores	Evaluate potential exposure of sewer cross bores and develop a plan to address risk by end of 2012.	Maintain low (near zero) leak rate for Incorrect Operations leaks as reported on the PHMSA Annual Report.	On going
Other				
Dwellings over Facilities	Build-Over's	Address and remediate Build-Over's as they are identified per General Procedure G42	A decrease in the number of Build-Over's.	Upon Discovery
Records	Digitize records	2014 - Digitize records to make more assessable by company personnel	Reduce time to locate records and installation documents	2015/Completed
Records	Convert records	2015 Convert records from retired software system to new data format and tool. 2015	Reduce inconsistencies with records and metadata associated reducing time to locate records.	2016/Completed
SIP Video	System Integri ty Awareness	Create a video to promote System Integrity awareness	Informational plan	2015/Completed
MAOPs separated by valves	Review system where MAOPs are separated by single valves	Eliminate valves between MAOPs outside of regulator stations	OPUC, GIS, Engineering Services, Gas Control, Compliance, Sys. Ops, Field Personnel	2028
Enhanced EFV Remediation	Installation of EFV on services installed prior to EFV Rule	Ongoing project to address services that were installed prior to EFV rule and install EFV a EFV valve on these services	Reduce the number services that do not have an EFV or curb valve.	On going
Idle Risers	Review and develop remediation strategies to protect/remove idle risers	Ongoing project to identify risers where the meter set has been removed (idle risers) and develop a strategy to remediate high risk idle risers	Reduce the number of idle risers	On going

Appendix D-2: Additional or Accelerated (A/A) Action Documentation Form

Additional or Accelerated (A/A) Action Documentation Form

Date:

Originator:

A/A Action:

DESCRIPTION OF A/A ACTION

THREAT(S) A/A ADDRESSES
List threats (per DOT Distribution Annual Report)

METHOD THREAT WAS IDENTIFIED
__ Risk Model
__ SME
__ Industry Identified Threat

CURRENT COMPLIANCE ACTIVITIES THAT ADDRESS THREAT
For example, leakage surveys, CP surveys, patrols…

DO CURRENT COMPLIANCE ACTIVITIES ADEQUATELY ADDRESSING THREAT
Explain how the A/A Action will improve system safety beyond the current compliance activities

DESCRIPTION OF LOCATION(S) THAT A/A WILL BE IMPLEMENTED
Give a detailed description of location(s) that will be covered by this A/A action.

WILL ADDITIONAL DATA NEED TO BE GATHERED?
List any additional data that will need to be gathered for the A/A action

PERFORMANCE METRIC
List performance metric or effectiveness measure

FUNDING
For example DIMP Capital or DIMP Bare, include appropriate accounting string.

IMPLEMENTATION DATE/DURATION
Start date: XX/XX/XXXX
Proposed completion date: XX/XX/XXXX

Chapter 9.0

Measure Performance, Monitor Results, and Evaluate Effectiveness

NW Natural

Distribution Integrity Management Program

Program Plan

Appendix E-1. Performance Measures for Code Requirements and A/A Actions.

Code Requirement or A/A Action	Performance Measure	Effectiveness Measure	Baseline Measurements
CFR 49 Part 192.1007(e)(1)(i)	Number of hazardous leaks either eliminated or repaired (or total number of leaks if all leaks are repaired when found), categorized by cause	Maintain a low or decreasing trend in the number of hazardous leaks either eliminated or repaired, categorized by cause on the PHMSA Annual Report	Per 2010 Annual Report • OR - Corrosion Hazardous Leaks - 6 • OR - Natural Forces Hazardous Leaks - 0 • OR - Excavation Damage Hazardous Leaks - 3 • OR - Other Outside Force Damage Hazardous Leaks - 0 • OR - Material or Welds Hazardous Leaks - 51 • OR - Equipment Hazardous Leaks - 0 • OR - Incorrect Operations Hazardous Leaks - 0 • OR - Other Hazardous Leaks - 1 • WA - Corrosion Hazardous Leaks - 0 • WA - Natural Forces Hazardous Leaks - 0 • WA - Excavation Damage Hazardous Leaks - 2 • WA - Other Outside Force Damage Hazardous Leaks - 0 • WA - Material or Welds Hazardous Leaks - 4 • WA - Equipment Hazardous Leaks - 0 • WA - Incorrect Operations Hazardous Leaks - 0 • WA - Other Hazardous Leaks - 0
CFR 49 Part 192.1007(e)(1)(ii)	Number of excavation damages	Maintain a low or decreasing trend in the number excavation damages, reported on the PHMSA Annual Report	Per 2010 Annual Report • OR - Excavation Damages - 499 • WA - Excavation Damages - 55
CFR 49 Part 192.1007(e)(1)(iii)	Number of excavation tickets (receipt of information by NW Natural from the notification center)	Maintain a low or decreasing trend in the measure of Damages per 1000 locates	Per 2010 Annual Report • OR – 499 damages on 159,342 locates = 3.1 damages/1000 locates • WA – 55 damages on 17,370 locates = 3.2 damages/1000 locates

CFR 49 Part 192.1007(e)(1)(iv)	Total number of leaks, either eliminated or repaired, categorized by cause	Maintain a low or decreasing trend in the total number of leaks either eliminated or repaired, categorized by cause in the PHMSA Annual Report	Per 2010 Annual Report • OR - Corrosion Leaks - 22 • OR - Natural Forces Leaks - 0 • OR - Excavation Damage Leaks - 402 • OR - Other Outside Force Damage Leaks - 0 • OR - Material or Welds Leaks - 220 • OR - Equipment Leaks - 0 • OR - Incorrect Operations Leaks - 0 • OR - Other Leaks - 11 • WA - Corrosion Leaks - 1 • WA - Natural Forces Leaks - 0 • WA - Excavation Damage Leaks - 47 • WA - Other Outside Force Damage Leaks - 0 • WA - Material or Welds Leaks - 8 • WA - Equipment Leaks - 0 • WA - Incorrect Operations Leaks - 0 • WA - Other Leaks - 0
CFR 49 Part 192.1007(e)(1)(v)	Number of hazardous leaks either eliminated or repaired (or total number of leaks if all leaks are repaired when found), categorized by material	Maintain a low or decreasing trend in the number of hazardous leaks either eliminated or repaired, categorized by material in the PHMSA Annual Report	Per 2010 HLR-M Report • OR - Hazardous Leaks on Coated Steel - 39 • OR - Hazardous Leaks on Poly – 38 • OR - Hazardous Leaks on Bare Steel – 5 • OR - Hazardous Leaks on ABS – 0 • WA - Hazardous Leaks on Coated Steel - 1 • WA - Hazardous Leaks on Poly – 4 • WA - Hazardous Leaks on Bare Steel – 0 • WA - Hazardous Leaks on ABS – 0
Replace Bare Steel	Number of known system leaks at end of year scheduled for repair	All known bare steel has been removed from the system, therefore this A/A Action is no longer measured. Should bare steel be discovered as a result of normal maintenance activies, the bare steel will be removed and DIMP team will determine if A/A needs to be reinstated.	Per 2010 Annual Report • OR - Bare Steel Main - 22 miles • OR - Bare Services - 167 • OR - Leaks Scheduled for Repair - 35 • WA - Bare Steel Main - 4 miles • WA - Bare Steel Services – 5 • WA - Leaks Scheduled for Repair - 2

Specific mitigation plans for identified high risk active areas on land movement	Number of leaks cause by natural forces	Maintain low (near zero) leak rate for natural force leaks as reported on PHMSA Annual Report.	Per 2010 Annual Report • OR – Natural Forces Leaks – 0 • WA – Natural Forces Leaks - 0
Actively reduce damages through training, education, and enforcement as implemented by Damage Prevention Team.	Measure of damages per 1000 locates	Maintain a low or decreasing trend in the measure of damages per 1000 locates.	Per 2010 Annual Report • OR – 499 damages on 159,342 locates = 3.1 damages/1000 locates • WA – 55 damages on 17,370 locates = 3.2 damages/1000 locates
Investigate the current state of pipeline markers on HP Dist. Pipelines and bring to current standards	Measure of damages per 1000 locates	Maintain a low or decreasing trend in the measure of damages per 1000 locates	Per 2011 Annual Report • OR – 536 damages on 153305 locates = 3.5 damages/1000 locates • WA – 67 damages on 16134 locates = 4.2 damages/1000 locates
Guard Posts	Number of leaks causes by Other Outside Forces	Maintain low (near zero) leak rate for other outside force damage leaks as reported on PHMSA Annual Report.	Per 2010 Annual Report • OR – Other Outside Force Leaks – 0 • WA – Other Outside Force Leaks - 0
Replace ABS services	Total number of ABS services	A count of ABS services in service at years end as reported on Annual Report with a goal of zero.	Per 2010 Annual Report • OR – 154 ABS services • WA – 5 ABS services
Service Tee caps	Number of hazardous leaks caused by Material or Weld Failure	A decrease in the number of Hazardous leaks associated with Material or Weld Failure.	Per 2010 Annual Report • OR – Material or Welds Hazardous Leaks – 0 • WA – Material or Welds Hazardous Leaks – 0
Replace riser valve in Coastal areas that have had historic issues	Number of hazardous leaks cause by Equipment Failure	A decrease in the number of Hazardous leaks associated with Equipment Failure.	Per 2011 Annual Report • OR – Hazardous Equipment Failure Leaks – 711 • WA – Hazardous Equipment Failure Leaks – 0
Sewer Cross Bores	Number of leaks cause by Incorrect Operations	Maintain low (near zero) leak rate for Incorrect Operations leaks.	Per 2010 Annual Report • OR- Incorrect Operations Leaks – 0 • WA – Incorrect Operations Leaks - 0

Proactive EFVs	Number of leaks caused by excavation damage	A decrease in the number of Hazardous leaks on services associated with excavation damage	Per 2020 Annual Report • OR- Excavation Damage Leaks - services – 285 • WA – Excavation Damage Leaks – services - 39
Sunshields	Number of leaks caused by corrosion	A decrease in the number of Hazardous leaks on services associated with corrosion	Per 2020 Annual Report • OR- Corrosion leaks – services - 5 • WA – Corrosion leaks - services - 0

ANNUAL REPORT FOR
CALENDAR YEAR 2010
GAS DISTRIBUTION SYSTEM

A federal agency may not conduct or sponsor, and a person is not required to respond to, nor shall a person be subject to a penalty for failure to comply with a collection of information subject to the requirements of the Paperwork Reduction Act unless that collection of information displays a current valid OMB Control Number. The OMB Control Number for this information collection is 2137-0522. Public reporting for this collection of information is estimated to be approximately 16 hours per response, including the time for reviewing instructions, gathering the data needed, and completing and reviewing the collection of information. All responses to this collection of information are mandatory. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to: Information Collection Clearance Officer, PHMSA, Office of Pipeline Safety (PHP-30) 1200 New Jersey Avenue, SE, Washington, D.C. 20590.

PART A - OPERATOR INFORMATION

NOTICE: This report is required by 49 CFR Part 191. Failure to report can result in a civil penalty not to exceed 100,000 for each violation for each day that such violation persists except that the maximum civil penalty shall not exceed $1,000,000 as provided in 49 USC 60122.		OMB NO: 2137-0522 EXPIRATION DATE: 01/31/2014
U.S Department of Transportation Pipeline and Hazardous Materials Safety Administration	**Form Type:**	INITIAL
	ID:	10155
	(DOT use only)	20120885-15943

ANNUAL REPORT FOR
CALENDAR YEAR 2011
GAS DISTRIBUTION SYSTEM

A federal agency may not conduct or sponsor, and a person is not required to respond to, nor shall a person be subject to a penalty for failure to comply with a collection of information subject to the requirements of the Paperwork Reduction Act unless that collection of information displays a current valid OMB Control Number. The OMB Control Number for this information collection is 2137-0522. Public reporting for this collection of information is estimated to be approximately 16 hours per response, including the time for reviewing instructions, gathering the data needed, and completing and reviewing the collection of information. All responses to this collection of information are mandatory. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to: Information Collection Clearance Officer, PHMSA, Office of Pipeline Safety (PHP-30) 1200 New Jersey Avenue, SE, Washington, D.C. 20590.

PART A - OPERATOR INFORMATION

1. Name of Operator	NORTHWEST NATURAL GAS CO
2. LOCATION OF OFFICE (WHERE ADDITIONAL INFORMATION MAY BE OBTAINED)	
2a. Street Address	220 N.W SECOND AVE
2b. City and County	PORTLAND,MULTNOMAH
2c. State	OR
2d. Zip Code	97209
3. OPERATOR'S 5 DIGIT IDENTIFICATION NUMBER	13840
4. HEADQUARTERS NAME & ADDRESS	
4a. Street Address	220 N. W. SECOND AVENUE
4b. City and County	PORTLAND,MULTNOMAH
4c. State	OR
4d. Zip Code	97209
5. STATE IN WHICH SYSTEM OPERATES	WA

Chapter 10.0

Periodic Evaluation and Improvement

Appendix F-1. Revision Log Distribution Integrity Management Program Plan

Date	Section	Rev	Primary Change	Approved
8/1/2011		**0**	Initial Document	JSK
9/5/2012	2.1	**1**	Changed Field Construction and Maintenance Manual to Field Operations Manual	JSK
9/5/2012	3.1	**1**	Updated IMP org chart	JSK
9/5/2012	4	**1**	Updated definition of SME	JSK
9/5/2012	5.0, Fig 5-0	**1**	Updated flowchart for clarity	JSK
9/5/2012	New section 5.2	**1**	Added new section 5.2 titled Missing Data	JSK
9/5/2012	Old section 5.2	**1**	Old Section “5.2 Review” renamed “5.3 Review” and flowchart moved to Chapter 10 with other plan review language.	JSK
9/5/2012	Old section 5.3	**1**	Renumbered section 5.4. Updated CFM reference to new FOM reference.	JSK
9/5/2012	6.0, Figure 6-0	**1**	Updated flow chart to correct errors and clarify process.	JSK
9/5/2012	6.6.3	**1**	Clarified language regarding ABS services	JSK
9/5/2012	8.0, Figure 8-0	**1**	Corrected errors in flow chart.	JSK
9/5/2012	8.1.3	**1**	Added A/A action Investigate condition of marker posts on HP dist. Pipe in Class 1 and 2 locations.	JSK
9/5/2012	8.1.6	**1**	Added A/A action to replace riser valves in coastal locations	JSK
9/5/2012	8.1.8	**1**	Added new section 8.1.8 A/A action documentation.	JSK
9/5/2012	9	**1**	Added reference to SPO/SPW 003 pertaining to the Annual Report	JSK
9/5/2012	9.7	**1**	Added new section 9.7 for monitoring performance measures and effectiveness review. Moved some language from old section 10.2 to new section 9.7.	JSK
9/5/2012	10.1	**1**	Updated section to include all components mentioned in FAQ C.4.f.2. Updated flowchart (old chart 5-1) to match.	JSK

9/5/2012	Old section 10.2	**1**	Section removed. Pertinent components moved to new section 9.7	JSK
9/5/2012	New section 10.2	**1**	New section 10.2 added “Notification of plan Changes”	JSK
9/5/2012	New section 11.2	**1**	Added new section 11.2 to outline procedure for collecting and submitting data for Mechanical Fitting Failure Report.	JSK
9/5/2012	Appendix D-1	**1**	Added A/A action to investigate and remediate marker posts on HP Dist. Pipelines	JSK
9/5/2012	Appendix D-1	**1**	Added A/A action to investigate and replace problematic riser valves installed in coastal locations	JSK
9/5/2012	New Appendix D-2	**1**	Added new A/A Action documentation form	JSK
9/5/2012	Old Appendix D-2	**1**	Renamed former Appendix D-2 to Appendix D-3. Added information from 2011 Annual Report.	JSK
9/5/2012	Appendix E-1	**1**	Added 2011 Distribution Annual Report - Oregon	JSK
9/5/2012	Appendix E-2	**1**	Added 2011 Distribution Annual Report - Washington	JSK
9/5/2012	Appendix E-3	**1**	Updated table	JSK
10/8/2012	3.1	**2**	Updated Org Chart	JSK
10/8/2012	5	**2**	Updated plan revision timing to once per calendar year	JSK
10/8/2012	5.2	**2**	Updated language to mention initial review of pipe data and reference Appendix A-3	JSK
10/8/2012	5.2	**2**	Updated language to mention no need to actively research missing or insufficient data	JSK
10/8/2012	5.2	**2**	Added reference to Mapframe help document for plat corrections.	JSK
10/8/2012	5.4	**2**	Added language about using paper as-built’s for large projects.	JSK
10/8/2012	Figure 6-0	**2**	Updated flowchart for clarity	JSK
10/8/2012	6.3.1	**2**	Updated language concerning seismic risk to system	JSK

10/8/2012	6.3.4	**2**	Updated language about Natural forces not considered a threat.	JSK
10/8/2012	6.8.1	**2**	Added section 6.8.1 Build-overs	JSK
10/8/2012	7.5	**2**	Changed Risk model review to annual	JSK
10/8/2012	8.1.5/8.1.6	**2**	Moved Service Tee Cap A/A action to Material, Weld or Joint Failure from Equipment Failure	JSK
10/8/2012	9	**2**	Updated list of Performance measures listed	JSK
10/8/2012	9.5	**2**	Updated language on tracking Hazardous leaks by material	JSK
10/8/2012	New 9.6	**2**	Added Known system leaks at end of year scheduled for repair as a performance measurement	JSK
10/8/2012	New 9.7	**2**	Added Number of ABS services in system at end of year as a performance measure	JSK
10/8/2012	New 9.9	**2**	Added section 9.9 Effectiveness Measures to define how the performance measures are evaluated	JSK
10/8/2012	9.1	**2**	Changed effectiveness review from periodic to annual	JSK
10/8/2012	10.1	**2**	Updated plan review language and changed review timeline from periodic to once per calendar year. Updated bullets to match flowchart 10-0	JSK
10/8/2012	Appendix A-2	**2**	Added new appendix A-2 that lists all the attributes that are collected on newly constructed facilities in GIS	JSK
10/8/2012	Appendix A-3	**2**	Added new appendix A-3 that evaluates the amount of missing data in the GIS system	JSK
10/8/2012	Appendix C-3	**2**	Updated for clarity	JSK
10/8/2012	Appendix D-1	**2**	Renamed Performance Measure to Effectiveness Measure	JSK
10/8/2012	Appendix E-1	**2**	Added new Appendix E-1 to record baseline for all performance measures	JSK
10/8/2012	Appendix E	**2**	Renumbered remaining appendices in E to account for the new E-1	JSK

10/8/2012	Appendix E-4	**2**	Renamed to report hazardous leaks by material	JSK
10/24/2012	New 9.6	**3**	Added Number of Miles of Bare Steel Main in the System at End of Year as a Performance Measure	JSK
10/24/2012	New 9.7	**3**	Added Number of Bare Steel Services in the System at End of Year as a Performance Measure	JSK
11/1/2012	3.1 Table 1	**3**	Updated IMP Org Chart	JSK
11/1/2012	6.7.3	**3**	Modified language of Mechanical fitting failures to remove frost heave as a failure mechanism. Added language that icing from pressure cut may cause a failure. Also added language that mechanical fitting failure may be classified as Natural Forces or Excavation Damage depending on root cause of failure.	JSK
11/1/2012	5.4	**3**	Added language that newly installed pipe must meet the requirements of Engineering Standard 27-001, and Engineering Specification 003 and 004.	JSK
11/5/2012	7.4	**3**	Added validation process for DIMP Risk Model	JSK
4/1/2013	Entire Document	**4**	Revision Date to 3.1 and updated documents date. Spelling and other minor corrections are not individually noted.	RRT
4/1/2013	5.2	**4**	Changed reference from Mapframe help document to Fieldsmart User's Guide	RRT
4/1/2013	6.1.1	**4**	Updated reference from 6.3 to 6.1.2 regarding SME approach to threat identification.	RRT
4/1/2013	6.1.3	**4**	Simplified reference to NTSB website. Web links in the DIMP plan were broken. "Reports may be found at: http://www.ntsb.gov/Publictn/P_Acc.htm; Recommendation Letters may be found at: http://www.ntsb.gov/recs/letters/". Changed to read…	RRT

			"Reports and recommendation letters may be found at: http://www.ntsb.gov"	
4/1/2013	6.6.6	**4**	Removed reference to Aldyl-A from this section	RRT
4/1/2013	6.6.7	**4**	Added section to reference to Aldyl-A	RRT
4/1/2013	8.1.5	**4**	Added "Vintage Plastic Replacement" and "Aldyl-A" to material replacement list.	RRT
4/1/2013	8.1.8	**4**	Added Section 8.1.8 to address Build-Over's as an A/A.	RRT
4/1/2013	8.1.8	**4**	Renumbered 8.1.8 to 8.1.9 to accommodate "Other" threats after Build-Overs were added as an A/A.	RRT
4/1/2013	9	**4**	Changed "ABS services" to "Vintage Plastic" per change to section 8.1.5	RRT
4/1/2013	Appendix D Table D-1	**4**	Added Build-Over's to list of DIMP A/A.	RRT
4/1/2014	Entire document	**5**	Miscellaneous spelling and grammar	RRT
4/1/2014	1	**5**	Updated customer count 600,000 to 695,000	RRT
4/1/2014	Table 1	**5**	Updated Org Chart	RRT
4/1/2014	5.1.2	**5**	Updated vendor name "GL" to "DNV GL"	RRT
4/1/2014	5.1.2	**5**	Change "imported" to "referenced" to reflect actual practice.	RRT
4/1/2014	5.1.3	**5**	Added information regarding implementation of ERV (Engineering Records Viewer)	RRT
4/1/2014	5.1.5	**5**	Re-worded to clarify PragmaCAD's role	RRT
4/1/2014	5.4	**5**	Changed reference to Engineering Specifications "004" to MTS-003" and "003" to MTS-001"	RRT
4/1/2014	6.2.2	**5**	Changed "NW Natural is aware of one area where…" to "NW Natural is aware of areas where…"	RRT
4/1/2014	6.2.3	**5**	Changed "(paint)" to "(epoxy/paint)" in the 3rd paragraph.	RRT

4/1/2014	6.6.7	**5**	Added sentence “All know Aldyl A services were removed from NW Natural’s system in 2013.” To the end of the paragraph.	RRT
4/1/2014	8.2.4	**5**	Changed “Advantica” to “DNV-GL Essentials” to reflect proper name of product.	RRT
4/1/2014	Appendix D-3	**5**	Updated performance metrics with 2012 and 2013 data.	RRT
3/31/2015	All sections	**6**	Updated dates and footer information to reflect annual review	RRT
3/31/2015	1	**6**	Updated customer count to 700,000	RRT
3/31/2015	3.1.2	**6**	Changed “Integrity Management Supervisor” to “ Manager of System Integrity” to reflect current organizational structure.	RRT
3/31/2015	Table 1	**6**	Changed titles in IMP Organizational Chart to reflect organizational structure and retirement of Bruce Paskett	RRT
3/31/2015	Section 5.1.2	**6**	Updated name of vendor “(Essentials by Advantica/DNV-GL)” modified to “(Essentials by DNV-GL)”	RRT
3/31/2015	Section 5.1.3	**6**	Replaced references to “FileNet” with “ERV”.	RRT
3/31/2015	Section 5.1.3	**6**	Removed “a digital record database”. Currently records are stored in a shared drive and ERV is used to retrieve information using meta-data.	RRT
3/31/2015	Section 6.8.2	**6**	Last sentence of this section was added to describe the implementation of the sewer cross bore program in 2013.	RRT
3/31/2015	Section 8.1.7	**6**	Removed “and develop a plan” from first bullet point. The plan was developed in 2013.	RRT
3/31/2015	Table D-1	**6**	In the row pertaining to “Corrosion” the completion date of bare steel replacement was changed from 2021 to 2015 to reflect revised agreement with OPUC to accelerate bare steel replacement.	RRT

3/23/2016	All sections	**7**	Updated dates and footer information to reflect annual review	CAW
3/23/2016	1	**7**	Changed over 700k to approximately	CAW
3/23/2016	Table 1	**7**	Removed Andrea Kuehnel from Chart	CAW

August 29, 2025

DIRECT TESTIMONY OF WAYNE K. PIPES

Table of Contents

I. Introduction and Summary 2

II. Discussion of Projects Included in this Case 4

A. The Dalles Resource Center Project 4

B. Security Upgrades 11

II. List of Exhibits 17

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position at Northwest Natural Gas Company ("NW Natural" or "the Company").

A. My name is Wayne K. Pipes. I am the Director of Facilities, Security and Emergency Management for NW Natural. I am responsible for facilities, real estate, security and emergency management activities for NW Natural, which includes planning and management of real estate, construction, capital projects, maintenance, and security and emergency management for NW Natural's facilities.

Q. Please summarize your educational background and business experience.

A. I have over 38 years of facilities management and construction experience. I have been employed at NW Natural since 2014. Before assuming my current position at NW Natural in 2014, I worked for New Seasons for a year as Director of Design, Construction, and Facilities Management. I also worked for Knowledge Universe for 15 years as Vice President of Facilities and Development, and for Red Lion Hotels for 17 years as Senior Director of Facilities Management.

Q. What is the purpose of your testimony?

A. The primary purpose of my testimony is to describe major facilities projects that are included in this rate case. Specifically, I will discuss The Dalles Resource Center ("The Dalles RC") and physical security upgrades the Company is undertaking at various sites.

Q. Please provide a summary of your testimony.

A. I will discuss the major facilities projects included in this rate case. These projects will enhance security and improve The Dalles RC, which will increase functionality and

support ongoing safe and efficient operations. A summary of the projects is below:

- The Dalles Resource Center – As part of the Company's on-going facilities strategy, NW Natural will be relocating The Dalles RC to a new location in The Dalles, Oregon. I give an overview of The Dalles RC Project and why the Company is replacing the current facility (i.e., the current facility/site is too small and does not include the NW Natural standard equipment and functionality that is required for efficient and safe operations). I also discuss the purchase of a new piece of land to build the new facility. The land purchase will occur in 2025, and The Dalles RC Project will be complete in October 2026.
- Security Enhancements - NW Natural is making physical security enhancements at its facilities and field infrastructure through a multi-year effort. Enhanced physical security is necessary in response to increasing threats to facilities and direction from the United States Department of Homeland Security's Transportation Security Administration ("TSA") about those threats. These annual enhancements will continue and should be completed in 2028.

Q. Have you prepared exhibits to accompany your testimony?

A. Yes. The exhibits to my testimony are:

- Exh. WKP-2 – KPFF Report – The Dalles Resource Center
- Exh. WKP-3 – The Dalles Resource Center Alternatives Analysis
- Exh. WKP-4 – Cushman & Wakefield Report
- Exh. WKP-5 – Physical Security Enhancements Alternatives Analysis
- Exh. WKP-6C – 2022 RFP Site Security Upgrades Summary

- Exh. WKP-7 – 2018 Pipeline Security Guidelines
- Exh. WKP-8 – TSA Directives 2021-01E and 2021-02F

II. DISCUSSION OF PROJECTS INCLUDED IN THIS CASE

A. The Dalles Resource Center Project

Q. Please provide an overview of the existing resource center in The Dalles and the operations there.

A. NW Natural operates a resource center in The Dalles, Oregon, which is essential for supporting the delivery of safe and reliable service across Klickitat and Skamania Counties in Washington as well as Hood River and Wasco Counties in Oregon. NW Natural currently leases this property, and the lease expires at the end of 2026. The leased area is one-half acre and includes a prefabricated steel building. The building consists of a single-story 65-foot by 40-foot garage, a 19-foot by 40-foot ground-floor office, and a 19-foot by 40-foot mezzanine office above the ground floor, totaling about 4,100 square feet. The site also features a microwave tower. Ten employees work from this site, representing Customer Field Services, Construction, Emergency Response, and Community Affairs.

The services provided out of this location include customer field services, construction, transmission maintenance, leakage inspection, system operations, and field engineering. The facility also provides materials and equipment storage.

Q. Why is The Dalles Resource Center Project necessary?

A. The Dalles RC Project is necessary for several reasons. First, as mentioned above, the lease is expiring in December 2026. NW Natural's standard procedure in these situations is to evaluate whether the Company could potentially extend the lease or if

other alternatives, such as relocation, should be considered. This evaluation occurred during the period 2018-2020, at the end of which the best path forward identified was relocation. The current site (half acre) has become wholly inadequate and the daily operations at this location have simply outgrown the site. The evaluation determined that approximately 2.5 acres are needed for efficient ongoing and future operational functionality.

Second, the office building lacks current standard NW Natural functionality. It does not have a conference room, a write-up room, a drying room, or changing room and showers, and the kitchen is inadequate. The existing site is too small to support current operational needs like a vehicle fueling system, pipe storage, truck scale, truck and equipment wash system and a decant system. The site also lacks and cannot accommodate sufficient indoor covered storage for Company tools and materials, or enclosed parking for specialty equipment, to protect it from the environment. The site also lacks space to accommodate adequately sized storage bins for rocks and sand. The absence of a decant system means employees must drive 23 miles one way (1.5-hour round trip) to dispose of wet spoils. Similarly, the lack of a covered spoils bin requires employees to drive five miles one way (20-minute round trip) to dispose of dry spoils. NW Natural must relocate to a new site because it cannot overcome size constraints in the existing facility to adequately provide for these functional operational improvements.

Third, a seismic assessment of the metal building was completed in 2016 by KPFF Engineering (Exh. WKP-2) and concluded that the building does not meet current life-safety building codes, raising concerns about employee safety and the

ability to operate after a seismic event. Additionally, the lack of onsite fueling could hinder NW Natural's response capabilities during a major natural disaster.

In sum, The Dalles RC Project is necessary because the current lease is expiring, the existing site lacked seismic resiliency, and the buildings and site are too small to accommodate required operations functionality and to enhance efficiency and employee safety.

Q. What alternatives did the Company consider before selecting The Dalles Resource Center land?

A. The Company considered several alternatives as summarized in Exh. WKP-3. The Company's broker, Cushman & Wakefield, conducted an extensive two-year search and evaluated several properties, and the site of the new The Dalles RC was the only available property that met the Company's requirements for an adequately sized space in an appropriately zoned area. The new property is large enough to accommodate the Company's new purpose-built building and necessary equipment and vehicle storage. The property was also desirable because it was the lowest cost and carried lower risk for zoning approval. The Cushman and Wakefield Report is provided as Exh. WKP-4.

Q. What steps did the Company take after selecting The Dalles site?

A. The Company enlisted the help of various consultants to conduct due diligence on the potential new site that included site design; civil and geotechnical engineering; environmental evaluation; construction estimating; planning, zoning, and construction evaluation; and engagement with The Dalles Planning Department. The Company

determined based on its due diligence that the new site would meet current requirements for a resource center.

Q. How is The Dalles Resource Center Project important to the Company's business continuity planning?

A. The Dalles RC is the Company's only facility in the Columbia Gorge. The resource center is essential to the Company's ability to perform basic utility functions and serves as a center for Company regional emergency response. The Dalles RC project will increase Company emergency response readiness by providing a new facility that will be operational following a major seismic event. Additionally, NW Natural will install a fueling station that will be available for Company use during emergencies that could impact retail fueling stations.

Q. Please describe the scope of The Dalles Resource Center Project.

A. The Company will construct and move into a new facility on the newly purchased site. The new facility will include an office building and warehouse that will be designed to be operational following a significant seismic event. The new facility will also provide various yard support infrastructure, including a covered pipe storage shed, enclosed specialty equipment storage garage attached to the pipe storage building, a spoils and decant system shed, a fuel tank within a fueling canopy, and a truck wash room that includes a Landa unit for separating oil from water.

The project will also include basic general site improvements like landscaping, yard lighting, parking area striping and bollard installation, fencing, and motorized driveway gates, and the Company will construct the building with necessary features like HVAC, plumbing, and mechanical systems and furniture.

Q. Please describe the office building and warehouse the Company will construct at The Dalles Resource Center.

A. The Company will construct both an office building and a warehouse designed to be operational following a significant seismic event. The office building will include offices, a write-up room, a non-commercial galley, locker rooms with showers, a drying room, and a data room. The Company will utilize the warehouse to store the various tools and equipment necessary to support operations at The Dalles RC.

Q. Please explain why the Company needs the various outbuildings and equipment at The Dalles Resource Center.

A. The functionality of The Dalles RC aligns with the functionality of NW Natural's resource centers across its service territory to support Company operations, safety, and resiliency objectives. I also explained the need for each of these structures, systems, and pieces of equipment in my testimony in docket UG-200994 (Exh. WKP-1CT, page 5, lines 11-15) for the updated and retrofitted Vancouver Resource Center where I state that NW Natural:

> " . . . will address improvements to the yard, including construction of outbuildings to provide for needed storage, covered spoils bins, specialty equipment garage, decant system, vehicle fueling station, truck wash booth and equipment, and site work, including paving, lighting and fencing."

I provide the following additional detail for each of the site features described above.

Q. Why is the covered pipe storage needed?

A. There is no existing covered storage space at The Dalles Resource Center for pipes and special equipment. Because the Company's pipes require protection from ultraviolet ("UV") light, the Company has had to use tarps to provide UV protection, which may

increase the risk of injury to NW Natural personnel when removing and tarping polyethylene pipe.

Q. How will the Company use the specialty equipment garage?

A. During freezing weather, critical equipment has been stored in the mechanic garage area at night and then removed in the morning to allow mechanics to utilize the garage. The specialty equipment garage will provide heated storage space and a permanent home for temperature sensitive equipment such as the vacuum truck and vapor extraction unit.

Q. Why did NW Natural decide to install a fueling station?

A. The fueling station will improve productivity by allowing employees to fuel their vehicles and equipment while on site at the beginning and end of their shifts, without having to rely on driving to retail gas stations. Additionally, as I discussed above, the fueling station will support the Company's business continuity objectives by providing an independent on-site fuel source in the event of a major disaster limiting access to retail fueling sources.

Q. What is the decant system and why is it important to NW Natural's The Dalles operations?

A. The decant system is used to remove liquids from soils removed during excavation work (also called "spoils") completed by utility operations. The liquids are removed by placing the soil in the decant system, which is a sloped containment bin that enables liquids to separate from the soil by allowing settling of the heavier solid materials and evaporation and draining of the liquids.

The decant system is important to NW Natural's The Dalles field operations because disposal of spoils is required to support the Company's construction projects—including large capital projects, system reinforcement projects, main extensions, new service installations, customer relocates, and cut and abandons—that involve vacuum excavation and horizontal directional drilling operations. Environmental compliance requirements are continuing to reduce the availability for disposal sites, and as a result, sites accepting spoils are overcrowded with vehicles and pose safety concerns for the Company's employees when entering sites, during spoil disposal, and exiting sites. Additionally, due to the limited availability of sites accepting spoils, NW Natural has often needed to haul spoils to far away alternate locations, which is an inefficient use of resources in terms of both fuel and employee time. Due to the above issues, NW Natural is planning to install these systems at all resource centers over the next several years.

Q. How are the spoils bins used in the Company's operations?

A. The spoils bins are used for storage of sand and gravel, which is used for fill material in construction, and are also used for storage of material removed during excavation activities, which may include soils, asphalt, and other materials. These materials are stored on site in the spoils bins on an ongoing basis and then hauled off to a disposal site in larger quantities for efficiency.

Q. Why is the truck scale needed?

A. The truck scale is a safety measure to ensure that NW Natural's trucks and trailers meet applicable weight limitations to avoid overloading with equipment and materials.

Q. Why is the truck wash needed?

A. The truck wash system is used for cleaning all vehicles and equipment used at The Dalles Resource Center, which includes dump trucks, backhoes, trailers, specialty equipment, pickup trucks, and service vans. Keeping this equipment clean improves safety by ensuring equipment can be inspected properly prior to use, and helps maintain the equipment and extends its life expectancy.

Q. What is the timing associated with The Dalles Resource Center Project?

A. The Company expects to purchase the new property in September 2025. The Company is in the early stages of designing the new facility and expects to complete The Dalles RC and place it into service in October 2026, in Rate Year 1.

Q. What will the Company do to maintain service between the time it vacates the existing facility and when it starts utilizing the new The Dalles Resource Center?

A. The Company will continue to occupy its existing facilities until the new The Dalles RC is completed. The lease at the existing property expires on December 31, 2026.

Q. Please describe the Company's proposal for cost recovery for The Dalles Resource Center Project.

A. The Company is seeking to include $17.6 million as an addition to rate base, or $4.4 million on a Washington-allocated basis. The allocation is based on the number of customers served by The Dalles Resource Center in Washington versus Oregon.

B. Security Upgrades

Q. Please summarize the security upgrades NW Natural is undertaking.

A. In response to increasing threats and new direction from TSA, NW Natural is undertaking a comprehensive, multi-year effort to enhance the physical security at the

Company's facilities and field infrastructure. The initial phase of this effort included a pilot program to complete upgrades at five high-priority sites in 2023.

After the pilot concluded, NW Natural began implementing security upgrades more broadly in 2024. The Company anticipates completing multiple sites per year over the next three or four years. I have included Exh. WKP-5, the alternative analysis for the Physical Security Upgrades completed in December 2024. Currently, NW Natural anticipates that all security upgrades will be completed by 2028.

Q. How did NW Natural determine that security upgrades are necessary?

A. A variety of emerging threats and new requirements over the last six years have led NW Natural to evaluate and prioritize physical security upgrades. The Company began working on a physical security strategy and roadmap in 2017 to address issues of employee and public safety posed by potential security breaches. The first step in this process was to document all physical security apparatuses associated with Company facilities and identify potential risks. To aid in this effort, NW Natural engaged a consulting firm, CH2M, in 2017 to develop a criticality ranking and asset protection recommendations. With input from NW Natural subject matter experts, CH2M completed the criticality ranking of the Company's facilities and field infrastructure in early 2018.

In March 2018, TSA—the federal agency that oversees pipeline safety—issued pipeline security guidelines that contained recommendations regarding assessing the risks of and implementing site-specific security measures at both critical and non-

critical facilities.[1] See Exh. WKP-7. The TSA updated these guidelines in 2021, creating a mechanism for designating "critical" facilities to ensure these sites have sufficient security to avoid service disruptions to important infrastructure and to the public at large.

Following the May 2021 ransomware attack on the Colonial Pipeline, TSA issued several directives mandating cybersecurity measures. See Exh. WKP-8. One way that these directives enhance cybersecurity is by addressing physical security, because TSA recognized that unauthorized access to physical facilities could enable a bad actor to obtain access to cyber systems. Along with the pipeline security guidelines, the cybersecurity directives related to physical security highlighted the importance of NW Natural's ongoing efforts to strengthen physical security and the need to accelerate and expand those efforts.

In June 2022, TSA conducted an audit of several NW Natural sites classified as "critical" infrastructure, and the TSA audit recommendations also informed the Company's planned upgrades during the pilot and at other sites.

Finally, the United States in general has seen a recent uptick in attacks on the energy system, including intentional destruction of critical infrastructure, and the Company has experienced a number of break-ins and theft at the Company's resource centers. For all these reasons, NW Natural decided to address physical security upgrades in a comprehensive way—first by pursuing the pilot and then the broader program.

[1] Transportation Security Administration, *Pipeline Security Guidelines* (March 2018; updated April 2021), *available at* https://www.tsa.gov/sites/default/files/pipeline_security_guidelines.pdf.

Q. Please provide additional detail regarding the pilot program.

A. NW Natural designed the pilot program to help the Company refine its choice of technology/equipment, procurement strategy, quality assurance, risk management, cost estimates, and efficient execution of security upgrades. In particular, the pilot was designed so the Company could improve its knowledge of costs, supply chain issues, and equipment that may need long lead time; test various price breaks for purchasing materials needed in bulk; and identify efficiencies from conducting upgrades at multiple sites or along with unrelated projects at specific sites.

The Company's facilities and field infrastructure include more than 1,200 sites, and because security upgrades can be costly, it is not feasible to complete every recommended upgrade at each site. Instead, the pilot included more limited upgrades at each site—for example, installing an anti-climb attachment to an existing fence rather than installing an entirely new anti-climb fence; using automated fence monitoring that can sense human movement; employing uncuttable fencing materials; and using key cards along with security codes for access to sensitive information. Following the pilot, NW Natural evaluated the general contractor, Essex Construction, that implemented the pilot and overall project implementation to determine the most efficient and effective approach to security upgrades more broadly. The Company's post-pilot focus is on choosing durable materials and mechanisms that result in stronger physical and cyber security.

Q. Who is the general contractor for the broader security upgrade program, and how did NW Natural select them?

A. The general contractor is Essex Construction, and NW Natural selected them through a request for proposals process in which they achieved the highest score and were the lowest cost. Essex Construction has experience working with other utilities in this type of work. A summary of the Request for Proposals is included as confidential Exh. WKP-6C.

Q. Please provide specific examples of the types of security upgrades that will be undertaken at program sites.

A. The scope varies from site to site and can include one or more of the following: New fencing, anti-climb fencing, lighting, video surveillance systems, intelligent intrusion detection systems, enhanced gates, gate alarms, and/or radar stations and signage. The list of NW Natural sites requiring physical security upgrades in Washington comprises primarily of telemetry sites, district regulator stations, and gate stations.

Q. How will the security upgrades provide benefits?

A. Security upgrades provide several benefits: They improve customer and employee safety; protect property, plant and equipment; and improve cyber security at locations that are connected to the Company's gas control system. They also ensure NW Natural is compliant with requirements from regulators—specifically the TSA. And, they help ensure the Company's system can continue providing safe and reliable service to customers without interruption.

Q. What is the Company's current forecasted cost for the security upgrades?

A. The Company estimates it will complete an additional $2.5 million in upgrades annually from 2025 through 2028. This equates to approximately $375 thousand annually on a Washington-allocated basis.

Q. What is the Company's anticipated timing for these projects?

A. Various sites are completed each year, and the Company is anticipating the work to be completed in 2028.

Q. Does this conclude your Direct Testimony?

A. Yes.

Appendix ASCE 41-13 Summary Data Sheet & Checklists

Introduction

This report is to summarize the findings of our seismic evaluation of the NW Natural The Dalles Service Center located at 1125 Bargeway Road, The Dalles, OR. The evaluation was performed using the procedures of ASCE 41-13 "Seismic Evaluation and Retrofit of Existing Buildings." Please note that this evaluation only relates to the seismic performance of the structure. It does not address issues related to gravity framing.

Scope and Intent

KPFF Consulting Engineers was contracted to perform a Tier 1 seismic evaluation of the NW Natural The Dalles Service Center located in The Dalles, Oregon. This evaluation is based on a site visit that was completed on May 3, 2016, and upon the procedures of ASCE 41-13 "Seismic Evaluation and Retrofit of Existing Buildings." The intent of the evaluation is to determine if the structure meets the acceptance criteria of the Basic Performance Objective for Existing Buildings (BPOE). For this evaluation, the building was considered a Risk Category II building (i.e. a standard building occupancy) as defined by the International Building Code and the Oregon Structural Specialty Code. Therefore, the BPOE requires meeting the Life Safety Structural Performance level at the BSE-1E seismic hazard level, and the Life Safety Nonstructural Performance level also at the BSE-1E seismic hazard level. The City of Portland, chapter 24.85, stipulates that the BSE-1E seismic hazard level shall not be taken as less than 75 percent of the BSE-1N seismic hazard level. This City of Portland requirement is being applied to all NW Natural evaluations as to provide a consistent evaluation process across all locations. Life Safety, BSE-1E, and BSE-1N are defined as follows:

- Life Safety is a structural performance level in which a structure has significantly damaged components but retains a margin against the onset of partial or total collapse. It is possible that the structure will be damaged to the extent that it is not practical to repair and re-occupy the building.

- BSE-1E is a seismic hazard level that represents an earthquake that has a probability of exceedance of 20% in a 50 year period. This can also be thought of as an earthquake that is not expected to be exceeded in a 225 year return period.

- BSE-1N is two thirds of a seismic hazard level that represents an earthquake that has a probability of exceedance of 2% in a 50 year period multiplied by a risk coefficient. This can also be thought of as two thirds of the ground acceleration of an earthquake that is not expected to be exceeded in a 2,475 year return period.

Site and Building Data

The NW Natural The Dalles Service Center is an existing pre-engineered and prefabricated steel building, located at 1125 Bargeway Road, in The Dalles, Oregon. The original construction date is unknown. The overall building measures approximately 84 feet in the

northeast-southwest direction by 40 feet in the northwest-southeast direction. It consists of a single story 65-foot by 40-foot garage, a 19-foot by 40-foot ground floor office, and a 19-foot by 40-foot mezzanine office (above the ground floor office). The combined building is approximately 4,100 square feet.

The roof structure consists of corrugated metal roofing that spans between cold-formed metal joists. The joists span between transverse steel frames, and the frames are bolted to the slab/foundation. The lateral force resisting system in the northeast-southwest direction consists of metal roof decking and diagonal roof bracing, which transfer load to the transverse frames via bolted connections, and bolted connections transfer the load from the frames into wall diagonal bracing, and these diagonals are bolted to the base of the frames that are bolted to the slab/foundation. The lateral force resisting system in the northwest-southeast direction consists of metal roof decking and diagonal roof bracing, which transfer load to the transvers frames, and the frames are bolted to the slab/foundation.

List of Criteria Used for Analysis

A geotechnical investigation was not performed for this evaluation. It was assumed that classification of the soils at the site as Site Class D and the following ground motions were used for the analysis:

Parameter	Value	Comments
$S_{X1,\ BSE\text{-}1E}$	0.157 g	Design spectral response acceleration parameter at 1 second for the BSE-1E seismic hazard level.
$S_{XS,\ BSE\text{-}1N}$	0.458 g	Design short-period (0.2 seconds) spectral response acceleration parameter for the BSE-1N seismic hazard Level.
T	0.217 s	Building fundamental period, as defined in Section 4.5.2.4.
S_a	0.343 g	Response spectral acceleration parameter. S_a = minimum($S_{X1,\ BSE\text{-}1E}$ / T, 0.75$S_{XS,\ BSE\text{-}1N}$)

The Level of Seismicity for the structure is therefore considered to be “High” as defined by Section 2.5 of ASCE 41. Please reference the full summary of the evaluation assumptions listed in the appendix.

Findings

The building was evaluated using the Tier 1 checklists, including the “Life Safety Non-structural Checklist,” as required in Section 4.4 of ASCE 41-13. The building in its existing condition does not meet the requirements of the Basic Performance Objective for Existing Buildings (i.e. Life Safety structural performance at three-quarters of BSE-1N seismic hazard level, as amended by the City of Portland Chapter 24.85). The following table summarizes the deficiencies that were identified for the building per the Tier 1 checklists. Reference Appendix A for the summary data sheet and completed checklists.

Structural Deficiencies

No.	Item	Tier 1 Ref.	Comments
1	n/a	n/a	n/a

Note: There were no identified structural noncompliant items. However, the following list of structural unknowns may contain noncompliant items if evaluation was possible.

Structural Unknowns

No.	Item	Tier 1 Ref.	Comments
1	Load Path	A.2.1.1	It is unclear how the mezzanine attaches to the steel frames or if it is self-supported/braced. The metal building alone appears to have a complete load path.
2	Mezzanines	A.2.1.3	It is not clear how the mezzanine is laterally braced. The mezzanine connections to the main steel frame were not exposed to view, and the building structure drawings were not available for review.
3	Liquefaction	A.6.1.1	A geotechnical report was not available for review. However, the Oregon Department of Geology and Mineral Industries (DOGAMI) Statewide Geohazards Viewer does provide information on site hazards. Per DOGAMI's Hazard Viewer, this building site has a "low" earthquake liquefaction hazard.
4	Slope Failure	A.6.1.2	A geotechnical report was not available for review. However, the Oregon Department of Geology and Mineral Industries (DOGAMI) Statewide Geohazards Viewer does provide information on site hazards. Per DOGAMI's Hazard Viewer, this building site has a "high" landslide hazard.
5	Surface Fault Rupture	A.6.1.3	A geotechnical report was not available for review. However, the Oregon Department of Geology and Mineral Industries (DOGAMI) Statewide Geohazards Viewer does provide information on site hazards. Per DOGAMI's Hazard Viewer, there are no identified active faults located within several miles of the site.
6	Ties Between Foundation Elements	A.6.2.3	Without structural drawings, it is not known if foundation ties between columns are present.
7	Brace Axial Stress Check	A.3.3.1.2	Without structural drawings, and the lack of access inside the northern part of the exterior walls, the quantity of diagonal rod bracing bays is not known.
8	Moment-Resisting Connections	A.3.1.3.4	Without structural drawings that describe the frame details, it is not possible to perform this check.

No.	Item	Tier 1 Ref.	Comments
9	Compact Members	A.3.1.3.8	Without structural drawings that describe the frame details, it is not possible to determine the frame member section properties.

Nonstructural Deficiencies

No.	Item	Tier 1 Ref.	Comments
1	Shut-Off Valves	A.7.13.3	A natural gas shut-off valve was not identified.
2	Flexible Couplings	A.7.15.4	Hazardous material piping (natural gas) does not appear to have flexible couplings (all rigid steel).
3	Tall Narrow Contents	A.7.11.2	Not all cabinets/refrigerators/storage racks/etc. are anchored.
4	Fall-Prone Contents	A.7.11.3	Heavy items on storage racks do not appear to be braced to the racks.

Note: Not all nonstructural checklist items were able to be identified. The following list of nonstructural unknowns may contain noncompliant items if evaluation was possible.

Nonstructural Unknowns

No.	Item	Tier 1 Ref.	Comments
1	Suspended Gypsum Board	A.7.2.3	The ceiling attachments were not viewable.
2	Overhead Glazing	A.7.4.8	The type of glazing is not known.
3	Stair Details	A.7.10.2	The stair details were not accessible to view, and structural drawings were not available for review; therefore the condition is not known.

Conceptual Seismic Upgrade Work

No explicit structural deficiencies are identified in the Tier 1 Checklists as noted in the Structural Deficiencies table previously shown in this report. However, there are structural unknowns that may contain noncompliant items if evaluation was possible. These unknowns may be identified as compliant or noncompliant if more extensive investigation, beyond that of a Tier 1 checklist, was performed.

Nonstructural deficiencies are identified in the Tier 1 Checklists, and are listed in the Nonstructural Deficiencies table previously shown in this report. There are also nonstructural unknowns that may contain noncompliant items if evaluation was possible. These unknowns

may be identified as compliant or noncompliant if more extensive investigation, beyond that of a Tier 1 checklist, was performed. The following is a list of potential solutions to mitigate the identified deficiencies:

1. Shut-Off Valves: Identify the shut-off valves for natural gas. Add shut-off valve if one is not present.
2. Flexible Couplings: Add flexible couplings to natural gas piping.
3. Tall Narrow Contents: Anchor cabinets/refrigerators/storage racks/etc. that are taller than 6 feet and with a height-to-depth ratio greater than 3-to-1.

No explicit structural deficiencies are identified in the Tier 1 Checklists; however, as previously noted, several structural unknowns may contain noncompliant items if more extensive investigation was performed. Based on our experience with seismic upgrades of similar buildings, the probable cost of an upgrade of this type related to direct structural costs would be approximately $25 - $30 per square foot. This does not include costs associated with nonstructural deficiencies, soft costs, impacts to architectural or M/E/P systems, business interruption, geotechnical ground improvement, etc. It is assumed that an M/E/P designer or contractor would address costs associated with the identified nonstructural deficiencies.

Summary

This ASCE 41-13 Tier 1 seismic evaluation was prepared for the NW Natural – The Dalles Service Center. It was found that the aforementioned building, in its current state, does not achieve the desired seismic performance objective for Life Safety Structural Performance at the BSE-1E seismic hazard or 0.75 x BSE-1N seismic hazard as amended by the City of Portland's Chapter 24.85. It also does not achieve the desired seismic performance objective for Life Safety Nonstructural Performance at the same seismic hazard as stated above.

Since there are no identified structural deficiencies, yet several unknowns, further investigation should be completed to determine compliance of the identified unknowns. If the unknowns were to identify structural deficiencies, in the event of a significant seismic event, it is expected that the building will be damaged, possibly to the point where repair and re-occupancy of the building is not possible. The threat to the life safety of the building occupants, under the seismic hazards and performance objectives mentioned in this report, is higher than it would be compared to a building constructed to modern building codes. Most of the nonstructural seismic upgrade work would relate to bracing and/or restraint of nonstructural components and contents. The nonstructural unknowns should also be further investigated. It is our opinion that conventional seismic upgrade work could be employed to reduce/mitigate this seismic risk.

RATING				DESCRIPTION	COMMENTS
C ☐	NC ☐	N/A ☐	U ☒	LOAD PATH: The structure shall contain a complete, well-defined load path, including structural elements and connections, that serves to transfer the inertial forces associated with the mass of all elements of the building to the foundation. (Commentary: Sec. A.2.1.1. Tier 2: Sec. 5.4.1.1)	Unclear how the mezzanine attaches to the steel frames. The metal building alone appears to have a complete load path: metal roof decking and roof diagonal rod bracing, diagonal rod bracing in the N-S direction and moment frames in the E-W direction.
C ☐	NC ☐	N/A ☒	U ☐	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support are anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 4.5.3.7. (Commentary: Sec. A.5.1.1. Tier 2: Sec. 5.7.1.1)	There are no concrete or masonry walls.

16.1.2LS Life Safety Basic Configuration Checklist

Low Seismicity

Building System

General

RATING				DESCRIPTION	COMMENTS
C ☐	NC ☐	N/A ☐	U ☒	LOAD PATH: The structure shall contain a complete, well-defined load path, including structural elements and connections, that serves to transfer the inertial forces associated with the mass of all elements of the building to the foundation. (Commentary: Sec. A.2.1.1. Tier 2: Sec. 5.4.1.1)	Unclear how the mezzanine attaches to the steel frames. The metal building alone appears to have a complete load path: metal roof decking and roof diagonal rod bracing, diagonal rod bracing in the N-S direction and moment frames in the E-W direction.
C ☐	NC ☐	N/A ☒	U ☐	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building is greater than 4% of the height of the shorter building. This statement need not apply for the following building types: W1, W1A, and W2. (Commentary: Sec. A.2.1.2. Tier 2: Sec. 5.4.1.2)	There are no immediately adjacent buildings.
C ☐	NC ☐	N/A ☐	U ☒	MEZZANINES: Interior mezzanine levels are braced independently from the main structure or are anchored to the seismic-force-resisting elements of the main structure. (Commentary: Sec. A.2.1.3. Tier 2: Sec. 5.4.1.3)	The mezzanine connections to the main steel frame were not exposed to view, and building structure drawings were not available for review. It is not clear how the mezzanine is laterally braced.

Building Configuration

RATING				DESCRIPTION	COMMENTS
C	NC	N/A	U		
☐	☐	☒	☐	WEAK STORY: The sum of the shear strengths of the seismic-force-resisting system in any story in each direction is not less than 80% of the strength in the adjacent story above. (Commentary: Sec. A2.2.2. Tier 2: Sec. 5.4.2.1)	This is a one-story building (with the exception of the mezzanine).
C	NC	N/A	U		
☐	☐	☒	☐	SOFT STORY: The stiffness of the seismic-force-resisting system in any story is not less than 70% of the seismic-force-resisting system stiffness in an adjacent story above or less than 80% of the average seismic-force-resisting system stiffness of the three stories above. (Commentary: Sec. A.2.2.3. Tier 2: Sec. 5.4.2.2)	This is a one-story building (with the exception of the mezzanine).
C	NC	N/A	U		
☒	☐	☐	☐	VERTICAL IRREGULARITIES: All vertical elements in the seismic-force-resisting system are continuous to the foundation. (Commentary: Sec. A.2.2.4. Tier 2: Sec. 5.4.2.3)	The steel frames are continuous to the foundation.
C	NC	N/A	U		
☒	☐	☐	☐	GEOMETRY: There are no changes in the net horizontal dimension of the seismic-force-resisting system of more than 30% in a story relative to adjacent stories, excluding one-story penthouses and mezzanines. (Commentary: Sec. A.2.2.5. Tier 2: Sec. 5.4.2.4)	This is a one-story building, and the steel frames appear to be symmetric.

C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-MH. STRUCTURAL SEPARATIONS: Partitions that cross structural separations have seismic or control joints. (Commentary: Sec. A.7.1.3. Tier 2. Sec. 13.6.2)	This check is not required for the Life Safety Performance Level.
C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-MH. TOPS: The tops of ceiling-high framed or panelized partitions have lateral bracing to the structure at a spacing equal to or less than 6 ft. (Commentary: Sec. A.7.1.4. Tier 2. Sec. 13.6.2)	This check is not required for the Life Safety Performance Level.

Ceilings

RATING				DESCRIPTION	COMMENTS
C	NC	N/A	U		
☐	☐	☒	☐	LS-MH; PR-LMH. SUSPENDED LATH AND PLASTER: Suspended lath and plaster ceilings have attachments that resist seismic forces for every 12 ft^2 of area. (Commentary: Sec. A.7.2.3. Tier 2: Sec. 13.6.4)	There are no lath and plaster ceilings.
C	NC	N/A	U		
☐	☐	☐	☒	LS-MH; PR-LMH. SUSPENDED GYPSUM BOARD: Suspended gypsum board ceilings have attachments that resist seismic forces for every 12 ft^2 of area. (Commentary: Sec. A.7.2.3. Tier 2: Sec. 13.6.4)	This was not viewable for gypsum board ceilings.

Legend: C = Compliant, NC = Noncompliant, N/A = Not Applicable, U = Unknown

© 2014 American Society of Civil Engineers

C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-MH. INTEGRATED CEILINGS: Integrated suspended ceilings with continuous areas greater than 144 ft^2, and ceilings of smaller areas that are not surrounded by restraining partitions, are laterally restrained at a spacing no greater than 12 ft with members attached to the structure above. Each restraint location has a minimum of four diagonal wires and compression struts, or diagonal members capable of resisting compression. (Commentary: Sec. A.7.2.2. Tier 2: Sec. 13.6.4)	This check is not required for the Life Safety Performance Level.
C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-MH. EDGE CLEARANCE: The free edges of integrated suspended ceilings with continuous areas greater than 144 ft^2 have clearances from the enclosing wall or partition of at least the following: in Moderate Seismicity, 1/2 in.; in High Seismicity, 3/4 in. (Commentary: Sec. A.7.2.4. Tier 2: Sec. 13.6.4)	This check is not required for the Life Safety Performance Level.
C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-MH. CONTINUITY ACROSS STRUCTURE JOINTS: The ceiling system does not cross any seismic joint and is not attached to multiple independent structures. (Commentary: Sec. A.7.2.5. Tier 2: Sec. 13.6.4)	This check is not required for the Life Safety Performance Level.
C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-H. EDGE SUPPORT: The free edges of integrated suspended ceilings with continuous areas greater than 144 ft^2 are supported by closure angles or channels not less than 2 in. wide. (Commentary: Sec. A.7.2.6. Tier 2: Sec. 13.6.4)	This check is not required for the Life Safety Performance Level.

Legend: C = Compliant, NC = Noncompliant, N/A = Not Applicable, U = Unknown

© 2014 American Society of Civil Engineers

C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-H. SEISMIC JOINTS: Acoustical tile or lay-in panel ceilings have seismic separation joints such that each continuous portion of the ceiling is no more than 2500 ft^2 and has a ratio of long-to-short dimension no more than 4-to-1. (Commentary: Sec. A.7.2.7. Tier 2: 13.6.4)	This check is not required for the Life Safety Performance Level.

Light Fixtures

RATING				DESCRIPTION	COMMENTS
C	NC	N/A	U		
☐	☐	☒	☐	LS-MH; PR-MH. INDEPENDENT SUPPORT: Light fixtures that weigh more per square foot than the ceiling they penetrate are supported independent of the grid ceiling suspension system by a minimum of two wires at diagonally opposite corners of each fixture. (Commentary: Sec. A.7.3.2. Tier 2: Sec. 13.6.4 and 13.7.9)	Grid ceilings do not occur. Light fixtures are connected directly to the gypsum board ceilings.
C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-H. PENDANT SUPPORTS: Light fixtures on pendant supports are attached at a spacing equal to or less than 6 ft and, if rigidly supported, are free to move with the structure to which they are attached without damaging adjoining components. (Commentary: A.7.3.3. Tier 2: Sec. 13.7.9)	This check is not required for the Life Safety Performance Level.
C	NC	N/A	U		
☐	☐	☒	☐	LS-not required; PR-H. LENS COVERS: Lens covers on light fixtures are attached with safety devices. (Commentary: Sec. A.7.3.4. Tier 2: Sec. 13.7.9)	This check is not required for the Life Safety Performance Level.

Legend: C = Compliant, NC = Noncompliant, N/A = Not Applicable, U = Unknown

Cladding and Glazing

RATING				DESCRIPTION	COMMENTS
C ☐	NC ☐	N/A ☒	U ☐	LS-MH; PR-MH. CLADDING ANCHORS: Cladding components weighing more than 10 lb/ft^2 are mechanically anchored to the structure at a spacing equal to or less than the following: for Life Safety in Moderate Seismicity, 6 ft; for Life Safety in High Seismicity and for Position Retention in any seismicity, 4 ft. (Commentary: Sec. A.7.4.1. Tier 2: Sec. 13.6.1)	The building does not have this type of cladding.
C ☐	NC ☐	N/A ☒	U ☐	LS-MH; PR-MH. CLADDING ISOLATION: For steel or concrete moment frame buildings, panel connections are detailed to accommodate a story drift ratio of at least the following: for Life Safety in Moderate Seismicity, 0.01; for Life Safety in High Seismicity and for Position Retention in any seismicity, 0.02. (Commentary: Sec. A.7.4.3. Tier 2: Section 13.6.1)	All walls are metal siding and are "hard-fastened" directly to the structural frame.
C ☐	NC ☐	N/A ☒	U ☐	LS-MH; PR-MH. MULTI-STORY PANELS: For multi-story panels attached at more than one floor level, panel connections are detailed to accommodate a story drift ratio of at least the following: for Life Safety in Moderate Seismicity, 0.01; for Life Safety in High Seismicity and for Position Retention in any seismicty, 0.02. (Commentary: Sec. A.7.4.4. Tier 2: Sec. 13.6.1)	There are no multi-story panels.
C ☐	NC ☐	N/A ☒	U ☐	LS-MH; PR-MH. PANEL CONNECTIONS: Cladding panels are anchored out-of-plane with a minimum number of connections for each wall panel, as follows: for Life Safety in Moderate Seismicity, 2 connections; for Life Safety in High Seismicity and for Position Retention in any seismicity, 4 connections. (Commentary: Sec. A.7.4.5. Tier 2: Sec. 13.6.1.4)	There are no cladding panels.

Legend: C = Compliant, NC = Noncompliant, N/A = Not Applicable, U = Unknown

© 2014 American Society of Civil Engineers

C	NC	N/A	U		
☒	☐	☐	☐	LS-MH; PR-MH. BEARING CONNECTIONS: Where bearing connections are used, there is a minimum of two bearing connections for each cladding panel. (Commentary: Sec. A.7.4.6. Tier 2: Sec. 13.6.1.4)	The metal siding are fastened directly to the wall framing at several locations.
☐	☐	☒	☐	LS-MH; PR-MH. INSERTS: Where concrete cladding components use inserts, the inserts have positive anchorage or are anchored to reinforcing steel. (Commentary: Sec. A.7.4.7. Tier 2: Sec. 13.6.1.4)	There are no concrete cladding components.
☐	☐	☐	☒	LS-MH; PR-MH. OVERHEAD GLAZING: Glazing panes of any size in curtain walls and individual interior or exterior panes over 16 ft^2 in area are laminated annealed or laminated heat-strengthened glass and are detailed to remain in the frame when cracked. (Commentary: Sec. A.7.4.8: Tier 2: Sec. 13.6.1.5)	The type of glazing is not known.

Masonry Veneer

RATING				DESCRIPTION	COMMENTS
C	NC	N/A	U		
☐	☐	☒	☐	LS-LMH; PR-LMH. TIES: Masonry veneer is connected to the backup with corrosion-resistant ties. There is a minimum of one tie for every 2-2/3 ft^2, and the ties have spacing no greater than the following: for Life Safety in Low or Moderate Seismicity, 36 in.; for Life Safety in High Seismicity and for Position Retention in any seismicity, 24 in. (Commentary: Sec. A.7.5.1. Tier 2: Sec. 13.6.1.2)	There is no masonry veneer.

Legend: C = Compliant, NC = Noncompliant, N/A = Not Applicable, U = Unknown

C	NC	N/A	U		
☐	☐	☒	☐	LS-LMH; PR-LMH. CANOPIES: Canopies at building exits are anchored to the structure at a spacing no greater than the following: for Life Safety in Low or Moderate Seismicity, 10 ft; for Life Safety in High Seismicity and for Position Retention in any seismicity, 6 ft. (Commentary: Sec. A.7.8.2. Tier 2: Sec. 13.6.6)	There are no canopies.
☐	☐	☒	☐	LS-MH; PR-LMH. CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 have vertical reinforcement. (Commentary: Sec. A.7.8.3. Tier 2: Sec. 13.6.5)	There are no concrete parapets.
☒	☐	☐	☐	LS-MH; PR-LMH. APPENDAGES: Cornices, parapets, signs, and other ornamentation or appendages that extend above the highest point of anchorage to the structure or cantilever from components are reinforced and anchored to the structural system at a spacing equal to or less than 6 ft. This checklist item does not apply to parapets or cornices covered by other checklist items. (Commentary: Sec. A.7.8.4. Tier 2: Sec. 13.6.6)	Where these items occur, they are anchored.

Masonry Chimneys

RATING				DESCRIPTION	COMMENTS
C	NC	N/A	U		
☐	☐	☒	☐	LS-LMH; PR-LMH. URM CHIMNEYS: Unreinforced masonry chimneys extend above the roof surface no more than the following: for Life Safety in Low or Moderate Seismicity, 3 times the least dimension of the chimney; for Life Safety in High Seismicity and for Position Retention in any seismicity, 2 times the least dimension of the chimney. (Commentary: Sec. A.7.9.1. Tier 2: 13.6.7)	There are no URM chimneys.

© 2014 American Society of Civil Engineers

C	NC	N/A	U		
☐	☐	☒	☐	LS-LMH; PR-LMH. ANCHORAGE: Masonry chimneys are anchored at each floor level, at the topmost ceiling level, and at the roof. (Commentary: Sec. A.7.9.2. Tier 2: 13.6.7)	There are no masonry chimneys.

Stairs

RATING				DESCRIPTION	COMMENTS
C	NC	N/A	U		
☐	☐	☒	☐	LS-LMH; PR-LMH. STAIR ENCLOSURES: Hollow-clay tile or unreinforced masonry walls around stair enclosures are restrained out-of-plane and have height-to-thickness ratios not greater than the following: for Life Safety in Low or Moderate Seismicity, 15-to-1; for Life Safety in High Seismicity and for Position Retention in any seismicity, 12-to-1. (Commentary: Sec. A.7.10.1. Tier 2: Sec. 13.6.2 and 13.6.8)	These types of stair enclosures do not occur in this building.
C	NC	N/A	U		
☐	☐	☐	☒	LS-LMH; PR-LMH. STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure does not rely on shallow anchors in concrete. Alternatively, the stair details are capable of accommodating the drift calculated using the Quick Check procedure of Section 4.5.3.1 without including any lateral stiffness contribution from the stairs. (Commentary: Sec. A.7.10.2. Tier 2: 13.6.8)	The stair details were not accessible to view, and structural drawings were not available for review; therefore, the condition is not known.

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: The Dalles
Date: 12/11/2024
Project Sponsor: Wayne Pipes
Executive Sponsor: Mardi Saathoff
Project Manager: Philip Zlatnik
Preparer: Philip Zlatnik

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking.

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	NW Natural operates a resource center in The Dalles, Oregon (the Company's only facility in the Columbia River Gorge), which is essential for supporting the delivery of safe and reliable service and serving as a center for the Company's regional emergency response across northern Hood River and Wasco Counties in Oregon, as well as Klickitat and Skamania Counties in Washington. The facility is small, leased, and the lease expires at the end of 2026. The leased area is ½ acre and includes a prefabricated steel building. The building consists of a single-story 65-foot by 40-foot garage, a 19-foot by 40-foot ground-floor office, and a 19-foot by 40-foot mezzanine office above the ground floor, totaling about 4,100 square feet. The site also features a microwave tower. Ten employees work from this site, representing Customer Field Services, Construction, Emergency Response, and Community Affairs. KPFF Engineering completed a seismic assessment of the metal building in 2016 and concluded that the building does not meet current life-safety building codes, raising concerns about employee safety. Additionally, the lack of onsite fueling could hinder NW Natural's response capabilities during a major natural disaster. The office building lacks standard NW Natural functionality. It does not have a conference room, a write-up room (where the crews meet each morning to get their assignments for the day and close out their day), a drying room, or changing room or showers, and the kitchen is inadequate. In addition, the existing site is too small to support current operational needs like a vehicle fueling system, pipe storage, and a decant system. The site lacks and cannot accommodate sufficient indoor covered storage for Company tools and materials, or enclosed parking for specialty equipment, to protect it from the environment. The site also lack space to accommodate adequately sized storage bins for rocks and sand. The absence of a decant system means employees must drive 23 miles one way (1.5-hour round trip) to dispose of wet spoils. Similarly, the lack of a covered spoils bin requires employees to drive 5 miles one way (20-minute round trip) to dispose of dry spoils.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	The lease on the current facility expires at the end of 2026. We need to find a new site that provides adequate and safe facilities to support our evolving business operations while upholding the values of the Company.

Desired Deliverables What high level output / scope / deliverables are core to this project?	The goal of the project is to provide an office building with standard NW Natural functionality, a warehouse, and the necessary outbuildings and yard functionality, including paving.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	**How options were chosen:** • The options being evaluated are the available properties for sale in The Dalles. **Who was involved in the choice?** • Project team, Environmental team, Operations, and the Facilities Steering Committee. **How options were evaluated:** • Fit, accessibility, cost and risk. **Were any criteria considered more important?** • Fit and cost.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Fit, Accessibility and Costs	The project team considered the required functionality and how well the functionality could be accommodated at the various parcels of land for sale, the accessibility, and the cost of the parcels.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	Purchase two adjacent parcels of land (lots 4 & 5) from the Port of The Dalles and build a new resource center spanning both sites. After the Company completes the purchase of a new two-parcel site, the Company will construct and move into a new facility on the new site. The new property will be used for materials and equipment storage once it is purchased and for construction materials and activities as the new facility is being constructed. The new facility will include an office building and warehouse (both designed to be functional following a seismic event) and various yard support infrastructure. The other structures include a covered pipe storage shed, enclosed specialty equipment storage garage attached to the pipe storage building, a spoils bin and decant system shed, a fuel tank within a fueling canopy, and a truck washroom that includes a Landa unit for separating oil from water. The scope will also include a truck and heavy equipment scale. The Company will also make general site improvements like landscaping, yard lighting, paving, striping and bollard installation, fencing, and motorized driveway gates.
In brief, why is this the	The Company's real estate brokers and the project team evaluated fourteen sites over the last year and a half. The team evaluated five sites more closely with test fits and zoning reviews. From these evaluations, the team is recommending the adjacent parcels of land (Lots 4 & 5) in the Port of The

recommended option?	Dalles as they will best meet the operational and corporate real estate needs of the Company based on cost, usable land and accessibility for vehicles and associated risks.	
Assessment	**Analysis Against Criteria:** Costs, Usable land, and Approach	**Pros:** • Least expensive property available for purchase. • Has the largest amount of usable space of the two finalist sites being considered. • There is strong support from employees and operations management for this approach. • Creating a new resource center at this location would create no or little disruption to Operations. • Recent experience with architect, consultants, and general contractor on similar projects (new build at Lincoln City and Warrenton). **Cons:** • Not applicable
	Analysis Against Criteria: Accessibility and Risks	**Pros:** • The lots 4 & 5 being recommended have excellent vehicle access which is critical for emergency response. • The two lots to be used are zoned industrial, which is appropriate for the intended purpose. • The two lots avoid the potential development risk associated with the Columbia Cinema property since other property is not zoned for our use and would require a conditional use approval. • The project team has met with the permitting agencies in The Dalles and Agencies Having Jurisdiction (AHJ's) appear supportive of the Company's plans for the combined sites. **Cons:** • Not applicable
	Analysis Against Criteria: Timing	**Pros:** • Time required to acquire, design, and permit fits within the Company's desired timeline including completing the project by the time the lease for the current facility in The Dalles expires at the end of 2026. **Cons:** • Completing the due diligence and securing approvals and permits can take time. It is conceivable that there would be significant delays to any of these, then this represents a risk to the schedule.
	Additional Risks	Building a new facility on new site does involve unknown geo-technical conditions, and securing approvals and permits can take time.
	Additional Benefits	**Financial Benefits:** • Bid review process, including competitively bidding scopes over $25,000, results in a lower overall cost. • Structural upgrades to minimize impact from seismic event. **Operational Benefits:** • Multiple design review approach to ensure design meets requirements. • Efficiency: Eliminating need to drive to external locations to dispose of spoils. • Reduced risk: safety (seismic upgrades to office/warehouse, and ability to weigh trucks to ensure not overweighting). • Environmental: Reducing truck drive time to dispose of spoils. **Customer Benefits:** • Benefit of improved availability of employees to carry out evolving day-to-day operations by eliminating unnecessary driving to dispose of wet spoils. Improved efficiency and productivity.

		Employee Benefits: • Improved employee morale from improved functionality (decant tank onsite, exercise room). • Improved efficiency (reduced driving time to dispose of spoils). • Reduced risk: safety (seismic, driving overweighted vehicles). **Other Benefits:** • Bid review process, including competitively bidding scopes over $25,000, results in a lower overall cost. • Complying with ODOT requirement for ensuring vehicles are not over weighted. • Benefit of improved reliability because of addressing the seismic resiliency issue.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$ 14.8 m	$ 1.63 m (11%)	$ 16.4 m
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$ 0		$ 0
Source/ Method of Cost Data	Bremik (General contractor), LRS (Architect), URI (Owners Representative), project team, Cushman & Wakefield, commercial real estate broker		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Purchase a new site and build new resource center where the Columbia Cinema is located.	
In brief, why is this option not recommended?	This alternative is not recommended because it would be more expensive and carries a higher risk than the recommended option.	
Assessment	**Analysis Against Criteria:** Costs, Usable land, and approach	**Pros:** • N/A **Cons:** More expensive than Lots 4 & 5
	Analysis Against Criteria: Risks	**Pros:** • N/A **Cons:** • There are zoning issues with this location. It is not zoned industrial. • There is significantly more public relations risk associated with this option given that it is currently the only functioning movie cinema in The Dalles.
	Analysis Against Criteria: Timing	**Pros:** • N/A **Cons:** • The cinema is not approved for the intended usage. It is currently zoned commercial, and this would need to be changed to industrial, which would require a permitting variance and additional time.
	Additional Risks	The permit variance process is complicated and there is no guarantee that it would be approved.
	Additional Benefits	**Financial Benefits:** • N/A **Operational Benefits:** • N/A **Customer Benefits:**

		• N/A **Employee Benefits:** • N/A

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$ 15.8 m	$ 1.7 m (11%)	$ 17.5 m
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	N/A		N/A
Source/ Method of Cost Data	Bremik (General contractor), LRS (Architect), URI (Owners Representative), project team, Cushman & Wakefield, commercial real estate broker		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Purchase a new site and build new resource center at either 215 Terminal Avenue, 208 Webber Street or Ward Road.	
In brief, why is this option not recommended?	The team is not recommending any of these sites as having reviewed them they were determined to be not suitable for our operational and corporate real estate purposes.	
Assessment	**Analysis Against Criteria:** Costs, Usable land, and approach	**Pros:** • N/A **Cons:** • The sites are deemed unsuitable for the following reasons: ○ **Terminal Ave:** The parcel size is insufficient for our needs, and the sloping topography would limit its usability. ○ **Ward Rd:** The property size does not meet the required functionality. ○ **Webber St:** Proximity to the railroad line would likely impede site access.
	Analysis Against Criteria: Risks	**Pros:** • N/A **Cons:** • The sites are considered unsuitable for the following reasons: ○ **Terminal Ave:** The sloping topography would limit its usability. ○ **Webber St:** Proximity to the railroad line would likely impede site access.
	Analysis Against Criteria: Timing	**Pros:** • N/A **Cons:** • N/A
	Additional Risks	N/A
	Additional Benefits	**Financial Benefits:** • N/A **Operational Benefits:** • N/A **Customer Benefits:** • N/A **Employee Benefits:** • N/A
POTENTIAL COST (EXCLUDING CONTINGENCY)		

Capital Range	Direct	CURRENT COH	Total
	$ n/a	$ n/a	n/a

	N/A	N/A	
Source/ Method of Cost Data	Bremik (General contractor), LRS (Architect), URI (Owners Representative), project team, Cushman & Wakefield, commercial real estate broker		

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Purchase the current site and retrofit the existing building and yard	• Site too small • Not for sale
Alternative 4	Move employees, equipment, materials, and vehicles to the Parkrose Resource Center	• The Parkrose Resource Center is 75 + miles away and moving this far away would severely impact the Company's ability to respond to emergency calls in the Hood River, Wasco, Klickitat and Skamania Counties. • Parkrose is not large enough to accommodate the employees, equipment, materials, and vehicles from The Dalles. • Additionally, Parkrose does not have a decant system or a truck scale.
Alternative 5	Move employees, equipment, materials, and vehicles to the Vancouver Resource Center	• The Vancouver Resource Center is 82+ miles away and moving this far away would severely impact the Company's ability to respond to emergency calls in the Hood River, Wasco, Klickitat and Skamania Counties. • Vancouver is not large enough to accommodate the employees, equipment, materials, and vehicles from The Dalles.
Alternative 6	Do nothing	• Does not address the issue of the current lease expiring on 12/31/2026. • Does not address the lack of functionality at the existing leased facility. • Does not address the need for a local means of disposing of wet spoils. • Does not address safety and health needs of employees. • Does not address regulatory (ODOT) requirements.

NW Natural Land Acquisition and Negotiation Summary – The Dalles, OR

Objective: Cushman & Wakefield was engaged to identify and secure a land site or existing structure for purchase. The ideal site needed to be a strategically located, approximately (2) two to four (4) acre parcel of commercially or industrially zoned land with easy access to transportation links, ensuring both optimal value and cost efficiency. We completed this search over a period of multiple years, unable to find a structure which (1) existed and (2) was financially feasible to develop into the building NW Natural needed.

---

1. Site Selection Process:

Our team followed our typical site selection process below; however, what was unique about this requirement was the limited availability of inventory, both in existing structures that could be converted and available land.

- *Defining Requirements*: Established key criteria, including site size, zoning, accessibility, infrastructure availability, and future expansion potential.
- *Market Research*: Assessed available properties, market conditions, recent sales, and comparable transactions to determine the best options. In this particular instance there were so few options being marketed that we actively called all sites that we felt could potentially meet NW Natural's need to identify off-market opportunities.
- *Property Shortlisting*: Identified top candidates based on cost, location, entitlement feasibility, and development readiness. There were very few sites, and most were non-conforming uses, or sites that use to be alternative uses. For example, we evaluated converting a movie theater for this use and it proved to be problematic and cost prohibitive. Suffice to say all rocks were uncovered.
- *Due Diligence*: Conducted site visits, environmental assessments, and legal compliance reviews to mitigate risks before advancing negotiations. Additionally, evaluated construction costs of reconfigurations versus the cost of new construction.

---

2. Negotiation Strategy & Execution:

After a five year search for an existing facility that could be converted, we identified land at the Port of The Dalles which met the needs of NW Natural most efficiently; however, we initially began negotiating on sites 8 & 9, which contained attributes provided them a higher value for other users. Additionally, after our due diligence, it was determined that a significant amount of the lots was not developable, due to both slope as well as wetlands.

As a result, our negotiation strategy to pay only for the portion of the lots that NW Natural could develop and build on. Additionally, the Port preferred to have NW natural relocate to lots 4 & 5. NW Natural fit well on lots 4 & 5, and the attributes that made lots 8 & 9 a higher value for the Port did not impact NW Natural. However, lots 4 & 5 were larger so our team negotiated that we would pay for only the size of developable land we would have purchased on lots 8 & 9.

No warranty or representation, expressed or implied, is made as to the accuracy of the information contained herein, and same is submitted subject to errors, omissions.

3. Cost Savings Summary:

Our team's negotiation strategy was implemented to achieve optimal results and used two primary strategies:

1: Only pay on the useable land, not the land in entirety

2: Develop on the most cost affordable land (size and price) that fit NW Natural's need.

Originally, the Port placed NW Natural on lots 8 and 9, which had an asking price of $1,276,691.33. However, the Port later determined that these sites, despite their excellent views of the Columbia River Gorge, were not well-suited for industrial use. As a result, they instead offered lots 4, 5, and 6, stating that lots 8 and 9 were no longer an option.

Lots 4 and 5 were significantly larger (6.4 acres compared to 2.7 acres), with a combined asking price of $2,310,000—substantially more than the original lots. Despite this, we successfully negotiated for NW Natural to pay only for the usable area of lots 4 and 5.

After evaluating these lots, NW Natural not only secured the agreement to pay only for the usable portion but also negotiated an additional $75,000 credit from the Port. This resulted in a final purchase price of $999,999.00, making it the most cost-effective land option.

It is important to note that after evaluating multiple existing buildings and other sites in the area over a period of five (5) years, these were the only sites that would be suitable for this facility. The concern from the community was that NW Natural would have to look outside the Dalles, which from a business perspective did not serve customers as well, and from a real estate perspective would have been more costly.

Summary: Through a multi-year site selection process we were able to find multiple land and sites to be evaluated. However, after due diligence on multiple sites all sites were ruled out because they were either cost prohibitive (a reconfiguration far exceeded new construction costs) or they did not meet the needs of NW Natural (zoning, soils, etc). After we identified sites that could work we negotiated only to pay for land that could be developed and through due diligence and test fits identified the most cost effective solution for NW Natural that best meet their needs.

If you have any questions, we would be happy to provide additional information or have a discussion.

Thank you,

Matt Johnson
Executive Managing Director

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: 2025 Physical Security Enhancement - Oregon
Date: 12/3/2024
Project Sponsor: Wayne Pipes
Executive Sponsor: MardiLyn Saathoff
Project Manager: Mackenzie Hopkins
Preparers: Philip Zlatnik, Mackenzie Hopkins

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking.

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	The initial phase of a multi-year initiative concluded early in 2024 with a pilot project focused on enhancing security. This phase successfully upgraded security at five high-priority locations and updated the Corporate Security Standards document, specifically the Tiers of Protection. Additionally, it reduced incidents of theft and break-ins at a local resource center and provided crucial insights for the broader security enhancement program. After the first year of the project concluded, the project team and key stakeholders identified the next group of priority sites for upgrades in 2025.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	In response to increasing threats, changing trends in the security industry, and ongoing direction from TSA, NW Natural is undertaking a comprehensive, multi-year effort to enhance the physical security at the Company's facilities and field infrastructure.

Desired Deliverables
What high level output / scope / deliverables are core to this project?
	Continue with the security upgrade program that started with the pilot in 2023.
	• Enhance physical security at critical facilities, as identified by the TSA Pipeline Guidelines and assessments conducted by Corporate Security.
	• Complete security upgrades at the sites approved for 2025. The upgrades will include a combination of the following:
	  ○ 7' Anti-Climb or 8' Chain Link Fence with three strands of barbed wire and outward barbed wire arms.
	  ○ Panel Filler and rock as needed.
	  ○ Black industrial fencing slats.
	  ○ Emergency egress for every pedestrian gate with mesh screening and pick plates installed.
	  ○ Protected padlock enclosure for all pedestrian and vehicle gates with padlocks.
	  ○ Reinforced vehicle gate with full metal shrouds.
	  ○ NW Natural "No Trespassing" signage every 50 feet and at every pedestrian/vehicle gate.
	  ○ Perforated metal installed over existing or infilled/secured exterior building windows.
	  ○ Reinforced exterior building doors with no windows and 6" exterior door pick plates.
	  ○ Storefront design locks for exterior building doors with no interior locking tumbler.
	  ○ LED lighting to sufficiently illuminate all interior and exterior areas.

	○ CCTV cameras to provide sufficient coverage of exterior areas. ○ Clear vegetation zone several feet from the exterior fence line. ○ Bollards, Jersey barriers, or other traffic control devices. • Update the Tiers of Protection and hardware specifications as required. • Continue to execute and evolve the program to manage security upgrades at the high-priority sites annually over the next three years.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	The review process concentrated on evaluating the remaining NW Natural sites based on their criticality, as well as the equipment and materials required to enhance physical security in the most cost-effective way, rather than adopting entirely different security measures like deploying guards. Building on the security pilot conducted in 2023, the method for prioritizing sites has evolved to include critical facilities as outlined in the TSA Pipeline Guidelines, sites identified as Critical Cybersecurity Assets (CCSA), and recommendations from Corporate Security. The approach has been shared with the Physical Security Steering Committee.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Implementation Approach and Costs	The decision-making criteria encompass approaches for addressing both short-term and long-term security risks at the different sites, compliance with TSA regulations, and the overall costs.
Criteria: Risks	The decision criteria focus on the criticality and risk profile of each site (including any recent/recurring security incidents) and the urgency of compliance with TSA requirements.
Criteria: Timing	• Urgency to address security gaps. • Safety considerations, such as avoiding hot work (like welding) during summer at remote locations.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	Proceed with the third year of the multi-year program to implement physical security upgrades.
In brief, why is this the recommended option?	• Leverages the approach endorsed by industry leader CH2M. • Implements design specifications and tiers of protection as recommended by Corporate Security. • Builds upon the successful pilot project completed in early 2024. • Reduces risk to employees and customers in a methodical, risk-based manner, prioritizing according to site criticality.

	• Offers the most effective strategy to address security vulnerabilities at the Company's sites and ensure compliance with TSA regulations. • Continuously informs and guides the ongoing multi-year program to address the Company's security needs. • Helps ensure the Company's system can continue providing safe and reliable service to customers without interruption.	
Assessment	**Analysis Against Criteria:** Implementation Approach and Costs	**Pros:** • Most cost-effective method for enhancing security across the Company's service territory. • The implementation approach is refined through updates made to the Tiers of Protection and the development of hardware specifications during the pilot, including unit pricing. • Continuation of security upgrades reinforces the Company's commitment to complying with TSA regulations. • Enhances physical security at facilities and increases accountability for access by personnel and visitors. **Cons:** • May still require the deployment of guards or other forms of deterrents at certain sites for specific tasks that necessitate human presence.
	Analysis Against Criteria: Risks	**Pros:** • The risk mitigation strategy benefits from insights derived from the successful completion of the pilot project, including the use of gas and Radio Frequency detection equipment at pipeline and telemetry sites (where microwave equipment is present). **Cons:** • None identified.
	Analysis Against Criteria: Timing	**Pros:** • The implementation plan is refined by insights gained from completing the pilot project, which include detailed hardware specifications, understanding product lead times, and better understanding of installation timeframes. **Cons:** • None identified.
	Additional Risks	• Potential delays in the supply chain could impact the timely completion of security upgrades. • Changes in regulatory requirements or updates to TSA guidelines may require adjustments to planned security measures, potentially increasing costs and implementation time. • Unforeseen technical challenges could arise with new security technologies or hardware being integrated into existing systems.
	Additional Benefits	• **Incident Analysis:** Provides the capability for video review at some sites, enhancing security and safety incident responses. • **Data Utilization:** Employs analytics and technology to analyze data and video, aiding in investigations and operational assessments.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.5M	$0.25M (10%)	$2.75M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	N/A	N/A	
Source/ Method of Cost Data	Essex (General contractor), URI (Owners Representative), project team.		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Enhance site security by deploying contract guards at select locations in addition to reinforcing physical barriers and controls. This includes installing upgraded fencing, enhanced lighting, more robust access control systems, and improving clearance from vegetation to reduce concealment opportunities.	
In brief, why is this option not recommended?	Given NW Natural's 1200+ geographically diverse and often remote sites, deploying security guard services extensively would be cost prohibitive. While deploying guards at select locations is possible, for 2025, there is only one site where this approach makes sense. This strategy is not sustainable or recommended for most sites.	
Assessment	**Analysis Against Criteria:** Implementation Approach and Costs	**Pros:** • Provides real-time security response to break-ins. **Cons:** • Incurs additional Operations and Maintenance (O&M) costs on top of the expenses for implementing physical security enhancements at each site. • Not feasible to deploy guards at all sites, especially in remote locations.
	Analysis Against Criteria: Risks	**Pros:** • Provides for more immediate security response to break-ins. **Cons:** • Limited capability to deploy guards at all sites, especially those in remote areas.
	Analysis Against Criteria: Timing	**Pros:** • Provides for more immediate security response to break-ins. • Guards can potentially be deployed more quickly at select sites compared to implementing full security upgrades. **Cons:** • Not sustainable as a long-term security solution. • Full security upgrades are still necessary at sites, even with guard deployment.
	Additional Risks	N/A
	Additional Benefits	N/A

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.5M	$0.25M (10%)	$2.75M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
		$ 73K*	
Source/ Method of Cost Data	Essex (General contractor), URI (Owners Representative), project team, current PO with Compass Security for unarmed security services. *Annual cost for deploying guards at the noted one site (8x5).		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	Establish a Security Operations Center (SOC) and employ 5-6 full-time employees to monitor camera feeds and manage alarm systems across multiple sites. This setup will enable centralized surveillance and rapid response coordination.

In brief, why is this option not recommended?	While establishing a Security Operations Center (SOC) and hiring 5-6 full-time employees offers a more integrated long-term security solution compared to deploying contract guards, it is not recommended at this time due to the higher O&M costs involved. Additionally, this option would still necessitate upgrading fencing, lighting, and access control at resource centers and remote sites, further increasing the overall cost.	
Assessment	**Analysis Against Criteria:** Implementation Approach and Costs	**Pros:** • Provides more immediate security response to break-ins. **Cons:** • Incurs significant operational and maintenance costs and implementing physical security enhancements at each site. • Limited feasibility of deploying guards at all sites, particularly in remote locations.
	Analysis Against Criteria: Risks	**Pros:** • Provides for more immediate security response to break-ins. **Cons:** • Limited capability to deploy guards at all sites, especially those in remote areas.
	Analysis Against Criteria: Timing	**Pros:** • Provides for more immediate security response to break-ins. **Cons:** • Establishing the SOC would entail additional time but potentially could be done in parallel with implementing physical security enhancements at each site.
	Additional Risks	N/A
	Additional Benefits	N/A

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.5M	$0.25M (10%)	$2.75M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
		$ 800-960K*	
Source/ Method of Cost Data	Essex (General contractor), URI (Owners Representative), project team. * Assumption: Fully loaded Security Consultant FTE is $160K/year		

ALTERNATIVES CONSIDERED NOT VIABLE

Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why

	Description	**Why the Alternative is not viable**
Alternative 3	Take no action	The current risk level, as determined by CH2M's security assessment, is unacceptable. Additionally, Corporate Security has indicated that there is still work to be done to ensure compliance with TSA guidelines.
Alternative 4		
Alternative 5		

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

1 INTRODUCTION

Under the provisions of the Aviation and Transportation Security Act (Public Law 107-71), the Transportation Security Administration (TSA) was established on November 19, 2001 with responsibility for civil aviation security and "security responsibilities over other modes of transportation that are exercised by the Department of Transportation." On September 8, 2002, TSA initiated its pipeline security efforts. Those responsibilities now reside within the Office of Security Policy and Industry Engagement's Surface Division.

1.1 Background and Purpose

In executing its responsibility for national pipeline security, TSA originally utilized the Pipeline Security Information Circular, issued on September 5, 2002, by the Department of Transportation's (DOT) Office of Pipeline Safety as the primary Federal guideline for industry security. Complementing this document, and also adopted by TSA, was the DOT-issued Pipeline Security Contingency Planning Guidance of June 2002.

Recognizing that the Security Circular required updating, TSA initiated a process to amend the Federal security guidance. The 2010 Pipeline Security Guidelines were developed with the assistance of industry and government members of the Pipeline Sector and Government Coordinating Councils, industry association representatives, and other interested parties. This document was soon revised resulting in the 2011 Pipeline Security Guidelines.

The advancement of security practices to meet the ever changing threat environment in both the physical and cyber security realms required that the guidelines be updated again. Utilizing a similar industry and government collaborative approach, TSA developed this document, which supersedes the 2011 version of the Pipeline Security Guidelines.

The security measures in this guidance provide the basis for TSA's Pipeline Security Program Corporate Security Reviews and Critical Facility Security Reviews. This document is guidance and does not impose requirements on any person or company. The term "should" means that TSA recommends the actions described. Nothing in this document shall supersede Federal statutory or regulatory requirements.

1.2 Scope

These guidelines are applicable to operational natural gas and hazardous liquid transmission pipeline systems, natural gas distribution pipeline systems, and liquefied natural gas facility operators. Additionally, they apply to operational pipeline systems that transport materials categorized as toxic inhalation hazards (TIH). TIH materials are gases or liquids that are known or presumed on the basis of tests to be so toxic to humans as to pose a health hazard in the event of a release during transportation. (See the Hazardous Materials Regulations: 49 CFR parts 171-180.)

Operators of pipeline systems not included in the descriptions above are encouraged to implement the security measures contained herein to the extent appropriate to their particular system.

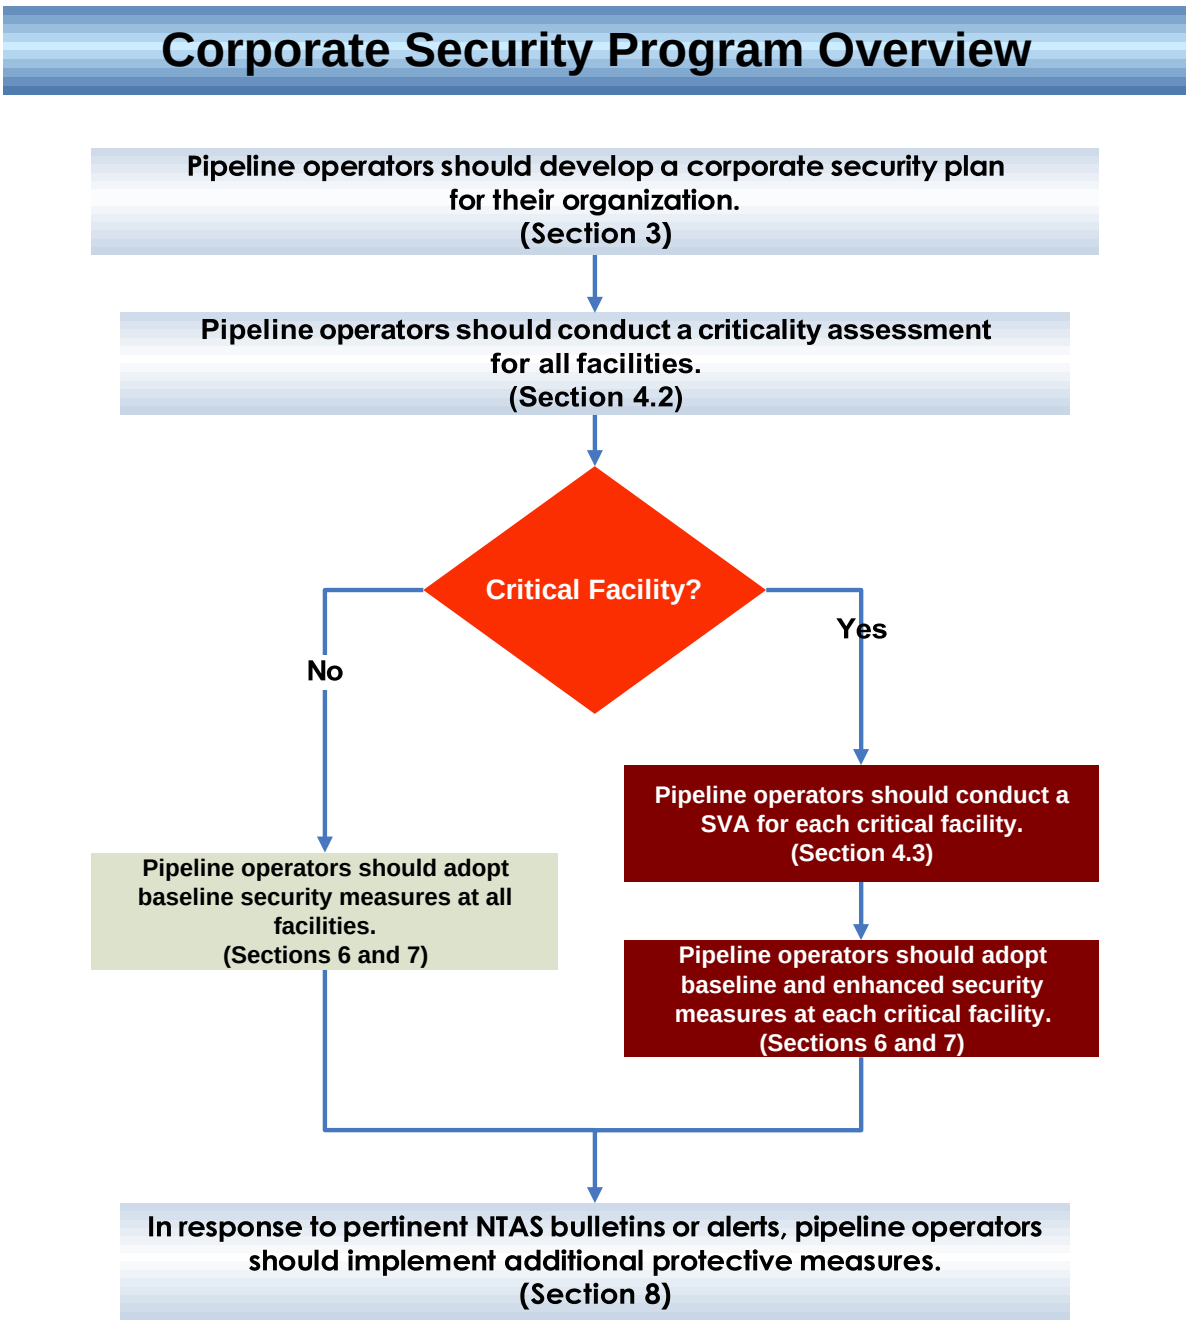
2 CORPORATE SECURITY PROGRAM

A risk-based corporate security program should be established and implemented by each pipeline operator to address and document the organization's policies and procedures for managing security related threats, incidents, and responses. In addition, each operator should:

- Develop a corporate security plan as described in Section 3;
- Ensure sufficient resources, to include trained staff and equipment, are provided to effectively execute the corporate security program;
- Ensure identified security deficiencies have appropriate financial resources allocated in the corporate budgeting and purchasing processes;
- Assign a qualified primary and alternate staff member to manage the corporate security program;
- Develop and maintain a cyber/Supervisory Control and Data Acquisition (SCADA) security plan, or incorporate cyber/SCADA security measures in the corporate security plan;
- Develop and maintain security elements within the corporate incident response and recovery plan;
- Implement appropriate threat level protective measures upon receipt of a pertinent National Terrorism Advisory System (NTAS) Bulletin or Alert; and
- Notify TSA of security incidents meeting the criteria provided in Appendix B by phone or email as soon as possible.

Figure 1 identifies the major steps that each pipeline operator should take in creating and implementing a corporate security program and the relevant sections in the guidelines where specific details are provided.

Figure 1: Corporate Security Program Overview



3 CORPORATE SECURITY PLAN

3.1 Introduction

Operators should develop and implement a security plan customized to the needs of the company. The corporate security plan should be comprehensive in scope, systematic in its development, and risk-based reflecting the security environment. At a minimum, the plan should:

- Identify the primary and alternate security manager or officer responsible for executing and maintaining the plan;
- Document the company's security-related policies and procedures, to include, but not limited to, methodologies used and timelines established for conducting criticality assessments, risk assessments, and security vulnerability assessments (SVAs), if applicable;
- Reference other company plans, policies and procedures such as insider threat, business continuity, incident response and recovery plans;
- Be reviewed on an annual basis, and updated as required based on findings from assessments, major modifications to the system or any of its facilities, substantial changes to the environment in which it operates, or other significant changes;
- Be protected from unauthorized access based on company policy; and,
- Be provided to TSA for review upon request.

3.2 Security Plan Elements

This section identifies and provides a brief description of the recommended elements of a corporate security plan. In developing their plan, operators should incorporate these elements in a format that is most suitable to their organization.

- **System(s) Description** - Identify the pipeline system(s) to which the plan applies.
- **Security Administration and Management Structure** - Identify the person(s) primarily responsible for the corporate security program, and describe the responsibilities and duties of personnel assigned to security functions.
- **Risk Analysis and Assessments** - Describe the methodology used to conduct security risk analysis to include criticality assessments and SVAs.
- **Physical Security and Access Control Measures** - Describe the corporate policies and procedures employed to reduce security risks throughout the company.
- **Equipment Maintenance and Testing** - Discuss policies and procedures for ensuring security systems and equipment are maintained and function properly.

- **Personnel Screening** - Describe policies and procedures for conducting employee background checks, including criteria for disqualification and process for appeal, in compliance with Federal and state laws. Describe company policies for contractor personnel background checks.
- **Communications** - Describe the policies and procedures employed to ensure effective communication is maintained on both a routine and emergency basis. The description should include, but not be limited to, types of equipment used, communication methods between personnel, facilities, off-site responders, and procedures for notification of government and law enforcement agencies.
- **Personnel Training** - Describe security training requirements, to include training in security equipment operation, security awareness, and security incident recognition and reporting procedures for company personnel and contractors.
- **Drills and Exercises** - Describe company policies and procedures for conducting security drills and exercises. Establish requirements for after-action reports, communication of lessons learned, and implementation of security improvement efforts based on exercise results.
- **Security Incident Procedures** - Describe procedures for responding to security incidents and emergencies. Define the types of events that constitute a breach of security, describe the procedures for investigating security incidents, and who should be notified. In addition, the emergency response plan may be referenced in this section.
- **NTAS Response Procedures** - Describe the operator's additional protective measures for periods of heightened threat corresponding to the duration of Department of Homeland Security (DHS) NTAS Bulletins or Alerts.
- **Plan Reviews** - Describe policies and procedures for the review, validation, and updating of the corporate security plan.
- **Recordkeeping** - Describe security-related recordkeeping requirements, such as for criticality assessments, SVAs, and other company sensitive security information, as well as measures to prevent unauthorized disclosure.
- **Cyber/SCADA System Security Measures** - Describe the corporate policies and procedures employed to reduce security risks to cyber/SCADA systems and assets throughout the company. If a separate cyber/SCADA security plan is maintained, it should be incorporated by reference.
- **Essential Security Contact Listings** - List internal and external emergency contact information for reporting and responding to a security incident or suspicious activity.
- **Security Testing and Audits** - Describe policies and procedures for auditing and testing of the effectiveness of the company's security plan and procedures, to include documentation of results.
- **Outreach** - Describe policies and procedures for company security awareness outreach efforts to neighbors, law enforcement, media, and the public.

4 RISK ANALYSIS

4.1 Introduction

The intent of these guidelines is to bring a risk-based approach to the application of the security measures throughout the pipeline industry. As stated in the National Infrastructure Protection Plan, DHS assesses risk as a function of threats, vulnerabilities, and consequences. With this in mind, the most effective security programs employ a risk management process that facilitates planning and decision making to mitigate risks for pipeline assets. General elements include:

- Assessments used to determine facility criticality;
- Threat assessments identifying known or potential adversaries;
- Vulnerability assessments identifying security weaknesses;
- Risk assessments (based on threat, vulnerability, and consequence, considering facility criticality assessment findings);
- Risk mitigation to determine and implement appropriate risk reduction countermeasures; and
- Ongoing risk management to monitor, reassess, and modify the program.

Recognizing that there are multiple risk assessment methodologies, each operator should determine the process and methodology most appropriate for implementation of the corporate security plan at the facilities comprising their pipeline system. TSA may ask to review the operator's risk assessment methodology.

4.2 Criticality Assessment

Determining facility criticality is an essential first step in the security risk management process. Information and findings gathered in the criticality assessment assist operators with prioritizing assets and implementing risk reduction countermeasures. Operators should evaluate each operating facility within their system using the criteria outlined in Section 5.2 to determine or validate criticality. Operators should:

- Conduct facility criticality assessments on a periodic basis, not to exceed 18 months, for all facilities;
- Document the methodology used, and retain the criticality assessment until no longer valid;
- Conduct an SVA or the equivalent as outlined in Section 4.3 of this document for facilities determined to be critical; and
- Maintain and secure the company's list of critical facilities.

The operator's list of critical facilities is subject to review and evaluation by TSA. Operators and TSA will work together towards concurrence on the facilities listed.

4.3 Security Vulnerability Assessment

A security vulnerability assessment (SVA) is one of the risk assessment methodologies pipeline operators may choose. The SVA serves as a planning and decision support tool to assist security managers with identifying, evaluating, and prioritizing risks and determining effective security measures to mitigate threats and vulnerabilities to their critical facilities. Common steps performed while conducting an SVA include:

- Asset Characterization - identification of hazards and consequences of concern for the facility, its surroundings, and its supporting infrastructure; and identification of existing layers of protection;
- Threats Assessment - description of possible internal and external threats;
- Security Vulnerability Analysis - identification of potential security vulnerabilities and existing countermeasures and their level of effectiveness in reducing identified vulnerabilities;
- Risk Assessment - determination of the relative degree of risk to the facility in terms of the expected effect on each asset and the likelihood of success of an attack; and
- Countermeasures Analysis – comparison of strategies that reduce the probability of a successful attack or reduce the possible degree of success, strategies that enhance the degree of risk reduction, the capabilities and effectiveness of mitigation options, and the feasibility of the options.

Operators of critical pipeline facilities should:

- Conduct an SVA or the equivalent on a periodic basis, not to exceed 36 months, and within 12 months after completion of a significant enhancement or modification to the facility;
- Conduct an SVA or the equivalent for newly identified or constructed critical facilities within 12 months of designation or after achieving operational status.
- Document findings from each assessment and retain them until no longer valid;
- Implement appropriate findings from the SVA in a timely fashion but no later than 24 months after SVA completion; and
- Document the assessment methodology used and make the documentation available for TSA review upon request.

5 CRITICALITY

5.1 Introduction

The objective in determining which pipeline facilities are critical is to ensure that reasonable appropriate security risk reduction measures are implemented thereby reducing the impact of service disruptions to critical infrastructure and the public.

5.2 Facility Criticality

The designation of critical pipeline facilities is a challenging task considering the diverse operational and market environments spanning the pipeline industry. Pipeline operators are uniquely positioned to understand the criticality of their operations and the infrastructure necessary to serve those functions. Pipeline companies should develop a written policy and procedure to identify critical facilities in accordance with their enterprise risk management process and the TSA guidance below.

To aid operators in applying the guidance, the criteria are differentiated for each of the three major pipeline subsectors:

- natural gas distribution
- natural gas transmission (to include LNG peak shaving and satellite plants)
- hazardous liquid transmission

Determination of pipeline critical facilities:

- TSA is responsible for notifying pipeline operators of TSA-designated critical pipeline systems. Operators should pay particular attention to identifying critical facilities on these systems.
- A pipeline facility is considered critical if it provides primary service to designated critical infrastructure and is determined by the operator to be a "single point of failure" (i.e., does not have redundancy or systematic backup). TSA defines a single point of failure as a facility that if rendered inoperable would degrade service to critical infrastructure to the point that the infrastructure would not be able to satisfactorily perform its critical mission.
- Operators are responsible for conducting an operational assessment and identifying specific pipeline facilities that are necessary for critical pipeline systems (as designated by TSA) to function.
- System redundancies, contingency plans and available mitigations may be considered when evaluating the criticality of a facility. If requested, operators should provide TSA documentation including how identified redundancies are evaluated. This documentation is protected from unauthorized disclosure as sensitive security information. As external mutual aid is not under the control of the operator, it should not be considered as a contingency or mitigation factor when identifying critical facilities.
- Operators should coordinate with the appropriate internal company business functions, (e.g., sales, marketing, and rates (tariffs)) to identify pipeline feeds to potentially critical

infrastructure, including large volume customers such as natural gas-fired power generation plants, military bases and defense industrial base manufacturers.

- Operators may take into consideration whether firm or interruptible contracts are in place. In general, contracts for interruptible service may indicate the dependency on a fuel source is not vital to that critical infrastructure; however, this assumption should be validated with owners of said critical infrastructure.
- Operators may consider adjustments based on the severity of consequences as a result of the loss of a facility or disruption in service (e.g., climate conditions, restart capability and life-safety).
- Operators may consider their ability to continue operations (e.g., product free flow or alternate or redundant prime-mover capacity) as an adequate facility backup as long as they demonstrate no impact to deliverability.
- TSA, in consultation with pipeline operators, may designate specific pipeline facilities as critical in accordance with this guidance.
- Operators may set more stringent criteria and designate facilities as critical in addition to those meeting the guidance below.

A pipeline facility is defined as new and existing pipelines, rights of way, and any equipment, facility, or building used in the transportation of gas or hazardous liquids or in the treatment of gas or hazardous liquids during the course of transportation.[1] Critical facilities may include, but are not limited to:

- pipeline interconnections
- metering and/or regulating stations
- pump stations
- compressor stations
- operational control facilities
- main line valves
- tank farms, terminals

If damage or destruction of a facility has the potential to meet at least one of the following criteria, the facility or facilities should be designated as critical.

[1] Consistent with definitions in 49 CFR § 192.3, 193.2007 and 195.2.

Table 1: Critical Facility Criteria

Criteria	Subsector	Guidance
1. Disrupt or significantly reduce required service or deliverability to installations identified as critical to national defense.		TSA will notify pipeline operators who directly serve installations or defense industrial base (DIB) manufacturers deemed critical to national defense and who rely on the pipeline commodity to perform a critical mission at that location.
	Natural Gas Distribution	Natural gas distribution operators should designate as critical those facilities that must function to provide service to critical defense installations or DIB manufacturers with a firm contract.
	Natural Gas Transmission	Natural gas transmission operators should designate as critical those facilities that must function to provide service to critical defense installations or DIB manufacturers with a firm contract.
	Hazardous Liquid Transmission	Hazardous liquid transmission operators should designate as critical those facilities that must function to provide service to critical defense installations or DIB manufacturers.
2. Disrupt or significantly reduce required service or deliverability to key infrastructure (such as power plants or major airports) resulting in major operational disruption.		TSA will notify pipeline operators of key infrastructure they serve (e.g., "black start" electric power generation plants, Category X airports and service to the Strategic Petroleum Reserve).
	Natural Gas Distribution	Service to Natural Gas-Fired Power Generation Plants Natural gas distribution operators should designate as critical those facilities that must function to provide service to power generation facilities that: • Directly serve as Defense Critical Electric Infrastructure as identified by Department of Energy (DOE) and with firm contract • Receive natural gas in excess of 30,000 MMcf annually per a firm contract as listed on Energy Information Administration (EIA) Form 923 (Power Plant Operations Report (Annual)) • Serve as a "black start" electric generation plant with firm contract
	Natural Gas Transmission	Service to Natural Gas-Fired Power Generation Plants Natural gas transmission operators should designate as critical those facilities that must function to provide service to power generation facilities that: • Directly serve as Defense Critical Electric Infrastructure as identified by DOE and with firm contract

Criteria	Subsector	Guidance
2. Disrupt or significantly reduce required service or deliverability to key infrastructure (such as power plants or major airports) resulting in major operational disruption. (Cont.)	Natural Gas Transmission (Cont.)	• Receive natural gas in excess of 30,000 MMcf annually per a firm contract as listed on EIA Form 923 (Power Plant Operations Report (Annual)) • Serve as a "black start" electric generation plant with firm contract
	Hazardous Liquid Transmission	Service to Category X Airports Hazardous liquid transmission operators should designate as critical those facilities that must function to provide service to TSA designated Category X airports. Service to the Strategic Petroleum Reserve (SPR) Hazardous liquid transmission operators should designate as critical those facilities that must function to provide service to or within the SPR sites.
3. Cause mass injuries, casualties or significant health or environmental effects.[2]	Natural Gas Distribution	Operator-Generated Methodology In addition to guidance below, natural gas distribution operators should use their own methodology to designate additional critical facilities which may cause mass casualty or significant health effects. Operators should consider variation in service territory and facility siting, differences in regional weather extremes and distinctions among risk profiles. Facilities Operating Near Occupied Buildings or Areas Natural gas operators should evaluate their facilities through their Distribution Integrity Management Program (DIMP)[3] or comparable risk methodology and designate as critical those facilities that: • Operate at pressures above 125 PSIG • Operate in a Class 4 location (regardless of operating pressure) as defined in the Dept. of Transportation (DOT) 49 Code of Federal Regulations [4] • Operate in a Class 3 location (regardless of operating pressure) and do not have service regulators installed or redundant overpressure protection systems

[2] For these guidelines, a mass casualty incident is defined as an event that overwhelms the local healthcare system, where the number of casualties vastly exceeds the local resources and capabilities in a short period of time.
[3] 49 CFR, Part 192 Subpart P, Gas Distribution Pipeline Integrity Management (IM).
[4] 49 CFR § 192.5.

Criteria	Subsector	Guidance
3. Cause mass injuries, casualties or significant health or environmental effects. (Cont.)	Natural Gas Distribution (Cont.)	High Risk (Tiered) Facilities under DHS CFATS Natural gas distribution operators should review and consider as critical all facilities designated as high risk under the DHS Chemical Facility Anti-Terrorism Standards (CFATS) program.
	Natural Gas Transmission	Facilities Operating in HCAs Natural gas transmission operators should designate as critical all facilities operating in High Consequence Areas (HCAs) as defined in Dept. of Transportation (DOT) 49 Code of Federal Regulations.[5] HCAs could include designated human health-safety, structure or human occupancy impact zones from a release of natural gas. High Risk (Tiered) Facilities under DHS CFATS Natural gas transmission operators should review and consider as critical all facilities designated as high risk under the DHS Chemical Facility Anti-Terrorism Standards (CFATS) program.
	Hazardous Liquid Transmission	Facilities Operating in HCAs Hazardous liquid transmission operators should designate as critical all facilities operating in High Consequence Areas (HCAs) as defined in Dept. of Transportation (DOT) 49 Code of Federal Regulations.[6] HCAs can include commercially navigable waterways, high population areas, other populated areas, or unusually sensitive areas. High Risk (Tiered) Facilities under DHS CFATS Hazardous liquid transmission operators should review and consider as critical all facilities designated as high risk under the DHS Chemical Facility Anti-Terrorism Standards (CFATS) program.
4. Disrupt or significantly reduce required service or deliverability resulting in a state or local government's inability to provide essential public services and emergency response for an	Natural Gas Distribution	Natural gas distribution operators should designate as critical those facilities that directly support essential public services and emergency response and which rely on natural gas to perform their critical mission. Consideration should be given to: • government complexes or hubs that function as a state's primary government facility, including executive, legislative and judicial complexes • state emergency response headquarters

[5] 49 CFR § 192.903 and Appendix E to Part 192: Guidance on Determining High Consequence Areas and on Carrying Out Requirements in the Integrity Management Rule.
[6] 49 CFR § 195.450, 195.452 and Appendix C to Part 195: Guidance for Implementation of an Integrity Management Plan.

Criteria	Subsector	Guidance
extended period of time.	Natural Gas Distribution (Cont.)	• complexes that provide essential public service or emergency response capability[7] Operators should coordinate with the appropriate state office (e.g., State Office of Emergency Management) to identify essential public service and emergency response facilities. In the case that state offices are nonresponsive to operator requests, TSA will work with DHS to facilitate this coordination. For this criterion, an extended period of time is defined as the inability to provide essential public services and emergency response for seven or more consecutive days due to a disruption of natural gas distribution service.
	Natural Gas Transmission	Not applicable
	Hazardous Liquid Transmission	Hazardous liquid transmission operators should designate as critical those facilities that directly support essential public services and emergency response and which rely on hazardous liquids to perform their critical mission. Consideration should be given to: • government complexes or hubs that function as a state's primary government facility, including executive, legislative and judicial complexes • state emergency response headquarters • complexes that provide essential public service or emergency response capability[8] Operators should coordinate with the appropriate state office (e.g., State Office of Emergency Management) to identify essential public service and emergency response facilities. In the case that state offices are nonresponsive to operator requests, TSA will work with DHS to facilitate this coordination. For this criterion, an extended period of time is defined as the inability to provide essential public services and emergency response for seven or more consecutive days due to a disruption of hazardous liquid transmission service.

[7] See FEMA *Continuity Guidance Circular* (February 2018) and particularly National Essential Functions 6 – Provide Emergency Services, 7 – Maintain Economic Stability, and 8 – Provide Basic Essential Services.
[8] See FEMA *Continuity Guidance Circular* (February 2018) and particularly National Essential Functions 6 – Provide Emergency Services, 7 – Maintain Economic Stability, and 8 – Provide Basic Essential Services.

Criteria	Subsector	Guidance
5. Disrupt or significantly reduce the intended usage of major rivers, lakes, or waterways (for example, public drinking water for large populations or disruption of major commerce or public transportation routes).	Natural Gas Distribution	Not applicable
	Natural Gas Transmission	Not applicable
	Hazardous Liquid Transmission	Hazardous liquid transmission operators should designate as critical all pipeline facilities that could significantly impact public drinking water sources if state or local advisories are issued. Hazardous liquid transmission operators should designate as critical all pipeline facilities subject to Oil Pipeline Response Plans[9] impacting a PHMSA-defined Major River-High Volume Area or Other Navigable Waters.[10] Hazardous liquid transmission operators are encouraged to consult with environmental/risk specialists with expertise in this area.
6. Disrupt or significantly reduce required service or deliverability to a significant number of customers or individuals for an extended period of time.	Natural Gas Distribution	Natural gas distribution operators should designate as critical all facilities that if disrupted for more than seven consecutive days would experience reduced service or deliverability to 100,000 or more meters.
	Natural Gas Transmission	Not applicable
	Hazardous Liquid Transmission	Not applicable
7. Significantly disrupt pipeline system operations for an extended period of time.	Natural Gas Distribution	Natural gas distribution operators should designate as critical all pipeline facilities where the loss or disruption of facility operations lasting more than seven days would significantly impact overall deliverability and system safety. Factors to consider in determining criticality of a facility include: • whether a facility contains components not readily available to the operator due to long lead times or limited geographic sourcing • if a facility contains critical pipeline cyber assets[11] Natural gas distribution operators should identify as critical operational control rooms without a hot site backup (i.e., a backup control room that is continuously running and where all hardware and software are run concurrently with the primary site).

[9] 49 CFR, Part 194 – Response Plans for Onshore Oil Pipelines.
[10] 49 CFR, Part 194 – Response Plans for Onshore Oil Pipelines, Appendix B.
[11] Section 7.2, TSA *Pipeline Security Guidelines* (March 2018).

Criteria	Subsector	Guidance
7. Significantly disrupt pipeline system operations for an extended period of time. (Cont.)	Natural Gas Transmission	Natural gas transmission operators should designate as critical all pipeline facilities where the loss or disruption of facility operations lasting more than 14 days would significantly impact overall deliverability and system safety. Factors to consider in determining criticality of a facility include: • whether a facility contains components not readily available to the operator due to long lead times or limited geographic sourcing • if a facility contains critical pipeline cyber assets[12] Natural gas transmission operators should identify as critical operational control rooms without a hot site backup (i.e., a backup control room that is continuously running and where all hardware and software are run concurrently with the primary site).
	Hazardous Liquid Transmission	Hazardous liquid transmission operators should designate as critical all pipeline facilities where the loss or disruption of facility operations lasting more than seven days would significantly impact overall deliverability and system safety. Factors to consider in determining criticality of a facility include: • whether a facility contains components not readily available to the operator due to long lead times or limited geographic sourcing • if a facility contains critical pipeline cyber assets[13] Hazardous liquid transmission operators should identify as critical operational control rooms without a hot site backup (i.e., a backup control room that continuously running and where all hardware and software are run concurrently with the primary site).

[13] Section 7.2, TSA *Pipeline Security Guidelines* (March 2018).

6 FACILITY SECURITY MEASURES

6.1 Introduction

Upon completion of the risk analysis process, operators should determine the appropriate mitigation measures for both critical and non-critical facilities.

6.2 Baseline and Enhanced Security Measures

Pipeline operators should develop and implement baseline security measures at all of their facilities.

Operators should develop and implement **both** baseline and enhanced security measures at each of their critical facilities.

Table 2 identifies the baseline and enhanced security measures for operators to implement at appropriate pipeline facilities. Recurring actions are summarized in Appendix A.

6.3 Site-Specific Security Measures

Operators should develop, document, and implement site-specific security measures for each of their critical facilities. These measures should be tailored explicitly for each facility and address specific actions to be taken in response to pertinent NTAS Bulletins or Alerts. On a periodic basis, not to exceed 18 months, these site-specific security measures should be reviewed and updated as necessary.

Table 2: Baseline and Enhanced Security Measures

	BASELINE SECURITY MEASURES	ENHANCED SECURITY MEASURES
Physical Security and Access Control	**Fencing / Barriers**	
	Employ measures to impede unauthorized access to facilities.	Create a security perimeter that impedes unauthorized vehicles from entering the facility perimeter or critical areas by installing and maintaining barriers (e.g., fences, bollards, jersey barriers, or equivalent.)
	Maintain fences, if used, without gaps around gates or underneath the fence line.	
	Ensure that there is a clear zone for several feet on either side of the fence, free of obstructions, vegetation, or objects that could be used for concealment or to scale the fence.	
	Access Controls	
	Employ measures to impede unauthorized persons from gaining access to a facility and restricted areas within a facility.	Implement procedures (such as manual or electronic sign in/out) for controlling access to the facility and restricted buildings or areas within the facility.
	Close and secure perimeter gates or entrances when not in use.	Monitor and escort visitors at critical facilities.
	Post “No Trespassing” or “Authorized Personnel Only” signs at intervals that are visible from any point of potential entry.	
	Gates	
		Install and maintain gates of an equivalent quality to the barrier to which they are attached.
	Locks and Key Control	
		Establish and document key control procedures for key issuance, tracking, collection, loss, and unauthorized duplication.
		Use patent keys to prevent unauthorized duplication.
		Conduct key inventories every 24 months.

Table 2: Baseline and Enhanced Security Measures

	BASELINE SECURITY MEASURES	ENHANCED SECURITY MEASURES
Physical Security and Access Control	**Facility Lighting**	
		Provide sufficient illumination for human or technological recognition of intrusion into the facility perimeter or critical areas.
	Intrusion Detection & Monitoring	
		Provide critical facilities or critical areas within a facility with security measures to monitor, detect, and assess unauthorized access 24 hours a day, 7 days a week.
Personnel Security	**Personnel Identification and Badging**	
	Develop identification and badging policies and procedures for personnel who have access to secure areas or sensitive information. These policies should address: • Lost or stolen identification cards or badges; • Temporary badges; and • Personnel termination.	Ensure that company or vendor identification is available for examination by being visibly displayed or carried by personnel while on-site.
		Ensure personnel identification cards or badges are secure from tampering and contain the individual's photograph and name.
	Background Investigation	
	Establish policies and procedures for applicant pre-employment screening and behavioral criteria for disqualification of applicants and employees.	Conduct pre-employment background investigations of applicants for positions that are: • Authorized regular unescorted access to control systems or sensitive areas; • Authorized access to sensitive information; • Assigned security roles; • Assigned to work at or granted access rights to critical facilities. At a minimum, investigations should: • Verify and validate identity; • Check criminal history*; and • Verify and validate legal authorization to work. * NOTE: Operators should consider using the Federally-established list of disqualifying crimes (see 49 CFR 1572.103) to assess the suitability of their personnel for these positions.

Table 2: Baseline and Enhanced Security Measures

	BASELINE SECURITY MEASURES	ENHANCED SECURITY MEASURES
Personnel Security		Verify that contractors have background investigation policies and procedures at least as rigorous as the pipeline operator's.
		Conduct recurring background investigations on a regular basis (as labor laws or bargaining unit contracts allow), not to exceed 10 years, for employees occupying security positions or who have access to sensitive information or areas.
Equipment Maintenance and Testing	**Equipment Maintenance and Testing**	
	Develop and implement a maintenance program to ensure security systems are in good working order.	Through routine use or quarterly examination, verify the proper operation and/or condition of all security equipment.
	Identify and respond to security equipment malfunctions or failures in a timely manner.	
		Provide an equivalent level of protective security measures to mitigate risk during power outages, security equipment failure, or extended repair of security systems.
Design & Construction	**Design and Construction**	
	Integrate security risk mitigation measures during the design, construction, or renovation of a facility.	Conduct an SVA for newly identified or constructed critical facilities within 12 months of designation or after achieving operational status.
		Update the facility SVA within 12 months following significant modifications.
Communication	**Communication**	
	Develop internal and external notification requirements and procedures for security events.	Ensure primary and alternate communication capabilities exist for internal and external reporting of appropriate security events and information.
	Document and periodically update contact (who) and communication (how) information for Federal, state, and local homeland security/law enforcement agencies. (See Appendix B for TSA contact information.)	Establish a defined process for receiving, handling, disseminating, and storing security and threat information.

Table 2: Baseline and Enhanced Security Measures

	BASELINE SECURITY MEASURES	ENHANCED SECURITY MEASURES
Personnel Training	**Personnel Training**	
	Provide security awareness briefings, to include security incident recognition and reporting procedures, for personnel with unescorted access upon hiring and every 3 years thereafter.	Provide security training, to include incident response training, to personnel assigned security duties upon hiring and annually thereafter.
	Document security training and maintain records in accordance with company record retention policy.	
Drills and Exercises	**Drills and Exercises**	
	Conduct periodic security drills or exercises, to include announced or unannounced tests of security and incident plans. These can be conducted in conjunction with other required drills or exercises. * NOTE: Response to an actual security incident can satisfy this measure.	Conduct or participate in an annual security drill or exercise. Multiple facilities may participate in a common drill or exercise.
		Develop and implement a written post-event report assessing security drills or exercises and documenting corrective actions.
Security Incident Procedures	**Security Incident Procedures**	
	Implement procedures for responding to security incidents or emergencies and to pertinent National Terrorism Advisory System (NTAS) Bulletins or Alerts. These procedures should include the appropriate reporting requirements.	
	Post bomb threat checklists by telephones at staffed facilities.	

Table 2: Baseline and Enhanced Security Measures

	BASELINE SECURITY MEASURES	ENHANCED SECURITY MEASURES
Recordkeeping	**Recordkeeping**	
	Develop and document recordkeeping policies and procedures for security information. Protection of SSI in accordance with the provisions of 49 CFR Parts 15 and 1520 should be specifically addressed.	
	The following documents, as appropriate, should be retained until superseded or replaced: • Corporate Security Plan; • Criticality assessment(s); • Training records; • Security drill or exercise reports; • Incident response plan(s); • Security testing and audits. Make security information records available to TSA upon request.	In addition to the documents specified for non-critical facilities, the following documents, applicable to critical facilities, should be retained until superseded or replaced: • SVA(s); • Site-specific measures. Make security information records available to TSA upon request.
Outreach	**Outreach**	
		Conduct outreach to nearby law enforcement agencies to ensure awareness of the facility's functions and significance.
		Conduct outreach to neighboring businesses to coordinate security efforts. Also conduct outreach to neighboring residences to provide facility security awareness.

7 PIPELINE CYBER ASSET SECURITY MEASURES

7.1 Introduction

The operational technology used by the operators to manage their infrastructure and products are vital to the pipeline system's safe and efficient operation. "Operational technologies" (OT) are the systems that detect or cause a change through the direct monitoring and/or control of physical devices, processes and events in the pipelines. OT systems include control systems (SCADA, process control systems (PCS), distributed control systems (DCS)), measurement systems and telemetry systems, which are collectively referred to as "pipeline cyber assets."

The National Institute of Standards and Technology (NIST) has developed the *Framework for Improving Critical Infrastructure Cybersecurity,* a set of standards and best practices to assist organizations in managing cybersecurity risks and to promote the protection of critical infrastructure. To implement an effective cybersecurity strategy, pipeline operators should consider the approach outlined in the NIST Framework and the guidance issued by DHS and the Department of Energy along with industry-specific or other established methodologies, standards, and best practices (see Section 7.4).

7.2 Pipeline Cyber Assets Classification

Operators should evaluate pipeline cyber assets and classify them using the following criteria:

- Critical pipeline cyber assets are OT systems that can control operations on the pipeline. Baseline and enhanced security measures should be applied to these assets.
- Non-critical pipeline cyber assets are OT systems that monitor operations on the pipeline. Baseline security measures should be applied to these assets.

7.3 Security Measures for Pipeline Cyber Assets

Table 3 shows the baseline and enhanced cybersecurity measures that pipeline operators should apply to pipeline cyber assets based on their criticality designation. These measures incorporate updates to the previous TSA Pipeline Security Guidelines as well as recommendations and practices from the government and industry documents listed in Section 7.4. The cybersecurity guidelines that follow are organized according to the relevant functions and categories presented in the NIST Framework.

Table 3: Baseline and Enhanced Cyber Security Measures

	Baseline Security Measures	Enhanced Security Measures
Identify	**Asset Management**	
	Establish and document policies and procedures for assessing and maintaining configuration information, for tracking changes made to the pipeline cyber assets, and for patching/upgrading operating systems and applications. Ensure that the changes do not adversely impact existing cybersecurity controls.	Employ mechanisms to maintain accurate inventory and to detect unauthorized components.
	Develop and maintain a comprehensive set of network/system architecture diagrams or other documentation, including nodes, interfaces, remote and third party connections, and information flows.	Review network connections periodically, including remote and third party connections. Develop a detailed inventory for every endpoint.
	Review and assess pipeline cyber asset classification as critical or non-critical at least every 12 months.	
	Business Environment	
	Ensure that any change that adds control operations to a non-critical pipeline cyber asset results in the system being recognized as a critical pipeline cyber asset and enhanced security measures being applied.	
	Governance	
	Establish and distribute cybersecurity policies, plans, processes and supporting procedures commensurate with the current regulatory, risk, legal and operational environment.	
	Review and assess all cybersecurity policies, plans, processes, and supporting procedures regularly, not to exceed 36 months, or when there is a significant organizational or technological change. Update as necessary.	Review and assess all cybersecurity policies, plans, processes, and supporting procedures regularly, not to exceed 12 months, or when there is a significant organizational change. Update as necessary.
	Risk Management Strategy	
	Develop an operational framework to ensure coordination, communication and accountability for information security on and between the control systems and enterprise networks.	

Table 3: Baseline and Enhanced Cyber Security Measures

	Baseline Security Measures	Enhanced Security Measures
Identify	**Risk Assessment**	
	Establish a process to identify and evaluate vulnerabilities and compensating security controls.	Ensure threat and vulnerability information received from information sharing forums and sources are made available to those responsible for assessing and determining the appropriate course of action.
Protect	**Access Control**	
	Establish and enforce unique accounts for each individual user and administrator, establish security requirements for certain types of privileged accounts, and prohibit the sharing of these accounts. In instances where systems do not support unique user accounts, then implement appropriate compensating security controls (e.g., physical controls).	Restrict user physical access to control systems and control networks through the use of appropriate controls. Employ more stringent identity and access management practices (e.g., authenticators, password-construct, access control).
	Ensure that user accounts are modified, deleted, or de-activated expeditiously for personnel who no longer require access or are no longer employed by the company.	
	Establish and enforce access control policies for local and remote users. Procedures and controls should be in place for approving and enforcing policy for remote and third-party connections.	Monitor physical and remote user access to critical pipeline cyber assets.
	Ensure appropriate segregation of duties is in place. In instances where this is not feasible, apply appropriate compensating security controls.	
	Change all default passwords for new software, hardware, etc., upon installation. In instances where changing default passwords is not technically feasible (e.g., a control system with a hard-coded password), implement appropriate compensating security controls (e.g., administrative controls).	Employ mechanisms to support the management of accounts.

Table 3: Baseline and Enhanced Cyber Security Measures

	Baseline Security Measures	Enhanced Security Measures
Protect	**Awareness and Training**	
	Ensure that all persons requiring access to the organization's pipeline cyber assets receive cybersecurity awareness training.	Provide role-based security training on recognizing and reporting potential indicators of system compromise prior to obtaining access to the critical pipeline cyber assets.
	Establish and execute a cyber-threat awareness program for employees. This program should include practical exercises/testing.	
	Data Security & Information Protection	
	Establish and implement policies and procedures to ensure data protection measures are in place, including identifying critical data and establishing classification of different types of data, establishing specific handling procedures, and protections and disposal.	
	Protective Technology	
	Segregate and protect the pipeline cyber assets from enterprise networks and the internet using physical separation, firewalls and other protections.	
	Regularly validate that technical controls comply with the organization's cybersecurity policies, plans and procedures, and report results to senior management.	
	Implement technical or procedural controls to restrict the use of pipeline cyber assets for only approved activities.	
Detect	**Anomalies and Events**	
	Implement processes to generate alerts and log cybersecurity events in response to anomalous activity. Review the logs and respond to alerts in a timely manner.	
	Security Continuous Monitoring	
	Monitor for unauthorized access or the introduction of malicious code or communications.	
	Conduct cyber vulnerability assessments as described in your risk assessment process	Utilize independent assessors to conduct pipeline cyber security assessments.

Table 3: Baseline and Enhanced Cyber Security Measures

	Baseline Security Measures	Enhanced Security Measures
Detect	**Detection Processes**	
	Establish technical or procedural controls for cyber intrusion monitoring and detection.	
	Perform regular testing of intrusion and malware detection processes and procedures.	
Respond	**Response Planning**	
	Establish policies and procedures for cybersecurity incident handling, analysis and reporting, including assignment of the specific roles/tasks to individuals and teams.	Conduct cybersecurity incident response exercises periodically.
	Establish and maintain a cyber-incident response capability.	Establish and maintain a process that supports 24 hours a day cyber incident response.
	Communications	
	Report significant cyber incidents to senior management; appropriate federal, state, local, tribal, and territorial (SLTT) entities; and applicable ISAC(s).	Pipeline operators should follow the notification criteria in Appendix B
	Mitigation	
	Ensure the organization's response plans and procedures include mitigation measures to help prevent further impacts.	
Recover	**Recovery Planning**	
	Establish a plan for the recovery and reconstitution of pipeline cyber assets within a timeframe to align with the organization's safety and business continuity objectives.	
	Improvements	
	Review the organization's cyber recovery plan annually. Update as necessary.	

7.4 Cyber Security Planning and Implementation Guidance

The following is a list of planning and implementation guidance developed by industry or Federal government entities. Operators should consult the current edition of these and other cyber security references on a frequent basis in developing and reviewing their company's cyber security program.

- American Chemistry Council, *Guidance for Addressing Cyber Security in the Chemical Industry*
- American Gas Association (AGA) Report Number 12, *Cryptographic Protection of SCADA Communications, Part 1: Background, Policies and Test Plan*

- U.S Department of Homeland Security, Transportation *Systems Sector Cybersecurity Framework Implementation Guidance,* June 2015

8 PROTECTIVE MEASURES FOR NATIONAL TERRORISM ADVISORY SYSTEM (NTAS) ALERTS

The Department of Homeland Security's NTAS provides a framework to disseminate information via Bulletins or Alerts regarding the threat of terrorist acts to the nation.

TSA has developed a supplement to this document containing recommended security measures to reduce vulnerabilities to pipeline systems and facilities during periods of heightened threat and to establish a consistent security posture within the pipeline industry. This supplement is unclassified but sensitive and is marked as Sensitive Security Information (SSI). The password- protected document may be obtained by email request to pipelinesecurity@dhs.gov.

APPENDIX A – RECURRING ACTIONS

	RECURRING ACTIONS				
	12 Months	**18 Months**	**24 Months**	**36 Months**	**Other**
Baseline	Perform an annual review of the corporate security plan and update as required. (Section 3.1)	Conduct facility criticality assessments on a periodic basis, not to exceed 18 months. (Section 4.2)			Periodically update contact and communications information for government agencies. (Table 2 Communication)
					Conduct security drills or exercises on a periodic basis. (Table 2 Drills and Exercises)
	Review and assess pipeline cyber asset classification as critical or non-critical at least every 12 months. (Table 3 Cyber Asset Management)			Review and assess all cybersecurity policies, plans, processes, and supporting procedures regularly, not to exceed 36 months. (Table 3 Cyber Governance)	Perform regular testing of intrusion and malware detection processes and procedures. (Table 3 Cyber Detection Processes)
	Review the organization's cyber recovery plan annually. (Table 3 Cyber Improvements)				Conduct cybersecurity incident response exercises periodically. (Table 3 Cyber Response Planning)
					Periodically review facility staffing requirements for implementing additional security measures. (NTAS Supplement, p.1)
					Provide notification of a pipeline incident in accordance with Appendix B.

RECURRING ACTIONS					
	12 Months	**18 Months**	**24 Months**	**36 Months**	**Other**
Enhanced	Conduct a SVA within 12 months of significant modification to a critical facility, a newly identified critical facility or a newly constructed facility identified as critical. (Section 4.3)		Implement appropriate findings NLT 24 months after SVA completion. (Section 4.3)	Conduct periodic SVAs, not to exceed 36 months. (Section 4.3)	
		Review site-specific security measures periodically, not to exceed 18 months. (Section 6.3)	Conduct key inventories every 24 months. (Table 2 Locks and Key Control)		Verify the proper operation and/or condition of all security equipment through routine use or quarterly examination. (Table 2 Equipment Maintenance and Testing)
	Conduct or participate in an annual security drill or exercise. (Table 2 Exercises and Drills)				Conduct recurring background investigations, not to exceed 10 years, for employees occupying security positions or in sensitive positions. (Table 2 Background Investigation)
	Provide security training to personnel assigned security duties upon hiring and annually thereafter. (Table 2 Personnel Training)			Provide security awareness briefings for personnel with unescorted access upon hiring and every 3 years thereafter. (Table 2 Personnel Training)	
	Review and assess all cybersecurity policies, plans, processes, and supporting procedures regularly, not to exceed 12 months. (Table 3 Cyber Governance)				

Note: 1. Baseline measures apply to all pipeline operators. Enhanced measures apply to operators' critical facilities.
2. All baseline and enhanced security measures are detailed in Section 6 of this document.

APPENDIX B - TSA NOTIFICATION CRITERIA

As the lead Federal agency for pipeline security, TSA requests to be notified of security incidents that are indicative of a deliberate attempt to disrupt pipeline operations or activities that could be considered precursors to such an attempt. Pipeline operators should notify the Transportation Security Operations Center (TSOC) via phone at 866-615-5150 or email at TSOC.ST@dhs.gov as soon as possible if any of the following incidents occurs or if there is other reason to believe that a terrorist incident may be planned or may have occurred:

- Explosions or fires of a suspicious nature affecting pipeline systems, facilities, or assets;
- Actual or suspected attacks on pipeline systems, facilities, or assets;
- Bomb threats or weapons of mass destruction (WMD) threats to pipeline systems, facilities, or assets;
- Theft of pipeline company vehicles, uniforms, or employee credentials;
- Suspicious persons or vehicles around pipeline systems, facilities, assets, or right-of-way;
- Suspicious photography or possible surveillance of pipeline systems, facilities, or assets;
- Suspicious inquiries from people asking about pipeline system, facility, or asset operations, vulnerabilities, or security practices;
- Suspicious individuals applying for security-sensitive positions in the pipeline company;
- Theft or loss of sensitive security information (detailed pipeline maps, security plans, etc.).

When contacting the TSOC, provide as much of the following information as possible:

- Name and contact information;
- The time and location of the incident, as specifically as possible;
- A description of the incident or activity involved;
- Which entities have been notified and what actions have been taken;
- The names and/or descriptions of persons involved or suspicious parties and license plates as appropriate.

Actual or suspected cyber-attacks that could impact pipeline industrial control systems (SCADA, PCS, DCS), measurement systems and telemetry systems or enterprise associated IT systems should be reported to the National Cybersecurity and Communications Integration Center (NCCIC) at 888-282-0870.

For questions or concerns, email the TSA Pipeline Security staff at pipelinesecurity@dhs.gov

APPENDIX C – LIST OF ACRONYMS

AGA	American Gas Association
ANSI	American National Standards Institute
APGA	American Public Gas Association
API	American Petroleum Institute
CFR	Code of Federal Regulations
DCS	Distributed Control System
DHS	U.S. Department of Homeland Security
DOT	U.S. Department of Transportation
FEMA	Federal Emergency Management Agency
HSEEP	Homeland Security Exercise and Evaluation Program
HSIN	Homeland Security Information Network
ICS	Industrial Control System
INGAA	Interstate Natural Gas Association of America
ISA	International Society of Automation
IT	Information Technology
NIST	National Institute of Standards and Technology
NTAS	National Terrorism Advisory System
PCS	Process Control System
SCADA	Supervisory Control and Data Acquisition
SSI	Sensitive Security Information
SVA	Security Vulnerability Assessment
TIH	Toxic Inhalation Hazard
TSA	Transportation Security Administration
TSOC	Transportation Security Operations Center
WMD	Weapons of Mass Destruction

APPENDIX D – REFERENCE DOCUMENTS

Operators should consult the current edition of these and other security references on a frequent basis in developing and reviewing their company's security program. Cyber planning and implementation guidance appears in Section 7.4.

MEMORANDUM

To: Covered Pipeline Owner/Operators

Date: May 1, 2025

Subject: Renewal of the Security Directive Pipeline-2021-01 Series: *Enhancing Pipeline Cybersecurity*

Attached to this memorandum is Security Directive (SD) Pipeline-2021-01E: *Enhancing Pipeline Cybersecurity*. This SD is a continuation of the SD Pipeline-2021-01 series and cancels and supersedes SD Pipeline-2021-01D. SD Pipeline-2021-01E is effective on May 3, 2025, and expires May 2, 2026. Revisions to the text of the SD are highlighted in **bold**.

This SD applies to Owner/Operators of TSA-designated hazardous liquid and natural gas pipelines or liquefied natural gas facilities. All Owner/Operators subject to these requirements have been previously notified by TSA. If TSA identifies additional Owner/Operators with critical pipeline systems or facilities who were not previously subject to the SD Pipeline-2021-01 series, TSA will notify these Owner/Operators and provide specific compliance deadlines for the requirements in this SD.

The renewal of this SD continues to require covered Owner/Operators to take crucial measures to enhance pipeline cybersecurity, which were first issued in May 2021. There are no substantive revisions to the SD Pipeline-2021-01 series through this renewal, i.e., changes are limited to the effective date, expiration date, and series letter designation.

Consistent with TSA's previous determination, this SD is not marked as Sensitive Security Information (SSI). While SDs generally are categorically deemed SSI under TSA's regulations (49 CFR part 1520), TSA previously determined that the contents of this SD would not be detrimental to transportation security if publicly disclosed. No revisions to the Information Collection Request previously approved by the Office of Management and Budget are necessary to accommodate any information collected under the revision.

The SD requires that Owner/Operators provide written confirmation of receipt of this SD via email to SurfOps-SD@tsa.dhs.gov. All queries concerning the attached SD should be submitted to TSA at TSA-Surface@tsa.dhs.gov.

SECURITY DIRECTIVE

NUMBER	Security Directive Pipeline-2021-01**E**
SUBJECT	Enhancing Pipeline Cybersecurity
EFFECTIVE DATE	**May 3, 2025**
EXPIRATION DATE	**May 2, 2026**
CANCELS AND SUPERSEDES	Security Directive Pipeline-2021-01D
APPLICABILITY	Owners and operators of a hazardous liquid and natural gas pipeline or a liquefied natural gas facility notified by TSA that their pipeline system or facility is critical
AUTHORITY	49 U.S.C. 114(d), (f), (*l*) and (m)
LOCATION	All locations within the United States

I. PURPOSE AND GENERAL INFORMATION

Due to the ongoing cybersecurity threat to pipeline systems and associated infrastructure, the Transportation Security Administration (TSA) is issuing this Security Directive.[1] All revisions to this Security Directive series from the previous version, Security Directive Pipeline-2021-01**D**, are highlighted in bold.

This Security Directive continues to require three critical actions. First, it requires TSA-specified Owner/Operators to report cybersecurity incidents to the Department of Homeland Security's Cybersecurity and Infrastructure Security Agency (CISA). Second, it requires Owner/Operators to designate a Cybersecurity Coordinator and alternate(s) sufficient to ensure either the primary or alternate Cybersecurity Coordinator is available to TSA and CISA at all times (24 hours per day, seven days per week) to coordinate cybersecurity practices and address any incidents that arise. Third, it requires Owner/Operators to review their current activities against TSA's recommendations for pipeline cybersecurity to assess

[1] TSA is issuing **t**his Security Directive under the authority of 49 U.S.C. 114(*l*)(2)(A), which states: "Notwithstanding any other provision of law or executive order (including an executive order requiring a cost-benefit analysis), if the Administrator determines that a regulation or Security Directive must be issued immediately in order to protect transportation security, the Administrator shall issue the regulation or Security Directive without providing notice or an opportunity for comment and without prior approval of the Secretary."

cyber risks, identify any gaps, develop remediation measures, and report the results to TSA and CISA.

To avoid duplicate reporting, information provided to CISA pursuant to this Security Directive will be shared with TSA and may also be shared with the National Response Center and other agencies as appropriate. Similarly, information provided to TSA pursuant to this Security Directive will be shared with CISA and may also be shared with the National Response Center and other agencies as appropriate.[2] All information that must be reported to TSA or CISA pursuant to this Security Directive is sensitive security information subject to the protections of 49 CFR part 1520.

TSA may use the information, with company-specific data redacted, for TSA's intelligence-derived reports. TSA and CISA also may use information submitted for vulnerability identification, trend analysis, or to generate anonymized indicators of compromise or other cybersecurity products to prevent other cybersecurity incidents.[3]

II. ACTIONS REQUIRED

A. Applicability and Deadlines for Compliance

1. *Applicability:* The provisions of this Security Directive apply to Owners and operators of a hazardous liquid and natural gas pipeline or a liquefied natural gas facility notified by TSA that their pipeline system or facility is critical.[4]

2. *Additional Critical Pipeline Systems or Facilities:* In the event that TSA identifies additional Owner/Operators with critical pipeline systems or facilities who are not currently subject to the Security Directive Pipeline-2021-01 series, TSA will notify the Owner/Operator and provide specific compliance deadlines for the requirements in this Security Directive.

B. Owner/Operators must designate and use a primary and at least one alternate Cybersecurity Coordinator at the corporate level.

1. Owner/Operators must provide in writing to TSA, at SurfOps-SD@tsa.dhs.gov, the names, titles, phone number(s), and email address(es) of the Cybersecurity Coordinator and alternate Cybersecurity Coordinator(s) within seven days of the commencement of new operations or change in any of the information required by this section.

---

[2] Presidential Policy Directive (PPD) 41 calls for Federal cyber incident response agencies to share incident information with each other to achieve unity of governmental effort. *See* PPD-41 § III.D.

[3] *See* Information Collection Request, OMB No. 1652-0050 for TSA's identification of the Most Critical Pipelines, as required by sec. 1557(b) of the 9/11 Act and OMB No. 1652-0055 for assessment data.

[4] *See* section 1557(b) of the *Implementing Recommendations of the 9/11 Commission Act of 2007,* Pub. L. 110-53 (121 Stat. 266; Aug. 3, 2007) (9/11 Act) (codified at 6 U.S.C. § 1207). Section 1557(b) requires TSA to review pipeline security plans and inspect critical facilities of the 100 most critical pipeline operators. In general, criticality is determined based on factors such as the volume of product transported, service to other critical sectors, *etc*.

2. The Cybersecurity Coordinator and alternate(s) must—

   a. Be a U.S. citizen who is eligible for a security clearance;

   b. Serve as the primary contact for cyber-related intelligence information and cybersecurity-related activities and communications with TSA and CISA;

   c. Ensure the primary or an alternate Cybersecurity Coordinator is accessible to TSA and CISA 24 hours a day, seven days a week;

   d. Coordinate cyber and related security practices and procedures internally; and

   e. Work with appropriate law enforcement and emergency response agencies.

C. Owner/Operators must report cybersecurity incidents to CISA involving systems that the Owner/Operator has responsibility to operate and/or maintain including:

   1. Unauthorized access of an Information or Operational Technology system;

   2. Discovery of malicious software on an Information or Operational Technology system;

   3. Activity resulting in a denial of service to any Information or Operational Technology system;

   4. A physical attack against the Owner/Operator's network infrastructure, such as deliberate damage to communication lines; and

   5. Any other cybersecurity incident that results in operational disruption to the Owner/Operator's Information or Operational Technology systems or other aspects of the Owner/Operator's pipeline systems or facilities, or otherwise has the potential to cause operational disruption that adversely affects the safe and efficient transportation of liquids and gases including, but not limited to impacts to a large number of customers, critical infrastructure or core government functions, or impacts national security, economic security or public health and safety.

D. Owner/Operators must report the information required by Section II.C., as soon as practicable, but no later than 24 hours after a cybersecurity incident is identified. Reports required by this section must be made to CISA Central using CISA's Reporting System form at: **https://www.cisa.gov/forms/report** or by calling (888) 282-0870.[5] If the required information is not available at the time of reporting, Owner/Operators must submit an initial report within the specified timeframe and provide supplemental information within 24 hours of it becoming available. All reported information will be protected in a manner appropriate for the sensitivity and criticality of the information.

[5] CISA's Incident Reporting System provides a secure web-enabled means of reporting computer security incidents to CISA. This system assists analysts in providing timely handling of the security incidents Owner/Operators must report pursuant to this Security Directive as well as the ability to conduct improved analysis.

E. The report to CISA required by Section II.C. must include the following information, as available to the reporting Owner/Operator at the time of the report:

1. The name of the reporting individual and contact information, including a telephone number or email address. The report must also explicitly specify that the information is being reported in order to satisfy the reporting requirements in this Security Directive.

2. The affected hazardous liquid and natural gas pipeline(s) and/or facilities, including identifying information and location.

3. Description of the threat, incident, or activity, to include:

   a. Information about who has been notified and what action has been taken;

   b. Any relevant information observed or collected by the Owner/Operator, such as malicious IP addresses, malicious domains, malware hashes and/or samples, or the abuse of legitimate software or accounts; and

   c. Any known threat information, to include information about the source of the threat or attack, if available.

4. A description of the incident's impact or potential impact on Information or Operational Technology systems and operations. This information must also include an assessment of actual, imminent or potential service operations, operational delays, and/or data theft that have or are likely to be incurred, as well as any other information that would be informative in understanding the impact or potential impact of the cybersecurity incident.

5. A description of all responses that are planned or under consideration, to include, for example, a reversion to manual backups, if applicable.

6. Any additional relevant information.

F. Cybersecurity Vulnerability Assessment

1. Owner/Operators must review Section 7 of TSA's 2018 Pipeline Security Guidelines (with Change 1 (April 2021)),[6] and—

   a. Assess whether current practices and activities to address cyber risks to Owner/Operators Information and Operational Technology systems align with the Guidelines;

   b. Identify any gaps; and

   c. Identify remediation measures that will be taken to fill those gaps and a timeline

[6] Available at https://www.tsa.gov/sites/default/files/pipeline_security_guidelines.pdf.

for implementing these remediation measures.

2. The assessment and identification of gaps must be completed using the form provided by TSA.[7]

3. The completed vulnerability assessment report containing all information required by this section must be submitted to TSA. Owner/Operators who have previously submitted a vulnerability assessment to TSA are not required to update and submit a revised assessment.

III. PROCEDURES FOR SECURITY DIRECTIVES

A. Owner/Operators must:

1. Immediately provide written confirmation of receipt of this Security Directive via email to TSA at SurfOps-SD@tsa.dhs.gov.

2. Immediately disseminate the information and measures in this Security Directive to corporate senior management, security management representatives, and any personnel having responsibilities in implementing the provisions in this Security Directive. The Owner/Operator also should share this Security Directive with anyone subject to the provisions of this Security Directive to include, but not limited to, Federal, state, and local government personnel, tenants, and contractors.

3. Brief all individuals responsible for implementing this Security Directive.

B. Owner/Operators may comment on this Security Directive by submitting data, views, or arguments in writing to TSA via email at TSA-Surface@tsa.dhs.gov. TSA may amend the Security Directive based on comments received. Submission of a comment does not delay the effective date of the Security Directive.

IV. DEFINITIONS

A. *Business critical functions* means the Owner/Operator's determination of capacity or capabilities to support functions necessary to meet operational needs and supply chain expectations.

B. *Cybersecurity incident* means an occurrence that, without lawful authority, jeopardizes or is reasonably likely to jeopardize the integrity, confidentiality, or availability of computers, information or communications systems or networks, physical or virtual infrastructure controlled by computers or information systems, or information resident on the system. This definition includes an event that is under investigation or evaluation by the Owner/Operator as a possible cybersecurity incident without final determination of the event's root cause or nature (such as malicious, suspicious, or benign).

[7] The assessment form is not Sensitive Security Information before it is completed. Once any question is answered on the form, however, it becomes Sensitive Security Information subject to the protections of 49 CFR part 1520.

C. *Days* means calendar days unless otherwise indicated. As used for compliance deadlines, if a requirement must be met on a date that is a federal holiday, the compliance deadline will be the next federal business day after the holiday.

D. *Information Technology system* means any services, equipment, or interconnected systems or subsystems of equipment that are used in the automatic acquisition, storage, analysis, evaluation, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data or information that fall within the responsibility of an Owner/Operator subject to TSA's Cybersecurity Requirements to operate and/or maintain.

E. *Operational disruption* means a deviation from or interruption of business critical functions that results from a compromise or loss of data, system availability, system reliability, or control of systems.

F. *Operational Technology system* is a general term that encompasses several types of control systems, including industrial control systems, supervisory control and data acquisition systems, distributed control systems, and other control system configurations, such as programmable logic controllers, fire control systems, and physical access control systems, often found in the industrial sector and critical infrastructure. Such systems consist of combinations of programmable electrical, mechanical, hydraulic, pneumatic devices or systems that interact with the physical environment or manage devices that interact with the physical environment.

G. *Owner/Operator* means a person who owns or maintains operational control over pipeline facilities or engages in the transportation of hazardous liquids or natural gases and who has been identified by TSA as one of the most critical interstate and intrastate natural gas and hazardous liquid transmission pipeline infrastructure and operations.

H. *Unauthorized access* means access of an Information Technology or Operational Technology system from an unknown source; access by a third party or former employee; an employee accessing systems for which he or she is not authorized. This term may include a non-malicious policy violation such as the use of shared credentials by an employee otherwise authorized to access it.

V. APPROVAL OF ALTERNATIVE MEASURES

Owner/Operators must immediately notify TSA via email at TSA-Surface@tsa.dhs.gov if unable to implement any of the measures in this Security Directive. Owner/Operators may submit proposed alternative measures and the basis for submitting the alternative measures to TSA for approval to the email address above.

MEMORANDUM

To: Covered Pipeline Owner/Operators

Date: May 1, 2025

Subject: Renewal of the Security Directive Pipeline-2021-02 Series: *Pipeline Cybersecurity Mitigation Actions, Contingency Planning, and Testing*

Attached to this memorandum is Security Directive (SD) Pipeline-2021-02F: *Pipeline Cybersecurity Mitigation Actions, Contingency Planning, and Testing*. This SD is a continuation of the SD Pipeline-2021-02 series and cancels and supersedes SD Pipeline-2021-02E. SD Pipeline-2021-02F is effective on May 3, 2025, and expires on May 2, 2026. Revisions to the text of the SD are highlighted in **bold**.

This SD series applies to Owner/Operators of TSA-designated hazardous liquid and natural gas pipelines or liquefied natural gas facilities. All Owner/Operators subject to these requirements have been previously notified by TSA. If TSA identifies additional Owner/Operators with critical pipeline systems or facilities who were not previously subject to the SD Pipeline-2021-02 series, TSA will notify these Owner/Operators and provide specific compliance deadlines for the requirements in this SD.

The renewal of this SD maintains TSA's performance-based cybersecurity requirements, which were first issued in July 2021. There are no substantive revisions to the SD Pipeline-2021-02 series through this renewal, i.e., changes are limited to the effective date, expiration date, and series letter designation.

Consistent with TSA's previous determination, this SD is not marked as Sensitive Security Information (SSI). While SDs generally are categorically deemed SSI under TSA's regulations (49 CFR part 1520), TSA previously determined that the contents of this SD would not be detrimental to transportation security if publicly disclosed. No revisions to the Information Collection Request previously approved by the Office of Management and Budget are necessary to accommodate any information collected under the revision.

The SD requires that Owner/Operators provide written confirmation of receipt via email to SurfOps-SD@tsa.dhs.gov. All queries concerning the attached SD should be submitted to TSA at TSA-Surface@tsa.dhs.gov.

SECURITY DIRECTIVE

NUMBER	Security Directive Pipeline-2021-02**F**
SUBJECT	Pipeline Cybersecurity Mitigation Actions, Contingency Planning, and Testing
EFFECTIVE DATE	**May 3, 2025**
EXPIRATION DATE	**May 2, 2026**
CANCELS AND SUPERSEDES	Security Directive Pipeline-2021-02E
APPLICABILITY	Owners and Operators of a hazardous liquid and natural gas pipeline or a liquefied natural gas facility notified by TSA that their pipeline system or facility is critical
AUTHORITY	49 U.S.C. 114(d), (f), (*l*) and (m)
LOCATION	All locations within the United States

I. PURPOSE AND GENERAL INFORMATION

The Transportation Security Administration (TSA) is issuing this Security Directive due to the ongoing cybersecurity threat to pipeline systems, under the authority of 49 U.S.C. 114(*l*)(2)(A).[1] This Security Directive continues to require performance-based regulatory cybersecurity measures first issued by TSA on July 26, 2021 under the Security Directive Pipeline-2021-02 series.[2] In general, this Security Directive is applicable to the same pipeline and liquefied natural gas facilities subject to the requirements of the Security Directive Pipeline-2021-01 series, which first went into effect on May 28, 2021.[3] All

[1] This Security Directive series is issued under the authority of 49 U.S.C. 114(*l*)(2)(A), which states: "Notwithstanding any other provision of law or executive order (including an executive order requiring a cost-benefit analysis), if the Administrator determines that a regulation or security directive must be issued immediately in order to protect transportation security, the Administrator shall issue the regulation or security directive without providing notice or an opportunity for comment and without prior approval of the Secretary."
[2] As noted in the Office of Management and Budget's Unified Agenda, TSA intends to more permanently codify these requirements through notice-and-comment rulemaking.
[3] *See* Section II.A. for applicability.

revisions to this Security Directive series from the most recent version, SD Pipeline-2021-02**E**, are highlighted in **bold**.

The actions required by TSA continue to be necessary to protect the national security, economy, and public health and safety of the United States and its citizens from the impact of malicious cyber intrusions affecting the nation's most critical gas and liquid pipelines. Even minor disruptions in critical pipeline systems may result in temporary product shortages that can cause significant harm to national security. Prolonged disruptions in the flow of commodities could lead to widespread energy shortfalls, with ripple effects across the economy. Disruptions and delays may affect other domestic critical infrastructure and industries that depend on the commodities transported by the nation's pipeline systems.

The goal of this Security Directive is to reduce the risk that cybersecurity threats pose to critical pipeline systems and facilities by implementing layered cybersecurity measures that demonstrate a defense-in-depth approach against such threats. Recent and evolving intelligence emphasizes the growing sophistication of nefarious persons, organizations, and governments, highlights vulnerabilities, and intensifies the urgency of implementing and sustaining the requirements in this Security Directive series.[4]

To protect against the ongoing threat to the United States' national and economic security, this Security Directive mandates that TSA-specified Owners/Operators of pipeline and liquefied natural gas facilities implement the following cybersecurity measures to prevent disruption to, and degradation of, this critical infrastructure. Specifically, Owner/Operators must do the following:

1. Establish and implement a TSA-approved Cybersecurity Implementation Plan that describes the specific cybersecurity measures employed and the schedule for achieving the outcomes described in Section III.A. through III.E.

2. Develop and maintain an up-to-date Cybersecurity Incident Response Plan to reduce the risk of operational disruption, or the risk of other significant impacts on business critical functions, as defined in this Security Directive, should the Information and/or Operational Technology systems of a gas or liquid pipeline be affected by a cybersecurity incident. *See* Section III.F.

3. Develop a Cybersecurity Assessment Plan and submit (a) an annual update, for approval, that describes how the Owner/Operator will proactively and regularly assess the effectiveness of cybersecurity measures and identify and resolve device,

[4] *See, e.g.*, Joint Cybersecurity Advisory (AA22-110A), *Russian State-Sponsored and Criminal Cyber Threats to Critical Infrastructure* (dated April 20, 2022), available at *https://www.cisa.gov/uscert/sites/default/files/publications/AA22-110A_Joint_CSA_Russian_State-Sponsored_and_Criminal_Cyber_Threats_to_Critical_Infrastructure_4_20_22_Final.pdf*. *See also* additional information regarding current threats posted at *https://www.cisa.gov/shields-up*. *See also* Office of the Director of National Intelligence (ODNI), *Annual Threat Assessment of The U.S. Intelligence Community* (dated **March 2025**), available at **2025** Annual Threat Assessment of the U.S. Intelligence Community; and CISA Joint Cybersecurity Advisory: *People's Republic of China State-Sponsored Cyber Actor Living off the Land to Evade Detection* (AA23-144a) (dated May 24, 2023), available at https://www.cisa.gov/news-events/cybersecurity-advisories/aa23-144a.

network, and/or system vulnerabilities, and (b) an annual report that provides Cybersecurity Assessment Plan results from the previous year. *See* Section III.G.

TSA significantly revised the Security Directive Pipeline 2021-02 series**,** initially issued in July 2021**,** to provide Owner/Operators with more flexibility to meet the intended security outcomes while ensuring sustainment of the cybersecurity enhancements accomplished through this Security Directive series. Cybersecurity experts from TSA and the Cybersecurity and Infrastructure Security Agency (CISA) contributed to the development of the measures in this Security Directive series to ensure the efficacy of the requirements in mitigating system vulnerabilities.

This revision retains the transition to a more flexible, performance-based approach requiring all Owner/Operators to submit a Cybersecurity Implementation Plan for TSA approval. All currently identified critical Owner/Operators have a TSA-approved Cybersecurity Implementation Plan in place. This plan sets the security measures and requirements against which TSA inspects for compliance.[5] *See* Section II.B. Pursuant to 49 U.S.C. 114(f), the TSA Administrator is authorized to "enforce security-related regulations and requirements"; "inspect, maintain, and test security facilities, equipment, and systems"; and "oversee the implementation, and ensure the adequacy of security measures at … transportation facilities." Given this authority, TSA may require Owner/Operators to provide specific documentation and access to TSA as necessary to establish compliance. *See* Section IV of this Security Directive for examples of the type of records to which TSA may require access.

Although TSA has determined that this document is not sensitive security information, all information that must be reported or submitted to TSA pursuant to this Security Directive is sensitive security information subject to the protections of part 1520 of title 49, Code of Federal Regulations (CFR). DHS may use the information, with company-specific data redacted, for DHS's intelligence-derived reports. DHS also may use information submitted for vulnerability identification, trend analysis, or to generate anonymized indicators of compromise or other cybersecurity products to prevent other cybersecurity incidents.[6] Information provided to DHS pursuant to this Security Directive may also be shared with other agencies as appropriate.[7] The distribution, disclosure, and availability of information will be restricted to persons with a need to know, and safeguarding, protecting, and marking methods for sensitive/critical information will be utilized.[8] The Office of Management and Budget has approved this collection under OMB Control No. 1652-0056.

The Transportation Security Oversight Board (TSOB) is statutorily required to "review and ratify or disapprove" emergency regulations and security directives issued by TSA under 49 U.S.C. 114(*l*)(2). *See* 49 U.S.C. 114(*l*)(2)(B) and 115(c)(1). The TSOB previously

[5] *See also* 49 U.S.C. 114(f); 49 CFR part 1503.
[6] *See* OMB Control No. 1652-0056.
[7] Presidential Policy Directive (PPD) 41 requires Federal agencies to rapidly share incident information with each other to achieve unity of governmental effort. *See* PPD-41 § III.D ("Whichever Federal agency first becomes aware of a cyber incident will rapidly notify other relevant Federal agencies in order to facilitate a unified Federal response and ensure that the right combination of agencies responds to a particular incident"). Furthermore, for purposes of information shared with DHS pursuant to this directive, cyber incident responders with responsibilities under PPD-41 are "covered" persons with a "need to know," as provided by 49 CFR 1520.7 and 1520.11, respectively.
[8] *See* 49 CFR 1520.5(b)(5) and *https://www.tsa.gov/for-industry/sensitive-security-information*.

determined that TSA may renew this security directive without additional review by the TSOB if no changes are made to the requirements. If the TSOB decides not to ratify any section or subsection of this Security Directive, or deems any section or subsection inapplicable, the remainder of this Security Directive shall not be affected unless otherwise specified by the TSOB.

II. ACTIONS REQUIRED

A. Applicability, Deadlines for Compliance, and Scope

1. *Covered Pipeline Owner/Operators:* This Security Directive applies to Owner/Operators of TSA-designated critical pipeline systems or facilities notified before July 26, 2022, that they are required to comply with the Security Directive Pipeline-2021-02 series.[9]

2. *Additional Critical Pipeline Systems or Facilities:* If TSA identifies additional Owner/Operators with critical pipeline systems or facilities who were not already subject to the Security Directive Pipeline-2021-02 series, TSA will notify the Owner/Operator and provide specific compliance deadlines for the requirements in this Security Directive.

3. *Managed Security Service Providers:* If an Owner/Operator has delegated to, or shared responsibility with, a Managed Security Service Provider, wholly or in part, for specific security measures in the Owner/Operator's Cybersecurity Implementation Plan, the Owner/Operator retains sole responsibility under this Security Directive for ensuring compliance with the Owner/Operator's TSA-approved Cybersecurity Implementation Plan and this Security Directive.

4. *Authorized Representative:* Authorized Representatives are empowered by the Owner/Operator to coordinate and/or conduct activities required by this Security Directive and/or contained within the Owner/Operator's TSA-approved Cybersecurity Implementation Plan. Both Owner/Operators and Authorized Representatives are liable for non-compliance on the part of the Authorized Representative with the applicable requirements of the Owner/Operator's TSA-approved Cybersecurity Implementation Plan and this Security Directive.

5. *Scope:* The requirements in this Security Directive apply to the covered Owner/Operators' Critical Cyber Systems.

   Note: If an Owner/Operator determines they have no Critical Cyber Systems, as defined in Section VII., they must notify TSA in writing within 60 days of the effective date of this Security Directive. TSA will notify the Owner/Operator if the agency disagrees with the Owner/Operator's determination and may require the Owner/Operator to provide additional information regarding the methodologies or

[9] *See* § 1557(b) of the *Implementing Recommendations of the 9/11 Commission Act of 2007*, (Pub. L. 110-53; 121 Stat. 266; Aug. 3, 2007) (9/11 Act) (codified at 6 U.S.C. 1207(b) (requiring TSA to review pipeline security plans and inspect critical facilities of the 100 most critical pipeline operators). Applicability for this Security Directive is the same as the Security Directive Pipeline-2021-01 series and the Security Directive Pipeline-2021-02 series.

rationale used to identify Critical Cyber Systems. In the event that an Owner/Operator who does not have Critical Cyber Systems changes its method of operations, they must reevaluate whether they have a Critical Cyber System, and if so, notify TSA within 60 days of the change in operations to determine the schedule for complying with the requirements of this Security Directive.

B. Cybersecurity Implementation Plan

1. The Cybersecurity Implementation Plan must provide the information required by Sections III.A. through III.E. of this Security Directive and describe in detail the Owner/Operator's defense-in-depth plan, including physical and logical security controls, for meeting each of the requirements in Sections III.A. through III.E.

2. Once approved by TSA, the Owner/Operator must implement and maintain all measures in the TSA-approved Cybersecurity Implementation Plan and meet any schedule stipulated in the plan.

III. CYBERSECURITY MEASURES

The Owner/Operator must:

A. Identify the Owner/Operator's Critical Cyber Systems as defined in Section VII. of this Security Directive. TSA will notify the Owner/Operator if the agency disagrees with the Owner/Operator's determination and may require the Owner/Operator to provide additional information regarding the methodologies or rationale used to identify Critical Cyber Systems. After consultation with Owner/Operators, TSA may notify an Owner/Operator that it must include additional Critical Cyber Systems identified by TSA not previously identified by the Owner/Operator in its Cybersecurity Implementation Plan.

B. Implement network segmentation policies and controls designed to prevent operational disruption to the Operational Technology system if the Information Technology system is compromised or vice versa. As applied to Critical Cyber Systems, these policies and controls must include:

1. A list and description of —

a. Information Technology and Operational Technology system interdependencies;

b. All external connections to the Operational Technology system; and

c. Zone boundaries, including a description of how Information Technology and Operational Technology systems are defined and organized into logical zones based on criticality, consequence, and operational necessity.

2. An identification and description of measures for securing and defending zone boundaries, that includes security controls—

a. To prevent unauthorized communications between zones; and

b. To prohibit Operational Technology system services from traversing the Information Technology system, unless the content of the Operational Technology system is encrypted while in transit.

C. Implement access control measures, including for local and remote access, to secure and prevent unauthorized access to Critical Cyber Systems. These measures must incorporate the following policies, procedures, and controls:

1. Identification and authentication policies and procedures designed to prevent unauthorized access to Critical Cyber Systems that include—

a. A schedule for memorized secret authenticator resets; and

b. Documented and defined mitigation measures for components of Critical Cyber Systems that will not have passwords reset in accordance with the schedule required by the preceding subparagraph (III.C.1.a.) and a timeframe to complete these mitigations.

2. Multi-factor authentication, or other logical and physical security controls that supplement password authentication to provide risk mitigation commensurate to multi-factor authentication. If an Owner/Operator does not apply multi-factor authentication for access to industrial control workstations in control rooms regulated under 49 CFR parts 192 or 195, the Owner/Operator shall specify what compensating controls are used to manage access.

3. Policies and procedures to manage access rights based on the principles of least privilege and separation of duties. Where not technically feasible to apply these principles, the policies and procedures must describe the compensating controls that the Owner/Operator will apply.

4. Enforcement of standards that limit availability and use of shared accounts to those that are critical for operations, and then only if absolutely necessary. When the Owner/Operator uses shared accounts for operational purposes, the policies and procedures must ensure—

a. Access to shared accounts is limited through account management that uses principles of least privilege and separation of duties; and

b. Individuals who no longer need access do not have knowledge of the password necessary to access the shared account.

5. Schedule for review of existing domain trust relationships to ensure their necessity and policies to manage domain trusts.

D. Implement continuous monitoring and detection policies and procedures that are designed to prevent, detect, and respond to cybersecurity threats and anomalies affecting Critical Cyber Systems. These measures must include:

1. Capabilities to—

a. Prevent malicious email, such as spam and phishing emails, from adversely impacting operations;

b. Prohibit ingress and egress communications with known or suspected malicious Internet Protocol addresses;

c. Control impact of known or suspected malicious web domains or web applications, such as by preventing users and devices from accessing malicious websites;

d. Block and prevent unauthorized code, including macro scripts, from executing; and

e. Monitor and/or block connections from known or suspected malicious command and control servers (such as Tor exit nodes, and other anonymization services).

2. Procedures to—

a. Audit unauthorized access to internet domains and addresses;

b. Document and audit any communications between the Operational Technology system and an external system that deviates from the Owner/Operator's identified baseline of communications;

c. Identify and respond to execution of unauthorized code, including macro scripts; and

d. Implement capabilities (such as Security, Orchestration, Automation, and Response) to define, prioritize, and drive standardized incident response activities.

3. Logging policies that—

a. Require continuous collection and analyzing of data for potential intrusions and anomalous behavior; and

b. Ensure data is maintained for sufficient periods to allow for effective investigation of cybersecurity incidents.

4. Mitigation measures or manual controls to ensure industrial control systems can be isolated when a cybersecurity incident in the Information Technology system creates risk to the safety and reliability of the Operational Technology system.

E. Reduce the risk of exploitation of unpatched systems through the application of security patches and updates for operating systems, applications, drivers, and firmware on Critical Cyber Systems consistent with the Owner/Operator's risk-based methodology. These measures must include—

1. A patch management strategy that ensures all critical security patches and updates on Critical Cyber Systems are current.

2. This strategy required by Section III.E.1. must include:

    a. The risk methodology for categorizing and determining criticality of patches and updates, and an implementation timeline based on categorization and criticality; and

    b. Prioritization of all security patches and updates on CISA's Known Exploited Vulnerabilities Catalog.[10]

3. If the Owner/Operator cannot apply patches and updates on specific Operational Technology systems without causing a severe degradation of operational capability to meet business critical functions, the patch management strategy must include a description and timeline of additional mitigations that address the risk created by not installing the patch or update.

F. Develop and maintain a Cybersecurity Incident Response Plan.

1. Owner/Operators must have an up-to-date Cybersecurity Incident Response Plan for the Critical Cyber Systems that include measures to reduce the risk of operational disruption, or the risk of other significant impacts on business critical functions should the covered pipeline or facility experience a cybersecurity incident. The Cybersecurity Incident Response Plan must provide specific measures sufficient to ensure the following objectives, as applicable:

    a. Prompt containment of the infected server or device.

    b. Segregation of the infected network (or devices) to ensure malicious code does not spread by, as necessary —

        i. Segregating (removing from the network) the infected device(s);

        ii. Segregating any other devices that shared a network with the infected device(s);

        iii. Preserving volatile memory by collecting a forensic memory image of affected device(s) before powering off or moving; and

        iv. Isolating and securing all infected and potentially infected devices, making sure to clearly label any equipment that has been affected by malicious code.

    c. Security and integrity of backed-up data, including measures to secure backups, store backup data separate from the system, and procedures to ensure that the backup data is free of known malicious code when the backup is made and when tested for restoral.

[10] Available at*: https://www.cisa.gov/known-exploited-vulnerabilities-catalog*.

d. Established capability and governance for isolating the Information and Operational Technology systems in the event of a cybersecurity incident that results or could result in operational disruption.

e. Exercises to test the effectiveness of procedures, and personnel responsible for implementing measures, in this Cybersecurity Incident Response Plan, no less than annually. These exercises must—

i. Test at least two objectives of the Owner/Operator's Cybersecurity Incident Response Plan required by subparagraphs F.1.a. through F.1.d. of this section, no less than annually; and

ii. Include the employees identified (by position) in paragraph F.2 of this section as active participants in the exercises.

2. The Cybersecurity Incident Response Plan must identify who (by position) is responsible for implementing the specific measures in the Incident Response Plan and any necessary resources needed to implement the measures.

G. Develop a Cybersecurity Assessment Plan for proactively assessing and auditing cybersecurity measures.

1. The Owner/Operator must develop a Cybersecurity Assessment Plan for proactively assessing Critical Cyber Systems to ascertain the effectiveness of cybersecurity measures and to identify and resolve device, network, and/or system vulnerabilities.

2. The Cybersecurity Assessment Plan required by Section III.G.1. must –

a. Assess the effectiveness of the Owner/Operator's TSA-approved Cybersecurity Implementation Plan;

b. Include a cybersecurity architecture design review at least once every two years that includes verification and validation of network traffic and system log review and analysis to identify cybersecurity vulnerabilities related to network design, configuration, and inter-connectivity to internal and external systems;

c. Incorporate other assessment capabilities, such as penetration testing of Information Technology systems and the use of "red" and "purple" team (adversarial perspective) testing;

d. Include a schedule for assessing and auditing specific cybersecurity measures and/or actions required by subparagraphs G.2.a. through G.2.c. The schedule must ensure at least one-third (1/3) of the policies, procedures, measures, and capabilities in the TSA-approved Cybersecurity Implementation Plan are assessed each year, with 100 percent assessed over any three-year period; and

e. Ensure a Cybersecurity Assessment Plan annual report of the results of assessments conducted in accordance with the Plan is submitted to TSA as described in paragraph G.4. of this section. The required report must indicate—

i. For the previous 12 months, which assessment method(s) were used to determine whether the policies, procedures, and capabilities described by the Owner/Operator in its Cybersecurity Implementation Plan are effective; and

ii. Results of the individual assessments conducted in the previous 12 months.

3. The Owner/Operator must submit its Cybersecurity Assessment Plan on an annual basis to TSA for approval. The Cybersecurity Assessment Plan must be submitted to TSA no later than 12 months from the date of TSA's approval of the Owner/Operator's previous Cybersecurity Assessment Plan.

4. The Owner/Operator must submit the Cybersecurity Assessment Plan report required by section G.2.e. to TSA no later than 12 months from the date of TSA's approval of the most recent Cybersecurity Assessment Plan.

IV. RECORDS

A. *Use of previous plans, assessments, tests, and evaluations.* As applicable, Owner/Operators may use previously developed plans, assessments, tests, and evaluations to meet the requirements of this Security Directive. If the Owner/Operator relies on these materials, they must include an index of the records and their location organized in the same sequence as the requirements in this Security Directive. In addition, these materials must be explicitly incorporated by reference into the Cybersecurity Implementation Plan and made available to TSA upon request.

B. *Protection of sensitive security information.* The Owner/Operator must, at a minimum, store and transmit the following information required by this Security Directive consistent with the requirements in 49 CFR part 1520:[11]

1. Plans and reports; and

2. Audit, testing, or assessment results.

C. *Documentation to Establish Compliance*

1. The Owner/Operator must make records necessary to establish compliance with the requirements of this Security Directive available to TSA upon request for inspection and/or copying.

2. TSA may request to inspect or copy the following documents to establish compliance with this Security Directive:

a. Hardware/software asset inventory, including supervisory control, and data acquisition systems.

b. Firewall rules.

[11] Owner/Operators may contact SSI@tsa.dhs.gov for more information on how to comply with requirements for the protection of Sensitive Security Information.

c. Network diagrams, switch and router configurations, architecture diagrams, publicly routable internet protocol addresses, and Virtual Local Area Networks.

d. Policy, procedural, and other documents that informed the development, and documented implementation of, the Owner/Operator's Cybersecurity Implementation Plan, Cybersecurity Incident Response Plan, Cybersecurity Assessment Plan, and assessment or audit results.

e. Data providing a "snapshot" of activity on and between Information and Operational Technology systems, such as—

i. Log files;

ii. A capture of network traffic (i.e., packet capture (PCAPs)), not to exceed a period of twenty-four hours, as identified and directed by TSA;

iii. "East-West Traffic" of Operational Technology systems/sites/environments within the scope of this Security Directive's requirements; and

iv. "North-South Traffic" between Information and Operational Technology systems, and the perimeter boundaries between them.

f. Any other records or documents necessary to establish compliance with this Security Directive.

V. PROCEDURES FOR SECURITY DIRECTIVES

A. General Procedures

1. *Confirm Receipt.* Immediately provide written confirmation of receipt of this Security Directive via e-mail to TSA at SurfOps-SD@tsa.dhs.gov;

2. *Dissemination.* Immediately disseminate the information and measures in this Security Directive to corporate senior management and security management representatives. The Owner/Operator must provide the applicable security measures in this Security Directive to the Owner/Operator's direct employees and authorized representatives responsible for implementing applicable security measures as necessary to ensure compliance.

B. *Comments.* Owner/Operators may comment on this Security Directive by submitting data, views, or arguments in writing to TSA via e-mail at TSA-Surface@tsa.dhs.gov. Any comments referring to specific measures in this Security Directive must be protected in accordance with the requirements in 49 CFR part 1520. TSA may amend the Security Directive based on comments received. Submission of a comment does not delay the effective date of the Security Directive or requirement to comply with the provisions of the Security Directive.

C. *Submission of Documentation to TSA.* Owner/Operators are required to submit documents in a manner prescribed by TSA. TSA will provide Owner/Operators specific instructions for submission of required documents.

VI. AMENDMENTS TO CYBERSECURITY IMPLEMENTATION PLAN

A. *Changes to ownership or control of operations.* An Owner/Operator required to submit a Cybersecurity Implementation Plan under Section II.B. of this Security Directive must submit a request to amend its Cybersecurity Implementation Plan if, after approval, there are any changes to the ownership or control of the operation.

B. *Changes to conditions affecting security*. An Owner/Operator required to submit a Cybersecurity Implementation Plan under Section II.B. of this Security Directive must submit a request to amend its Cybersecurity Implementation Plan if, after approval, the Owner/Operator makes, or intends to make, permanent changes to the policies, procedures, or measures approved by TSA, including, but not limited to, changes to address:

1. Determinations that a specific policy, procedure, or measure in the Cybersecurity Implementation Plan is ineffective based on results of the audits and assessments required under Section III.G. of this Security Directive; or

2. The Owner/Operator has identified or obtained new or additional capabilities for meeting the requirements in the Security Directive that have not been previously approved by TSA.

C. *Permanent change*. For purposes of this section, a "permanent change" is one intended to be in effect for 45 or more calendar days.

D. *Schedule for requesting amendment*. The Owner/Operator must file the request for an amendment to its Cybersecurity Implementation Plan with TSA no later than 50 calendar days after the permanent change takes effect, unless TSA allows a longer time period.

E. *TSA approval*.

1. TSA may approve a requested amendment to a Cybersecurity Implementation Plan if TSA determines that it is in the interest of the public and transportation security and the proposed amendment provides the level of security required under this Security Directive.

2. TSA may request additional information from the Owner/Operator before rendering a decision.

F. *Petition for reconsideration*. No later than 30 calendar days after receiving a denial of an amendment to a Cybersecurity Implementation Plan, the Owner/Operator may file a petition for reconsideration following the procedures in 49 CFR 1570.119.

VII. DEFINITIONS

In addition to the terms defined in 49 CFR 1500.3, the following terms apply to this Security Directive:

A. *Authorized Representative* means, for the purpose of this Security Directive, a person who is not a direct employee of the Owner/Operator, but is authorized to act on the Owner/Operator's behalf to perform measures required by the Security Directive and/or contained within the Owner/Operator's TSA-approved Cybersecurity Implementation Plan. The term authorized representative may include agents, contractors, and subcontractors. This term does not include Managed Security Service Providers.

B. *Business critical functions* means the Owner/Operator's determination of capacity or capabilities to support functions necessary to meet operational needs and supply chain expectations.

C. *Critical Cyber System* means any Information or Operational Technology system or data that, if compromised or exploited, could result in operational disruption. Critical Cyber Systems include business services that, if compromised or exploited, could result in operational disruption.

D. *Cybersecurity architecture design review* means a technical assessment based on government and industry-recognized standards, guidelines, and best practices that evaluates systems, networks, and security services to determine if they are designed, built, and operated in a reliable and resilient manner. These reviews must be designed to be applicable to the Owner/Operator's Information and Operational Technology systems.

E. *Cybersecurity incident* means an event that, without lawful authority, jeopardizes, disrupts or otherwise impacts, or is reasonably likely to jeopardize, disrupt or otherwise impact, the integrity, confidentiality, or availability of computers, information or communications systems or networks, physical or virtual infrastructure controlled by computers or information systems, or information resident on the system. This definition includes an event that is under investigation or evaluation by the Owner/Operator as a possible cybersecurity incident without final determination of the event's root cause or nature (such as malicious, suspicious, benign).

F. *Days* means calendar days unless otherwise indicated. As used for compliance deadlines, if a requirement must be met on a date that is a federal holiday, the compliance deadline will be the next federal business day after the holiday.

G. *Demilitarized Zone (DMZ)* or *perimeter network*, means a network area (a subnetwork) that sits between an internal network and an external network. The security demilitarized zone is used for providing external controlled access to services used by external personnel to the control system network to ensure secure application of system updates and upgrades. For someone on the external network who does not have authorization to connect to the internal network, the demilitarized zone is a dead end.

H. *East-West Traffic* means, in a networking context, the lateral movement of network traffic within a trust zone or local area network.

I. *Information Technology **s**ystem* means any services, equipment, or interconnected systems or subsystems of equipment that are used in the automatic acquisition, storage, analysis, evaluation, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data or information that fall within the responsibility of the Owner/Operator to operate and/or maintain.

J. *Interdependencies* means relationships of reliance within and among Information and Operational Technology systems that must be maintained for those systems to operate and provide services.

K. *Managed Security Service Providers* means for the purposes of this Security Directive, a person who is not a direct employee of the Owner/Operator, but who provides one or more services or capabilities that the Owner/Operator is using to perform measures required by the Security Directive and/or contained within the Owner/Operator's TSA-approved Cybersecurity Implementation Plan. Managed Security Service Providers generally provide a logical service or capability. Managed Security Service Providers are not Authorized Representatives.

L. *Memorized secret authenticator* means a type of authenticator comprised of a character string intended to be memorized by, or memorable to, the subscriber, permitting the subscriber to demonstrate something they know as part of an authentication process.

M. *North-South Traffic* means network traffic that moves through a perimeter boundary into another trust level.

N. *Operational disruption,* for purposes of this Security Directive, means a deviation from or interruption of business critical functions that results from a compromise or loss of data, system availability, system reliability, or control of system**s**.

O. *Operational Technology **s**ystem* is a general term that encompasses several types of control systems, including industrial control systems, supervisory control and data acquisition systems, distributed control systems, and other control system configurations, such as programmable logic controllers, fire control systems, and physical access control systems, often found in the industrial sector and critical infrastructure. Such systems consist of combinations of programmable electrical, mechanical, hydraulic, pneumatic devices or systems that interact with the physical environment or manage devices that interact with the physical environment.

P. *Owner/Operator* means a person who owns or maintains operational control over pipeline facilities or engages in the transportation of hazardous liquids or natural gases and who has been identified by TSA as one of the most critical interstate and intrastate natural gas and hazardous liquid transmission pipeline infrastructure and operations.

Q. *Phishing* means tricking individuals into disclosing sensitive personal information through deceptive computer-based means (such as internet web sites or e-mails using social engineering or counterfeit identifying information).

R. *Security, Orchestration, Automation, and Response* means capabilities that enable Owner/Operators to collect inputs monitored by the security operations team. For example, alerts from the security information and event management system and other security technologies – where incident analysis and triage can be performed by leveraging a combination of human and machine power – help define, prioritize and drive standardized incident response activities. These capabilities allow an Owner/Operator to define incident analysis and response procedures in a digital workflow format.

S. *Shared Account* means an account that is used by multiple users with a common authenticator to access systems or data. A shared account is distinct from a group account, which is a collection of user accounts that allows administrators to group similar user accounts together in order to grant them the same rights and permissions. Group accounts do not have common authenticators.

T. *Spam* means electronic junk mail or the abuse of electronic messaging systems to indiscriminately send unsolicited bulk messages.

U. *Tor,* also known as *The Onion Router,* means software that allows users to browse the web anonymously by encrypting and routing requests through multiple relay layers or nodes. Tor software obfuscates a user's identity from anyone seeking to monitor online activity (such as nation states, surveillance organizations, information security tools). This deception is possible because the online activity of someone using Tor software appears to originate from the Internet Protocol address of a Tor exit node, as opposed to the address of the user's computer.

V. *Trust relationship* means an agreed-upon relationship between two or more system elements that is governed by criteria for secure interaction, behavior, and outcomes relative to the protection of assets. This term refers to trust relationships between system elements implemented by hardware, firmware, and software.

W. *Unauthorized Access of an Information Technology or Operational Technology System* means access from an unknown source, access by a third party or former employee; an employee accessing systems for which he or she is not authorized; and may include a non-malicious Owner/Operator's policy violation such as the use of shared credential by an employee otherwise authorized to access it.

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position at Northwest Natural Gas Company dba NW Natural ("NW Natural" or "Company").

A. My name is Brian E. Fellon. My title is Vice President, Chief Information Officer & Chief Information Security Officer. I am responsible for NW Natural's information technology and services ("IT&S"), including cybersecurity, information technology ("IT"), operational technology ("OT"), service desk, and other technology-related architecture, infrastructure, network, and applications—which together enable NW Natural to support its customers and operate successfully.

Q. Please describe your education and employment background.

A. I hold a Bachelor's degree in business administration from the University of Washington and a Master of Business Administration from Seattle University. I have more than 25 years of experience in IT, and nearly 20 years of IT leadership in management and executive levels. I joined NW Natural in my current role in 2024. Prior to joining NW Natural, I was Director of Information Technology, Application Services, at Puget Sound Energy in Bellevue, Washington for eight years. Prior to that, I held a variety of technical and technology leadership roles in consulting, aerospace, and retail sectors.

Q. What is the purpose of your testimony?

A. The primary purpose of my testimony is to introduce and describe the IT&S projects and programs for which the Company is seeking recovery in this case. I will therefore provide an overview of NW Natural's strategic vision, explain major IT&S planning

areas, and provide details regarding the major IT&S projects and programs for which recovery is sought in this rate case.

Q. Please summarize your testimony.

A. First, I provide an overview of NW Natural's IT&S environment, including the ongoing need to migrate to cloud-based software and associated cost-recovery concerns. Second, I provide an update on the Company's Horizon Program. Third, I describe the IT&S projects that will be included in each year of the proposed multi-year rate plan ("MYRP"), including preexisting and pro forma projects. Finally, I detail two programmatic IT&S efforts for which the Company seeks cost recovery in this proceeding: (1) the EDP Data Reporting and Analytics Program and (2) the Telemetry Refresh Program.

Q. Please explain how the Company's major IT&S projects are organized.

A. The Company's major IT&S projects are organized into the following categories:

1. **Horizon Program:**[1] The Horizon Program is a multi-year, two-phase IT&S initiative to upgrade NW Natural's central technology architecture. While the second phase of this project will not be placed in service until after the MYRP in this case, several smaller prerequisite projects will enter service during the MYRP. I discuss this Program and the constituent prerequisite projects in more detail in Section III (Horizon Program Update).

[1] NW Natural uses the term "program" internally to refer to large, multi-project initiatives. This use is distinct from the Commission's use of "programmatic investments" to mean investments made according to a schedule or plan, where investment is forecast using "historical trends." *See* Used and Useful Policy Statement ¶¶ 11n.19, 35.

2. **Field and Web Mapping:** Field and Web Mapping refers to the systems and tools that allow NW Natural to view its infrastructure and other assets in a geospatial format and for collecting various types of data related to these assets. These tools also provide field and office personnel with visual representations of NW Natural facilities and assets, which they use for a range of business purposes including inspection and compliance programs. Currently, NW Natural is in the midst of a multi-year initiative to update the Company's field and web mapping solutions by phasing out end-of-life software and transitioning to a consolidated set of modern software solutions.
3. **Field Workforce Management:** Field Workforce Management involves the tools necessary to schedule, dispatch, and route NW Natural personnel in the field. Successful field workforce management relies on accurate and efficient field and web mapping for visibility into NW Natural's system and physical assets, and then uses this foundation to optimize the management of field personnel.
4. **Identity Governance and Administration ("IGA"):** IGA is the process of granting, updating, reviewing, and revoking access to technology systems for NW Natural employees and contractors, based on job changes or other Company needs, and forms an important component of the Company's security controls. The Company's IGA work effort includes several projects necessary to transition to an automated IGA software solution, and thus ensure consistent, secure monitoring and control of access and permissions.

5. **Customer Self-Service:** The Customer Self-Service enhancements initiative provides customers with new features and efficiencies to improve communication and accessibility, helping customers manage their accounts more easily through the web-based and phone systems. Customer Self-Service projects also equip customer service representatives with tools to resolve complex issues faster and serve customers more efficiently.
6. **Technology Refresh:** Technology Refresh focuses on physical infrastructure necessary to enable the Company's IT&S. This category of work includes microwave towers, voice radio, and telemetry equipment—all of which is necessary to monitor and maintain to ensure the safe and reliable provision of service.
7. **Gas Control Daily Operations Platform ("GCDOP"):** The GCDOP is a strategic initiative to replace the company's aging, custom-built Supervisory Control and Data Acquisition ("SCADA") platform with a modern, modular, and secure SCADA platform to control and monitor the Company's distributed pipeline infrastructure.
8. **Application Lifecycle Management ("ALM"):** ALM refers to work needed to update and maintain critical IT&S applications and platforms. These maintenance-related investments are necessary to ensure IT&S systems' security and reliability. By keeping software and equipment at supported levels, NW Natural can continue to receive critical system and security patches, take advantage of the latest technology features, and maintain license compliance as defined by support agreements. While ALM can overlap with other categories

of IT&S work, the Company uses ALM to refer to work that is exclusively lifecycle-related.

9. **Back-Office Functions:** Back-office Functions represent the underlying administrative infrastructure needed to ensure that NW Natural, as a utility company, operates safely, reliably, and effectively. In the Company's IT&S space, this includes financial reporting software, billing systems, risk analytic tools, and report generation functions.

Q. How are the Company's IT&S investments allocated to Washington customers?

A. The Company's IT&S investments are allocated to Washington and Oregon customers using the allocation factor of total customers. The Washington allocation factor for total customers in this case is 12.17 percent. The Direct Testimony of Kyle T. Walker (Exh. KTW-1T) addresses the topic of allocation factors and their associated methodology.

II. OVERVIEW OF THE IT&S ENVIRONMENT

Q. Please describe NW Natural's current IT&S environment.

A. IT&S continues to play a critical and ever-evolving role in serving customers, utility operations, and cybersecurity. In this dynamic environment, NW Natural strives to modernize its systems while prudently preserving and extending the useful life of the systems in place. The Company will continue to prioritize IT&S cybersecurity, ensuring that both the new and existing IT&S platforms are safeguarded against potential threats.

Q. Does the Company's IT&S environment continue to include the adoption of cloud-based solutions?

A. Yes. Cloud-based solutions have become industry standard for large enterprises. Utilities often transition to cloud-based solutions when legacy systems reach end-of-life because these solutions have become the standard offering in the industry, if not the only available offering for a given system. Legacy systems are increasingly difficult and costly to maintain, lack compatibility with modern technologies, and pose significant cybersecurity risks. Cloud-based platforms provide enhanced scalability with resource demands, real-time data accessibility, and robust support and real-time cybersecurity updates from developers. With on-premises options being phased out, cloud-based solutions are now the primary avenue for utilities to maintain their operations and ensure reliable service delivery in an evolving energy landscape. Over the last several years, the Company has successfully migrated an array of IT&S solutions and platforms to Microsoft's Azure cloud platform as part of NW Natural's overarching goal of simplifying IT&S solutions.

Q. Is NW Natural continuing to experience financial pressures associated with the cloud-based solutions?

A. Yes. While cloud-based solutions are the prudent (and sometimes only) choice for the Company and our customers, the accounting rules associated with these solutions create new financial pressures for several reasons. **First**, unlike on-premises solutions, the utility can capitalize only the implementation costs of cloud-based assets, with the depreciable life of this asset tied to the duration of the contract for the software service. Typically, in the IT&S field, these contracts are relatively short—between one and five

years. As such, the depreciable life of the asset is very fast compared to most of the utilities' long-lived assets. With a five-year asset life, if the utility does not recover a single year of the asset, the utility is foregoing 20 percent of the recovery of that asset.

Second, cloud-based assets are a relatively new technology. NW Natural did not have any cloud-based assets prior to 2020. As such, this asset class is a growing asset class, which creates a more urgent financial need to ensure that the Company is routinely recovering this new asset class.

Third, because cloud-based solutions entail ongoing subscriptions, the accounting rules require that these subscription costs be accounted for as operations and maintenance ("O&M") expense. As noted above, with the system-wide migration to cloud-based solutions, NW Natural is continuing to experience increases in the Company's annual incremental O&M expense as the Company moves to more cloud-based tools.

Q. How does the rapidly changing IT&S environment impact project forecasting in a MYRP?

A. The rapid evolution of IT&S systems makes these projects particularly challenging to forecast with specificity in the more remote years of a MYRP. As I note above, IT&S projects frequently operate on shorter time horizons. Thus, particularly for projects in Rate Years 2 and 3, the Company bases its cost estimates and forecast need on the reasonably expected lifecycles of certain critical IT&S infrastructure.

For instance, the Company currently anticipates needing to update or replatform its website as part of the Website Technology Project in 2027 (Rate Year 2). This timeline reflects a typical planning lifecycle for website technologies. However, since

software tools evolve rapidly, the Company will not be able to finalize its evaluation and confirm specific options until closer to the project kick-off date in 2026. Thus, certain projects in the later years of the MYRP will involve additional documented analysis concerning project scope, cost, and alternatives, to support prudent and timely decision-making.

Q. How does the rapid evolution of IT&S systems impact the Company's application lifecycle management?

A. The rapid evolution of IT&S systems means that the Company must plan for routine system updates. For IT&S systems, the application lifecycle is usually 2-3 years, at which point the Company must update to current software. If updates are not made, then the Company risks exposing these crucial systems to cybersecurity threats or facing reliability challenges due to lack of vendor support. In adopting new software versions, the Company seeks to balance longevity and reliability. While adopting the most recent version would ensure that vendor support would be available for the longest period of time, the latest software versions often experience the most "bugs" or technical issues. Thus, the Company seeks to prudently balance maintaining existing, vendor-supported software versions while ensuring that applications remain secure and reliable.

Q. Is there a particular area of the Company's IT&S environment that is undergoing the most transformative change during this MYRP?

A. Yes. The Company's field and web mapping program is undergoing a particularly transformative change. This multi-year initiative involves upgrading and replacing the systems used to manage and view NW Natural's geospatial and physical asset data.

The geographic information system ("GIS") team uses geospatial data to maintain NW Natural's gas asset records and to model the Company's gas facilities and operations. This detailed network model allows the Company to control how gas moves through the system and to highlight potential system gaps. The following simplified Table 1 summarizes the Company's roadmap for the field and web mapping product suite relevant to this MYRP, which consolidates significant functionality onto the Company's new IQGeo platform:

///

///

///

Table 1. Company's Roadmap for the Field and Web Mapping Product Suite

Application	Status	Uses	Users
IQGeo	• 2020: Implementation • 2023: Lifecycle management (version update to 6.5) • 2027: Lifecycle management (version update to latest major release, currently forecasted as 8.x)	View geospatial data and maps, complete surveys, report leaks	Field and Back Office
MapFrame	Replaced by IQGeo (2024)	View and correct maps	Field and Back Office
ArcMap (Esri)	Will be replaced by ArcGIS Pro (2026)	Create, edit, and analyze GIS data and connectivity model	GIS, Environmental Management, Pipeline Integrity
ArcGIS Pro (Esri)	Will replace ArcMap (2026)	Create, edit, and analyze GIS data and connectivity model	GIS, Environmental Management, Pipeline Integrity
Geometric Network (Esri)	Will be replaced by Utility Network (2026)	Model network connectivity of gas infrastructure	GIS, Pipeline Integrity, others for valve isolation and cathodic protection tracing
Utility Network (Esri)	Will replace the Geometric Network (Esri) (2026)	Model network connectivity of gas infrastructure	GIS, Pipeline Integrity, others for valve isolation and cathodic protection tracing
ArcFM Viewer	Will be replaced by Esri product (2026)	Trace cathodic protection network	Corrosion Team
Visual Fusion	Will be replaced by IQGeo and Esri (2027)	View valve isolation tracing maps for emergency response	Back Office, Gas Control
Capture (IQGeo)	Will be replaced by IQGeo Network Manager (2027)	Field drawing tool for newly constructed assets	Field and Back Office

Q. How do the projects you detail in your testimony align with the Company's overarching strategic goals?

A. Each of the projects I detail in my testimony supports the Company's goal of serving customers through a secure and compliant system. These projects ensure the reliability and resilience of NW Natural's operations, enhance operational security, and leverage opportunities to streamline NW Natural's IT&S portfolio using off-the-shelf tools that are effective and vendor-supported. NW Natural has worked closely with software vendors to identify competitive and effective solutions that prioritize quality customer service and reliable business operations. As the Company implements its overarching strategic IT&S transition to cloud-based platforms, NW Natural will continue to prudently maximize the useful life of existing IT&S systems for the benefit of customers.

III. HORIZON PROGRAM UPDATE

Q. Please briefly describe the Horizon Program.

A. As described in UG-200994, the Horizon Program is a multi-year, two-phase IT&S initiative to upgrade NW Natural's central technology architecture. Each phase, referred to as Horizon 1 and Horizon 2: Vista ("H2: Vista"), is driven by a significant keystone project to upgrade a major piece of software using modern, industry-standard software tools. NW Natural successfully completed the first phase of the transformational effort ("Horizon 1") in 2022, by upgrading the Company's backbone enterprise resource planning ("ERP") software. The costs for this phase of the project were included in year two of the UG-200994 Multi-Year Rate Plan. Horizon 1 was implemented on time and within reasonable budget parameters, providing valuable

lessons learned for the Horizon Program's second major phase: H2: Vista. This second phase will comprehensively update the Company's outdated customer information system ("CIS") and other customer-facing functions and related services, and is currently in development.

Q. What is the status of the Horizon Program?

A. In 2024, the Company completed the initial planning stage of H2: Vista, which involved a comprehensive framing study to confirm the sequence and scope of various prerequisite and component projects. This careful preliminary analysis was crucial to minimize risk in the larger implementation components of H2: Vista. NW Natural is moving forward with the prerequisite projects identified in the study to prepare for its CIS replacement. These prerequisite activities will ensure that NW Natural has the right foundational technologies in place to support its CIS replacement and will ensure that the Company's legacy CIS is able to provide reliable service to NW Natural customers during the transition.

Q. Please summarize the CIS study approach.

A. The Company completed the six-month study with third-party consultant support from Ernst & Young ("EY"). EY was selected through a competitive procurement process, which included several vendors that are leaders in implementations of this type. EY brought extensive experience in completing recent similar work with other utilities around the country. The study followed a structured approach, starting with a current state assessment, followed by the identification of the strategic alternatives, and concluding with a development of the recommendation and a roadmap for the program.

The December 2024 NW Natural Executive Update of the CIS study is included in confidential Exh. BEF-2C.

Q. Please summarize the study recommendation.

A. The study recommended initiating implementation of the new CIS in 2030, while dedicating the next five years to completing the prerequisite work. This approach mitigates the risks associated with the upcoming CIS replacement project and establishes a more balanced and steady expenditure pattern in the years leading up to the CIS implementation. This recommendation is based on several compelling reasons:

- **Financial Impacts:** Financial management is a cornerstone of this recommendation, focusing on reducing near-term costs. This plan prioritizes NW Natural's mission of providing affordable service by minimizing the immediate impact on customer rates.
- **Service Impacts:** By extending the timeline for completing peripheral and prerequisite projects, NW Natural can address more pressing customer needs sooner.
- **Strategy & Alignment:** This strategy enables steady investment in the existing technology and the completion of vital prerequisite projects, while deferring major capital expenditures and synchronizing them with the completion of other large capital programs.
- **Implementation Logistics:** This plan acknowledges the current personnel limitations within NW Natural's IT&S and business teams, which are not presently staffed to manage such a large-scale project. There is too great a risk of unknown complexities to move forward with prerequisites and CIS project launch in a single

workstream. CIS is a critical business function and a longer timeframe for completion is needed to adequately reduce project risk.

- **Technology Considerations:** Delaying the CIS replacement allows NW Natural to continue using its existing CIS asset, thereby obtaining additional value from the investment. While the current system meets business needs today, its flexibility and scalability to accommodate growth and evolving customer needs are limited.

Additionally, the study categorized CIS Replacement projects into three groups:

1. **Evolve & Sustain projects:** These are essential to maintain business as usual while preparing for the CIS replacement, including the cutover and stabilization phases.
2. **Prerequisite projects:** These projects are necessary to meet core business needs and mitigate risks associated with the CIS Replacement, while aligning with the customer lifecycle management roadmap.
3. **CIS Replacement projects:** These are directly related to the replacement efforts, such as the CIS implementation itself.

Q. What alternatives did the Company consider?

A. NW Natural evaluated three alternatives for CIS replacement to determine which one best aligns with the Company's desired outcomes and objectives. The evaluation involved a thorough examination of each alternative's advantages, disadvantages, and potential impacts:

1. **Near-Term CIS Replacement:** This alternative involves replacing the existing CIS with SAP within the next five years. This approach would require

significant financial investment in the next few years and the simultaneous execution of prerequisite and peripheral projects.

2. **Long-Term CIS Replacement:** This alternative is a gradual approach to replacing the existing CIS in the early 2030s, one that balances expenditure and resources utilization over time. It allows for the completion of necessary peripheral projects before transitioning to the new CIS.

3. **Defer CIS Replacement Decision:** This alternative involves improving and strengthening the existing CIS through regular hardware and software refreshes. It also includes redesigning the user interface and reducing its scope to primarily billing functions. The decision on replacing the existing CIS would be deferred indefinitely.

Q. How did NW Natural consider each of these alternatives?

A. Each alternative was developed with a proposed timeline, along with a sequence of activities, which allowed the Company to better understand the broader impact of the sequencing of work outlined in the alternatives. Each of the three CIS alternatives was then scored across a set of criteria and business objectives. These criteria were categorized into key areas of impact, including Strategy and Alignment, Service Impact, Financial Impact, Implementation Logistics, and Technology considerations. For each area, specific criteria such as strategic fit, regulatory compliance, benefits versus risks, customer expectations, and operational excellence were evaluated.

Q. What alternative did NW Natural choose for its CIS system?

A. After completing its formal evaluation process, the Company chose long-term replacement (option 2), while also incorporating some stabilization work for the

existing CIS. A CIS replacement is among the most complex projects a utility can undertake, and because of this NW Natural intends to complete all peripheral and prerequisite work at a manageable pace to account for staffing level dynamics. This work will put the Company on track to replace the CIS on a specific timeline, currently estimated to be 2032. By adopting this deliberate, structured approach to replacing its CIS, NW Natural can ensure a seamless transition to a new system while maintaining customer service quality.

Q. What other considerations were a factor in NW Natural's decision to postpone the replacement of the CIS system?

A. NW Natural needs to complete several prerequisite and peripheral projects in advance of replacing the CIS system. Completing this work along with preparing to launch a new CIS would be extremely challenging due to the limited size of NW Natural's current CIS support team. The existing CIS system is maintained by a small, experienced team within NW Natural, which includes key employees eligible for retirement over the next 3-5 years. These individuals possess detailed working knowledge of the CIS's architecture, operation, customizations, and integrations. Regulatory requirements and business enhancements involving changes to the CIS flow through a very narrow funnel of design and development capacity. By extending the time needed before starting the new CIS implementation from two years to five years, NW Natural can build up its CIS staffing, execute the necessary peripheral projects, and implement certain prerequisite projects.

Q. Were there external factors in the market affecting the decision to not pursue replacing the CIS in the near-term?

A. Yes. System integrator demand is outpacing supply for utilities looking to replace their CIS in the next two years. According to EY, many similarly sized or larger utilities are pursuing CIS replacement projects. There is a finite capacity of quality CIS system integrators, and the current competition for these resources would result in higher costs or lower quality resources for NW Natural.

Q. Were there other factors considered in the decision to not pursue the third alternative of maintaining the current CIS and deferring the CIS replacement decision indefinitely?

A. Yes. The Company determined that making significant investments in the existing CIS would not be a viable long-term solution. Long-term support (e.g., over 10 years) of the current CIS and its associated hardware will become increasingly difficult, risky, and costly. While NW Natural plans to take steps over the next several years to evolve and sustain the existing CIS as needed, the underlying CIS technologies (e.g., iSeries hardware and report program generator, or "RPG," code) are moving toward obsolescence.

Q. How is NW Natural planning to manage risks associated with the current CIS given the replacement date of 2032?

A. NW Natural is implementing a series of "Evolve & Sustain CIS" projects to ensure the continued stability and performance of the existing CIS leading up to and through its replacement. These projects include activities necessary to maintain business as usual while preparing for the replacement of the CIS and through the cutover and stabilization

phases. This work encompasses several key upgrade projects, including (a) enhancing the integration of the CIS with the Clevest field work management system to enhance operational efficiency, (b) upgrading the CIS graphical user interface to better support customer service representatives, and (c) performing lifecycle upgrades scheduled between 2028 and 2030. These projects are strategically planned to keep the CIS components up-to-date and secure, ensuring consistent service reliability for customers within a well-managed budget. The projects are grouped to address different operational needs, including vendor selection and third-party integrations, ensuring that each aspect of the CIS is optimized for performance and security.

Q. Is the Company seeking cost recovery of projects associated with H2: Vista in this rate case?

A. Yes. NW Natural is seeking cost recovery associated with completing several projects that are part of the CIS replacement roadmap. These projects are essential to maintain business as usual while preparing for the CIS replacement. Although these projects are part of the CIS roadmap, they are also necessary as part of ongoing investment to ensure continued availability, stability, and security of our existing CIS. The projects are:

- **CIS to Clevest Integration Hardening and Upgrade Project:** This project will ensure a robust and efficient connection between the current CIS and the Clevest field work management system, which is critical for ensuring stable transfer of work orders between the two systems. This project involves $612 thousand in proforma system investment, with a Washington allocation of $74 thousand. This project is expected to be in service in August 2025.

- **Application Lifecycle Management - LegaSuite Project:** This project is required to update to CIS graphical user interface (GUI) to maintain system technical currency. This project involves $56 thousand in total system investment, with a Washington allocation of $7 thousand.
- **CIS Data Quality Cleansing:** This initiative mitigates CIS replacement risk by migrating CIS data to the Enterprise Data Platform ("EDP"), conducting data quality analysis, and implementing data governance measures. By transferring historical CIS data to the EDP and retaining only the current data necessary for billing within the CIS, the scope and risk of the CIS replacement will be significantly reduced. This project involves $4.5 million in total system investment, with a Washington allocation of $545 thousand. I discuss this project in more detail below, along with other Rate Year 3 projects (Section VIII).

IV. IN-SERVICE PROJECTS
(through March 31, 2025)

A. Genesys Replatform Project

Q. As an initial matter, can you please provide some background on Genesys' role within NW Natural?

A. Genesys is the Company's advanced call routing software provider. Previously, NW Natural used Genesys PureConnect, an on-premises solution, to serve 7 groups and 300 combined agents across NW Natural, including Customer Support and the Customer Contact Center. Due to the centrality of Genesys' role in NW Natural's communications operations, the Genesys PureConnect software was a critical infrastructure system that needed to be available 24 hours a day, 365 days a year. As a

result, reliability issues with this system were unacceptable for public health and safety.

Q. Please describe the Genesys Replatform Project.

A. The Genesys Replatform Project transitioned the Genesys call routing solution to a cloud environment, in response to the impending termination of support for the on-premise PureConnect platform by the software provider.

Q. Why was the Genesys Replatform Project necessary?

A. The Genesys Replatform Project was necessary to maintain the integrity and reliability of the Company's communications with customers. Fundamentally, this project was driven by the sunset of the Genesys PureConnect on-premises software. Genesys was phasing out the availability of and support for the PureConnect system, first by ceasing to offer new support agreements in January 2024, and then by fully ceasing support and operation of the system on July 31, 2025. Thus, while Genesys PureConnect had been an integral part of handling NW Natural's customer interactions and support experience, the Company needed to transition to a different call routing solution.

Q. What are the benefits of the Genesys Replatform Project?

A. In addition to preventing outages on this critical part of NW Natural's communications infrastructure, the Genesys Replatform Project reduced the risk of product downtime and supported integration with other software solutions. A cloud-hosted call-routing software can greatly minimize outages compared to on-premises options, which can be subject to location-specific service interruptions. Similarly, Genesys Cloud supports integrations with a wide range of other software solutions, which can facilitate future integrations across other technologies and platforms.

Q. Did NW Natural consider alternatives to replatforming the Genesys software?

A. Yes. NW Natural explored deploying a new contact center solution, but doing so would have been more costly, more labor-intensive, and would not have provided assurance of superior service. Moreover, integrating a new software solution with the Company's other software systems would have introduced additional reliability risks.

Q. What is the status of the Genesys Replatform Project?

A. The Genesys Replatform Project was placed in service in September 2024. The alternatives analysis for this project is attached as Exh. BEF-3.

Q. What cost recovery is NW Natural requesting for the Genesys Replatform Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $3.1 million on a system basis, or $0.4 million on a Washington-allocated basis.

B. Utilities International Planner Replatform Project

Q. Please describe the Utilities International ("UI") Planner Replatform Project.

A. The UI Planner Replatform Project migrated the Company's UI planning system into the cloud. UI Planner is NW Natural's corporate financial and regulatory finance planning system and is also used by most of the Company's utility peers to perform complex, iterative forecasts and problem-solving. The Company's legacy version of UI Planner was first implemented in 2014 and was no longer supported by the software provider after 2023. In order to continue using the UI Planner software, the system needed to be replatformed to the modern cloud-based environment—which also required integrating UI Planner's new cloud-based software product.

Q. What alternatives did NW Natural consider to replatforming the UI Planner software?

A. The only available alternative to UI Planner was Excel's manual spreadsheet functionality, which the Company used prior to UI Planner. Thus, the Company considered foregoing the UI Planner replatform and reverting to Excel. However, this option was not considered to be reasonably viable for several reasons. **First,** Excel does not have the functionality to run complex models, meaning that any forecasting analysis would require sequenced and interrelated model runs that take significantly longer and yield less reliable results. **Second,** Excel requires laborious manual entry that is both error-prone and costly. **Third,** Excel models must still be built, requiring significant up-front and ongoing maintenance labor.

Q. Are there other benefits of replatforming UI Planner besides maintaining existing functionality?

A. Yes. The new UI product comes with additional benefits not available in the legacy, on-premises model, including significantly faster model run times, greater modeling transparency, and alternative financial statement methods—which are important for Generally Accepted Accounting Principles ("GAAP") forecasting.

Q. What is the current status of the UI Planner Replatform Project?

A. The UI Planner Replatform Project entered service in September 2024. The alternatives analysis for this project is attached as Exh. BEF-4.

Q. What cost recovery is NW Natural requesting for the UI Planner Replatform project in this case?

A. NW Natural seeks to recover its capital investment of approximately $2.1 million on a system basis, or $0.3 million on a Washington-allocated basis.

C. IQGeo Upgrade Project

Q. Please provide some context on how the IQGeo Upgrade Project fits into the Company's field and web mapping program.

A. The IQGeo Upgrade Project is part of a multi-year program to replace the Company's field and web mapping solutions by phasing out end-of-life software tools and transitioning to a consolidated set of modern software solutions. NW Natural relies on its field and web mapping tools to view its infrastructure and other assets in a geospatial format and to collect various types of data related to these assets. These field and web mapping tools provide field and office personnel with visual online and offline representations of NW Natural facilities and assets, which they use for a range of business purposes, including inspection compliance programs.

IQGeo is a key piece of this consolidation and transition project and serves as the Company's new field and web mapping operations hub. IQGeo is a user-friendly, map-based tool that provides field and office personnel with the information they need to improve data accuracy and safety. IQGeo was first licensed in 2019, was implemented in 2020, and is gradually being supplemented with additional functionalities (known as "use cases") over time.

Q. Please describe the IQGeo Upgrade Project.

A. The IQGeo Upgrade Project (a) upgraded to a newer, fully supported version of IQGeo, (b) replatformed IQGeo to Azure's enterprise-wide cloud environment, and (c) established automated testing for the IQGeo application.

Q. Why was it necessary to upgrade IQGeo?

A. It was necessary to upgrade IQGeo to mitigate risks of technical failures for the Company's essential field and web mapping system. As with other software products, IQGeo requires periodic upgrades to address bug fixes, incorporate product improvements, and maintain support services from the software vendor. In this case, the software vendor had discontinued full support for the existing product version. Additionally, NW Natural is in the process of upgrading and replacing other legacy mapping applications that rely on or integrate with IQGeo (such as, for example, those included in the Field and Web Maps Enablement Phase II Project). The previous version 6.1 of IQGeo was not compatible with these other projects, further supporting the need to undertake the upgrade.

Q. What is the current status of the IQGeo Upgrade Project?

A. This project entered service in December 2023. The alternatives analysis for this project is attached as Exh. BEF-5.

Q. What cost recovery is NW Natural requesting for the IQGeo Upgrade Project in this case?

A. NW Natural seeks to recover its capital investment of $1.8 million on a system basis, or $0.2 million on a Washington-allocated basis.

D. MapFrame Replacement Project

Q. Please provide some background on the MapFrame Replacement Project and how this Project fits into the Company's field and web mapping program.

A. The MapFrame Replacement Project continues the Company's field and web mapping goals by transitioning away from an end-of-life software tool and consolidating features in a modern system. MapFrame was previously used as a general map viewer and map correction tool, allowing the field and back-office users to:

- View gas facility location and asset information;
- Document changes to field conditions and mapping errors; and
- Create personal map notes for users to document information.

None of the above functionalities were available in NW Natural's other field and web mapping software tools. This Project allowed the Company to consolidate software tools by replacing MapFrame with IQGeo, which provides an up-to-date visual interface with NW Natural's operational assets.

Q. Please describe the MapFrame Replacement Project.

A. The MapFrame Replacement Project transitioned the Company away from an existing end-of-life software system (MapFrame) and developed equivalent functionality in the Company's IQGeo platform. This Project involved developing CIS integration to view customer information, creating location widgets to display locational information, implementing a design interface to allow for map corrections, enabling users to generate personal notes tied to maps, and facilitating map printing from mobile devices. All of these features were part of developing a new set of "use cases" in IQGeo, consistent with the goal for IQGeo's development as a central operations hub.

Q. Why was the MapFrame Replacement Project necessary?

A. The MapFrame Replacement Project was necessary because the previous MapFrame software was end-of-life, and indeed had not received a software update from its developer since 2015. As a result, transitioning away from this product was important to ensure continuity of NW Natural's operations. Transitioning MapFrame's functions to IQGeo was also a prerequisite for other field and web mapping transition efforts, which are designed to integrate with IQGeo's more modern system.

Q. Are there any additional benefits of the MapFrame Replacement Project?

A. Yes. By transitioning MapFrame's current map viewing and map correction functions into IQGeo, the Company was able to streamline the Company's IT&S product suite. This consolidation is consistent with NW Natural's broader strategy of simplifying its IT&S portfolio to benefit customers.

Q. Did NW Natural consider alternatives to the MapFrame Replacement Project?

A. Yes, NW Natural considered two alternatives to the MapFrame Replacement Project. **First,** the Company considered implementing an alternative mapping solution to replace MapFrame. This option was not selected because it would involve implementing a new—non-IQGeo—mapping solution, which would complicate the Company's IT&S environment, delay implementation of a new solution, and increase licensing, implementation, and maintenance costs.

Second, the Company considered maintaining the existing MapFrame solution. This option was not selected because it would undermine reliability of the Company's mapping functions in the short-term, would require NW Natural to pay to maintain two software systems instead of one, and would merely delay identifying a replacement

option in the long-term because the current MapFrame tool is already end-of-life. In addition, delaying a transition away from MapFrame would delay the other geospatial projects that depend on IQGeo taking on MapFrame's current map-viewing functionalities.

Q. What is the status of the MapFrame Replacement Project?

A. The MapFrame Replacement Project was placed in service in July 2024. The alternatives analysis for this project is attached as Exh. BEF-6.

Q. What cost recovery is NW Natural requesting for the MapFrame Replacement Project in this case?

A. NW Natural seeks to recover its capital investment of $3.0 million on a system basis, or $0.4 million on a Washington-allocated basis.

E. Clevest Optimization Project

Q. Please provide some background on the Clevest Optimization Project.

A. Clevest is NW Natural's new mobile workforce management software used to schedule, dispatch, and complete all work in the field—ranging from emergency response to routine maintenance work. Clevest replaced NW Natural's previous end-of-life application, PragmaCad ("P-CAD"), and was developed and implemented as part of the Horizon 1 Program. Clevest was fully deployed in 2022 and has since served as NW Natural's mobile workforce management tool.

Q. Please describe the Company's Clevest Optimization Project.

A. The Clevest Optimization Project was an incremental new effort to optimize and improve the Clevest mobile work management system, including (1) resolving post-deployment issues identified in the product's performance ("stabilization") and

(2) adding new functionalities that were initially not included but, following the product's launch, turned out to be critical ("optimization"). By expeditiously stabilizing and optimizing the Clevest software, the Company ensured that the tool continues to provide the best value for the Company and its customers.

Q. Why was post-deployment stabilization necessary?

A. While effective in a testing environment, Clevest proved to have difficulty accommodating the complexity of NW Natural's operations. As a result, when the platform was deployed and used, the Company encountered issues such as slowed response times. For instance, system input requests would have long lag times, often ranging from 3-5 minutes, and even up to 30 minutes. While the system was operable, these significant lag times created delays in work order processing and customer response times. A new dedicated workstream was necessary to address the post-deployment project performance issues.

Q. Why was post-deployment optimization necessary?

A. As part of streamlining NW Natural's IT&S infrastructure, NW Natural initially determined that certain features and functions of the Clevest platform were non-essential and could be deprioritized. For instance, while work orders could be viewed in sequence, the platform did not allow users to view all work orders tied to a certain location. In practice, the absence of these features and functions resulted in dissatisfaction for both field employees and customers. For instance, without the ability to alert a field worker that multiple work requests were scheduled at the same location, multiple visits would be scheduled—resulting in an ineffective allocation of employee time and confusing customers. Based on this feedback from Clevest users,

NW Natural identified a list of mission-critical and high-priority functionalities necessary to optimize Clevest's performance.

Q. Did NW Natural attempt to avoid and mitigate post-deployment problems in the initial Clevest procurement process?

A. Yes. NW Natural sought to avoid and minimize any development and deployment issues with Clevest by bringing in an implementation expert, Accenture, to help manage the implementation process. NW Natural coordinated meetings with Accenture and the Clevest vendor, including regular meetings with senior leaders and executives at each company. NW Natural also committed a dedicated business lead and project manager to focus on Clevest work, with twice-daily status updates to maintain progress and momentum.

Q. What alternatives did NW Natural consider before proceeding with the Clevest Optimization Project?

A. NW Natural considered four main alternatives before deciding to proceed with the Clevest Optimization Project: (1) addressing only basic stabilization issues (such as lagging response times), without pursuing further optimizations or enhancements; (2) addressing stabilization issues and a subset of new functionalities deemed mission-critical, but not addressing other priority features; (3) addressing stabilization issues as well as mission-critical and high-priority functionalities and features; and (4) addressing stabilization issues and the full list of all functionalities and features identified by Clevest users. Of these, NW Natural selected the third option.

Q. Why did the Company decide not to restrict its efforts to basic stabilization issues?

A. The Company decided not to restrict the project to minimal stabilization issues for two reasons. **First,** declining to proactively address known gaps in performance would result in ongoing technical debt as known issues accrued over time. **Second,** failing to address the functional issues experienced by Clevest users would have undermined the value of the overall Clevest investment. Addressing mission-critical functionality gaps was essential to ensure NW Natural's successful provision of service and to avoid significant customer dissatisfaction. For instance, due to Clevest's inconsistent performance in assigning fieldwork out into the future, work assignments needed to be manually reviewed each morning to ensure that pre-work had been correctly assigned. By optimizing this functionality, the Company could ensure proper distribution of work among field resources and better meet scheduling commitments to customers.

Q. Why did the Company decide not to pursue only stabilization and mission-critical functionality improvements?

A. The Company decided not to pursue only stabilization and mission-critical functionality improvements because addressing the high-priority issues did not significantly impact the overall project cost. These additional functionality improvements are relatively high-impact, low-effort new features. For instance, as originally implemented, Clevest displayed phone numbers, but did not allow these numbers to be copied or clicked to trigger a call. A simple improvement now displays phone numbers as hyperlinks, thus allowing the number to be clicked to trigger an outbound call. Similarly, construction crews interfacing with Clevest need to select the type of equipment (e.g., pipe size) required for various projects. However, as deployed,

Clevest did not display products in a clearly discernible order and did not allow products to be filtered. New functionality added in the Clevest Optimization Project presents equipment in a more logical order and allows for type-ahead functionality, which quickly highlights the needed equipment for selection. By incorporating these kinds of low-investment features, the Company can facilitate more accurate recordkeeping and enable construction crews to spend less time interacting with the Clevest platform and more time serving customers.

Q. Why did the Company decide not to pursue the full suite of functionality improvements?

A. The Company decided not to pursue the full suite of functionality improvements to include medium- and low-priority features for two reasons. **First,** expanding the project to include medium- and low-priority features would have substantially increased the overall project costs. **Second,** the medium- and low-priority features required additional upgrades to the Clevest software in order to enable the new features. However, such upgrades are not yet available, and would thus have significantly delayed optimizing the Clevest product. Due to these combined cost and delay factors, the Company decided to focus on the mission-critical and high-priority features instead.

Q. Were there additional alternatives that were rejected as not viable at this stage?

A. Yes. NW Natural identified three alternatives to the Clevest Optimization Project but determined they were not viable under the circumstances: (1) accepting the Clevest product without modification or improvement; (2) implementing a new mobile work management option; and (3) reverting to the original P-CAD tool.

Q. Why was it not viable to simply continue to use Clevest as it was deployed?

A. Continuing to rely on Clevest as deployed without any stabilization or optimization was deemed unacceptable due to the significant delays associated with the tool, which made it challenging for field employees and caused delays in processing orders. As deployed, the product also encountered unexpected data access restrictions, extensive user interface demands, and other functionality issues. The Company's mobile work management tool is a key aspect of the Company's day-to-day operations and customer engagement. Declining to address key issues in the product's performance was not an acceptable option.

Q. Why did NW Natural not consider switching to an entirely different mobile work management platform?

A. Following Clevest's deployment, NW Natural did not consider switching to a wholly new mobile work management platform due to concerns regarding cost, delay, lack of clearly preferable alternative tools, and ongoing strengths with Clevest:

- **Cost:** Any mobile work management platform requires considerable expense to design, develop, deploy, and integrate. Even significant investment in optimizing/enhancing an existing system cannot reasonably compare to the cost of starting the process from scratch with a whole new mobile work management tool.
- **Delay:** Implementing a new product option would take years to complete. NW Natural was already using Clevest as the Company's mobile work management tool and required prompt improvements to the tool's functionality. Identifying and deploying a brand-new tool would have required significantly more time without alleviating the immediate need for tool enhancements.

- **Alternative Tools**: Available market offerings for mobile work management tools were limited. As a result, even if NW Natural sought to identify and implement an alternate vendor's tool, other deployment issues could arise.
- **Clevest Usefulness:** As designed, Clevest remained a used and useful product and continued to offer the potential for substantially improved user experience over the previous P-CAD tool.

Q. Given the post-deployment issues, why did NW Natural not consider reverting, even temporarily, to the P-CAD tool?

A. Reverting to the previous P-CAD tool was not possible as that tool was already end-of-life. While P-CAD has rolled out a new mobile workforce management system offering, this new system is a wholly new software platform—and its use would thus require the same comprehensive deployment effort described above.

Q. What is the current status of the Clevest Optimization Project?

A. The Clevest Optimization Project was placed in service in July 2024. The alternatives analysis for this project is attached as Exh. BEF-7.

Q. What cost recovery is NW Natural requesting for the Clevest Optimization Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $7.6 million on a system basis, or $0.9 million on a Washington-allocated basis.

F. Identity Governance and Automation Phase 1 Project

Q. Please provide some context for the Identity Governance and Automation (IGA) Program as a whole.

A. The IGA Program is a multi-year, multi-phase effort to identify, implement, and integrate a new IGA software system to establish robust security access and privilege management. Robust security access and privilege management is essential to ensure that critical information is protected and that no single individual has end-to-end access for key decision-making pathways. Indeed, secure access controls are a key part of complying with the Sarbanes-Oxley Act of 2002. This legislation requires NW Natural and other public companies to implement, among a range of other security-related controls, mechanisms to ensure that unauthorized individuals cannot access sensitive financial information.[2]

Previously, security access and other privileges were handled manually, with no centralized control point. As a result, there was no mechanism to certify that an individual's access to security and other functions had been removed following offboarding or other role changes. By implementing a new IGA system, NW Natural increased security of both customer and Company data while streamlining the staff management process.

[2] Sarbanes-Oxley Sections 302.2, 404.

Q. Please describe the IGA Phase 1 Project and how this relates to the other IGA Program phases.

A. The IGA Phase 1 Project focused on selecting, installing, and configuring a modern IGA solution, integrating the solution with the Company's workforce-management systems, and establishing core product functionality that ensures departing workers are automatically removed from network access and related services. Phase 2 and Phase 3 build on this foundation by integrating with additional IT&S systems, consolidating account visibility for centralized monitoring and reporting, and establishing automated access with those systems. Each of these subsequent phases are described in more detail below. Phase 2 is projected in to be in service in rate year 2, and Phase 3 in rate year 3.

Q. Why is a dedicated IGA software solution necessary?

A. A dedicated IGA software solution is necessary to ensure consistent, secure monitoring and control of access and permissions across the Company. To be clear, monitoring and controlling security access and permissions is more complicated than merely turning a switch on or off. **First,** since there are a range of applications with different access points, there is currently no one centralized mechanism to remove security access for a given individual. **Second,** updated access and permissions may also be triggered by changed positions and roles, meaning that maintaining accurate and up-to-date security controls requires nuanced control. **Third,** an individual's access to any given system or piece of information cannot be viewed in isolation, but rather as a complete picture of that individual's security access and permissions across the

Company. This visibility is important to ensure that individuals do not have too much access to sensitive information.

Q. Why had the Company not previously implemented an IGA software tool?

A. NW Natural had not previously implemented an automated IGA tool because the Company was endeavoring to maximize the utility of the existing, less costly manual system. Historically, NW Natural had manually removed security and permissions access for departing personnel as part of the offboarding process and had attempted to improve and strengthen this system over time. However, even an enhanced manual system carries greater risk of failure and security gaps than an automated system. NW Natural therefore determined to move forward with identifying and implementing a centralized IGA software tool.

Q. What software system did NW Natural select for the IGA system and how was this tool selected?

A. NW Natural selected a software system called IdentityNow, developed by a third-party vendor, SailPoint. NW Natural selected SailPoint's IdentityNow tool through a multi-step, multi-factor evaluation process. **First,** the Company collaborated with an independent consultant, Forrester, to establish initial parameters for IGA software and system needs. Forrester also provided a list of possible system integrators, which are third parties with deep subject matter expertise that can help guide the selection and implementation of specific software tools. **Second,** NW Natural conducted a competitive request for proposal ("RFP") process to select a system integrator, evaluating each for cost-competitiveness and industry experience. This process resulted in NW Natural selecting Integral Partners as the system integrator. **Third,**

Integral Partners worked with NW Natural to develop a detailed picture of minimum system requirements for an IGA solution. Integral Partners used this assessment to prepare a scoring system for different IGA solutions, allowing a side-by-side comparison of each option's technical environment, useability, integration capabilities, auditing functions, types of security controls provided, and other key factors. **Fourth,** Integral Partners then scored IGA tools from 18 different vendors to identify a subset of reasonable options for more detailed consideration. This process yielded three software options that the system integrator considered to be reasonably in line with NW Natural's system requirements and operational needs: SailPoint's IdentityNow, SailPoint's IdentityIQ ("IIQ"), and [redacted] For each of these options, Integral Partners also provided cost estimates. **Fifth,** NW Natural assessed each of the three options and conducted its own assessment of available alternatives.

Q. Why did NW Natural select SailPoint's IdentityNow?

A. NW Natural selected SailPoint's IdentityNow software tool because it offered the best, most cost-effective solution to serve long-term customer needs. SailPoint's IdentityNow scored the highest in Integral Partners' scoring system, and offers a comprehensive, user-friendly, and secure IGA solution. SailPoint also has a strong vendor reputation and industry recognition, readily integrates with NW Natural's other IT&S systems, and provides good long-term cost-effectiveness.

Q. Was the IdentityNow solution the least-cost long-term option overall?

A. Yes. IdentityNow's annual subscription costs of $250,000 per year were similar to the other IGA options—which ranged from an estimated $225,000 (for [redacted]) to

$300,000 (for SailPoint's IIQ) per year—while also providing substantially greater alignment with NW Natural's system. The slightly less expensive annual subscription option, [redacted], lacked built-in integrations with other applications in NW Natural's IT&S environment, and would therefore have required substantially more investment to integrate and maintain. As a result, accounting for the implementation and maintenance costs, SailPoint's IdentityNow solution presented the most cost-effective long-term option to provide these important security protections for customers.

Q. How did NW Natural identify the scope of work that would be included in the different phases of the IGA Program?

A. NW Natural identified the scope of work for each phase of the IGA Program in collaboration with Forrester and Integral Partners. In developing this roadmap, NW Natural identified three basic work streams: (1) initial product selection, implementation, and activation; (2) integration with the highest priority systems (specifically, workforce management systems); and (3) expansion of additional automated access controls throughout the Company's IT&S systems. Subsequent IGA phases then prioritize the additional IT&S systems for integration according to (i) the degree of security and compliance risks; (ii) the size of the user base affected; and (iii) complexity (and associated cost) of the integration effort. I discuss the specific components of the IGA Phase 2 and IGA Phase 3 Projects in more detail below.

Q. What is the current status of the IGA Phase 1 Project?

A. The Company placed this project in service in October 2024. The alternatives analysis for this project is attached as confidential Exh. BEF-8C.

Q. What cost recovery is NW Natural requesting for the IGA Phase 1 Project in this case?

A. NW Natural seeks to recover its investment of $3.5 million on a system basis, or $0.4 million on a Washington-allocated basis.

G. Start-Stop-Transfer Project

Q. Please describe the Start-Stop-Transfer Project and explain how this Project fits into the broader Customer Service Program.

A. The Start-Stop-Transfer Project is part of the Company's broader effort to modernize customer service functions, including by enabling self-service online features. The Start-Stop-Transfer Project created a new self-service tool that allows customers to initiate, terminate, or relocate their service with NW Natural using the Company's website. This project replaced and expanded on the existing manual entry forms previously found on the Company's website.

Q. Why was the Start-Stop-Transfer Project necessary?

A. The Start-Stop-Transfer Project was necessary to address customer dissatisfaction with the existing web-based interface for modifying their service with NW Natural. Based on the Company's web tracking, in 2022, only 29 percent of initiated forms to start, stop, or transfer service were successfully completed—resulting in approximately 100,000 customers who were unable to complete their service request online. This pattern corresponded to the prevalence of calls into the Company's Customer Care Center ("CCC"), where requests to start, stop, or transfer service constituted the single most common reason for customer calls in 2022. Based on feedback from the CCC team, the Company understood that customers struggled to complete the online forms

for a range of reasons, including (a) difficulty locating relevant account information; (b) confusion regarding which form to use for which circumstance; (c) the need for precise address information to complete a service request; and (d) lack of customer understanding regarding the importance of required information. The new Start-Stop-Transfer Project addressed all of these concerns through a new web-based tool, which also integrated with the Company's back-end CIS.

Q. What are the benefits of the Start-Stop-Transfer Project?

A. The central benefit of the Start-Stop-Transfer Project is that it enables customers to seamlessly initiate, terminate, and relocate their service with NW Natural, at their convenience and without the need to seek assistance by phone during business hours. The project improves the customer experience by implementing a user-friendly interface, which includes:

- A simplified road map for customers, along with easy navigation markers;
- Clear indicators of required form fields using accessible color coding;
- Explanatory "question mark" features to help customers understand the need for required information;
- Existing account validation and automatic provision of customer-specific information, such as accounts numbers, when starting a service request;
- A modernized address entry field with assisted entry to reduce customer input errors; and
- Increased access to self-service controls for customers renting properties.

Taken together, these new features help customers control their service at times that are most convenient for them—including when the CCC may not be available.

Q. Were there viable alternatives to Start-Stop-Transfer Project?

A. Yes, NW Natural considered two alternatives to the Start-Stop-Transfer Project described above. **First,** NW Natural considered pursuing an incremental approach, whereby the Company would improve only the address entry field portion of the feature. Based on CCC staff feedback, inaccurate address information was one barrier to customers successfully using NW Natural's online start-stop-transfer forms, because the previous tool did not auto-propose correct addresses and could not process a request if the address included errors. NW Natural therefore evaluated whether to modify only this aspect of the online forms as an incremental improvement. However, the Company concluded that this option was not preferable because (1) it would be more costly in the long term, as each new incremental improvement would require re-engaging an outside vendor, with associated start-up costs, and (2) there was no assurance that the address input improvement alone would significantly improve the customer experience. Given the range of issues described with the existing online forms and the need to bring in outside vendor support, the Company concluded that resolving the other prominent customer complaints simultaneously would best serve customers and would be most cost-effective.

Second, the Company considered automating the start-stop-transfer service forms into the Company's CIS, rather than maintaining a separate web-based system. While this option would have improved integration of the feature with the Company's back-end systems and improved allocation of staff time, it would not have addressed customer concerns with the online, self-service experience.

Q. What is the status of the Start-Stop-Transfer Project?

A. This project was placed in service in August 2024. The alternatives analysis for this project is attached as Exh. BEF-9.

Q. What cost recovery is NW Natural requesting for the Start-Stop-Transfer Project in this case?

A. NW Natural seeks to recover its capital investment of $2.7 million on a system basis, or $0.3 million on a Washington-allocated basis.

H. Composition 2.0 Project

Q. Please describe the Composition 2.0 Project and how this project fits into the Company's back-office functions.

A. The Composition 2.0 Project modernized the Company's electronic and printed documents for customers, including bills, notices, letters, welcome packages, and refund checks. Composition 2.0 was the second phase in the Composition overhaul project. In phase one ("Composition 1.0"), the Company implemented the OpenText platform that is the basis for the Company's broader document modernization effort. Prior to the Composition 2.0 Project, Composition software was used to produce digital bill PDFs, which were then used by NW Natural's third-party online payment processor to display customers' digital bills. These PDFs were also archived for record-keeping. With the implementation of the OpenText software as part of Composition 1.0, NW Natural was able to fully modernize additional customer-facing documents, as well as more comprehensively redesign and standardize document presentation in Composition 2.0. This redesign was the first time that NW Natural had comprehensively updated its bill presentation for customers in more than 26 years.

Q. What are the benefits of the Composition 2.0 Project for customers?

A. The Composition 2.0 Project provides a range of important benefits for customers, by allowing the Company to:

- Improve customers' ability to locate key information by enabling NW Natural to highlight important aspects of a customer's bill;
- Include answers to frequently asked questions on customer-facing documents;
- Develop multi-language documents;
- Include useful context for customers regarding their bills, such as comparing a customer's gas usage to the same month in prior years;
- Explain potential monthly bill fluctuations by providing information on factors that may be driving a month-to-month difference, such as the number of days in the billing cycle and average temperature variances from normal;
- Emphasize online payment and self-service account options accessible with a QR code;
- Highlight contact information for any remaining customer questions;
- Enable geographically segmented information, thus allowing Oregon customers to see only Oregon-specific information; and
- Provide greater clarity concerning customer payment plans.

Q. What are the benefits of the Composition 2.0 Project for the Company's internal operations?

A. In addition to creating more modern and user-friendly electronic and printed documents, Composition 2.0 provides three important benefits for the Company's

internal operations: **First,** Composition 2.0 allowed the Company to eliminate residual reliance on a legacy print generation function known as Advanced Function Printing, which was no longer supported by the vendor, IBM. **Second,** the project reduced risk associated with H2: Vista. By removing aspects of document presentment from the CIS now, the Company has fewer issues to resolve in H2: Vista. **Third,** the project standardized document sizes. Historically, NW Natural's documents were printed on smaller-than-standard paper. Switching to standard sizes substantially improved the printing and delivery process by:

- Reducing supply chain issues with procuring specialty paper products;
- Improving efficiency of the print-and-mail vendor by avoiding the daily need to set up custom settings to handle custom sizes; and
- Enabling automated process controls, which can detect bill insertion issues when papers are standard sizes.

Q. How did the Company develop its redesigned customer-facing documents?

A. The Company developed the redesigned documents through both a qualitative and quantitative information gathering process. On a qualitative level, the Company solicited feedback from 39 employees in customer-facing teams, including the Contact Center, Rates and Regulatory, Customer Lifecycle Management, and Account Services. These teams were able to identify key customer concerns that could be effectively and proactively addressed through revisions to customer documents.

From a quantitative perspective, NW Natural then distributed an online survey to over two thousand customers across the Company's service territory to validate the new design direction and to expand on identified questions or concerns. This survey

yielded 736 responses and over 500 narrative responses. These responses indicated strong support for the proposed redesign, with 86 percent of respondents liking the redesigned documents. Based on this data and the extensive customer feedback, NW Natural developed a list of "frequently asked questions" and responsive answers to include on customer-facing documents.

Q. What is the status of the Composition 2.0 Project?

A. NW Natural placed the Composition 2.0 Project in service in September 2024. The alternatives analysis for this project is attached as Exh. BEF-10.

Q. What cost recovery is NW Natural requesting for the Composition 2.0 Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $6.3 million on a system basis, or $0.8 million on a Washington-allocated basis.

I. PowerPlan Project

Q. Please describe the PowerPlan Project and how this project fits into the Company's back-office functions.

A. The PowerPlan Project transitioned a key accounting function, known as the capital settlement process, from the Company's existing PowerPlan tool and into the broader SAP ERP system. The capital settlement process tracks costs accumulated under work orders and projects and allocates those costs to various accounts in PowerPlan.

Q. Why was the PowerPlan Project necessary?

A. The PowerPlan Project was necessary to correct a lack of visibility of information between PowerPlan and SAP. SAP could not distinguish the settlement charges in PowerPlan from other charges, meaning that SAP's automated reports indicated that

total charges on any given capital project netted to $0.00—because charges incurred were offset by the returning settlement charge. Additionally, by performing the capital settlement process outside of SAP in PowerPlan, project managers and others had less visibility into the capital settlement process. Without this visibility, project managers and others had less opportunity to detect and correct errors, which had caused delays in issuing reports. NW Natural had therefore been relying on manual overrides to accurately track the capital settlements process, which was an unsustainably labor-intensive process.

Q. What are the benefits of the PowerPlan Project?

A. By transitioning the Company's capital settlements process to SAP, the PowerPlan Project was able to improve the accuracy of the Company's capital projects tracking and reporting data, enable effective allocation of Company accounting staff time, and provide project managers and others with visibility into the capital settlements process and with detailed cost-allocation information.

Q. Were there viable alternatives to the PowerPlan Project?

A. No. The only other alternative was to continue to use PowerPlan—which, as I have explained, required cumbersome workarounds and increased the potential of reporting errors for capital project tracking. As a result, maintaining the status quo did not address the Company's core need for a more reliable, transparent capital settlements process, and there were no other viable alternative means of providing this function.

Q. What is the status of the PowerPlan Project?

A. The PowerPlan Project was placed in service in March 2024. The alternatives analysis for this project is attached as Exh. BEF-11.

Q. What cost recovery is NW Natural requesting for the PowerPlan Project in this case?

A. NW Natural seeks to recover its capital investment of $1.4 million on a system-wide basis, or $0.2 million on a Washington-allocated basis.

J. SAP Treasury Project

Q. Please describe the SAP Treasury Project and how this project fits into the Company's back-office functions.

A. The SAP Treasury Project implemented an industry-standard software tool to automate and manage the Company's treasury functions—such as financial tracking and payment approval systems. The new tool provides consolidated and comprehensive visibility into the Company's financial risk management using the necessary subset of SAP's "Treasury Track" software functionalities.

Q. Why was the SAP Treasury Project necessary?

A. The SAP Treasury Project was necessary to address the risks and inefficiencies of the Company's existing manual processes. Previously, the Company relied on predominantly manual, Excel-based tools for its treasury processes, including cash-flow tracking (e.g., daily cash position report generation), bank account tracking, and analyzing liquidity needs. These functions are essential for managing financial risk and ensuring the successful functioning of the utility as a whole.

Q. Why was it important to transition away from manual tools for the Company's treasury processes?

A. It was important to transition away from manual tools for two reasons: (1) because they entail significant employee time that could be more effectively allocated; and

(2) because manual entry yields less reliable and accurate data. As a result, most peer utilities had already automated treasury functions, such as by using SAP's Treasury Track software.

Q. Did NW Natural consider any alternatives to the SAP Treasury Project for automating the Company's treasury processes?

A. Yes. NW Natural considered two alternatives to the chosen SAP Treasury Project: (1) exploring a non-SAP software solution; and (2) incorporating the full SAP Treasury Track software suite—rather than the selected limited functionalities.

Q. Why did NW Natural choose SAP as the software provider?

A. NW Natural chose to rely on SAP as the software provider because NW Natural's treasury processes must integrate smoothly with the Company's broader enterprise platform and data systems. Since NW Natural recently transitioned to SAP's S/4 HANA platform to provide this underlying enterprise platform, utilizing SAP's Treasury Track software enables smooth integration with NW Natural's data systems and other departments. Additionally, consolidating and streamlining the number of applications and vendors in the Company's portfolio is consistent with NW Natural's broader strategy of simplifying its IT&S portfolio for the benefit of customers.

Q. Why did NW Natural choose not to incorporate the full SAP Treasury Track software suite?

A. NW Natural chose not to take on the full SAP Treasury Track software suite because this comprehensive software bundle provides functions beyond the minimum viable product needed to meet NW Natural's treasury process needs, while increasing overall costs. The full SAP Treasury Track bundle would have included functions such as

multi-bank connectivity, market and credit risk modules, and reporting tools that are either unnecessary or already incorporated in other software tools. Given the higher incremental license and implementation costs, NW Natural selected a subset of the SAP Treasury Track functionality instead.

Q. What are the other benefits of the SAP Treasury Project?

A. In addition to addressing risk and non-optimal use of employee time, the SAP Treasury Project provides a wide array of additional benefits, including: (1) granular visibility into the Company's payment processing; (2) automated bank account tracking; (3) real-time visibility into market interest rate data; and (4) automated development of amortization and interest rate schedules.

Q. What is the current status of the SAP Treasury Project?

A. The SAP Treasury Project entered service in November 2023. The alternatives analysis for this project is attached as Exh. BEF-12.

Q. What cost recovery is NW Natural requesting for the SAP Treasury Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $2.9 million on a system basis, or $0.4 million on a Washington-allocated basis.

V. PRO FORMA PROJECTS
(April 1, 2025 – July 31, 2026)

A. Resource Scheduling Optimization Project

Q. Please describe the Resource Scheduling Optimization Project and how this project fits into NW Natural's workforce management program.

A. The Resource Scheduling Optimization Project will improve the software used by NW Natural's Resource Management Center ("RMC") to manage field worker schedules and timesheets, thus allowing the Company to better track and assign work. The Company's workforce management software, known as "Workforce," is part of the Company's SAP ERP backbone, and is used to enter and track time worked, time off, and other scheduling details (such as coordinating on-call shifts), while incorporating relevant bargained-for pay terms. The Resource Scheduling Optimization Project will resolve issues with the Workforce software that currently require several manual workarounds and will implement functionality improvements, described in more detail below.

Q. Why is the Resource Scheduling Optimization Project necessary?

A. The Resource Scheduling Optimization Project is necessary to allow the Workforce software to accurately and efficiently support project workflow. Currently, manual workarounds are required to ensure that work is assigned to individuals who are available and qualified, and to ensure that individuals with capacity are assigned adequate work. By optimizing the Workforce software, the Company will be better able to see and deploy its available field workforce.

Q. Did NW Natural consider alternatives to the project?

A. Yes. NW Natural considered three alternatives before deciding to proceed with the Resource Scheduling Optimization Project:

1. **Address only mission-critical items**. Mission-critical items are those needed to automate manual processes or to eliminate interference with current business processes. For example, mission-critical items include (a) adjusting extraneous exception messages that distract from genuinely critical exceptions; and (b) establishing standard shift patterns, including rotation and on-call shifts, to reduce the rework needed to allow the system to accurately reflect scheduled shifts. NW Natural would not pursue further optimization and enhancements with this alternative. This alternative was estimated to cost between $1.21 million and $1.31 million, not including construction overhead ("COH").
2. **Address both mission-critical and high-priority items.** This alternative would include additional work on high-priority changes that address integration between the Workforce software and other systems, such as Clevest and SuccessFactors (the Company's human resources software). For instance, reducing the volume of discreet blocks of time from Clevest by aggregating adjacent and identical slices reduces the time needed to audit timesheets. Similarly, incorporating accurate personnel qualifications data from SuccessFactors into Workforce allows scheduling to ensure that appropriately qualified personnel are assigned to needed work, rather than requiring manual verification processes. This alternative was estimated to cost between $1.43 million and $1.53 million, not including COH.

3. **Address mission-critical, high-priority and fully optimized items.** This alternative would include fully optimizing items that improve user experience, such as on the NW Natural mobile application. These optimizations are relatively minor, low-effort enhancements, such as enabling mobile features. This alternative was estimated to cost between $1.55 million and $1.65 million, not including COH.

Of these alternatives, NW Natural selected the third option, which included all three categories of improvements.

Q. Why did NW Natural choose to include high-priority optimizations in addition to mission-critical improvements?

A. The Company chose to include high-priority optimizations because restricting the project scope to only mission-critical improvements would not have resolved important process gaps and would have left several manual workarounds in place, while still entailing approximately $1.2 million to $1.3 million in capital investment. For instance, without incorporating an individual's qualifications from SuccessFactors, the Company would continue to rely on manual workarounds to ensure that work is assigned to individuals who are qualified to perform the assigned work.

Q. Why did NW Natural also choose to include fully optimized items?

A. The Company chose to include fully optimized items because these optimizations required relatively little development or configuration resources and, in some cases, simply involve enabling a feature. Thus, fully optimizing the functionality improvements results in high-impact new features without substantial additional cost.

Q. What is the status of the project?

A. The Company placed the project into service in March 2025. The operational efficiencies caused by the Workforce updates reduced the number of labor hours needed for RMC staff to perform manual workarounds, which enabled RMC staff to handle ancillary tasks that were previously assigned to contractors. The Company was able to remove two contractor roles by the end of May 2025, resulting in savings of approximately $88 thousand of O&M expense and $234 thousand of capital costs. Company witness Kyle T. Walker reflects these savings in the updated revenue requirement in his Direct Testimony.[3] The alternatives analysis for this project is attached as Exh. BEF-13.

Q. What cost recovery is NW Natural requesting for the Resource Scheduling Optimization Project in this case?

A. NW Natural seeks to recover its capital investment of $1.7 million on a system-wide basis, or $0.2 on a Washington-allocated basis.

B. Esri Utility Network Replatform Project

Q. Please provide some context for the Esri Utility Network ("UN") Replatform Project and how this project fits into the Company's field and web mapping program.

A. The Esri UN Replatform Project is part of the Company's ongoing effort to consolidate and update the field and web mapping systems. This Esri UN Replatform Project transitions several interrelated, end-of-life applications involved in managing the

[3] Exh. KTW-1T.

Company's detailed geospatial data to modern, supported platforms. As context, geospatial data is used to model the Company's pipeline infrastructure and support a range of Company operations, such as ensuring system integrity, modeling gas flows, tracking customer assets, and assigning field workers. While the geospatial data is used directly by certain NW Natural teams (such as Pipeline Integrity and GIS teams), the data is also integrated into other applications to allow non-GIS personnel to see NW Natural's pipeline infrastructure and apply map-based updates.

Currently, NW Natural uses software from Esri, a global provider of geospatial software, to manage the Company's geospatial data. This software includes both Esri's ArcMap, which allows NW Natural to create, edit, and analyze geospatial data, as well as Esri's Geometric Network, which models the Company's geospatial network. Together, this system serves as a digital twin of the NW Natural gas infrastructure, representing the location, status, material, and other characteristics of assets to support the safe operation and maintenance of the system. This network models how gas moves through the system, which not only allows the Company to reliably identify and locate assets, but also enhances operational integrity by identifying potential gaps and risks in the system's operations. Additionally, the network supports emergency response procedures, such as by identifying valves to isolate an area in case of system damage (also known as valve isolation tracing).

Q. Please describe the Esri UN Replatform Project.

A. The Esri UN Replatform Project involves four related product transitions: **First,** this project will replace the outdated Esri ArcMap software, which handles viewing, editing, analyzing, sharing, and managing geospatial data, with new Esri software

called ArcGIS Pro. **Second,** this project will migrate the geospatial data model from Esri's Geometric Network to Esri's new geospatial modeling tool, known as the Utility Network (UN). **Third,** this project will replace Schneider Electric's ArcFM software with equivalent functionality in the new Esri software—eliminating ArcFM from the Company's product suite. NW Natural's Corrosion Protection team currently uses Schneider Electric's ArcFM Viewer to trace cathodic protection needs. With the transition to the new Esri system, the Company will no longer need to maintain the separate ArcFM software. **Fourth,** this project will update the Esri server backbone, known as "ArcGIS Enterprise," to allow the geospatial data in Esri UN to integrate with the Company's other IT&S systems, such as Customer Order Management and Pipeline Locating.

Q. Why is the Esri UN Replatform Project necessary?

A. The ESRI UN Replatform Project is necessary because NW Natural's current geospatial data systems, including Esri Geometric Network, Esri ArcMap, and the underlying ArcGIS Enterprise server, are all nearing end-of-life and must be replaced or updated. The ArcGIS Enterprise server reaches end of support in August 2026. ArcMap is currently in a "mature support" phase, without patches or updates being provided, and even this support ends on March 1, 2028 for utility customers (other customers' support terminates March 1, 2026). Transitioning to ArcGIS Pro impacts the modeling network as well, as Esri's Geometric Network is not compatible with ArcGIS Pro. This consolidated Esri UN Replatform Project is therefore designed to allow NW Natural to migrate this integrated set of field and web mapping applications by July 2026.

Q. Did NW Natural consider alternatives to the Esri UN Replatform Project?

A. Yes, NW Natural considered two primary alternatives to the Esri UN Replatform Project. **First,** NW Natural considered a two-phase approach, whereby the Company would postpone the ArcMap-to-ArcGIS Pro replacement until closer to the 2028 end-of-service deadline, while proceeding with transitioning the network connectivity model to Esri's UN platform. This alternative was not selected because it would (a) result in higher overall project costs by requiring two different workstreams; and (b) complicate implementation because the data migrated to the UN platform would need to be kept as "read-only" to avoid data incompatibilities between the ArcMap and UN systems.

Second, NW Natural considered postponing both the ArcMap and Esri Geometric Network transitions until closer to the 2028 end-of-service deadline. This alternative was not selected because (a) NW Natural would still need to pursue a separate ArcGIS Enterprise update and (b) without the updates to the other Esri software, NW Natural would not be able to migrate and terminate Schneider Electric's ArcFM software—necessitating further updates to maintain that software, which is end-of-life. Updating ArcFM independently would likely cost between $750,000 and $1.3 million, depending on the available system integrators—further increasing overall project costs. Given the inevitability of transitioning the Esri products and the current limited support for these software systems, NW Natural determined not to further delay replatforming to the Esri UN and ArcGIS Pro systems.

Q. Are there any other factors that contribute to the timing of the Esri UN Replatform Project?

A. Yes. The timing of this project is also impacted by the broader market for system integrators. Esri is the dominant player in the field and web mapping space for utilities. All utilities will need to have transitioned away from Esri's Geometric Network by March 1, 2028. Competition for quality, affordable system integrators will become increasingly challenging the longer the Company waits to put this project in service. Thus, delaying this project would undermine NW Natural's ability to retain a high-quality and cost-effective system integrator.

Moreover, retaining a reliable system integrator is particularly important for a project with this degree of operational consequence. NW Natural geospatial data is both highly technical and foundational to the Company's safety, security, and emergency response functions. It is therefore particularly important that the Company accomplishes this transition in a timely, deliberate manner with quality support.

Q. Were there other alternatives that NW Natural rejected as not viable?

A. Yes. The Company determined that adopting an alternative geospatial data network solution from IQGeo, an existing NW Natural technology provider, was not viable. IQGeo's network offering is new to the market and unproven in the gas utility industry. While IQGeo works effectively as a data-viewer application, editing, managing, and maintaining detailed geospatial and network data is a far more complex task with crucial safety and reliability implications. Thus, NW Natural determined that adopting IQGeo's network option was too great an operational risk to be a viable alternative at this time.

Q. In addition to ensuring the reliability of the Company's geospatial data systems, are there other benefits to the Esri UN Replatform Project?

A. Yes. In addition to offering a more reliable system through required lifecycle management, the ESRI UN project will allow the Company to securely publish and share up-to-date geospatial information internally and externally, such as with local jurisdictions that use this information for project planning purposes. This tool replaces previously static, PDF maps that could not be readily updated to reflect the Company's dynamic system.

Q. What is the status of the Esri UN Replatform Project?

A. NW Natural conducted an RFP and selected a System Integrator, known as SSP Innovations, to facilitate this work in April 2025. The Esri UN Replatform project is in the Execution phase, and the Company plans to place this project in service in July 2026. The alternatives analysis for this project is attached as Exh. BEF-14.

Q. What cost recovery is NW Natural requesting for the Esri UN Replatform Project in this case?

A. NW Natural seeks to recover its capital investment of $14.1 million on a system-wide basis, or $1.7 million on a Washington-allocated basis.

C. Field and Web Maps Enablement Phase I Project

Q. Please describe the Field and Web Maps Enablement Phase I Project.

A. The Field and Web Maps Enablement Phase I Project is part of the Company's broader Field and Web Mapping multi-year initiative to update the Company's field and web mapping solutions by phasing out end-of-life software and transitioning to a

consolidated set of modern software solutions.[4] This Field and Web Maps Enablement Phase I Project transitioned the Company's valve isolation tracing functionality from Visual Fusion, an existing end-of-life software system, to the Company's IQGeo platform using a custom user interface. A valve isolation trace is performed when there is an emergency, such as pipeline damage, to create a map identifying the valves to be closed to isolate a specific area. The process also generates an impacted customer list for outage notifications. Valve isolation traces are run by members of the GIS support team, Engineering, Gas Control, and the RMC teams. The results are also used by the Emergency Contact Center team through Clevest, to create work orders to relight gas that was shut off during an emergency response.

Q. Why is the Field and Web Maps Enablement Phase I Project necessary?

A. The Field and Web Maps Enablement Phase I Project is necessary because the current Visual Fusion software has been in an end-of-life stage with Microsoft since 2021, which prompted NW Natural to undertake a careful product replacement assessment. The basic support that NW Natural receives does not include application enhancements or break fixes. As a result, transitioning away from this product is important to ensure continuity of NW Natural's operations as well as to mitigate cybersecurity concerns. While there are other uses of Visual Fusion, valve isolation tracing is its most critical functionality, so enabling another application to perform tracing is the highest priority Visual Fusion feature to transition. This project is a necessary step that will allow NW

[4] For a breakdown of the field and web mapping software transitions, please refer to Table 1 in Section II.

Natural to eventually decommission the Visual Fusion platform and reduce technical architectural complexity through platform consolidation.

Transitioning the remaining Visual Fusion functionalities is addressed in the Field and Web Maps Enablement Phase II Project, which I describe below.

Q. Did NW Natural consider alternatives to the Field and Web Maps Enablement Phase I Project?

A. Yes. NW Natural conducted a careful assessment to identify the replacement options for this functionality, which is critical to emergency response procedures. While replacement was necessary, the Company did not wish to over-invest in customization if an off-the-shelf option was available. As a result, NW Natural considered one primary alternative to the Field and Web Maps Enablement Phase I Project: implementing IQGeo's existing tracing module instead of creating a custom user interface. While the Company carefully considered this option, IQGeo's off-the-shelf tracing module requires users to rely on IQGeo's geospatial data network manager—as compared to the Esri UN tool, described above. In order to use IQGeo's tracing module, NW Natural would have needed to maintain one data model for Esri geospatial data and a second data model for IQGeo. This alternative was not selected because maintaining two geospatial data models presents too great a risk of error, in that running a trace in each system may provide different results—an unacceptable result for a tool specifically designed to address emergency situations. Since, as I explain above, the Company did not consider adopting IQGeo's back-end geospatial data network to be a viable alternative to Esri UN, the Company also determined not to use IQGeo's existing tracing module.

In addition, NW Natural considered maintaining the existing Visual Fusion software. However, the Company determined that this option was not viable because it would undermine the reliability of the Company's mapping functions due to reliance on the software that is end-of-life.

Based on this assessment, NW Natural determined that transitioning the Company's valve isolation tracing functionality to a custom interface in IQGeo was the best available alternative to meet customer needs.

Q. What is the status of the Field and Web Maps Enablement Phase I Project?

A. The Field and Web Maps Enablement Phase I Project was placed in service in June 2025. The alternatives analysis for this project is included in Exh. BEF-15.

Q. What cost recovery is NW Natural requesting for the Field and Web Maps Enablement Phase I Project in this case?

A. NW Natural seeks to recover its capital investment of $1.3 million on a system-wide basis, or $0.2 million on a Washington-allocated basis.

D. IGA Phase 2 Project

Q. Please describe the IGA Phase 2 Project and how it relates to the IGA Phase 1 Project.

A. The IGA Phase 2 Project builds on the foundation established in the IGA Phase 1 Project by controlling access to technology systems and integrating with physical security devices. While IGA Phase 1 implemented the foundational IGA software system and provides visibility into the scope and roles of individual users, IGA Phase 2 focuses on expanding application integration, automating access provisioning (as opposed to solely access removal), and adding new security and control mechanisms.

Additionally, this project will create access certifications, which can audit and report on access permissions to ensure that employees and contractors have access to only what they need. This functionality is particularly important so that offboarded employees or other unauthorized individuals cannot access sensitive information.

Q. Why is the IGA Phase 2 Project necessary?

A. The IGA Phase 2 Project is a necessary step to build expertise and improve security by centralizing control of user access permissions and building out these integrated control systems through the Company's other applications. As described above, Phase 2 builds on the foundation established in Phase 1 to expand the reach and functionality of the base automation, and refine access management processes.

Q. How did NW Natural consider alternatives to the IGA Phase 2 Project?

A. At a high level, the Company considered alternatives to IGA as a whole, as part of the broader IGA planning effort to determine the relevant factors that drive integration priority. Now, for the IGA Phase 2 Project, the Company is applying those criteria to determine the priority of specific application integrations. Prioritized applications include critical IT&S infrastructure systems like IQGeo that have high user volumes, and thus automatic access controls can save significant manual effort. The alternatives analysis for this project is attached as Exh. BEF-16.

Q. What is the status of the IGA Phase 2 Project?

A. The IGA Phase 2 Project is in the Execution phase, and is the project is expected to be completed by October 2025. The alternatives analysis for this project is attached as Exh. BEF-16.

Q. What cost recovery is NW Natural requesting for the IGA Phase 2 Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $2.8 million on a system-wide basis, or $0.3 million on a Washington-allocated basis.

E. JANA Project

Q. Please describe the JANA Project and how this project fits into the Company's back-office functions.

A. The JANA[5] Probabilistic Risk Model (a) refreshes the risk modeling used by NW Natural's Distribution Integrity Management Program ("DIMP"), and (b) transitions the Company's modeling from a relative risk assessment to a probabilistic model. Risk models are required by the Code of Federal Regulations ("CFR"), CFR 49 Part 192[6], and are used to assess risks associated with gas distribution system threats. Currently, NW Natural relies on a relative risk model, which measures the likelihood of failure associated with a threat, as compared to other risks. In contrast, a probabilistic risk model will allow the Company to quantitatively assess the probability of failure in any given system component and estimate the expected consequences, independent of that risk's relationship to other risks within the Company.

[5] "JANA" is JANA Corporation, a provider of risk modeling and software. *See* *Who We Are - Helping you predict risk in your pipeline systems | JANA*.

[6] I understand that 49 CFR Part 192 requires that an operator "evaluate the risks associated with its distribution pipeline" and "determine the relative importance of each threat and estimate and rank the risks posed to its pipeline[,]" including "each applicable current and potential threat, the likelihood of failure associated with each threat, and the potential consequences of such a failure." 49 CFR 192.1007(c). After the evaluation of risks, the operator must "identify and implement measures to address" the ranked risks. 49 CFR 192.1007(d).

Q. Why is the JANA Project necessary?

A. The JANA Project is necessary because a probabilistic risk assessment tool more accurately measures the risks relevant to customer safety, allows the Company to more effectively prioritize risks on a cost-optimized basis, and represents a crucial improvement to the Company's risk assessment process. Indeed, in a 2020 report titled "Pipeline Risk Modeling – Overview of Methods and Tools for Improved Implementation" ("2020 Report") the US Pipeline and Hazardous Materials Safety Administration ("PHMSA") identified the important benefits of a probabilistic risk management program for industries such as gas utilities. As this 2020 Report explained, a probabilistic risk model allows utilities to assess, not merely the qualitative degree of risk compared to other risks, but the quantitative degree of actual risk to pipeline safety. This probabilistic approach is particularly important for safety-critical functions like gas utility infrastructure, where the Company has an obligation, not merely to prioritize among system risks, but to ensure an overall safety of the system. A copy of the 2020 Report is included in Exh. BEF-17.

Q. Has PHMSA specifically commented on the importance of transitioning away from relative risk models?

A. Yes. In the 2020 Report, PHMSA emphasized the need for continuous improvement of risk modeling practices, and the importance that pipeline operators transition from relative risk modeling to probabilistic risk modeling:

> The [Integrity Management ("IM")] regulations also require operators to continuously improve their IM programs, and overall industry integrity performance has shown general improvement over time. However the continuing occurrence of significant pipeline incidents points to a continuing need for operators to upgrade their tools for risk assessment and risk management. *Upgrades to risk assessment processes using quantitative or probabilistic risk models is a prudent step for operators to take* to improve IM programs, allowing better definition of the risks on pipeline systems and better support for risk management practices.[7]

Q. Following PHMSA's 2020 Report, did NW Natural conduct additional analysis to determine whether a probabilistic risk model was necessary and appropriate for the Company?

A. Yes. Once PHMSA's 2020 Report was released, NW Natural performed an internal review of the existing relative risk model for the NW Natural distribution system. Based on this analysis, the Company determined that a probabilistic risk model was appropriate to ensure that the Company is remediating risk on a risk-cost optimized basis for a given risk—rather than based on the degree of difference between one risk and another.

Q. What is the difference between a relative risk model and a probabilistic risk model?

A. In a relative risk model, a score is developed for 50 foot x 50 foot raster sections throughout the system by multiplying the likelihood of failure by the consequence of failure to determine a risk score. The numerical components of this scoring system were developed by NW Natural based on industry and subject-matter-expert (SME) data in 2011 and are documented in the NW Natural DIMP Plan. A probabilistic risk

[7] Exh. BEF-17 at 19 (emphasis added).

model incorporates the probability of failure in the risk calculation along with quantifying the consequence of failure. By incorporating the probability of failure along with quantifying the consequence of failure, a more quantitative assessment of risk is developed for a specific asset in the NW Natural distribution system. This quantitative approach allows the Company to not only accurately rank risks based on the probability of risk, but also to quantify risk reduction achieved per threat mitigated, and thus to identify the most cost-efficient risk mitigation actions.

Q. Did NW Natural consider retaining its relative risk model?

A. Yes. However, based on PHMSA's 2020 Report and internal discussions, NW Natural determined that its current model should no longer be used, for several reasons:

1. **Compounding Uncertainty in Scale Assessments.** Relative risk models use what is known as an ordinal scale, where the values have relationships relative to each other (e.g., 4 is worse than 2), but where the intervals on the scale do not have a precise value (e.g., 4 is not necessarily twice 2). When these numerical values are then used within other calculations, the results of relative risk assessments are inconsistent and compound the more they are used.
2. **Range Compression Risk Distortion.** Relative risk models used bounded scales, despite the fact that the probability of failure and the associated potential consequences can vary by several orders of magnitude. Forcing these values onto a bounded scale compresses and potentially distorts the perceived risk and can result in inconsistent risk rankings.
3. **Cognitive Bias.** Relative risk models rely on subject matter expert assessments, as opposed to the statistical analysis of historical failure data used in

probabilistic risk models. Relying on subject matter expert assessments exposes the model to unconscious cognitive biases and can result in inconsistent risk assessments.

4. **Inability to Verify Accuracy.** Since relative risk models do not provide quantitative risk outputs, the model's assessments cannot be compared to actual events in order to verify the model's accuracy.

Based on this assessment, NW Natural concluded that it would be prudent to transition to a probabilistic risk model for the DIMP.

Q. Once NW Natural identified the need to transition to a probabilistic risk model, how did the Company select its preferred solution?

A. NW Natural selected its preferred probabilistic risk model solution by conducting demonstration sessions with the two vendors that implement risk models to support the natural gas industry: [redacted] and JANA. For the [redacted] demonstration session, the input data that NW Natural needed to use for the risk model were in a legacy format that could not be used by the vendor. The vendor presented options to resolve this issue, but such an option would have required a separate configuration of the GIS distribution system to be created. There were also concerns if legacy compliance data could be used in the risk model. Legacy compliance data is important as it provides a historical trend to threats to system. In contrast, the JANA demonstration provided an interface that was much more adaptable to all formats of legacy information that NW Natural had for inputs into the risk model. Additionally, the JANA risk model is more user-friendly for employees.

Q. What is the status of the JANA Project?

A. The JANA Project is in the Execute phase and will be placed in service in August 2025. The project alternatives analysis is included in confidential Exh. BEF-18C.

Q. What cost recovery is NW Natural requesting for the JANA Project in this case?

A. The Company seeks to recover its capital investment of $1.3 million on a system basis, or $0.2 million on a Washington-allocated basis.

F. Application Lifecycle Management - SAP Update Project

Q. Please describe the Application Lifecycle Management - SAP Update ("ALM-SAP") Project.

A. The ALM-SAP Project involved updating NW Natural's SAP S4 platform from S/4 HANA 2020 to the current version, S/4 HANA 2023. SAP S4 is the Company's key enterprise application used to support its field operations, engineering functions, financial operations, and ability to pay suppliers and vendors. As with other critical system software updates, updating SAP S4 involves multiple steps to ensure that NW Natural's operations are not disrupted. A system update therefore includes rigorous testing, training, updates to quality assurance, staging, and production environments, as well as post-deployment "hyper care" to quickly resolve any user-identified issues. Testing is particularly crucial for critical systems, as the updated software can impact integrated applications. These issues must then be addressed before the update can be successfully deployed. For the Company's SAP S4 platform, for instance, the Company depends on the system to comply with Sarbanes-Oxley requirements, meaning that both rigorous testing and rigorous documentation of those testing results are required.

Q. Why was it necessary to update SAP S4?

A. It was necessary to update SAP S4 as part of the standard application maintenance lifecycle, in order to mitigate risks of technical failures of the Company's essential enterprise operating system. As with other software products, SAP requires periodic updates to address bug fixes, incorporate product improvements, and maintain support services. In this case, NW Natural's current 2020 SAP S4 version will no longer be fully supported by SAP at the end of 2025. An unsupported platform would put the Company's operations at risk, as any security patches or other system issues could not be resolved without SAP's assistance. Therefore, updating SAP S4 to the latest version is critical in ensuring the essential functionality of NW Natural's SAP system. SAP has indicated that the new version will be supported through 2030.

Q. Were there viable alternatives to the ALM-SAP Project?

A. No. The only alternative to an update was remaining on the current SAP S4 version. This alternative would have placed NW Natural at significant risk as it results in limited vendor support for its critical enterprise application. The reduction in support would prevent the delivery of legal and regulatory changes, support for integrations, and functional enhancements. Also, there is no guarantee of technical updates including support of new operating systems and database versions. Lastly, even if updates were available, such updates may include additional fees for problem resolution.

Q. What is the status of the ALM-SAP Project?

A. The project was placed in service in June 2025. The alternatives analysis for this project is attached as Exh. BEF-19.

Q. What cost recovery is NW Natural requesting for the ALM-SAP Project in this case?

A. NW Natural seeks to recover its capital investment of $2.6 million on a system-wide basis, or $0.3 million on a Washington-allocated basis.

G. Clevest Update Project

Q. Please describe the Clevest Update Project and how this project fits into the Company's broader application lifecycle management program.

A. The Clevest Update Project involves updating NW Natural's mobile workforce management software from version 7.3 to version 8.3. The Clevest software is essential for scheduling, dispatching, and completing the majority of the Company's fieldwork, which ranges from emergency response to routine maintenance tasks. This project is part of the Company's broader application lifecycle management program, in that it seeks to implement a routine platform update as part of ensuring the security and reliability of the Company's IT&S software systems.

Q. Why is the Clevest Update Project necessary?

A. Updating Clevest is essential to mitigate the risks of technical failures in NW Natural's critical system used for scheduling, dispatching, and completing fieldwork. Like other software products, Clevest requires periodic updates from the vendor to address bug fixes, incorporate product improvements, and maintain support services. The standard support for the Company's current version of Clevest ended on December 31, 2024; extended support, which includes fixing security vulnerabilities or errors, will end on December 31, 2026. Operating on an unsupported platform could jeopardize NW Natural's operations if a software defect arises that requires vendor support for

resolution or the application of critical fixes, including security updates. Therefore, updating Clevest now is crucial to ensure the efficient and secure operation of this vital system. Additionally, the Clevest Update Project will allow for better coordination among resources, including a new calendar view for more efficient work scheduling. This improvement is particularly beneficial for managing tasks for work groups that currently rely on spreadsheets and multiple SharePoint sites for their work forecast and capacity management. Specific improvements include:

- Enhanced nearby order functionality and filtering will provide work groups with increased visibility of tasks that need to be completed and their locations.
- The "Targeted Nearby Orders" search will allow preconfigured search criteria to be created for different scenarios when the field is looking for specific types of work. For work groups that self-assign their work, these features will enable faster identification and assignment of work.
- Adding the "Special Indicators" functionality to Clevest will provide a crucial pipe inspection job code that allows field personnel and dispatchers a way to quickly identify high-priority work.
- Mobile platform enhancements will allow employees to self-assign work from the mobile platform, and to more efficiently complete time tickets at the end of shifts. These enhancements will also enable automatic resending of system messages that initially fail to send, reducing the number of queued work orders and preventing potential delays in information flow between systems.

Q. Were there viable alternatives to the Clevest Update Project?

A. No. The only alternative to updating Clevest to the latest version is to remain on the current Clevest version. Maintaining supported application is an integral part of the Company's cyber-security. Moreover, disruption to the Company's field workforce platform would substantially interfere with the Company's ability to ensure safe and reliable operations.

Q. What is the status of the Clevest Update project?

A. The Clevest Update Project planning phase is starting in the third quarter of 2025 and the project will be placed in service in the second quarter of 2026.

Q. What cost recovery is NW Natural requesting for the project in this case?

A. NW Natural seeks to recover its capital investment of $2.3 million on a system-wide basis, or $0.3 million on a Washington-allocated basis.

VI. RATE YEAR 1 PROJECTS
(August 1, 2026 – July 31, 2027)

A. Microwave Stability Project

Q. Please provide context for the Microwave Stability Project.

A. NW Natural relies on microwave towers to transmit information over long distances, and has employed this technology for decades as a reliable, non-wires information transmission alternative. This information is used as part of the Company's SCADA and Emergency Voice Radio systems, among other functions. NW Natural currently has 24 microwave towers, most of which were built decades ago—the oldest was installed in 1957. Many of these towers are in remote locations, and the Company has not previously conducted a comprehensive microwave assets site assessment.

Q. Please describe the Microwave Stability Project.

A. The Microwave Stability Project involves (a) conducting a detailed site assessment of the Company's microwave towers; (b) addressing identified operational challenges, interference issues, and safety hazards; and (c) replacing or expanding existing towers and addressing any residual safety issues. Each of these phases proceeds as follows:

- **2025 (Assessment Phase)**: NW Natural has engaged GP&A Telecommunications Engineers to conduct on-site surveys, maps, and health assessments of the existing 24 microwave towers. This work will produce detailed analysis and recommendations for each site, which will then be used to create a multi-year microwave stability strategy. This assessment phase is expected to be complete in August 2025.
- **2026 (Critical Fixes & Vendor Selection for Additional Work)**: Once the assessment is complete, NW Natural will address the urgent tower fixes and restore any downed microwave links that are identified as necessary. At the same time, the Company will conduct a vendor qualification and RFP selection process to perform any additional remedial work.
- **2027-2031 (Replace/Expand Towers & Safety Enhancements)**: Based on the final assessment, the Company will replace, relocate, and/or expand existing towers to address any gaps in transmission coverage.

Q. Why is the Microwave Stability Project necessary?

A. The Microwave Stability Project is necessary because ensuring the reliability of the microwave information transmission network is crucial to system reliability and emergency preparedness. Non-wires information transmission is particularly crucial

in emergency situations, such as "man down" scenarios, cellular communications outages, and other emergency response demands. These towers also host the antennae for the Company's voice radio communications system. However, the health, state, and operability of many of NW Natural's 24 microwave tower sites are unknown, posing potential safety hazards. Indeed, the Company is aware of five towers with degraded functionality due to tree and vegetation growth, meaning that those areas currently lack reliable voice radio functionality, telemetry data reporting, and back-up SCADA transmission. Restoring full communications and information transmission in these areas is critical.

Q. Is NW Natural considering alternatives to the Microwave Stability Project?

A. Yes. In addition to the ongoing analysis regarding project details and scope, NW Natural is considering converting to traditional wires-based network carrier transport, such as fiber optic cable, instead of microwave transport. However, there are disadvantages with traditional network carrier transport and, in some cases, this alternative is not feasible due to the remote location of some NW Natural sites. Where traditional network carriers are physically feasible, their disadvantages can include:

- **Cost:** Traditional network carrier transport, such as fiber optic or leased lines, can be more expensive due to installation, maintenance, and leasing fees.
- **Deployment Time**: Installing wired infrastructure often takes longer compared to deploying microwave links, which can be set up relatively quickly. Even where NW Natural seeks to lease existing lines, the Company must typically build the "last mile" segment, which can entail considerable cost and delay.

- **Flexibility:** Microwave transport offers greater flexibility in reaching remote or hard-to-access areas where laying cables might be impractical or impossible.
- **Interference and Maintenance**: While microwave networks can face interference issues, traditional networks are more susceptible to physical damage (e.g., from construction or natural disasters), which can lead to longer downtimes and higher repair costs.

Whether wires-based solutions are appropriate for individual sites will be assessed in the site-specific survey.

Q. What is the status of the Microwave Stability Project?

A. The Company plans to complete the initial assessment phase of this project in the third quarter of 2025. Near-term projects identified by this assessment (phase 2) will then be placed in service in the third quarter of 2026. Additional microwave tower replacements, relocations, and/or expansions, as well as any residual safety work (phase 3) will be placed in service incrementally thereafter, with the full Microwave Stability Project expected to be complete by the end of 2031.

Q. What cost recovery is NW Natural requesting for the Microwave Stability Project in this case?

A. NW Natural seeks to recover its capital investment for those portions of this project that will be placed in service before July 31, 2029, which consists of $25.2 million on a system-wide basis, or $3.1 million on a Washington-allocated basis. This amount includes a system projected $6.9 million being placed in service through Rate Year 1 ($0.8 million on a Washington-allocated basis), $7.0 million through Rate Year 2 ($0.9 million on a Washington-allocated basis) and $6.7 million through Rate Year 3 ($0.8

million on a Washington-allocated basis), subject to further specification following the detailed site assessment described above.

B. Customer Field Service Scheduling and Route Optimization Project

Q. Please provide some context for how the Customer Field Service Scheduling and Route Optimization Project fits into the Company's broader workforce management program.

A. The Customer Field Service Scheduling and Route Optimization Project builds on the work from the Resource Scheduling Optimization Project (discussed above). While the Resource Scheduling Optimization Project ensures that the Company has a clear picture of which resources are available when, the Customer Field Service Scheduling and Route Optimization Project allocates work and establishes the most efficient routes for that work to be performed by the Customer Field Services group. This Project focuses on service technician work, which is the highest volume customer-facing work, and optimizes how that work is assigned to the field workforce (including route optimization). This project prioritizes and sequences high-volume service technician work on a day-to-day level and ensures that customer-facing work is performed efficiently.

Q. Please describe the Customer Field Service Scheduling and Route Optimization Project.

A. This project will implement a new scheduling and optimization tool for customer field service work and integrate it with NW Natural's existing field work management solution. The updated field service scheduling tool will incorporate resource capacity, qualifications, service level agreements and work orders, and will optimize routes for

the associated technicians automatically. The tool will also re-optimize the route at a specified frequency or if manually triggered after an emergency order is placed. The primary objective of the project is to optimize and prioritize work for field operations, ensuring efficient and effective resource utilization.

Q. Why is the Customer Field Service Scheduling and Route Optimization Project necessary?

A. The Customer Field Service Scheduling and Route Optimization Project is necessary to address important shortfalls in the current work scheduling and routing system. Currently, the Company's scheduling cannot account for real-time traffic or filter project assignments based on work order priority. Additionally, when one work-assignment area is particularly busy, there is currently no mechanism to split that assignment area in order to increase the volume of field workers available to respond to system needs.

Q. What are the benefits of the Customer Field Service Scheduling and Route Optimization Project?

A. Benefits of this Project include:

- Automating the manual task of scheduling and assignment activities;
- Maximizing field work performed by ensuring tasks are properly distributed to the right resources, taking into account various factors such as traffic, skill sets, order aging, and strategic goals; and
- Enabling efficient responses and necessary adjustments throughout the day in response to disruptions caused by emergent tasks.

These improvements collectively enhance customer service and satisfaction by ensuring schedule adherence and quicker response times through automation.

Q. Is NW Natural considering alternatives to the Customer Field Service Scheduling and Route Optimization Project?

A. Yes. NW Natural is still in the process of considering available alternatives, and plans to complete a full alternatives analysis by January 2026. Possible alternatives include (a) sustaining the existing "Advanced Scheduler" system and (b) incorporating an alternate external solution.

Q. What is the status of the project?

A. This project is in the Initiate phase. It will begin the planning phase in the third quarter of 2025 and will complete a detailed alternatives analysis in January 2026. Pending the results of that assessment, NW Natural anticipates that this project will be placed in service in April 2027.

Q. What cost recovery is NW Natural requesting for the Customer Field Service Scheduling and Route Optimization Project in this case?

A. NW Natural seeks to recover its capital costs of approximately $2.7 million on a system basis, or $0.3 million on a Washington-allocated basis, which will be included in rates in Rate Year 2.

C. Compliance Data Management Optimization Project

Q. Please describe the Compliance Data Management ("CDM") Optimization Project.

A. The CDM Optimization Project will establish a clear technological and procedural system for tracking and managing compliance-related work by the CDM team. The

CDM team is responsible for managing legally mandated compliance work to ensure the integrity of the gas system. The CDM team's current processes are heavily manual, resource-intensive, and susceptible to human error, leading to delays in work order creation and reduced capacity for timely regulatory compliance in the field. With existing headcount, meeting operational demands is becoming unsustainable. The CDM Optimization Project will modernize NW Natural's compliance operations by introducing automation, enhancing system integration, and improving data capture in the field. These updates will align the Company's practices with industry standards, improve data integrity, and free up staff to focus on strategic compliance oversight—ultimately driving efficiency, reducing risk, and supporting regulatory excellence.

Q. Why is the Compliance Data Management Optimization Project necessary?

A. The CDM Optimization Project is necessary to address gaps in the Company's management of compliance work. Based on a gap analysis, gaps include system automation, automated compliance reporting and notification, and system integrations. This CDM Optimization Project addresses these gaps by creating automated reports, notifications, and work orders associated with necessary compliance-related work.

For instance, when a field worker submits a referral for repair work that is needed, there is currently no way to link the repair order with the inspection or original work order that initiated the referral. This disconnect creates a gap in reporting and requires the CDM team to spend significant time searching through the system to try to locate the repair order to prove the repair work was complete. The CDM Optimization Project automatically links the repair work referral with the original

inspection or initiating work order, thus ensuring continuity in tracking remedial and compliance-related work.

Similarly, the new project automates manual data entry tasks regarding equipment location and relative functions, preventing data entry errors. By addressing these gaps, the Company minimizes exposure to safety and compliance risks and better enables its CDM team to focus on the important task of managing compliance without having to navigate significant manual and inefficient processes.

Q. Is NW Natural considering alternatives to the Compliance Data Management Optimization Project?

A. Yes. NW Natural considered two alternatives for the CDM Optimization Project. **First,** NW Natural evaluated the option of maintaining current CDM tools and processes without addressing identified gaps. This approach would not equip the CDM team to effectively manage compliance or field operations and would fail to improve visibility, oversight, or public safety outcomes. The team would remain reactive—focused on transactional tasks and responding to compliance breaches—rather than proactively managing risk. Continuing with manual processes instead of implementing automated, controlled IT solutions increases the likelihood of missed critical referrals and compliance orders, posing operational and regulatory risks.

Second, the Company considered addressing a small number of items via an initiative in 2025 and not pursuing resolution for remaining gaps, such as providing automated notifications to field groups regarding new compliance obligations. This option was not selected due to the continued reliance on both manual processing and

ongoing contractor support. This option was also comparable from a cost perspective, and so did not provide commensurate benefits given the cost.

Q. What is the status of the CDM Optimization Project?

A. The CDM Optimization Project will begin in January 2026. The Company expects to place the project into service in October 2026. Further documentation supporting this project is included in Exh. BEF-20. The Company is currently working on an alternatives analysis for the CDM Optimization Project.

Q. What cost recovery is NW Natural requesting for the CDM Optimization Project in this case?

A. NW Natural seeks to recover its capital investment of $2.1 million on a system-wide basis, or $0.3 million on a Washington-allocated basis.

D. Field and Web Maps Enablement Phase II Project

Q. Please describe the Field and Web Maps Enablement Phase II Project.

A. The Field Web Maps Enablement Phase II Project will continue the broader effort to phase out end-of-life software tools and transition to a consolidated set of modern systems by (a) transitioning remaining Visual Fusion functionalities to IQGeo and Esri UN; (b) updating IQGeo to a supported version; and (c) transitioning the "as-built" data reconciliation process from the IQGeo Capture application to a new IQGeo tool, which will provide an up-to-date visual interface with NW Natural's operational assets. This Project will allow the Company to discontinue use of the Visual Fusion software.

Q. Why is the Field and Web Maps Enablement Phase II Project necessary?

A. The Field and Web Maps Enablement Phase II Project is necessary to both consolidate the Company's suite of field and web mapping tools and to ensure that the existing tools remain reliable, as follows:

- Visual Fusion software is end-of-life and has not received a software update since 2016. Web maps in Visual Fusion need to be moved to a different mapping solution. By transitioning Visual Fusion's map viewing and map functions into IQGeo, the Company streamlines the IT&S product suite. Transitioning these functions will require an updated version of IQGeo.
- The Company's current version of the IQGeo platform (6.5) is out of official support, and will need to be updated to a supported version. It is necessary to update IQGeo to mitigate risks of technical failures for the Company's essential field and web mapping system. As with other software products, IQGeo requires periodic updates to address bug fixes, incorporate product improvements, and maintain support services from the software vendor.
- IQGeo's Capture application will no longer be supported after equivalent functionality is incorporated into the base IQGeo platform in late 2026. Capture currently provides critical functionality, such as reconciling geospatial data with as-built equipment details. As a result, NW Natural will need to determine whether to replace this functionality with third-party software, or adopt IQGeo's replacement solution, Network Manager Gas. If NW Natural adopts IQGeo's Network Manager Gas, then a more current version of IQGeo's software will also be required.

Q. Is NW Natural considering alternatives to the Field and Web Maps Enablement Phase II Project?

A. Yes, though a full alternatives analysis will be completed in 2026 before beginning project work. At this time, the Company has conducted an initial assessment of a "no action" alternative and has concluded that some action is necessary for two reasons. **First,** maintaining the existing Visual Fusion software over the long-term will undermine the reliability of the Company's mapping functions, as Visual Fusion is already end-of-life. **Second,** maintaining IQGeo version 6.5 indefinitely is not viable because continued reliance on unsupported versions undermines the reliability of the Company's mapping functions and introduces risk to fixing product issues and maintaining product security. **Third**, the Company's Capture application is being phased out in 2026, and thus some replacement application will be required.

A detailed alternatives analysis will evaluate IQGeo's Network Manager application as a replacement for Capture. Other non-IQGeo solutions will also be considered, such as an Esri-solution or a solution from an Esri partner.

Q. What is the status of this Project?

A. This Project is currently in Intake phase, and NW Natural anticipates completing its analysis of alternatives in 2026, prior to starting work. This project is expected to be placed in service in July 2027.

Q. What cost recovery is NW Natural requesting for the Field and Web Maps Enablement Phase II Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $1.3 million on a system basis, or $0.2 million on a Washington-allocated basis.

E. Customer Self-Service Enhancements Project

Q. Please describe the Customer Self-Service Enhancements Project.

A. The Customer Self-Service Enhancements Project will develop several new features to make it easier for customers to conduct business with NW Natural online (through the Company's website) and over the phone (through the Interactive Voice Response ("IVR") system). While the precise contours of this project are still being developed, potential workstreams include:

- Create Landlord-Between-Tenant service functionality that will allow property managers the ability to start, stop, or transfer gas service for tenants through the Company's website when the tenant is unable to complete the transaction. Currently, landlords must call customer service in these circumstances, resulting in over 11,000 unnecessary calls annually. This new feature will allow property managers to manage gas services at their convenience, reducing the need for customer service calls.
- Automate back-office processing for residential start and transfer service. This feature will eliminate the up to three-day processing time required to complete start or transfer service requests made on the Company's website—made possible by the Start-Stop-Transfer Project, described above. Adoption and completion of the online start, stop, and transfer service request have increased from 29 percent to 60 percent since the new online tool launched. However, customers continue to contact customer service due to delays in back-office processing. This feature will remove the delay and enhance the customer experience.

- Enable Contact Center Co-Browsing (also known as "collaborative browsing"), allows customer service agents to simultaneously view and interact with the same web page that customers are seeing in real-time, thus allowing the customer service agent to more efficiently guide customers through challenges. This tool is particularly valuable for resolving issues concerning log-in and password issues, and is important to reduce customer time and frustration.
- Provide an HTML view of the customer bill to enhance mobile accessibility. Currently, the Company offers only a PDF view of the bill, which is not optimized for mobile devices. More than 50 percent of customers access the Company's website on a mobile device.
- Incorporate artificial intelligence ("AI") assistance technology into the IVR, such as Agent Assistant, Quality Management, After Call Summarization, Knowledge Article Generation, Virtual Agent (Chatbot), AI Rep Checklist, Predictive Routing, and Analytics. AI for NW Natural customer service agents will provide faster service and enable customers to self-serve via the IVR more efficiently.
- Enhance the Company's customer notification capabilities by integrating text messaging and enterprise-wide email capabilities for all customers. Offering text messaging for common customer communication is a much-desired feature asked for by customers in customer satisfaction surveys.
- Introduce the ability for customers to select the language they prefer for the website. The Company will begin with Spanish and phase in the other top languages in NW Natural's service territory.

- Incorporate several enhancements to the IVR that will improve current call-flows, increase the service order types available, and streamline integration with the payment processing provider—thus enabling more seamless interactions for customers that pay their bills over the phone. These improvements will also incorporate after-call surveys for better analytics to guide future improvements, after-hours callback scheduling capability, and the ability to modify and cancel service orders.

Q. Why are these self-service enhancements necessary?

A. These self-service enhancements are necessary to effectively serve customers and to reduce the volume of Customer Care Center (CCC) calls. The identified improvements will save customers time and offer more convenient methods to conduct business with the Company. Moreover, the improvements provide the type of responsive and clear service that customers expect from their service providers, as indicated from customer satisfaction surveys and comments to customer service agents. These improvements also accommodate more language options and enhance efficiency through increased automation. Together, these website and IVR self-service enhancements aim to eliminate barriers to customers getting the service they need.

Q. Will NW Natural consider alternatives to the Customer Self-Service Enhancements Project?

A. Yes, and NW Natural is continuing to consider project alternatives. NW Natural will complete an alternatives assessment for this project, including identifying the appropriate priority order for these enhancements, in the first quarter of 2026. In addition to evaluating the overall costs and self-service benefits of different aspects of

this project, the Company intends to evaluate alternatives according to their equity impacts. Specifically, the Company will continue to assess whether and to what extent various self-service enhancements address barriers to service for disproportionately impacted customers.

For instance, facilitating landlord service requests can help avoid service disruptions to tenants who may face language barriers or lack adequate digital access. Similarly, HTML bills are readily compatible with assistive technologies like screen readers, increasing accessibility for vision-impaired customers. In addition, improving phone-based actions can better support customers with rigid work schedules and limited computer access, while co-browsing functions with customer service can support customers with technology literacy barriers. Finally, providing a website with language translation options can expand the self-service opportunities for non-English readers. NW Natural will continue to evaluate these and other equity implications as part of its comprehensive alternatives assessment.

Q. What is the status of the Customer Self-Service Enhancements Project and when is it expected to be placed in service?

A. This Project will begin in early 2026, and is expected to place the identified series of enhancements in service incrementally over the following several years, beginning in the second half of 2026. NW Natural will be able to provide a clear roadmap and timeline for these enhancements after the alternatives analysis and project roadmap is completed in early 2026.

Q. What cost recovery is NW Natural requesting for the Customer Self-Service Enhancements Project in this case?

A. NW Natural currently estimates that this project will entail $11.1 million in capital investment over the life of the project (through 2029), including $2.5 million placed in service in Rate Year 1, $5.7 million in Rate Year 2, and $2.3 million in Rate Year 3.

F. Website Technology Project

Q. Please describe the Website Technology Project.

A. The Website Technology Project will update and potentially replatform the Company's website in order to enhance security and maintain the stability of the Company's website architecture. This project will start with an initial assessment phase (Phase Zero) to evaluate current functionalities, support, security gaps, and to identify a path forward that meets both technical and functional challenges. The primary goals of this project will be to enhance the security and stability of the Company's website, while identifying opportunities to improve the customer experience and to simplify the Company's digital architecture. The results of Phase Zero will guide cost-effective decision-making and result in a recommendation for a specific implementation path.

Q. What are the possible implementation paths for the Website Technology Project that NW Natural is currently considering?

A. NW Natural is currently considering two main implementation paths for the Website Technology Project. The first option would be to update the current website's underlying software components to fully supported versions and implement security improvements to the existing platform. Security improvements would include mechanisms such as single sign-on, advanced monitoring for malicious activity, cloud

security enhancements, and enhanced Payment Card Industry ("PCI") security to meet the latest security standards and requirements.

The second option would involve identifying and transitioning to a new platform for the website that incorporates the needed security improvements. Based on a preliminary analysis, this new platform would improve customer experience with additional self-service feature enhancements, simplify the website's architecture, and avoid the need to update the complex technology stack underlying the current website platform.

Q. Why is the Website Technology Project necessary?

A. The Website Technology Project is crucial to ensure that this customer-facing system, which handles over three million sessions annually, remains stable and secure. Similar to other software systems, the website software and platform require regular updates to address bug fixes, product software and technical system improvements, enhanced functionality, and vendor support. This project aims to update several overdue components and implement necessary security enhancements.

Q. Did NW Natural consider alternatives to the Website Technology Project?

A. As I explain above, NW Natural is in the process of evaluating alternatives for this project. A full alternatives analysis is expected to be completed in the third quarter of 2025, which will allow the Company to confirm the appropriate course of action.

Q. What is the status of the Website Technology Project?

A. The Website Technology Project is currently in the Planning phase. The Company currently anticipates beginning the Website Technology Project in 2026 and placing it in service in July 2027. The project charter is included in Exh. BEF-21.

Q. What cost recovery is NW Natural requesting for the Website Technology Project in this case?

A. NW Natural seeks to recover its capital investment for this project, currently estimated at $14.3 million on a system basis, or $1.7 million on a Washington-allocated basis.

VII. RATE YEAR 2 PROJECTS
(August 1, 2027 – July 31, 2028)

A. Gas Control Daily Operations Platform (GCDOP) Implementation Project

Q. Please describe the GCDOP Program as a whole.

A. The GCDOP Program is a strategic initiative to replace the Company's aging, custom-built SCADA platform with a modern, modular, and secure SCADA platform. This program includes separate efforts to first plan for and implement the new SCADA platform (the "GCDOP Implementation Project"), which will enter service in Rate Year 2, and then to subsequently implement additional gas system data capabilities (the "GCDOP Consolidated Reporting Project"), which will enter service in Rate Year 3.

Q. What is the role of the SCADA platform in NW Natural's operations?

A. The SCADA platform is real-time software that provides monitoring and control capabilities for NW Natural's Gas Control team managing the gas distribution pipeline system. This capability allows the Company to deliver gas to our customers in a safe and reliable manner, and is necessary to maintain pipeline situational awareness.

Q. What is NW Natural's current software solution for the SCADA platform?

A. NW Natural's current SCADA software platform was installed in 2005, and relies on a customized system that integrates with software called iFIX, developed and

maintained by GE Vernova ("GE"). Thus, the Company relies on a combination of in-house software developers and GE support to maintain the hybrid system operations.

Q. Why did NW Natural develop a hybrid SCADA solution?

A. A hybrid SCADA solution was developed in order to allow the iFIX software to meet the operational requirements for a gas distribution pipeline control room. Foundationally, the iFIX system is based on a human-machine interface (HMI) server that is designed to manage plant operations, rather than a gas distribution pipeline system for an enterprise control room. When the platform was installed in 2005, this type of HMI-server based software was commonly used because it was (a) cost-effective, (b) readily transitioned between the preexisting hardware systems to networking with field telemetry devices, and (c) allowed development of custom applications to address gaps in functionality required for an enterprise control room. However, this type of platform did not provide enterprise solutions and integrations—or the level of compliance functionalities—required for gas distribution system operations. As a result, NW Natural substantially modified the iFIX platform over time with custom gas management and compliance services that are now offered "off-the-shelf" by SCADA vendors.

Q. Why is the GCDOP Program needed?

A. The GCDOP Program is needed to address several deficiencies and risks with the Company's current hybrid system. **First,** the current customized system was developed over 20 years ago and is now difficult to maintain and support. By the time NW Natural's new SCADA platform is installed in 2027, the custom system will have been in service for 22 years, well beyond the normal useful life for this type of system.

Second, the current platform has become increasingly unstable and unreliable. As the existing software was modified over time to accommodate NW Natural's gas distribution pipeline system, the system architecture started experiencing more frequent system disconnects and manual restarts. In 2024, for instance, the system required 39 manual restarts. While NW Natural has a back-up server to respond to such outages, transitioning to this back-up is a manual process, which can take between 30 minutes and 2 hours.

Third, the Company lacks peer gas distribution company users to help encourage appropriate maintenance of iFIX as a gas control SCADA platform. Today, NW Natural is the only known gas distribution company using iFIX as a SCADA solution. Without a critical mass of gas distribution companies pressing for maintenance, major system deficiencies have gone unaddressed for years, resulting in recurring outages.

Fourth, the existing software system lacks robust and reliable reporting functionality. Forecasting and reporting are essential tools for the Gas Control and Gas Supply teams. The current system's data capture and reporting mechanisms do not readily integrate with the Company's other software solutions, such as Power BI, undermining the reliability and efficiency of these reporting functions.

Q. When did NW Natural initiate the current GCDOP Program?

A. NW Natural began planning for the current GCDOP Program in 2023. That year, NW Natural retained Accenture to conduct an initial system assessment and explore potential replacement or update options.

Q. What were the results of Accenture's initial system assessment?

A. The main result of Accenture's assessment was to recommend replacing—rather than updating—the existing iFIX platform. Accenture determined that updating the existing system would require the Company to first remove all the existing layers of custom integrations from iFIX and return the software to its baseline configuration, before attempting to update the system and redevelop the custom integration side of the platform. NW Natural estimates that this reversal and updating process would cost approximately $10.1 million. Given that this approach would continue to rely on extensive customization and would forego better-suited off-the-shelf options for modern gas control systems, Accenture recommended identifying a replacement option rather than reinvesting in the existing hybrid system.

Q. How did NW Natural identify and evaluate options for replacing the existing platform?

A. In 2024, NW Natural retained IBM to identify the requirements for a new SCADA platform and to conduct a gap analysis, which the Company then used as the basis for approaching potential vendors. IBM approached eight vendors with potentially compatible offerings—including GE, which offers other SCADA products in addition to iFIX. NW Natural received responses from two potential vendors: AspenTech ("Aspen") and [redacted]

NW Natural conducted substantial due diligence into both responsive bids, and selected Aspen as the lower-cost and better service option to provide a new SCADA software platform. Aspen is a reputable and reliable company that supports

approximately 70 percent of the electric utility market with targeted strategic growth in the gas utility industry.

Q. In addition to being lower-cost, does the Aspen software solution provide other benefits for the Company's new SCADA platform?

A. Yes. Aspen's software approach is modular, which means it is comprised of multiple services with separate software components. While somewhat more complex from a software perspective, this approach is appropriate when an outside software expert is maintaining the code. A modular system is helpful in several respects:

- First, modular software allows for incremental installation, whereby the Company can transition to the new platform in one step, and subsequently take on additional available capabilities (such as through the GCDOP Consolidated Reporting Project) in future steps.
- Second, modular software enables less disruptive updates as the system ages. When one portion of the system needs to be updated for maintenance, this portion of the system can be updated without impacting the full software stack.
- Third, a modular system is not only more easily installed, but is also more easily uninstalled, thus supporting streamlined eventual replacement as part of NW Natural's long-term, multi-decade lifecycle system planning.

Q. Following this RFP process, did NW Natural nonetheless reconsider updating the current system as an alternative to replacement?

A. Yes. In June 2025, GE issued a patch that addressed a major cause of the SCADA system's crashes over the past five years. This patch has substantially reduced the need for manual restarts. As a result, the Company reevaluated whether to update and

maintain the existing hybrid iFIX SCADA platform solution as an alternative to replacement. Based on this analysis, the Company ultimately determined that replacement was still appropriate for three reasons:

First, retaining a hybrid system remains too precarious for this essential gas control system function. As the Company has experienced, hybrid systems combine the risks of both inadequate third-party vendor support and limitations of in-house custom systems support. Here, GE has already demonstrated intermittent and delayed support for issues that have interfered with basic SCADA operations. Even following the recent update, NW Natural gas control operators must still carefully manage how they use the system to avoid triggering system freezes and restarts. Similarly, relying on in-house custom-built solutions adds substantial development risk and potential points of failure. Thus, while the immediate reliability concerns were largely addressed by GE's latest patch, a hybrid system built on GE's iFIX software remains unreliable long-term.

Second, reinvesting in a hybrid solution would be inconsistent with the Company's broader IT&S strategy to move away from custom in-house software and towards stable, off-the-shelf solutions. In 2005, there were limited options for SCADA software companies focused on the needs of gas distribution companies. With the development of off-the-shelf, modular SCADA software solutions for gas control systems, the Company has quality, modern options that are comprehensively designed for NW Natural's long-term needs.

Third, updating the Company's existing hybrid SCADA system would not address the data and reporting deficiencies in the iFIX platform. Even updated, the

iFIX platform would continue to rely on a data format that does not readily integrate with the Company's other software solutions, and would thus continue to rely on manual workarounds to ensure accurate reporting.

Based on this analysis, NW Natural concluded that replacing the existing platform remained the best long-term alternative to safely and reliably serve customers.

Q. Are there other benefits of the GCDOP Program beyond addressing issues with the existing SCADA software platform?

A. Yes. This program will provide a stable, industry-standard platform for NW Natural's central gas system operations and management system, while improving reliability and ensuring accurate, consistent reporting. In addition, the new system will feature:

- A secure modern architecture,
- Centralized management of display maintenance and distribution,
- Streamlined product and patch releases through vendor-managed source code,
- State-of-the-art cybersecurity aligned with ISO-27001 standards,
- Simplified database administration and improved system release efficiency,
- Enhanced system administration and operational resiliency, and
- Enhanced user experience.

Q. What is the status of the GCDOP Implementation Project?

A. The GCDOP Implementation Project is currently in the Assess phase. The alternative analysis is included as confidential Exh. BEF-22C.

Q. What cost recovery is NW Natural requesting for the GCDOP Implement Project in this case?

A. NW Natural is requesting to recover its capital investment of approximately $19.0 million on a system basis, or $2.3 million on a Washington-allocated basis.

B. Customer Order Management Replatform Project

Q. Please describe the Customer Order Management ("COM") Replatform Project.

A. The COM Replatform Project will transition the Company's crucial order management system to a new platform to replace the end-of-life on-premises platform. The COM application is integral to the Company's customer service functions, as it manages complex customer order processes, including pricing and quoting, order management, fulfillment, reporting, and compliance. Additionally, the COM application supports all builder and contractor partner order management processes through an integrated portal on the NW Natural website.

Q. Why is the COM Replatform Project necessary?

A. The COM Replatform Project is necessary because NW Natural's legacy COM solution, first launched in 2019, is approaching end-of-life. The existing COM application is based on Microsoft's Dynamics 365 software. Microsoft has announced the end-of-life for NW Natural's on-premises implementation, meaning no additional functional software updates will be released. Even this limited, security-only support will end in January 2029.

Q. In addition to the end-of-life service schedule, are there additional factors driving the timing of this Project?

A. Yes. The COM Replatform Project is an integral part of the CIS replacement effort (H2:Vista), and is necessary to meet H2:Vista's prerequisite timeline milestones. This Project is therefore being developed to enter service in March 2028, both to ensure that basic security support is still available, and to avoid overlap with the CIS replacement work.

Q. Did NW Natural consider alternatives to the COM Replatform Project?

A. NW Natural will explore and evaluate available alternatives for this project before work begins to ensure the appropriate solution is selected and implemented.

Q. What is the status of the COM Replatform Project?

A. The project was identified in the Company's CIS study[8] and is currently in the Intake phase. The project is expected to be placed in service in March 2028.

Q. What cost recovery is NW Natural requesting for the COM Replatform Project in this case?

A. NW Natural seeks to recover capital investment of approximately $4.8 million on a system basis, or $0.6 million on a Washington-allocated basis.

[8] Confidential Exh. BEF-2C.

C. IGA Phase 3 Project

Q. Please describe the IGA Phase 3 Project and how this Project relates to the broader IGA effort.

A. The IGA Phase 3 Project expands on the foundational work in IGA Phase 1 and the application integration work in IGA Phase 2 by expanding integration with additional applications, enabling periodic access certifications, and piloting role-based access control.

Q. How does role-based access control differ from the Company's existing user-access control systems?

A. Currently, access permissions are tied to specific individuals as they enter specific roles and are granted access, or leave the Company and are removed from access. Where an individual may stay with the Company—sometimes for decades—and take on a variety of different roles, it is important to update that individual's access permissions to avoid accruing access permissions that are no longer necessary for the individual's latest role. Thus, role-based access permissions allow access to be assigned based not on an individual's specific new access permissions, but on the full scope of appropriate access based on the individual's current role.

Q. Is the Company considering alternatives for the IGA Phase 3 Project?

A. Yes. The Company will continue to consider the appropriate scope of application integrations for this phase of the IGA Program. While the Company's decision to allocate application integration and a role-based access pilot to Phase 3 was considered as part of the broader IGA program evaluation, this ongoing application-specific evaluation allows the Company to pragmatically build on the foundation established in

Phases 1 and 2 within realistic resource, budget, and timeline constraints. Application integration is prioritized based on system risk, the number of users impacted, and the complexity of the integration required.

Q. What is the status of the IGA Phase 3 Project?

A. The Project is expected to be placed in service in October 2027.

Q. What cost recovery is NW Natural requesting for the IGA Phase 3 Project in this case?

A. NW Natural seeks to recover its capital investment of $2.4 million on a system basis, or $0.3 million on a Washington-allocated basis.

D. Customer Engagement Platform Project

Q. Please describe the Customer Engagement Platform Project.

A. The Customer Engagement Platform Project will provide a tool for the Company to efficiently and effectively communicate with customers beyond bulk-correspondence communications. This new system will serve an important role in enabling adoption of high efficiency equipment, ensuring compliance with managed curtailments, and facilitating targeted safety communications. In contrast to a CIS, which records transactions and customer information, the Customer Engagement Platform Project will allow the Company to track communications to and from customers, and to target communications to different types of customers with different needs.

Q. Why is the Customer Engagement Platform Project necessary?

A. The Customer Engagement Platform Project is necessary because the Company currently relies on a cumbersome, and frequently manual approach to managing customer engagement. In the absence of a Customer Engagement Platform, the

Company can segment customer communications based on customer class, or by manually parsing specific customer variables. As a result, the Company's current customer communications primarily involve broad, general messages to all customers. The Company lacks the tools to configure, manage, and track individual customer engagement and communications. This means the Company cannot ensure that only relevant communications are sent based on specific criteria such as preferred language, participation in payment or arrearage management plans, gas usage, bill payment method, dwelling type (e.g., apartment vs. home), and responses to previous communications.

A Customer Engagement Platform will allow the Company to efficiently tailor communications strategies to provide customers with the most useful information. For instance, the Company currently cannot automate communications to customers that have particularly high consumption rates who might benefit from information regarding more efficient heat systems. As another example, the Company currently must manually manage communications with customers who have repeatedly contacted customer service regarding bill levels, and who might benefit from participation in bill discount programs. This Project would better facilitate these tailored communications.

Q. What are the benefits of the Customer Engagement Platform Project?

A. The Customer Engagement Platform Project will benefit customers by ensuring that they receive important safety, cost-saving, and account information in the manner that works for them, while—just as importantly—avoiding providing unnecessary and irrelevant information that may be distracting or burdensome. This flexible

functionality will benefit all NW Natural customers, but also carries important equity benefits. For instance, the new platform will allow NW Natural to:

- Follow up with participants in programs like the Arrearage Management Program, payment plans, and bill discount programs, with consideration for language preferences, to ensure that customers have information relevant to their program participation;
- Personalize communications at an individual level, such as identifying program eligibility and relevant account status, to focus messaging and increase effectiveness of the communication;
- Direct public safety communications to customers in specific areas that will be affected by service disruptions through multiple communication methods, such as text, email, and phone calls, allowing time for disproportionately impacted customers to prepare and to communicate with Company representatives;
- Facilitate customers' migration to lower-cost payment methods, such as automated clearing house electronic payments, while avoiding communicating to customers who have already adopted such methods; and
- Ensure compliance during curtailments, with automated and faster follow-ups for non-responsive customers, while avoiding excessive communications to responsive customers.

Q. Will NW Natural consider alternatives to the Customer Engagement Platform Project?

A. Yes, and NW Natural is still evaluating alternatives for project implementation. A crucial component of the project will be conducting a study to thoroughly outline the

specific functionality requirements and explore various alternatives to address those needs.

Q. What is the status of the Customer Engagement Platform Project?

A. The project is slated to begin in 2026 with a needs study and alternatives analysis. Pending the outcome of that assessment, development would begin in late 2026 and the project is scheduled to enter service in October 2027.

Q. What cost recovery is NW Natural requesting for the Customer Engagement Platform Project in this case?

A. The Company seeks to recover its capital investment of $3.4 million on a system basis, or $0.4 million on a Washington-allocated basis, which would be provisional capital in Rate Year 2.

E. Project Continuation

Q. You indicated that certain projects previously described will include assets to be placed in service in Rate Year 2. Please identify these projects.

A. The following projects described above include assets to be placed in service in Rate Year 2:

- **Microwave Stability Project**: NW Natural expects to place $7.0 million of this $25.2 million project in service in Rate Year 2, reflecting the incremental replacement/expansion of microwave transmission towers (see detailed project discussion in Section VI.A).
- **Customer Self-Service Enhancements Project**: NW Natural expects to place $5.7 million of this $11.1 million project in service in Rate Year 2, reflecting the

incremental deployment of customer self-service functions (see detailed project discussion in Section VI.E).

VIII. RATE YEAR 3 PROJECTS
(August 1, 2028 – July 31, 2029)

A. H2:Vista - CIS Data Quality Cleansing Project

Q. Please describe the CIS Data Quality Cleansing Project.

A. This Project is a prerequisite the H2:Vista CIS replacement project to migrate and improve the Company's consolidated customer information data, enabling future seamless migration to a new CIS platform. Data migration is frequently one of the more complex and time-intensive aspects of a platform replacement, due to the number of constituent variables. This project will ensure that the Company can operate consistently while transitioning the integral CIS backbone architecture, and aligns with the Company's broader strategic goals of customer focus, operational excellence, and regulatory compliance. This project's timeline was designed to ensure completion before the Company initiates the H2:Vista project work, to minimize internal resource constraints.

Q. Why is the CIS Data Quality Cleansing Project needed?

A. The CIS Data Quality Cleansing Project is needed to ensure that customer data is accurate and consistent through the CIS replacement effort. Accurate and consistent data is necessary to maintain operational continuity, quality customer service, and regulatory compliance during system transitions, particularly when high volumes of existing data are incorporated into a new software solution.

Moreover, this project is not only a prerequisite for H2:Vista, but serves to make this data more accessible to current users. For instance, CIS data is frequently needed by the Data, Reporting, and Analytics team to prepare reports, but accessing this data currently depends on technical resources in CIS development.

Q. Did NW Natural consider alternatives to the CIS Data Quality Cleansing Project?

A. Yes. Alternatives for this project were considered as part of the comprehensive CIS replacement planning process, and NW Natural will complete an updated alternatives analysis in the Assess phase of the project. Any CIS replacement requires data migration, and the Company evaluated whether to conduct this data clean-up and migration as an initial step or simultaneously with the CIS replacement in H2:Vista. NW Natural determined that it was appropriate to sequence this work effort prior to H2:Vista in order to ensure access to adequate internal resources and avoid any operational breakdowns in the CIS transition process.

Q. What is the status of the CIS Data Quality Cleansing Project?

A. This project will begin in 2026. The project is expected to be complete and placed in service in October 2028.

Q. What cost recovery is NW Natural requesting for the CIS Data Quality Cleansing Project in this case?

A. NW Natural seeks to recover its expected investment of $4.5 million on a system basis, or $0.5 million on a Washington-allocated basis.

B. GCDOP Consolidated Reporting Project

Q. Please describe the GCDOP Consolidated Reporting Project.

A. The GCDOP Consolidated Reporting Project is the second phase of the GCDOP Program, discussed above. This project will ensure that the data collected by the new GCDOP is used effectively by incorporating the resulting data into NW Natural's enterprise data "warehouse"—the cloud Enterprise Data Platform (EDP). This project will also prepare specific use cases designed to provide effective and streamlined reporting, such as identifying areas to optimize gas quality and flow, analyzing lost and unaccounted for gas (LUAF), and tracking and managing underground storage.

Q. Has the Company already determined precisely which capabilities will be included in the second phase of the GCDOP Program?

A. No. The Company will be best positioned to determine the precise scope of the additional capabilities once the GCDOP is placed in service in fall of 2027.

Q. What is the status of the GCDOP Consolidated Reporting Project?

A. The project will begin in 2027 with the expectation that an alternatives analysis will be completed for this project after the GCDOP is placed in service in fall of 2027. After the project scope is finalized, the GCDOP Consolidated Reporting Project is expected to be placed in service in June 2029.

Q. What cost recovery is NW Natural requesting for the GCDOP Consolidated Reporting Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $3.8 million on a system basis, or $0.5 million on a Washington-allocated basis.

C. Voice Radio Tech Refresh Project

Q. Please provide some context for the Voice Radio Tech Refresh Project and how it fits into the Company's broader Technology Refresh Program.

A. Voice radio communications have been an integral part of NW Natural's day-to-day operations and emergency response strategy since the 1970's, and provide the core communications network across the Company's service territory. As with other Technology Refresh projects, this Voice Radio Tech Refresh Project focuses on updating the technology infrastructure necessary to support the Company's IT&S systems—here, the Company's voice radio system.

Q. Please describe the Voice Radio Tech Refresh Project.

A. The Voice Radio Tech Refresh Project updates the Company's digital mobile radio ("DMR") system from the current DMR-2 system to DMR-3. This project will be developed in three phases:

- **2027 (RFP, Design, System Purchase)**: NW Natural will conduct an RFP process, select a vendor, complete the detailed design of the DMR-3 system, obtain the necessary radio frequency, and purchase the system hardware (such as antennas, repeaters, and controllers).
- **2028 (System Installation, Radio Purchase, Initial Rollout)**: NW Natural will then configure, install, and test the system hardware, update training and support processes, and perform initial truck radio rollout.
- **2029 (Integration, Rollout)**: NW Natural will expand the Omnicore Digital Console and integrate the system with Emergency Services, including conducting training and performing the mobile handheld radio rollout.

Q. Why is the Voice Radio Tech Refresh Project necessary?

A. The Voice Radio Tech Refresh Project is necessary to strengthen the reliability of the Company's communications network and improve personnel safety, both in day-to-day operations and during emergencies. The current DMR-2 system does not include critical safety components such as GPS location tracking, "Technician Down Alerting," or data transmission capabilities. Technician Down Alerting functions using an accelerometer in the portable radio, and detects if the technician falls and is unable to call for help. DMR-3 also allows the system to dynamically select radio frequencies, which improves the system's reliability.

In addition to these important features, transitioning to DMR-3 is also important to enable collaboration with Emergency Services, such as police and fire departments. Emergency services providers have asked that the Company be able to communicate via radio during emergency situations to enable prompt and secure emergency coordination. Currently, DMR-2 allows the Company to receive radio communications, but not to respond, whereas DMR-3 will enable two-way communication and establish end-to-end message encryption.

Q. Will the Company consider alternatives to the Voice Radio Tech Refresh (DMR-3) Project?

A. Yes. In the Assess phase of the project, NW Natural will finalize an alternatives analysis for this project. NW Natural expects to consider three alternatives. **First**, NW Natural will consider the status quo of not transitioning to DMR-3 and instead retaining the DMR-2 system. As noted above, the lack of critical safety features in the

existing system and the inability to effectively communicate with Emergency Services in a crisis situation are key concerns.

Second, the Company will consider expediting the DMR-3 project and performing both the truck radio and handheld radio rollouts in 2027. The Company expects that a phased approach will be preferable because it (a) smooths cost impacts for customers, (b) avoids straining internal implementation resources, and (c) minimizes operational disruptions.

Third, NW Natural will consider using cell phones instead of voice radios, but this alternative is not likely to be viable because cell phones rely on telecommunications carriers which are prone to outages or blocked calls due to system failures and increased traffic during emergencies. One recent example of this occurred during the Los Angeles fires in the fall of 2024. A team of NW Natural Emergency Field Technicians were deployed to assist, and they could not communicate via their cell phones. However, the handheld voice radios worked, enabling the Field Technicians to communicate in real time during the emergency.

Q. What is the status of the Voice Radio Tech Refresh (DMR-3) Project?

A. This project is currently in the planning stage and the Company expects to finalize the project roadmap in Q3 of 2026. Based on preliminary planning, NW Natural expects to complete phase one of the project in the fourth quarter of 2027, place phase two into service by the fourth quarter of 2028 and place phase three into service by the fourth quarter of 2029.

Q. What cost recovery is NW Natural requesting for the Voice Radio Tech Refresh (DMR-3) Project in this case?

A. NW Natural seeks to recover its capital investment of approximately $6.7 million on a system basis, or $0.8 million on a Washington-allocated basis, over the MYRP. The Company is seeking recovery of Washington-allocated amounts of $0.3 million, $0.3 million, and $0.2 million for Rate Year 1, Rate Year 2, and Rate Year 3, respectively.

D. Project Continuation

Q. You indicated that certain projects previously described will include assets to be placed in service in Rate Year 3. Please identify these projects.

A. The following projects described above include assets to be placed in service in Rate Year 3:

- **Microwave Stability Project**: NW Natural expects to place $6.7 million of this $25.2 million project in service in Rate Year 3, reflecting the incremental replacement/expansion of microwave transmission towers (see detailed project discussion in Section VI.A). The Rate Year 3 amount on a Washington-allocated basis is $0.8 million.
- **Customer Self-Service Enhancements Project**: NW Natural expects to place $2.3 million of this $11.1 million project in service in Rate Year 3, reflecting the incremental deployment of customer self-service functions (see detailed project discussion in Section VI.E). The Rate Year 3 amount on a Washington-allocated basis is $0.3 million.
- **Voice Radio Tech Refresh Project**: NW Natural expects to place $1.9 million of this $6.7 million project in service in Rate Year 3, reflecting the new DMR system's

integration with Emergency Services and the rollout of mobile handheld radios (see detailed project discussion in Section VII.E). The Rate Year 3 amount on a Washington-allocated basis is $0.2 million.

IX. PROGRAMMATIC INVESTMENTS

Q. Please briefly distinguish between discrete projects or programs and "programmatic investments."

A. The Company uses the term "programmatic investments" to refer to those investments made according to a schedule or plan, where the investment is often forecast using historical trends, as opposed to discrete projects or programs that are not tied to trended forecasts or predictable schedules.[9]

A. Data, Reporting and Analytics Program

Q. Please describe the Data, Reporting and Analytics ("DRA") Program.

A. The DRA Program is an ongoing initiative to support the Company's data-driven decision-making. This Program builds on the Company's implementation of Microsoft's Power BI software stack, previously addressed in Docket UG-200994.[10] This set of tools allows the Company to develop analytics and publish reports for a range of critical business purposes, including safety, compliance, damage prevention, valve maintenance, and emergency tracking. Developing analytics and producing reports relies on carefully assessing the specific requirements, identifying the underlying data, structuring the associated reporting, testing the reporting and analysis

[9] The Company relies on the Commission's distinction between projects and programmatic investments. *See* Used and Useful Policy Statement ¶¶ 11n.19, 35.

[10] *In the Matter of Washington Utilities and Transportation Commission v. Northwest Natural Gas, d/b/a/ NW Natural*, Docket UG-200994, Direct Testimony of Jim R. Downing, Exh. JRD-1T at 38-39 (Dec. 18, 2020).

process, and then producing the reports and any required visualizations for the end users. End users range from internal departments to government entities. Taken together, this DRA process requires developing and testing connections between different parts of the Company's systems to provide useful, clear, and reliable reports and analysis.

Q. How does the DRA Program relate to the Company's essential operations and provision of service?

A. The DRA Program is central to the Company's operations and effective decision-making, as it is the means by which NW Natural understands and manages its overall operations and performance. For instance, effective data analytics allow the Company to track and report on emergency response times, call volumes, and areas affected, thereby allowing the Company to allocate resources more effectively. Similarly, data analytics are necessary to provide comprehensive damage prevention reports to state regulators, identify risk areas, and guide future investments. Effective decision-making, analysis, and reporting needs are met through individual use cases, which are developed and placed in service separately as each is completed.

Q. What categories of use cases are most commonly required for data-driven decision-making and reporting?

A. The DRA Program focuses on several key categories of use case development:

- **Safety and Incident Management**: This category includes reports that track safety incidents, including vehicle collisions, employee injuries, and pipeline damage, as well as the incidents' underlying causes. This type of report allows the Company

to effectively design interventions to prevent future incidents and protect customer, employee, and public safety.

- **Gas Operations and Maintenance**: This category of reports includes tracking gas leaks, outages, storage, and consumption. For example, reports can use historical data regarding consumption and storage, along with up-to-date weather forecasts, to better predict total supply needs and ensure that the Company has adequate supplies to reliably serve customers. This category of report also includes comprehensive pipeline maintenance histories, patterns of maintenance issues, and timelines for responsive maintenance activities.
- **Customer Service**: This category of reports includes customer service response times, patterns of customer feedback and satisfaction, and categories of concerns reported. These reports are crucial to effectively designing customer service support systems and to ensuring that customer field services are available when and where they are needed.
- **Regulatory and Compliance**: These reports are used to provide information to regulatory and governmental organizations, such as PHMSA, local governmental entities, and state regulators. For instance, the Company prepares substantial reports on pipeline code compliance, atmospheric corrosion, heat detection patterns, and a wide array of asset inspections. These reports are an important part of ensuring that the Company is meeting its safety and environmental responsibilities and legal obligations.
- **Financial and Billing**: This category of reports allows the Company to effectively track and manage Company spending by department and manager, including

identifying and explaining variance between budgets and actual spend levels. Reports also analyze customer billing and consumption patterns, such as arrearage overviews, late payments, and qualification for bill discount programs.

Q. How does NW Natural determine which use cases, reports, and analytics to pursue within the DRA Program?

A. The Company determines which use cases, reports, and analytics to pursue through use case intake forms, which allow for consistent evaluation of use case requests. This process includes oversight and approval of use case requests by NW Natural officers to ensure the appropriate reports and use cases are prioritized.

Q. Are there viable alternatives to the DRA Program?

A. No. To be clear, reporting and analytics play a critical role across the Company, including regulatory compliance, operational efficiency, financial management, customer service, safety, and emergency response. In the absence of the DRA Program and its ability to leverage the Company's consolidated data warehouse through the Power BI software, NW Natural would have to rely on labor-intensive, ad-hoc, Excel-based reporting to meet regulatory reporting requirements and data analysis needs. This alternative is not viable because a manual alternative is both more error-prone and too slow to meet compliance deadlines.

Q. Are there other benefits of the DRA Program's centralized data and analytics approach?

A. Yes. A centralized DRA Program provides a consistent and scalable approach to reporting. Unlike decentralized methods, which often rely on siloed data sources and manual processes, a centralized DRA Program ensures data integrity, avoids duplicated

efforts, and enables faster, more reliable insights from Company data. A centralized data warehouse also supports governance, security, and compliance by maintaining a single source of truth across the organization.

Q. What is the status of the DRA Program?

A. The DRA Program is active and ongoing, and will continue throughout the MYRP. New reports and use cases are placed in service as they are produced, tracked quarterly. Based on the Company's historical need for rigorous, data-driven reporting and analytics, there is a clear and predictable future need for further such capabilities. Table 2, below, is the Company's historical and forecast investment in the DRA Program, based on calendar years.

Table 2. Investment in DRA Program

Sum of Annual Forecasts - Capital Spend *Forecast does not include AFUDC, Tax or COH					
2023 - Actuals	2024 - Actuals	2025 – Actuals + Forecast	2026 - Forecast	2027 - Forecast	2028 - Forecast
$7,755,777	$6,580,103	$5,104,599	$ 4,500,300	$4,500,300	$4,500,300

Q. Has the Company's DRA Program investment changed over time?

A. Yes. As shown in Table 2 above, the Company has effectively reduced its annual DRA investment by optimizing report creation and improving data quality over time. These improvements have allowed the Company to reduce the annual estimated investment need to approximately $4.5 million. Forecast years are based on reasonable extrapolations from historical spend and projected DRA needs. With a stable data warehouse and clear ongoing reporting and analytic needs, the Company's future DRA investment is predictable, stable, and sustainable.

Q. What cost recovery is NW Natural requesting for the DRA Program in this case?

A. NW Natural seeks to recover, on a system-wide basis, its historical capital investment of $17 million, pro forma investment of $8.0 million, and ongoing forecast investments of approximately $4.5 million per Rate Year. On a Washington-allocated basis, these amounts are $2.1 million in historical investment, $1.0 million in pro forma investment, and $0.6 million in ongoing forecast investment per Rate Year.

B. Telemetry Lifecycle Management Program

Q. As an initial matter, what do you mean by "telemetry"?

A. Telemetry refers to the physical systems and equipment that allow NW Natural to manage its natural gas pipeline through the active, central monitoring and control system, known as Supervisory Control and Data Acquisition (SCADA). SCADA systems collect, transmit, and measure data from remote sources, using sensors and other devices to collect data through remote communications systems, known as telemetry. These telemetry systems include a range of equipment, such as SCADA Remote Terminal Units/Programmable Logic Controllers, pressure transmitters, flow meters, line heaters, actuators, and communications equipment.

Q. Please describe the Telemetry Lifecycle Management Program.

A. The Telemetry Lifecycle Management Program is an on-going effort to replace outdated physical SCADA equipment with modern technology to comply with new security and safety standards. The projects involve surveying, permitting, and deploying new equipment to the Company's remote monitoring and control sites. NW Natural targets 20 sites for updates each year.

Q. Why is the Telemetry Lifecycle Management Program necessary?

A. The Telemetry Lifecycle Management Program is crucial to ensure accurate and reliable telemetry regarding the condition and control of NW Natural's pipeline systems. These projects manage the lifecycle of the remote telemetry sites to ensure accurate data for the SCADA system, thus maintaining the Company's safe and reliable operation of its gas pipeline system.

The specific nature of the telemetry equipment varies by location, depending in part on the site's accessibility, and has historically included radio, network circuits, cellular, and satellite connections, and other transmission technologies. Over time, each site's telemetry equipment ages and reaches end-of-life and is no longer reliable. As a site reaches end of life, NW Natural must update the site with current technology to maintain system, regulatory, security, and safety requirements. By developing a systematic program for maintaining the Company's telemetry systems, NW Natural can support the critical functionality of its telemetry systems while avoiding unnecessary cost spikes.

Q. What is the schedule or plan for implementing the Telemetry Lifecycle Management Program?

A. The Telemetry Lifecycle Management Program is designed to allow for systematic maintenance across the Company's telemetry locations. As of June 2025, NW Natural has 283 telemetry sites, and periodically adds new telemetry sites to support changing SCADA monitoring needs and ensure adequate system coverage. The Telemetry Lifecycle Management Program targets approximately 20 sites per year, allowing the Company to maintain and update sites on approximately a 15-year rotating cycle. Since

the Telemetry Lifecycle Management Program was initiated in 2020, the Company has gradually established its sustainable maintenance program levels, which are expected to remain level, adjusted for inflation, going forward. This ongoing Telemetry Lifecycle Management Program entails predictable spending levels, as shown in Table 3 below.

Table 3. Telemetry Lifecycle Management Program Spending Levels

Calendar Year	Investment[11]
2020	$1.702 million
2021	$1.690 million
2022	$2.206 million
2023	$3.136 million
2024	$3.415 million
2025	$3.880 million
2026	$3.400 million
2027	$3.400 million
2028	$3.400 million
2029	$3.400 million

This consistent, programmatic investment level allows the Company to maintain the reliability of this important technological infrastructure.

Q. Why does the Company plan for a 15-year cycle for the Telemetry Lifecycle Management Program?

A. A 15-year cycle for telemetry maintenance and refresh is appropriate to allow the Company to account for the shorter life expectancies of the electronic equipment at these telemetry sites. When conducting the 15-year refresh, the Company evaluates each site and identifies those assets in need of replacement.

[11] Investment forecasts, beginning July 2025, are direct costs only.

Q. What is the status of the Telemetry Lifecycle Management Program?

A. The Telemetry Lifecycle Management Program is active and ongoing, and remains on-track to implement the planned site updates each year. For the 20 sites identified for the 2025 cycle, the Company has completed 9 sites to date.

Q. What cost recovery is NW Natural requesting for the Telemetry Lifecycle Management Program in this case?

A. The Company is requesting recovery of its historical investment through March 31, 2025, of $4.5 million on a system basis, or $0.5 million on a Washington-allocated basis. On a forward-looking basis through the MYRP, the Company expects to place this capital in-service, as shown in Table 4 below.

Table 4. Telemetry Lifecycle Management Program Investment in MYRP

MYRP Period	Investment
Pro-Forma (April 1, 2025 – July 31, 2026)	$4.5 million[12]
Rate Year 1 August 1, 2026 – July 31, 2027	$2.6 million
Rate Year 2 August 1, 2027 – July 31, 2028	$3.8 million
Rate Year 3 August 1, 2028 – July 31, 2029	$3.9 million

These amounts differ from the calendar year view, shown above, based on the timing of the Company's telemetry investments and the time period captured by the MYRP's respective Rate Years.

[12] The Pro Forma Period is slightly higher because it reflects 15 months of investment.

X. CONCLUSION

Q. What are your recommendations regarding the IT&S projects described in your testimony?

A. I propose the Commission approve cost recovery for these projects. As described in my testimony above, these projects are necessary for NW Natural to continue to provide safe and reliable service and will provide an improved and secure customer experience.

Q. Does this conclude your Direct Testimony?

A. Yes.

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Genesys Replatform
Date:9/20/2023
Project Sponsor: Dina Thompson
Executive Sponsor: Jim Downing
Project Manager: Christopher Long
Preparer: Christopher Long / Lisa Delaney
Was this project part of IRP: NO (enter "Yes, included", "Yes, Acknowledged" or "No")

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking.

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Genesys PureConnect is the Company's existing on-premises, advanced call routing software, which serves 7 groups and approximately 300 combined agents across NW Natural, including Customer Acquisitions, Customer Support, Engineering Support, IT, Marketing, Resource Management, Customer Contact Center, and Major Account Service Team(s). This platform also hosts functions within the Integrated Voice Response application to request service orders and interfaces with Paymentus to enable telephone access to billing accounts. "Genesys PureConnect is a "Tier 0" critical infrastructure system as defined in the NWN Application Availability Tiers standard. Outages will result in public Health and Safety concerns and immediate cessation of primary function(s). Tier 0 services are required to be available 24x7x365 and have clear resiliency requirements to ensure uptime." The initiative is in response to the upcoming end-of-life for the PureConnect product in early 2025.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g., why is the current state not working)?	**Problem Statement**: Starting in January 2024, Genesys will *cease to offer new support* agreements and license modifications for PureConnect limiting change to features, or capacity of the existing platform, with software support ending on July 31st, 2025, marking the system's end of life. ***On July 31st, 2025 the system will cease to operate.*** To secure our contact center operations, maintain system uptime, and ensure ongoing functional requirements are met, it is imperative to address the forthcoming end-of-life support for Genesys PureConnect and strategize a solution that aligns with our operational requirements. **Business Need:** Genesys PureConnect has been integral in handling our customer interactions. With the termination of official support, NWN faces potential risks, including: 1. **Operational Stability**: Without continued software lifecycle support, software glitches, malfunctions, or other unexpected issues that may disrupt our service delivery. 2. **Security Vulnerability:** As no new security patches will be released post support date, our system may become susceptible to potential security breaches or data compromises. 3. **Integration Challenges:** Over time, compatibility with other evolving systems or third-party software like Paymentus might be compromised, leading to integration issues and impact to end customers.

	Why is this problem worth Solving? 1. **Customer Satisfaction:** Maintaining the integrity and reliability of the contact center platform is paramount to ensuring customer satisfaction. Disruptions can lead to decreased customer satisfaction. 2. **Business Continuity:** To ensure that there is no disruption in our daily operations, we need a solution before support ends, allowing for ample time to transition as required. 3. **Cost Implications:** Proactively addressing this issue can prevent potential financial losses from disrupted operations, security breaches or emergency migrations. 4. **Improved Experience:** Staying updated with software solutions will not only prevent potential issues but can provide enhanced features, performance improvements, and better integration capabilities, ensuring a good user and customer experience. Additionally, new technology will bring customer self service functions to the platform further optimizing the customer's interaction.
Desired Deliverables What high level output / scope / deliverables are core to this project?	Ensure that NW Natural can continue to provide reliable contact center operations and maintain high-quality customer contact services. Ensure long-term, effective integration with other Company software solutions. Limit disruption to customers and NW Natural operations.

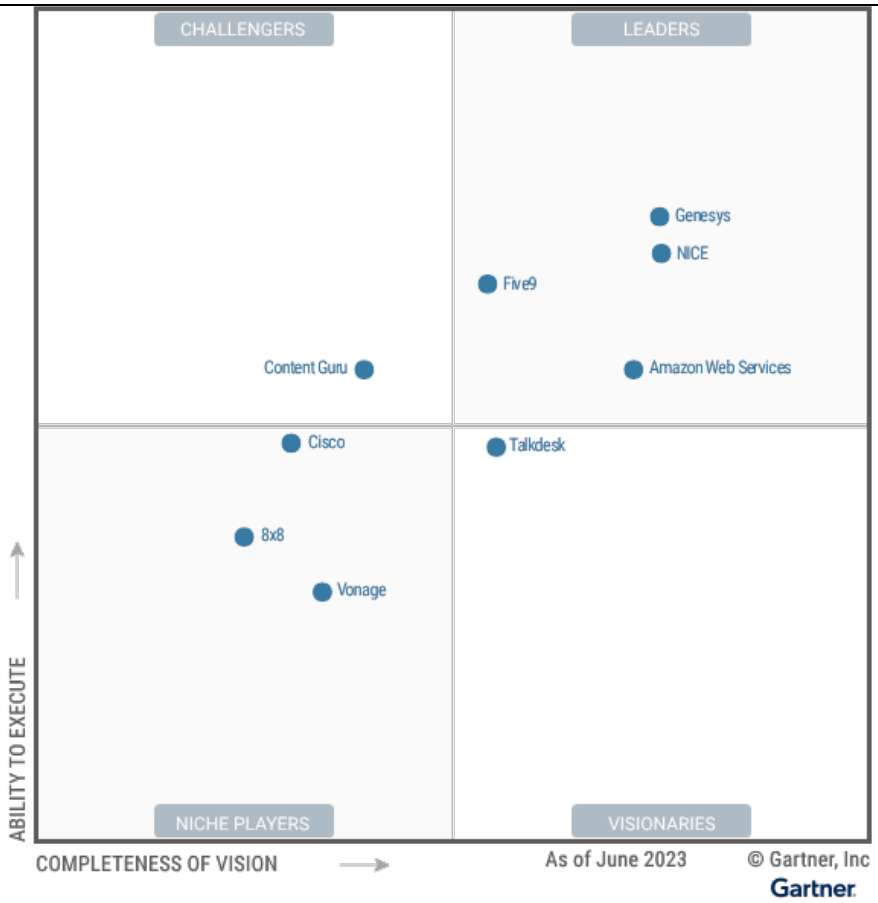
SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	Driven by the sunset of the Genesys PureConnect on-premises software lifecycle, a critical evaluation has been initiated to evaluate the sustainability and efficiency of the existing Genesys platform. The options under consideration are straightforward: either upgrade to the next-generation product from Genesys, explore solutions from a different vendor or maintain the status quo with the current on-premises Genesys system. Core requirements, such as basic features, agent and supervisor functionalities, integration capabilities, and workforce management functions, are anticipated to be comparable between both the upgrade and new solution exploration options. The leading alternatives, predominantly cloud-based, are expected to adhere to similar industry benchmarks regarding architecture and cybersecurity compliance. Given that these foundational elements are presumed consistent across provider choices, they won't form the crux of our analysis. Instead, our focus is on deployment efforts, user implications, and overarching cost considerations. The alternatives assessment process included: • **Current System Analysis**: Detailed documentation of the existing environment setup, including configurations, integrations, customizations, and roles

	• **Stakeholder and Business Feedback:** Compilation of feedback and requirements from executives, key stakeholders, and users of Genesys regarding features, capabilities, and constraints of the current solution.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Level of effort to deploy	a. Complexity • How intricate or straightforward is each option to implement, irrespective of the nature of the change (upgrade, new solution or maintaining existing system) b. Resource Allocation • What people, technical, and financial resources are required for each option? • Does the option require new expertise, or can it be handled by the current resources on staff? c. Timeline • How long is the expected duration from the mobilization of the vendor to completion of each option? • Are there any anticipated delays or hurdles specific to an option?
Criteria: User Impact	a. Learning Curve • How quickly can users adapt to the changes or upgrades presented by each option? • Does a particular option require users to unlearn certain processes or habits? b. Training Needs: • How quickly can users adapt to the changes or upgrades presented by each option? • Does a particular option require users to unlearn certain processes or habits? c. Productivity • Is there expected downtime or a potential drop in productivity during or post-implementation for each option? • How soon can normalcy or improved performance be expected post-transition?
Criteria: Overall Cost Implications	a. Initial Expenditure • What are the upfront costs associated with each option, including licensing, hardware, and setup? b. Ongoing Costs: • Are there recurrent expenses, such as maintenance fees, subscription costs, or additional licenses?

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	Replatform to Genesys Cloud
In brief, why is this the recommended option?	○ Seamless transition: As it's within the Genesys ecosystem, migration will be more straightforward with fewer compatibility issues and less possibility of user impact. ○ Opting for Genesys Cloud mitigates the risk of user disruption and training needs, given users' familiarity with the existing Genesys interface and terminology. This choice directly impacts a smoother transition and faster user adoption. ○ Gartner, an independent technology advisory firm, has recognized Genesys as a market leader in the Contact Center as a Service (CCaaS) sector, noting the following strengths: ▪ Genesys has an extensive operational and channel presence in multiple regions. This wide geographic reach makes it a strong contender for consideration by organizations interested in contact center platform consolidation. ▪ Genesys offers strong tools and processes to migrate customers either from other Genesys offerings or from competitors' premises-based platforms to Genesys Cloud CX. ▪ Genesys offers strong tools and processes to migrate customers either from other Genesys offerings or from competitors' premises-based platforms to Genesys Cloud CX. ▪ **Gartner Magic Quadrant for Contact Contact Center as a Service (CCaaS)**



- Genesys achieves the top Product or Service Scores by Gartner across several critical use cases in the Contact Center sector:

Analysis

Critical Capabilities Use-Case Graphics

Vendors' Product Scores for High-Volume Customer Call Center Use Case

Source: Gartner (August 2022)

<table>
<tr><td></td><td colspan="2"> 
Source: Gartner (August 2022)

Source: Gartner (August 2022)</td></tr>
<tr><td rowspan="3">Assessment</td><td>Analysis Against Criteria: Level of effort to deploy</td><td>As the migration remains within the Genesys ecosystem, a more streamlined transition process is expected with fewer compatibility challenges. Migrating data and training users for the new environment is still necessary.</td></tr>
<tr><td>Analysis Against Criteria: User Impact</td><td>Users familiar with Genesys PureConnect will find the Cloud variant somewhat familiar, thus reducing the learning curve. They would also benefit from enhanced and newly integrated features.</td></tr>
<tr><td>Analysis Against Criteria: Overall Cost Implications</td><td>Costs for transitioning to Genesys Cloud encompass licensing, potential infrastructure adjustments, and migration or training expenses. Manufacturer discounts for upgrading and long-term savings from scalability, and fewer infrastructure costs will help offset these initial outlays. Licensing costs are similar to other service providers in this space.</td></tr>
</table>

	Additional Benefits	**Reduced Risk of Downtime:** • Switching to a cloud solution can greatly minimize or prevent outages from significant failures in the virtual applications hosted in-house. The cloud solution primarily aims to maintain the uptime of a Contact Center application. **Integration and Futureproofing:** • Genesys Cloud supports easy integrations with other software solutions, like Paymentus "out of the box" using standard REST APIs

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2,000,299 - $2,202,299	6%	$2,120,316 - $2,334,436
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$60,000 - $70,000		Y2/Y3 recurring Genesys Cloud license subscription $373,678.33/year
Source/ Method of Cost Data	Bidder quote as a response to RFP process in progress. Project/Program O&M is forecasted for training requirements		

ALTERNATIVES CONSIDERED NOT VIABLE

Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why

	Description	**Why the Alternative is not viable**
Alternative 1	Deploy a new contact center solution.	Deploying a new contact center solution would be more costly, more labor-intensive, and take significantly more time, without any assurance of superior service. Moreover, switching to a wholly new service provider would carry additional integration risks, as the service has not demonstrated compatibility with the Company's other software systems. Furthermore, implementing a fully new alternative is not cost-effective as any new product would require the full design, development, and deployment process that the Company undertook when first implementing Genesys. In short, this option would carry significant potential for delay, performance degradation, and disruption of this critical service.
Alternative 2	Do nothing.	Opting to "do nothing" and retaining the existing Genesys on-premises presents unacceptable risks to both the public from a safety perspective and general business operations. Unchanged systems become more susceptible to security vulnerabilities and compatibility issues with evolving tools and 3rd party solutions in production at NWN. This not only exposes the organization to potential breaches if the infrastructure is not secure. Inaction would exacerbate vulnerabilities, potential for outages, and downtime due to lack of software support.

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: UI Planner Re-platform
Date: 5/22/23
Project Sponsor: Tobin Davilla/Jorge Moncayo
Executive Sponsor: Brody Wilson
Project Manager: SMichael Crotty
Preparer: Tobin Davilla
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	We are currently using the Utilities International (UI) legacy model for our financial planning solution. This solution will no longer be supported after this year. We need to either find a new solution or move to the new UI planner financial model.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	The existing version of NWN long range financial and regulatory tool (UI Planner) is reaching the end of life and will no longer be supported by UI at the end of 2023. The current version was implemented in 2014. To continue using this tool, it will need to be re-platformed.
Desired Deliverables What high level output / scope / deliverables are core to this project?	A financial forecasting solution that interfaces with our other existing financial systems and provides us with utility industry leading robust modeling capabilities that provides fast, accurate and complex financial, regulatory, and business development planning.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	Options were assessed by the Financial Planning and Analysis team. UI planner is our current tool used for utility and regulatory financial planning. It is the solution our utility peers use as well, and we are not aware of any other utility specific solution. The other alternative is to develop a model in Excel. Due to the above, two alternatives were discussed: 1) re-platforming UI planner from legacy model to their new system or 2) reverting back to Excel.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Ability to leverage this for future needs rather than a point solution.
Criteria: Cost-Benefit Analysis	Should a solution be built or bought.
Criteria: Timing	Ability to complete a project in time to meet a regulatory, business, product lifecycle, or safety requirement.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION: UI PLANNER *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	UI planner new solution	
In brief, why is this the recommended option?	UI planner is the utility industry leader in financial planning solutions used by most of our utility peers including PGE, PacifiCorp, Avista, Puget Sound, PG&E, and Southwest Gas to name a few. This solution performs highly complex iterative solving and allows us to work on multiple scenarios at the same time. This solution provides high confidence reports eliminating errors in the modeling. This solution also interfaces with our existing platforms such as SAP and PowerPlant.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	This solution will be a SaaS solution and the plan is for UI planner to provide SaaS managed services. This managed services contract will provide backups, disaster recovery, penetration and exception monitoring, annual upgrades, and security patches.
	Analysis Against Criteria: Cost Benefit Analysis	The new UI product comes with additional benefits not seen in the existing legacy model. Benefits include, but not limited to, faster run times of at least 10x speed which is critical as this could save significant time during peak period modeling; greater drill down transparency which is important to support regulatory data requests, and alternative financial statements which is important for GAAP forecasting. Re-platforming from legacy model to new system will enable us to continue support until new system is completed.
	Analysis Against Criteria: Timeline	This project can kick off in Q3 2023 and would be planned to be completed prior to fall 2024. By beginning the project in 2023, UI will continue to support our existing legacy model until project completion.
	Additional Risks	None that we can identify at this point
	Additional Benefits	Data integration with source systems, eliminating side excel spreadsheets, managed service supports backups, security patches, and upgrades. UI is a utility-specific company that includes best practice calculations into their models informed from peer utilities (continual improvements to reporting/calculations based on utility feedback.)

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$1.5M - $2.0M	$150K - $200K	$1.65M - $2.20M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0 - $0	$235K - $280K	
Source/ Method of Cost Data	Preliminary project pricing with Utilities International		

ALTERNATIVE 1: MICROSOFT EXCEL *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Utilize Microsoft Excel	
In brief, why is this option not recommended?	Excel does not have the functionality to run a complex model that is now necessary for more accurate financial planning. The complexity of analysis and scenarios does not make it feasible. In addition, running multiple scenarios is not possible in Excel so the planning process is greatly lengthened making it not possible to complete in timely manner. Human error is also greatly increased when performing in a non-fixed model such as excel.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	This solution doesn't meet scope requirements and agility needed by the business plus introduces a high likelihood of human error and traceability.

	Analysis Against Criteria: Cost Benefit Analysis	It would initially require a great deal of time and resources to attempt to get a model built in excel. However, it would utilize a product that we have which would require no incremental on-going maintenance costs. It could be built in-house or could be contracted to be built by a third party. Existing solutions would not be supported after this year during buildout of excel model.
	Analysis Against Criteria: Timeline	Timeline would be pressed due to the need to get a model finalized by end of 2023 since UI planner would no longer be supported.
	Additional Risks	There are many risks to building this in Excel. Not easily auditable with drill down functionality to assumptions, greater risk for human error, prone to adding quick shortcuts or workarounds & hardcoding, and version control to name a few. An extremely complex system that would need to be built from the ground up. Greater risk for human error in modeling.
	Additional Benefits	Excel is widely used so training future employees on how to use a model in excel or change logic is much easier than a specialized software solution such as UI planner.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$0	$0	$0
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0	$0	
Source/ Method of Cost Data	Assumed built in house and done by the team. No incremental cost, large time commitment.		

ALTERNATIVES CONSIDERED NOT VIABLE

Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why

	Description	**Why the Alternative is not viable**
Alternative 2	Do Nothing	Current solution will no longer be supported in 2024
Alternative 3	N/A	
Alternative 4	N/A	

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

None needed at this time.

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: IQGeo Upgrade
Date: 5/11/2023
Project Sponsor: Dina Thompson / Dan Kizer
Executive Sponsor: Jim Downing / Joe Karney
Project Manager: Joe Harrison
Preparer: Joe Harrison
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	The IQGeo version that NWN uses for field mapping of assets is currently on version 6.1.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	Our current software IQGEO 6.1 has been out of support since June 2022. While partial support continues through June 2024, this support does not include fixes for issues already addressed by subsequent updates (such as 6.5). IQGEO was initially implemented in 2020 and, consistent with other comparable software products, requires periodic upgrades to address bug fixes, product improvements, etc.
Desired Deliverables What high level output / scope / deliverables are core to this project?	• Upgrade IQGeo from version 6.1 to 6.5 • Migrate IQGeo installation from legacy Azure subscription to modern Enterprise Azure subscription • Create a software regression testing suite for IQGeo that is automated instead of manual

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	• Analysis conducted by the project team and external vendors to identify options, pros, cons, and potential risks and issues. • Project team agreed to a recommendation on implementation approach • Presented to the Steering Committee to gain approval to move forward with recommendation • Followed the Projects Governance Process for decision making.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Ability to leverage this for future needs, rather than a point solution
Criteria: Cost-Benefit Analysis	Whether a solution should be built or bought
Criteria: Timing	Ability to complete a project in time to meet a regulatory requirement

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION: UPGRADE + AZURE REPLATFORM + TEST AUTOMATION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	**Upgrade to 6.5 + Azure + Test Automation**: Upgrade IQGeo to version 6.5, and create testing automation and re-platform to new Azure cloud environment.	
In brief, why is this the recommended option?	• The decision to upgrade to version 6.5 was due to 6.5 being a supported version of IQGeo software that has all the capabilities NWN relies on to complete current workflows. • Since the IQGeo software needed to be upgraded anyway, it made sense to move it to the modern Azure cloud environment so the new installation could take advantage of new capabilities and security features present only in the new Azure environment. • IQGeo software is expected to be updated every 12 to 24 months. Since the software was going to be upgraded as part of this project, it made sense to build a suite of automated regression test tools now to support this upgrade and future upgrades.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• Reduce technical debt • Microsoft Azure subscription to comply NW Natural's security and architectural standards • Aligns with NWN GIS Roadmap
	Analysis Against Criteria: Cost Benefit Analysis	• Reduce risk associated with unsupported software for field operations • Reduces person hours and human element of testing future IQGeo software updates (every 12 – 24 mos.)
	Analysis Against Criteria: Timeline	• Upgrade of IQGeo is a necessary dependency for future projects such as ESRI UN, Network Gas Manager and Replacement of ArcFM, Visual Fusion and Mapframe (latter two are both end of life software)
	Additional Risks	• No current staff have experience configuring the IQGeo system, so there is reliance on the vendor's expertise
	Additional Benefits	• By working these three workstreams together instead of individually we can take advantage of reducing execution time and person hours by not duplicating efforts.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$500K - $1.75M	$50K - $175K	$550K - $1.9M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$50K - $150K	$0	
Source/ Method of Cost Data	Internal estimates of future project costs and vendor quotes.		

ALTERNATIVE 1: DO NOTHING *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	**Do Nothing**: Do not perform the upgrade, continue business as usual.	
In brief, why is this option not recommended?	While a grace period for support is offered by the vendor through June 2024, the software platform needs to be updated prior to that date. Given the compliance reporting requirements for field of assets it was deemed too risky to continue to run on software that is not fully supported by the vendor. IQGeo version 6.5 also provides features that will enhance NWN user experience.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• Lack of supported software introduces unnecessary risk. • Not upgrading would halt GIS Roadmap • Updated software capability from IQGEO version 6.5 wouldn't be available to the field.

	Analysis Against Criteria: Cost Benefit Analysis	• Zero spend today would likely cause increased costs later either in terms of emergent conditions leading to inability to report compliance or delay of future GIS projects.
	Analysis Against Criteria: Timeline	• Delay of future GIS projects.
	Additional Risks	• None
	Additional Benefits	• None

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$0	$0	$0
O&M Range	**Program/Project**	**Incremental Ongoing Maintenance & Support**	
	$0	$0	
Source/ Method of Cost Data	No costs incurred.		

ALTERNATIVE 2: UPGRADE ONLY *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	**Upgrade Only:** Upgrade to 6.5 only (No test automation or re-platform)	
In brief, why is this option not recommended?	Without test automation of the regression testing suite, this upgrade and future upgrades would still require significant person hours for testing phases, and without re-platforming to the new Azure subscription, IQGeo cannot benefit from the following: • Aligning with best practices. • Standardization (e.g., structure, naming convention) will normalize and simplify support. • Align with security policies • Current network access and control policies	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• Keeping software up-to-date and in a state of being supported by the vendor.
	Analysis Against Criteria: Cost Benefit Analysis	• Least costly in the short term.
	Analysis Against Criteria: Timeline	• Upgrade of IQGeo is a necessary dependency for future projects such as ESRI UN and Network Gas Manager for the Legacy Mapping Replacement project
	Additional Risks	• No current staff has experience configuring the system, so our reliance on the vendor's expertise increases.
	Additional Benefits	• None

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$400K - $1M	$40K - $100K	$440K - $1.1M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$40K - $100K	$xx - $xx	
Source/ Method of Cost Data	Internal estimates of future project costs and vendor quotes.		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*

	Description	Why the Alternative is not viable
Alternative 3	Upgrade to IQGeo 7.1	Version 7.1 not available until June 2023 and Inspection module capability required and currently used by NWN not available until June 2024. The timeline did not align with the project's desired timeline.
Alternative 4	Upgrade + Azure resubscription only	Including test automation work within the current project allows NWN to leverage existing project resources instead of a standalone project which would require incremental PMO resources to manage.
Alternative 5		

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

NW Natural
MAPFRAME REPLACEMENT ALTERNATIVES NARRATIVE

Program/Project Name: FieldSmart View (aka MapFrame) Replacement
Date: October 30, 2023
Project Sponsor: Dina Thompson / Dan Kizer
Executive Sponsor: Jim Downing / Joe Karney
Project Manager: Deirdre O'Donnell
Preparer: Shivon Van Allen, Deirdre O'Donnell
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which routes we end up taking

OBJECTIVES
Why are we tackling this project?

Current State
What is happening now? Where are we starting?

NW Natural (NWN) relies on FieldSmart View (commonly known as MapFrame) to support operations, including:

- Viewing gas facility location and asset information,
- Documenting changes to field conditions and mapping errors,
- Creating personal map notes for users to document information.

FieldSmart View does not have equivalent functionality in other parts of the NWN infrastructure. A single user may need to use FieldSmart View in addition to other mapping applications (IQGeo, Visual Fusion, Clevest, and/or ArcFM Viewer) in order to complete their work.

Fieldsmart View is one of five field and web mapping applications that NWN uses today. The applications, statuses, uses, and users are outlined below.

Application/Tool	Status	Uses	Users
Fieldsmart View (MapFrame)	End of Life	General map viewer, map correction creation	Field and back office
ArcFM Viewer	Near End of Life (2028)	Tracing cathodic protection network, limited feature editing	Corrosion Team
Visual Fusion	End of Life	Custom maps for different business groups, critical functionality is the valve isolation tracing map for emergency response	Back office, including Gas Control that relies on valve isolation tracing
Clevest	Implemented in 2022	Limited view of asset information, crew and work locations	Primarily used by field users and RMC
IQGeo	Implemented in 2020	Viewing GIS and SAP assets, completing surveys, reporting leaks, creating as-builts. Intended to be the application to replace FieldSmart View for field users.	Field and back office

Notably, the mapping data displayed in the above applications is created and maintained in Esri's ArcGIS Desktop Suite, specifically in the ArcMap application. Esri's ArcMap is the application where edits are made daily to GIS data based on as-builts and other changes

	made in the field. After the GIS data is edited in Esri, the mapping data can be viewed by the field and back-office users in the integrated application listed above, allowing employees and contractors to perform their work. Like FieldSmart View, Visual Fusion and ArcFM Viewer are at or near end-of-life, meaning that NWN will need to find replacement solutions for these tools in the future.
Problem Statement In simple terms, what are we trying to solve? What is the business need to tackle this? Why is this a problem worth solving (e.g., why is the current state not working)?	FieldSmart View is an old application that increases risk within NW Natural from a support & stability level and blocks other NWN IT&S modernization efforts (such as the Esri Utility Network migration, described below). • FieldSmart View is an end-of-life application, meaning the application no longer receives security updates or defect fixes from the software provider. The last S/W update from GE vendor was Oct 15 of 2015. No new enhancements or support for new operating systems are offered. This creates risk of service interruption and possible breakage for end users who rely on this application. It also creates additional workloads for NW Natural resources to maintain this application in its end-of-life state. • FieldSmart View cannot support data schema changes, reducing its ability to provide a complete look at NWN's assets. MapFrame backend processing uses an SDE service that reads the ESRI data but the service in not compatible with later versions of ESRI. • NWN's GIS data is migrating to a new data model (from Esri's Geometric Network (GN) to Esri's Utility Network (UN)). This migration is necessary because the tool NWN uses today for editing and analyzing GIS data (ArcMap) is near end of life, and the new tool we will migrate to (ArcGIS Pro) does not support our current data model (GN). ArcMap reaches end of life in 2028, meaning at that point Esri will not provide support, patching, or critical fixes. Therefore, by March 2028, NWN needs to transform our GIS data to the UN and switch to managing our GIS data in ArcGIS Pro. Because Fieldsmart View cannot support data schema changes, the application will not be able to display GIS data post-UN migration. Transitioning away from FieldSmart View is a dependency for the UN project.
Desired Deliverables What high level output / scope / deliverables are core to this project?	• Provide functionality equivalent or superior to FieldSmart View on a robust, fully supported platform. • Reduce the number of mapping applications necessary for the field to complete work. Enable most field users to have a single mobile device (iPad) to complete map-related work.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	• IQGeo was selected by NWN in 2018 as the product to replace FieldSmart View, Visual Fusion, and ArcFM Viewer. NWN began the work to replace these applications with IQGeo solutions in 2019 with some use cases being transitioned from these applications to IQGeo, including a general map viewing application, survey and inspection functionality, and integration with the asset management system. The work to transition the remaining use cases was put on hold to accommodate a higher priority project, Horizon1. • The MapFrame Replacement project's goal is to replace remaining like-for-like functionality in FieldSmart View with functionality in IQGeo. • Analysis conducted by the project team and vendors (TGG and IQGeo) identified options, pros, cons, and potential risks and issues associated with this project.
DECISION CRITERIA *Provide like for like functionality in IQGeo that is available in FieldSmart View today.*	

Criteria: Alignment to NW Natural's IT Strategy	• Ability to leverage IQGeo for future needs, rather than a point-in-time (i.e. temporary) solution • Solution provides end users with a single mapping solution available on one device (either mobile or laptop/PC)
Criteria: Cost-Benefit Analysis	• Whether a solution should be built or bought • Level of customization needed to provide and maintain essential functionality
Criteria: Timing	• Provide mapping solution before end of life of ArcMap and mandatory migration to Esri's Utility Network
Criteria: Product Familiarity	• The mapping tool will be used throughout the organization by field users and back officer personnel, on iPads and on laptops or desktops. Training and adoption considerations should be evaluated for mapping solution selected, including ease of use, level of support needed, and amount of training required.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description (Full scope of project)	Transfer key FieldSmart View functionality into IQGeo, including creation of map corrections, CIS integration to view customer information, location widget to display locational information, main design palette for designing work, a "lite" asset map viewer for contractors, ability for users to generate personal notes, and ability to print maps from mobile devices.	
In brief, why is this option recommended?	This option ensures business continuity and removes the risk of NWN critical operations running on an end-of-life platform. It allows NWN to expand platform functionality that will help technical growth in the future. This option aligns with NWN's geospatial strategy to work towards a single, consolidated field and web mapping application for end users and provide field users with a more streamlined method for their mapping needs. It also allows the Esri UN migration to continue uninterrupted.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• The operational and security risk of running an unsupported application and infrastructure will be remediated. • This work is a prerequisite for a critical platform upgrade of our Esri GIS solutions. • IQGeo added functionality will be available to the field and back-office users and allow IT&S to replace field laptops with mobile devices since many field users' work could be completed on an iPad. • Replacing FieldSmart View with IQGeo will reduce the organization's risk profile by eliminating one of the old, depreciated mapping applications in the portfolio without adding to the number of supported applications. Providing FieldSmart View-like functionalities in IQGeo will allow the majority of field users a more streamlined method for their mapping needs within a single application.
	Analysis Against Criteria: Cost-Benefit Analysis	• Zero spend today would likely cause increased costs later in terms of emergent conditions leading to inability to report compliance or delay of future GIS projects. • This approach allows us to transfer one of NW Natural's mapping applications, meaning slightly lower licensing costs since this application will no longer be needed.
	Analysis Against Criteria: Timing	• Delay of future projects, namely the Esri UN Migration. Completing the UN migration is dependent on transitioning away from FieldSmart View. • All projects with a geospatial impact at NWN share critical resources, so planning and early execution tasks will compete for NWN and vendor resources.
	Criteria: Product Familiarity	• IQGeo is available to all NWN employees today. Even if a team was not part of the Horizon 1, IQGeo rollout, teams have been exploring and using IQGeo for the past year.

		• Field users are already familiar with IQGeo and perform some of their work there today (the iPad and Windows application). • Training will include some users that are new to IQGeo, but for users already using IQGeo, training will consist of new functionality, not core product use.
	Additional Risks	• Enabling NWN's desired functionality in IQGeo will require custom development, which IT&S prefers to avoid as it adds risk and complexity over the lifespan of the application.
	Additional Benefits	• The Esri UN Migration continue planning activities with the best information and earliest timeframe known. Once FieldSmart functionality has been transferred to IQGeo, The Esri UN Migration can advance to critical execute steps • Business continuity ensured for this application

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$3.4M - $3.6M	$342k - $364k	$3.8M - $4M
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$113k - $125k		$60k for 2024 2023-2025 Total = $266k
Source/ Method of Cost Data	Capital range was estimated using a 10% accuracy for Assess Phase. So, range shows 90% to 110% Costs were created using a planned resource sheet with utilization expectations and team member expertise and estimates on two vendor costs (I.e., IQGeo and TGG). • Hardware: 20k estimation • Software: ○ Fieldsmart (GE) - $60K/year (w. estimate of 3% annual increase) ○ No additional IQGeo licensing costs expected due to already existing enterprise license that covers all employees and contractors ○ 2024 Total = $89k ○ 2025 Total = $91k ○ 2023-2025 Total = $266k Capital range based on a previous IT&S consolidated view with multiple applications. Therefore, capital range above weights FieldSmart migration as 45% of overall capital range.		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Do nothing and leave the current legacy applications in place.	
In brief, why is this option not recommended?	• NWN would continue to use multiple mapping applications on multiple devices. • FieldSmart View would continue to be at end of life and present significant risk. • Work on other projects, like the Esri UN Migration, would be significantly impacted, if not halted.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• This alternative would not allow NWN to move away from an application that is end of life. FieldSmart View cannot support data schema changes, reducing its ability to provide a complete look at NWN's assets. • Continuing to use this application places a burden on the NWN IT&S Application and GIS teams to maintain. • The Esri UN Migration would keep the legacy applications as dependencies. Technical debt would be incurred to ensure Esri migration incorporates the applications. This technical debt would incur

		cost at the time of implementation as well as create complexity & additional cost when Esri UN Migration expands. It would limit future projects ability to tap into NWN budgets and resource utilization • Additional functionality would not be available in IQGeo for field users.
	Analysis Against Criteria: Cost-Benefit Analysis	• By not transitioning away from FieldSmart View, NWN would continue the maintenance spend today and will still need to replace this application in the future. The project costs will be pushed into the future, since ultimately a solution is needed to replace FieldSmart View. • Esri UN Migration costs would increase tech debt by requiring development of additional, complex integrations and workarounds to enable the legacy applications to consume UN data, if that is even possible.
	Analysis Against Criteria: Timing	• Delay of future GIS projects, namely the Esri UN Migration. • Introduce increased complexity to the Esri UN Migration project in order to retool integrations to UN data.
	Additional Risks	• NWN has only one or two resources that have experience in FieldSmart View configuration. This provides a potential point of failure for NWN. • There is not adequate redundancy across field and web mapping applications, so if additional functionality is not added to IQGeo and an issue causes FieldSmart View to be unavailable, the organization would risk being unable to perform certain tasks, such as reporting mapping errors via Plat Corrections.
	Additional Benefits	• Change management not needed.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	NA	NA	NA
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$30k	$266k	
Source/ Method of Cost Data	• Hardware: 20k estimation (unknown currently) • Software: ○ Fieldsmart (GE) - $60K/year (w. estimate of 3% annual increase) ○ No additional IQGeo licensing costs expected due to already existing enterprise license that covers all employees and contractors ○ 2024 Total = $89k ○ 2025 Total = $91k 2023-2025 Total = $266k		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Implement an alternative mapping solution, like Esri's ArcGIS Field Maps, to replace FieldSmart View. Field Maps is a mobile application for viewing data, data capture and editing, and locating assets and information.	
In brief, why is this option not recommended?	The Esri UN Migration project is dependent on moving away from FieldSmart View before NWN can migrate to the UN. Implementing a new mapping solution could take longer and be more expensive than continuing to develop IQGeo. A new application would require additional planning and significant change management and training for NWN employees. These efforts would impact Esri UN Migration timeline as well as introduce a new (fifth) mapping solution for end users further complicating their ability to complete work.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• Field users would need to leverage two different mapping solutions (IQGeo and Field Maps) in the field which may increase confusion and increase training costs. • Would not be able to implement the Esri UN work before the FieldSmart View has been migrated

		• Technical/business overview and maintenance until Esri launch would need to support FieldSmart, an aging application, which would drain resource utilization. Any work done before the Esri UN launch would incur tech debt.
	Analysis Against Criteria: Cost-Benefit Analysis	• Increased licensing costs to enable Esri Field Maps for named users to access applications. • Increased costs later to maintain an additional field and web mapping application. • UN Migration costs would expand due to including an additional application to integrate. • Changes would require engaging with new external contractor support. This would add additional time and money to the project to get a new implementation vendor up to speed on NWN infrastructure and business.
	Analysis Against Criteria: Timing	• Delay of future GIS projects. • Potential delay of UN Migration. • Additional time spent to select application and vendor and to integrate and configure.
	Additional Risks	• Introduce another field mapping application, creating an additional application for IT&S to support and increased confusion and complexity for end users
	Additional Benefits	• Significant training and change management needed for end users

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.6M - $6.9M	$260k-$693k	$2.9M - $7.6M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$86k - $230k	$89k for 2024 2023-2025 Total = $266k	
Source/ Method of Cost Data	Take the recommended costs and then increase by 20%. Reasoning includes the fact that this would be a new system, new integration paths Ongoing maintenance unchanged		

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Clevest Optimization & Stabilization
Date: 11/16/2023
Project Sponsor: Dina Thompson / Jaime Ulestad / Dan Kizer/Cari Colton/Jim Hart
Executive Sponsor: Jim Downing / Joe Karney / Dave Weber
Project Manager: Graham Hulbert
Preparer: Jennifer Chiaratti
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking.

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Clevest is the new mobile workforce management software used by NWN to schedule, dispatch, and complete all work in the field (from emergency and compliance to routine). This platform is also used to support plant and fleet maintenance and compliance work. Clevest was deployed and became NWN's mobile workforce management tool in 2022. Following deployment of Clevest and as the product was being used, NWN identified certain issues with the product's performance requiring additional follow-up work and refinement. Based on a prior Alternatives Analysis, NWN concluded that essential product stabilization efforts were required, and that further analysis was necessary to determine whether and how to pursue further platform optimizations. As a result, NWN determined to: • Develop a clear road map of possible improvements to further optimize the Clevest product. • Develop a prioritized list of recommendations and a plan to standardize, simplify, and optimize work order related screens and workflows in NWN mobile work management system to improve field efficiency and effectiveness. NWN has recently completed an additional step in this analysis and must now decide whether, and to what extent, to pursue the prioritized list of recommendations.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	Prior to Clevest's deployment, some features were initially deprioritized but, following deployment and in the course of product use, were found to be critical. In the absence of these refinements and additional functionalities, NWN has been relying on inefficient workarounds that need to be ameliorated.
Desired Deliverables What high level output / scope / deliverables are core to this project?	Ensure that NWN's work management software interface can properly manage demands on employee time and ensure clear and user-friendly functionality, while meeting all relevant business and performance needs.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated.	• Conducted analysis with the project team and external vendors to identify options, pros, cons, and potential risks and issues. Team included: NW Natural field users, Enterprise Asset Management team (EAM), Information Technology and Services team (IT&S), and software vendor IFS, which owns the Clevest Platform

If some criteria were considered more important based on the type of project, please explain here.	• Project team and Project Sponsors agreed to a recommendation on implementation approach • Reviewed with Executive Sponsors to gain approval to move forward with recommendation • Reviewed with IT&S Alignment Team
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Ability to leverage this for future needs rather than a point solution.
Criteria: Cost-Benefit Analysis	Near-term and long-term costs compared to functional benefits for system users.
Criteria: Timing	Ability to complete the project in time to meet a regulatory, business, product lifecycle, or safety requirement.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION: Partial Optimization + High Priority Items *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	During the review process, identified areas of improvement were compartmentalized based on degrees of urgency, into distinct buckets: (1) mission-critical, (2) high priority, (3) medium/low priority. Mission-critical items address functionalities that drive essential aspects of NW Natural's successful provision of service to our customers, and the lack of which may drive negative financial consequences, increased operational or safety risk, or significant customer dissatisfaction. For example, one functional improvement in the "mission-critical" scope addresses "Future Date Assignments," which allows the system to effectively assign fieldwork out into the future. Currently, the Clevest system's functionality for future date assignments works inconsistently, meaning that, each morning, work assignments need to be manually reviewed to ensure that pre-work has been correctly assigned. By optimizing this functionality, we can ensure proper distribution of work among our field resources and better guarantee that we can make our scheduling commitments with our customers. As an additional example, there is no way to alert a scheduler or a fieldworker that there are multiple work requests at the same premise/location. This results in multiple visits from field techs and unsatisfied and confused customers. Thus, optimizing the workforce management software to allow for visibility into all fieldwork by location will enable better allocation of staff time and increase customer satisfaction. High priority items maximize functional impacts of the software and the overall utility of the investment. A simple example of a high priority item is to enable direct dialing functionality to a field resource assigned to a work order when monitoring work from the resource center. While individual phone numbers are visible in Clevest, they are not directly actionable and cannot be copied. A simple improvement would present the number as a hyperlink and allow a supporting back-office resource to trigger an outbound call with a simple click. The ability to quickly contact field crews enables safer operations and higher customer satisfaction. For field workers, most high priority items represent changes required to ensure that they have visibility to all information needed to perform work effectively and safely as well as the means to efficiently close out work. As an example, construction workers today are presented with a very long dropdown list in which they must choose the pipe size representative of what they have put into the ground. This list is not presented in any logical order which requires inefficient scrolling to select the applicable value. The high priority item that would remediate this inefficiency would be to simply present the pipe size in a logical order and allow supplemental type-ahead type of functionality to quickly bubble up the desired value. This is a low investment change that

	in aggregate will result in more accurate records and allow construction crews to spend more time serving our customers and less time inefficiently interacting with a form. The Partial Optimization + High Priority items option addresses both above buckets of mission-critical and high-priority items but does not include medium/low-priority items.	
In brief, why is this the recommended option?	This option allows NWN to not only remove the majority of significant workarounds in place due to system constraints, but also to optimize Clevest's performance, and thus to improve field efficiency by simplifying and standardizing completion of work steps in the system across various work order types. By expeditiously optimizing the Clevest software, the Company can ensure that the tool continues to provide the best value for the Company and its customers.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• By resolving technical issues with the in-use program, this approach reduces technical debt. • By executing a long-term plan for Clevest optimizations, the Company can clearly and deliberately plan for optimal efficiency rather than having to fix additional technical inefficiencies in a reactive manner in the future.
	Analysis Against Criteria: Cost Benefit Analysis	• A cohesive approach to address these constraints holistically is more cost effective and will result in better adoption than addressing each constraint individually. • Executing a prioritized plan for optimization ensures the cost-effective allocation of resources for maximum user benefit.
	Analysis Against Criteria: Timeline	• Targeting high-priority fixes and key functionalities for mission-critical items enables rapid improvements to product performance, while allowing for successful and efficient implementation of the high priority optimizations. • Limiting scope to high-priority items allows immediate implementation of key features, while also allowing team to reevaluate possible additional features after future Clevest product upgrades are implemented.
	Additional Risks	• Implementing optimizations/enhancements may identify interactions with previously pursued fixes, which would then need to be reconciled.
	Additional Benefits	• Significantly improves user experience. • Stabilizes the performance of the Clevest product. • Ensures that the platform will maintain functionality through future architecture enhancements.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$6.5M - $7.5M (Stabilization + Optimization)	$650k - $750k (Stabilization + Optimization)	$7.15M - $8.25M (Stabilization + Optimization)
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$300k - $310k (Stabilization + Optimization)		N/A
Source/ Method of Cost Data	Internal and external estimates of project costs.		

<table>
<tr><th colspan="4">ALTERNATIVE 1: Nothing above Stabilization

</table>

ALTERNATIVE 2: Partial Optimization *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	• Develop mission critical optimizations to address most essential user deficiencies. • Deliver "mission-critical" optimization items, described above, but not the "high priority" items. • Develop and deliver training required for any changes to processes.	
In brief, why is this option not recommended?	• Partial optimization will not address important issues identified by system users, while costing roughly the same amount as full optimization. • It does not position the platform for future evolution with expanding/changing system architecture. • The incremental costs of including high priority items in the project are marginal compared to this partially optimized solution. This would not be an efficient way to invest in the platform.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• Failing to implement needed improvements increases technical debt. • Will result in responding reactively to unaddressed concerns while declining to proactively plan for optimal performance. This does not align with NWN's IT strategy.
	Analysis Against Criteria: Cost Benefit Analysis	• Foregoing executing a full road map to maximize Clevest's efficacy and efficiency is slightly less costly in the short term but ignores possible significant functionality improvements that also leverage the existing Clevest investment. • Enables continued essential use of the platform, but without allowing for thoughtful long-term planning.
	Analysis Against Criteria: Timeline	• Delays full implementation of process optimization to realize more effective use of employee time.
	Additional Risks	• End user experience impacted by continuing to tweak or adjust existing processes that are not efficient. • Process complexities may still exist with workarounds.
	Additional Benefits	None

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$6.0M - $7.0M (Stabilization + Optimization)	$600k - $700k (Stabilization + Optimization)	$6.6M - $7.4M (Stabilization + Optimization)
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$300k - $310k (Stabilization + Optimization)		N/A
Source/ Method of Cost Data	Internal and external estimates of project costs.		

ALTERNATIVE 3: Full Optimization *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	• Develop and deliver full optimization to address all user deficiencies, including mission-critical, high-priority, and medium/low priority. • Develop and deliver training required for any changes to processes.	
In brief, why is this option not recommended?	• Options identified were dependent on service pack (i.e., minor product upgrades) and/or major upgrades that would create a longer delay, additional technology support, and further training to be developed and delivered. • Limits the ability to continue the progress of other enhancements and defect resolutions when a service pack and/or upgrade is in process.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• By resolving technical issues with the in-use program, this approach would reduce technical debt. • Medium/low-priority items require additional upgrades to Clevest software in order to enable implementation; these upgrades are not yet available.
	Analysis Against Criteria: Cost Benefit Analysis	• Highest cost of all alternatives
	Analysis Against Criteria: Timeline	• Extended timeline to deliver the improvements to product performance • Dependent on vendor product improvements for when their product upgrades will be released
	Additional Risks	• Implementing optimizations/enhancements may identify interactions with previously pursued fixes, which would then need to be reconciled. • Introduces upgrade-related risk for known mission-critical and high-priority fixes
	Additional Benefits	• Significantly improves user experience. • Stabilizes the performance of the Clevest product. Ensures that the platform will maintain functionality through future architecture enhancements.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$7.5M - $8.5M (Stabilization + Optimization)	$750k - $850k (Stabilization + Optimization)	$8.25M - $9.35M (Stabilization + Optimization)
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$300k - $320k (Stabilization + Optimization)		N/A
Source/ Method of Cost Data	Internal and external estimates of project costs.		

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Do Nothing	As deployed, the new Clevest work management system encountered significant challenges for users, necessitating multiple manual workarounds and other unacceptable inefficiencies. Based on user feedback, failing to perform basic product stabilization work is not viable.
Alternative 4	Implement an alternative mobile workforce management system and vendor to replace Clevest.	• Implementing a fully new alternative is not cost effective as any new product would require the full design, development, and deployment process that Clevest required. • Implementing a new product option would take multiple years to complete, while stabilization of the current product remains necessary. • Current offerings on the market for systems that support these functions are limited, and any such alternative solution could face similar constraints. • As designed, Clevest remains a useable and useful product and retains the potential to substantially improve user experience over the previous P-CAD tool.
Alternative 5	Revert to P-CAD tool.	Reverting to the previous P-CAD tool is not possible as that tool was already end-of-life when NWN transitioned to Clevest. While P-CAD offers a new workforce management system, this would entail the same issues as Alternative 4.

**Add rows for any additional alternatives considered not viable*

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Identity Governance and Administration
Date:
Project Sponsor: Matthew Carlson
Executive Sponsor: Jim Downing
Project Manager: Keaton Beyer
Preparer:
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Northwest Natural (NWN) does not have an Identity Governance Administration (IGA) tool. Currently, employee access is controlled in various systems with manual processes and no centralized control point.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	When an employee or contractor is offboarded from NWN, there is no way to certify their access has been completely removed from all systems because there is no centralized controller. The Sarbanes-Oxley Act (SOX) requires consistent, reliable removal of access permissions for offboarded employees as part of ensuring that unauthorized individuals cannot access sensitive financial information. Unfortunately, even with efforts to optimize and enhance NWN's manual processes, this manual method has been unable to sustain consistent compliance due to the scale and complexity of NWN's systems. As a result, NWN needs to implement an automated identity and access management tool and associated processes to control onboarding and offboarding.
Desired Deliverables What high level output / scope / deliverables are core to this project?	Installation of an IGA tool along with associated processes and integration with core systems.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	NWN hired Integral Partners, a company specializing in identity solution architecture and installation, who worked with NWN to gather requirements for an IGA tool, and then used these requirements to score potential IGA tools based on best fit for NWN. The main functional categories on which tools were evaluated are: • User Provisioning • Role-based Access Control (RBAC) • Access Request and Approval • Access Certification • Identity Analytics • Password Management • Segregation of Duties (SoD) • Reporting and Audit Trail • Compliance Management • Third-party Integrations with Leading Toolsets • Workflow Automation

	These are industry standard functions of an IGA tool which were scored based on the tools ability to meet NWN's 160 prioritized requirements and 26 use cases. This analysis yielded three strong contenders, which were then evaluated based on relative cost. The project team then evaluated the analysis and recommended the tool which best fit NWN's needs.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Comprehensive features and functionality paired with scalability, flexibility, user-friendly interface, integration capabilities, security and compliance, and vendor support.
Criteria: Cost-Benefit Analysis	Should a solution be built or bought and which bought solution is the most cost effective while still achieving the project's goal.
Criteria: Timing	Ability to complete a project in time to meet a regulatory, business, product lifecycle, or safety requirement.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	SailPoint IdentityNow (IDN)	
In brief, why is this the recommended option?	**SailPoint IdentityNow** best aligns with Northwest Natural's needs for a comprehensive, scalable, user-friendly, and secure IGA solution. SailPoint IdentityNow offers a robust feature set, scalability, usability, integration capabilities, security, and cost-effectiveness. This tool also has a strong vendor reputation and industry recognition, as supported by evidence from vendor documentation, case studies, and references.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	SailPoint IdentityNow is an easy to maintain system due to its configurability and user friendliness. It is a Solution as a Service (SaaS) meaning it is cloud hosted with yearly licenses rather than a bought solution, which is consistent with NWN's broader move towards implementing cloud-based, hosted tools.
	Analysis Against Criteria: Cost Benefit Analysis	SailPoint is the industry leader and one of the strongest offerings in this space. While SailPoint's subscription costs are somewhat higher than the other options considered, it presents the least-cost long-term solution because it requires less in-house customization and has demonstrated integration with other major tools, thus requiring less implementation cost and less ongoing maintenance.
	Analysis Against Criteria: Timeline	SailPoint IDN is highly configurable, meaning it does not require much custom coding to implement. This makes it one of the fastest tools to implement, though some change processes to replace existing manual processes and accommodate the tool will be required.
	Additional Risks	SailPoint IDN will require NWN to change their processes which means this project will have to consider the people change aspect of the implementation.
	Additional Benefits	• Comprehensive Features and Functionality: ○ **Rationale**: SailPoint IdentityNow presents a robust suite of Identity Governance and Administration (IGA) functionalities, catering to the specific needs of energy companies. This includes comprehensive identity lifecycle management, streamlined access request and certification processes, efficient role management, and advanced analytics. These features are strategically aligned with Northwest

		Natural's objective of fortifying identity governance within the energy sector, where security and regulatory compliance are paramount. ○ **Evidence**: Extensive review of vendor documentation and live product demonstrations demonstrate the tool's extensive array of capabilities. These features are well-suited to address the intricate identity management requirements of Northwest Natural, ensuring a seamless and secure user access experience while facilitating compliance with regulations and security standards. • <u>Scalability and Flexibility:</u> ○ **Rationale**: SailPoint IdentityNow offers flexibility to meet the needs of a large energy company and adapt to evolving needs, without compromising on the security-related benchmarks and requirements needed to ensure appropriate identity and governance protections. ○ **Evidence**: Examining case studies and seeking references from companies with similar needs that have successfully implemented SailPoint IdentityNow at scale provides concrete evidence of its capacity to adapt and expand, making it a well-suited solution for Northwest Natural's evolving and diverse user landscape. • <u>User-Friendly Interface:</u> ○ **Rationale**: Usability is a key factor, especially where administrators and managers interact with the system. An intuitive and user-friendly interface can streamline operations, reducing time spent on administration. ○ **Evidence**: User feedback or usability studies conducted by the vendor have provided evidence of "SailPoint IdentityNow's" user-friendliness. • <u>Integration Capabilities:</u> ○ **Rationale:** Seamless integration with existing systems and applications is essential for efficient identity management. SailPoint IdentityNow offers connectors and APIs that facilitate integration with various platforms, including HR systems, Active Directory, and cloud applications. ○ **Evidence:** Vendor-provided documentation on the availability and ease of use of integration connectors and APIs demonstrate its integration capabilities. • <u>Security and Compliance:</u> ○ **Rationale**: Security and compliance take precedence within the energy sector due to its critical infrastructure and regulatory framework. For Northwest Natural, safeguarding identity data is of utmost importance because identities have become a key target for nation states and criminals. SailPoint IdentityNow is adept at fortifying security, providing stringent controls, comprehensive audit trails, and robust compliance reporting mechanisms. These features are tailor-made to protect sensitive identity information and to ensure that Northwest Natural remains fully compliant with applicable regulations. ○ **Evidence**: The credibility of SailPoint IdentityNow in meeting the security and compliance needs of energy companies is substantiated through vendor whitepapers, detailed security documentation, and a host of recognized compliance certifications such as SOC 2 and ISO 27001. These certifications and documents underscore the tool's ability to uphold security and regulatory requirements. • <u>Vendor Reputation and Support:</u>

		○ **Rationale**: The reputation of the vendor and the quality of their support services are critical factors in ensuring a successful implementation and long-term partnership. ○ **Evidence**: References and testimonials from other organizations that have had positive experiences with SailPoint IdentityNow and its vendor can attest to its reliability and support quality. • <u>Industry Recognition:</u> ○ **Rationale**: Recognition and awards within the IAM industry can indicate the excellence of a particular IGA toolset. Awards and acknowledgments from reputable organizations or analysts can provide validation of its capabilities. ○ **Evidence**: Reports and assessments from industry analysts like Gartner, Forrester, or KuppingerCole recognize SailPoint IdentityNow as a leader in the IGA market.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$3,100,000 - $3,400,000	$310,000 - $340,000	$3,100,000- $3,400,000
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$250,000 - $275,000		$250,000 - $315,000
Source/ Method of Cost Data	Integral Partners. Sailpoint IDN licenses are $250,000 per year with the installation cost being the base, $400,000 for their work and the remaining $2,450,000 for internal labor. We can capitalize the first year of licenses as part of the total capital range. Ongoing maintenance and support figures are for licenses only. The system support will be done by existing FTE and therefore is not incremental.		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	SailPoint IdentityIQ (IIQ)	
In brief, why is this option not recommended?	SailPoint IIQ is SailPoint's on-premises IGA tool. It is highly customizable meaning it will accommodate NWN's processes. However, the extent of this tool's flexibility is the reason why it is not recommended. Highly custom systems take more time, money, and expertise to maintain, which increase the likelihood for bugs and downtime. Additionally, an overly customized system will allow automation of inefficient or relatively insecure processes, perpetuating existing problems rather than fixing the root cause.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	SailPoint is not investing as heavily into IIQ as they attempt to transition their customers to IDN, their SaaS cloud offering. This means it is lacking the robust features and functions of IDN which are required by NWN, causing IIQ to score lower in the analysis.
	Analysis Against Criteria: Cost Benefit Analysis	Similar up-front cost to the cloud offering recommended option, but with higher implementation and support costs including additional charges for upgrades estimated at $10,000 per custom module per upgrade.
	Analysis Against Criteria: Timeline	Increased customization means a longer implementation schedule.
	Additional Risks	
	Additional Benefits	

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$3,615,000 – $3,960,000	$361,500 - $396,000	$3,615,000 – $3,960,000
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$315,000 - $345,000		$325,000 - $410,000
Source/ Method of Cost Data	Integral Partners. SailPoint IIQ licenses are $300,000 per year plus 25% higher in effort than SailPoint IdentityNow to maintain per year due to maintaining customized processes and on prem upgrades.		

	Ongoing Maintenance and Support includes licenses and estimated yearly upgrade costs for on-premises software.

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	[redacted]	
In brief, why is this option not recommended?	[redacted] is an alternate software vendor that provides a similar tool, but with fewer established connections and integrations with third-party applications, which NWN will need to implement the tool in the broader IT&S environment. Ultimately, these shortcomings would make [redacted] more expensive to implement and maintain.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	[redacted] is in the top three recommended tools for NWN. It could work well for NWN but the issue is supportability and ease of maintenance which will result in higher near-term implementation and higher long-term upkeep costs.
	Analysis Against Criteria: Cost Benefit Analysis	[redacted] is customizable, but with customization comes maintenance cost. The tool will be harder to maintain requiring a larger team and higher operating expense.
	Analysis Against Criteria: Timeline	The implementation timeline for [redacted] is expected to be 20% longer due to higher customization required.
	Additional Risks	
	Additional Benefits	[redacted] does have all the necessary capabilities and is highly customizable which are two of its main benefits.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$3,800,000 - $4,175,000	$380,000 - $417,500	$3,800,000 - $4,175,000
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$315,000 - $345,000		$250,000 - $315,000
Source/ Method of Cost Data	Integral Partners. [redacted] licenses are $225,000 per year plus 15% higher in effort than SailPoint IdentityNow to maintain per year due to customized processes. Ongoing Maintenance and Support includes licenses and estimated yearly upgrade costs for on-premises software.		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	**One Identity**	Minimally met criteria and would require higher effort to implement and maintain with tool costs being similar to other options.
Alternative 4	**Omada**	Difficult maintainability and scalability. Omada has a low USA presence and is mainly in the EU posing potential support issues.
Alternative 5	**Microsoft**	Missing access certifications and Segregation of duties capabilities.
Alternative 6	**Do Nothing**	Does not meet the basis for the project to remediate SOX compliance issues or security needs.

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Web Portals: Start, Stop, Transfer
Date: 10.30.2023
Project Sponsor: Cory Beck
Executive Sponsor: Kim Rush
Project Manager: Carolyn Jane Campbell
Preparer: Carolyn Jane Campbell
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking.

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	The Customer Lifecycle Management (CLM) Team has initiated the Web Portals Start, Stop, Transfer project to improve the start, stop, and transfer service functionality on the current NW Natural website for residential customers. • All residential customers start or stop service during their relationship with NW Natural. • Start, stop, and transfer service requests are among the top reasons for inbound calls to the Customer Contact Center (CCC) and was the top reason for calls to the CCC in 2022. Higher call volume can, in turn, lead to long wait times. • In 2022, approximately 140,000 customers attempted to use start, stop, or transfer service forms online. Only 28% of those forms were completed, leaving approximately 100,000 customers that did not complete the online form. • Over 7,000 customers renting properties were unable to use start service forms online due to their landlord's agreement with NW Natural. These agreements are not visible to tenants and limits their ability to self-serve through the website.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g., why is the current state not working)?	The CLM Team has identified issues with the existing start, stop, and transfer service functionality that have contributed to customer dissatisfaction and inability to complete these processes online: • Customers do not receive their account number, or status of their request through the website portal, and therefore, are unable to immediately access their account details via self-service portals upon completing their start service request. • Customers are calling the CCC to receive assistance with their service due to a lack of available account information online. • Customers are unable to successfully start, or transfer their gas service and/or account online at their convenience because of inadequate features on the current NW Natural website. • Customers often find themselves in the wrong online form because the current website lacks explicit instructions, clear indicators of required form fields, and what required information is used for.
Desired Deliverables What high level output / scope / deliverables are core to this project?	The ability to support the customer journey through start, stop, and transfer service on the NW Natural website and updated integration with Customer Information System (CIS). These are the highest priority web portals improvements due to the high volume of customers that utilize this service monthly.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	Project criteria were reviewed based on providing the greatest benefit to residential customers wanting to self-serve online through the NWN website. Through direct customer surveys and interviews the team gathered customer data and insights to understand why customers do not use the self-service portal to the current interface's full extent. Simultaneously, NW Natural Customer Service Agents of varying tenure were interviewed. These interviews identified the most impactful features that would improve the existing online start, stop, and transfer user experience.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Customer Experience	The quality of the customer experience is the leading criterion used to identify the recommended option. The recommended option must include updates to existing processes and functionality, aimed at improving the customer experience both online and when contacting the CCC.
Criteria: New Features	New features must be associated with existing Start, Stop, and Transfer forms on the NW Natural website. New features must allow customers to reduce their need to call the CCC and self-serve through the online portal.
Criteria: Feasibility	The likelihood of this project being accomplished within a project timeline, maintains project scope, and accounts for the constraint on NW Natural resources. Since this project will rely heavily on CIS resources, the feasibility of this project must account for the availability of these resources.

SECTION 3: ALTERNATIVES DETAIL

<table>
<tr><th colspan="4">RECOMMENDED OPTION
Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A</th></tr>
<tr><td>Description</td><td colspan="3">Implement Start, Stop, Transfer website functionality, with partial CIS integration, including:

• Develop, implement, and test a new user-friendly web-based service management tool, including simplified road map, easy navigation, evident indicators of required form fields using accessible color coding, and text changes for to create clarity around required information.
• Digitally match customers to their current account and provide existing customer account validation and immediately provide customers with their account number start service requests.
• Modernize the address entry field to be a single line with assisted entry to reduce customer input errors.
• Upgrade the landing page with FAQs and new features to help customers determine what form to complete.
• Incorporate increased accessibility for additional information “Question Mark” features to add understanding to specific form field and the reason why they are required.
• Reduce limitations for access to self-service features, including removing the limitation for residential customers renting properties.</td></tr>
<tr><td>In brief, why is this the recommended option?</td><td colspan="3">Executing on the desired deliverables will provide customers with their account information immediately upon their start service request, expedite customer’s service orders, and reduce customer’s need to call the CCC for assistance on their start, stop, or transfer service request.

In addition, the recommended option includes essential integration with CIS providing internal system process upgrades to better manage eligible start, stop, and transfer service requests.

With better self-service options and focusing on direct customer requests, the recommended option will streamline processes that impact all residential customers in a meaningful way.</td></tr>
<tr><td rowspan="5">Assessment</td><td>Analysis Against Criteria: Customer Experience</td><td colspan="2">Incorporating additional functionality on the NW Natural website enhances how customers can proactively use self-service options to complete start, stop, and transfer service tasks via the online portal. When customers can self-serve, they are able to complete tasks at a time that is most convenient for them (e.g., in the evening when the CCC may not be available) and lessens their need to call the CCC for assistance. Fewer calls to the CCC reduces customer wait times when engaging with Customer Service Representants (CSR) and increases customer satisfaction with NW Natural.</td></tr>
<tr><td>Analysis Against Criteria: New Features</td><td colspan="2">The proposed functionality will reduce customer frustration by providing an intuitive and improved process online so customers can complete start, stop, or transfer service.</td></tr>
<tr><td>Analysis Against Criteria: Feasibility</td><td colspan="2">By targeting this project on the specific need to enable start-stop-transfer service online, NW Natural will have the resources necessary to support this project.</td></tr>
<tr><td>Additional Risks</td><td colspan="2">• Due to resource constraints on IT&S staff, there is some risk that this project may encounter delays due to competing project resource needs. While the outside vendor will perform the core development work, in-house staff are required for effective testing and integration.</td></tr>
<tr><td>Additional Benefits</td><td colspan="2">• Fewer calls into the CCC related to start, stop, or transfer of services increases the availability of CSRs to support customers calling with other service requests.
• Customer experience enhancements include low-effort high-impact updates for start, stop, transfer via self-service process already being heavily utilized.</td></tr>
<tr><td colspan="4">POTENTIAL COST (EXCLUDING CONTINGENCY)</td></tr>
<tr><td rowspan="2">Capital Range</td><td>Direct</td><td>CURRENT COH</td><td>Total</td></tr>
<tr><td>$1,593,750 - $2,987,500</td><td>10%</td><td>$1,753,125 – 3,306,250</td></tr>
</table>

O&M Range	Program/Project	Ongoing Maintenance & Support
	$38,135 - $76,240	$37,350 – 75,000
Source/ Method of Cost Data	Project scope was translated to a project schedule with estimates for Labor and Services costs. Labor was allocated based on estimated utilization % multiplied by the labor rate. Services were estimated based on anticipated work to be done and estimates provided by potential vendors. The total cost range for the project currently follows the PMO cone of uncertainty range for the current phase the project is in (-25% to +50%).	

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Full automation of the Start, Stop, and Transfer Service forms within the CIS. This alternative requires development to occur within CIS (not the website) which requires further and more complex development to CIS, including upgrades to CIS functionality.	
In brief, why is this option not recommended?	This alternative would result in higher costs, longer project timeline, and prioritizes NW Natural operational benefits over customer value add.	
Assessment	**Analysis Against Criteria: Customer Experience**	Automation of the Start, Stop, and Transfer Service forms within the CIS would not prioritize the customer's online self-service experience.
	Analysis Against Criteria: New Features	The features associated with full CIS automation would prioritize internal improvements over the customer experience. Negating this option because it does not fulfill the leading decision criteria.
	Analysis Against Criteria: Feasibility	This alternative would require an estimated additional six months to automate the back-office transactions. NW Natural cannot immediately support the amount of CIS resources required for this effort. The lack of available CIS resources will delay the implementation of essential self-service website improvements. Making this option not feasible based on time to completion and available NW Natural resources.
	Additional Risks	Risk would include the possible breakage of the current online system, making it even more challenging for customers to use the online self-service portal.
	Additional Benefits	More efficient back-office labor for NW Natural.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$3,506,250 – $5,259,375	10%	$3,856,875 - $5,785,323
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$38,135 - $76,240	$75,000 – $100,000	
Source/ Method of Cost Data	Estimate provided by potential vendor in conjunction with NWN Tech lead and CIS team input.		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Reduce scope to solely include updating the address entry field. Based on CCC feedback, the address entry field is one barrier to successfully using NW Natural's online start-stop-transfer form because it fails to auto-propose correct address solutions and will fail to process a request if the address includes any errors. A narrow upgrade focused on improving the address entry field would address this customer concern. NW Natural therefore considered modifying only this aspect of the web portal.	
In brief, why is this option not recommended?	This is not a complete alternative; exclusively updating the address entry field will not significantly improve the customer experience. While incremental improvements might be an option to test which fix is most impactful, the relative cost of pursuing these upgrades incrementally is substantially more costly.	
Assessment	**Analysis Against Criteria: Customer Experience**	This limited improvement would not resolve other prominent customer complaints received during interviews.
	Analysis Against Criteria: New Features	Updating the address entry field as a standalone effort would require more overhead than the benefit the limited update would provide customers.
	Analysis Against Criteria: Feasibility	Addressing customer complaints by improving the website in small increments, as this alternative suggests, will increase the cost of this project over time. External contractors are needed to complete the website redevelopment. The continual effort associated with onboarding and offboarding external contractors makes the work associated with implementing this limited update to the outcome less impactful. Therefore, it is more cost-effective to complete the updating of the address entry field as part of a larger inclusive scope.
	Additional Risks	This limited update will not have a high enough impact on customers currently able to complete the form to justify costs. Putting the availability of future funds for self-service website improvements at risk.
	Additional Benefits	One of the most common complaints from Customer Service Representatives (CSR) is related to address entry fields. Updating the address entry field would reduce the number of complaints from CSRs.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$201,840 - $403,680	10%	$222,024 - $444,048
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$10,00 – $15,000	$5,000	
Source/ Method of Cost Data	Services were estimated based on anticipated work to be done and a rough estimate provided by one vendor.		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*			
		Description	**Why the Alternative is not viable**
Alternative 3	Additional Interactive Voice Response (IVR) changes	Incorporation of IVR changes cannot be made due to a concurrent IVR Genesys cloud migration project. The Genesys project is updating the IVR system, making it inefficient to do both projects at the same time.	
Alternative 4		Do nothing	Customer feedback clearly indicates that the status quo is unacceptably difficult. Online engagement is an expected part of customer service, and updated functionality is thus an important part of providing adequate service to NW Natural's customers.

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Composition 2
Date: 05/22/2023
Project Sponsor: Alan Garcia / Dina Thompson
Executive Sponsor: Kim Rush / Jim Downing
Project Manager: April Johnson
Preparer: April Johnson
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Composition 2.0 is the second of two phases in the Composition project. The objective of this Composition project is to produce modern, user-friendly electronic and printed documents for customers, including bills, notices, letters, and refund checks, and to ensure that documents are presented the same whether in paper or digital form. Composition 1.0 implemented the OpenText platform that is the basis for this document modernization effort. Currently, Composition software is used to produce digital bill PDFs, which are then used by Paymentus to produce customers' digital bills. These PDFs are also archived for recordkeeping. For additional context on the Composition project as a whole and Composition 1.0, please see the 2018 Composition Software Alternatives Analysis.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	With the implementation of the Composition software, NWN is now in a position to fully modernize additional customer-facing documents, as well as more comprehensively redesign and standardize document presentation in Composition 2.0. Further extending the OpenText solution would also dispose of any remaining reliance on Advanced Function Printing (AFP) generation, which is no longer supported by IBM and is end-of-life.
Desired Deliverables What high level output / scope / deliverables are core to this project?	Improve performance and stability by implementing up-to-date software upgrades. Modernize customer-facing documents and improve customer experience. Standardize document scales and reduce supply chain issues.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated.	Initial Alternative Analysis was conducted in 2018 and underwent standard review process. Please reference the 2018 Composition Software Alternatives Analysis. Options have been reviewed by project team and project sponsors

If some criteria were considered more important based on the type of project, please explain here.	
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Ability to leverage this for future needs rather than a point solution.
Criteria: Cost-Benefit Analysis	Should a solution be built or bought.
Criteria: Timing	Ability to complete a project in time to meet a regulatory, business, product lifecycle, or safety requirement.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	OpenText Expansion/Upgrade & Document Redesign
In brief, why is this the recommended option?	Expanding the existing OpenText solutions (Document Presentment and Extended Enterprise Content Management (xECM)) allows NWN to modernize customer-facing documents including bills, letters, notices, and refund checks. The full extension of the OpenText software also eliminates the need to convert legacy CIS print file formats (AFP & TIFF) to PDF. The legacy CIS AFP generation currently being converted is unsupported/end of life from IBM. Redesigning customer-facing documents will modernize customer communication and clarity by highlighting key information, such as customer action items. Enabling customers to more easily find the most important information on their bills can save them time and effort, reduce customer frustration, and potentially reduce customer support calls. Modernized bills and other documents could also facilitate communication of potential energy efficiency measures and related opportunities for customers. The expanded and upgraded OpenText utilization further improve the customer experience by: • Opening the capability for multi-language documents. • Allowing for segmented information so OR customers will only see OR information and the same for WA customers seeing only WA information (the prior solution had both states combined). Providing only one state's info improves clarity and reduces customer confusion. • Providing increased clarity around payment plans • Prioritizing important customer communications to call attention to important customer issues and possible action items. By upgrading existing software and hardware to the latest versions of OpenText Document Presentment and Extended Enterprise Content Management (xECM), this approach also provides improved performance and stability. Lastly, the redesign portion of this project also includes standardizing document sizes and types. The custom size of our bill can cause supply chain issues. Sourcing non-standard size envelopes has the potential to cause billing delays. Standardizing document sizes would help ensure adequate access to print materials.

Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	NW Natural's IT&S strategy seeks to maintain a product suite of integrated, out-of-the-box products to minimize maintenance and support costs.
	Analysis Against Criteria: Cost Benefit Analysis	Reduced administrative costs around local printing
	Analysis Against Criteria: Timeline	January 2023 – May 2024
	Additional Risks	• Finalization of template design • SME availability • Software training for end users and internal NW Natural team • Long turnaround time with SAP customer support - accepted risk
	Additional Benefits	• Consistent design/brand communications across printed materials • Efficiency in on-going maintenance of upgrade software and decoupled form versions • New CIS functionality to support CCC team in customer communication/generating forms

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.9M - $3.1M	$290,000 - $310,000	$3.2M - $3.4M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0 - $50k	$0 - $10K	
Source/ Method of Cost Data	Resource forecasting, SOW's, Change Requests, all documented in Planview		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Remain in current state	
In brief, why is this option not recommended?	Expanding the Composition software allows NWN to leverage the existing software platform to substantially improve customer experience in customer-facing documents. Failing to proceed with the expansion and upgrade would not allow for modernization or standardization of document presentation and design, or ensure the ongoing reliability and stability of the software platform.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	Does not ensure ongoing stability of product suite Fails to maximize customer benefits of Composition project as a whole
	Analysis Against Criteria: Cost Benefit Analysis	Least cost option in the near term
	Analysis Against Criteria: Timeline	Proceeding now enables timely replacement of end-of-life programs.
	Additional Risks	Delaying or foregoing this project places pressure on other end-of-life programs currently supporting the document presentation workflow.
	Additional Benefits	None

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**

	$0	$0	$0
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0	$0	
Source/ Method of Cost Data	No change, current state.		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Upgrading OpenText but not redesigning customer-facing documents	A significant motivating factor of the Composition project is to improve customer experience. While proceeding with the upgrade alone would address the product stability issues, it would not address the project's central customer-service purpose.

PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: PowerPlan Optimization
Date: 9/15/23
Project Sponsor: Amanda Faulk / Cristan Kelley / Dina Thompson
Executive Sponsor: Brody Wilson / Jim Downing
Project Manager: Michael Crotty
Preparer: Jennifer Chiaratti
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Costs accumulated under work orders and projects are tracked and allocated to various accounts in PowerPlan. For capital costs, this process, known as the "capital settlement process," currently occurs in a software product called PowerPlan.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	. There has been a lack of visibility of information between PowerPlan and SAP, which has proven to be quite problematic. SAP cannot distinguish the settlement charges in PowerPlan from other charges. Consequently, the reporting within SAP reflects total charges on a project netting to $0.00 because the charges incurred are offset by the returning settlement charges. Additionally, by performing the capital settlement process outside of SAP in PowerPlan, project managers and others have less visibility into the capital settlement process. Without this visibility, project managers and others have less opportunity to detect and correct errors, which has sometimes caused delays in issuing reports.
Desired Deliverables What high level output / scope / deliverables are core to this project?	• Configure and implement changes to the capital settlement process to ensure appropriate system integration and necessary visibility by project managers and others. • Provide business and technical documentation supporting configuration and implementation. •

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	• Conducted analysis with the project team and external vendors to identify options, pros, cons, and potential risks and issues. Team included: NWN Accounting, IT&S, Accenture, PowerPlan • Project team and Project Sponsors agreed to a recommendation on implementation approach. • Reviewed with Executive Sponsors to gain approval to move forward with recommendation.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Process Standardization	Ability to leverage out of the box functionality in an efficient manner

Criteria: Reporting	Ability to produce accurate reporting and analyze data
Criteria: Timing	Ability to conduct the process in a timely manner

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION: Implement Capital Settlement Process in SAP *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	Transition the capital settlement process from PowerPlan to SAP	
In brief, why is this the recommended option?	Allows for use of standard cost reporting including transparency into the types of costs incurred.	
Assessment	**Analysis Against Criteria:** Process Standardization	• Utilizes standard out-of-the-box functionality which is more easily supportable during minor upgrades • Eliminates the need to implement and maintain workarounds (e.g., manual processes) in reports
	Analysis Against Criteria: Reporting	• Better cost reporting inside of SAP, aligned to standard. • Cost transparency will allow users to review, understand, and explain cost drivers
	Analysis Against Criteria: Timing	• Improve the timing of the settlement process as all costs are settled in the same system (SAP) • Reduces the effort to manually evaluate projects due to indecipherable cost information
	Additional Risks	• The extent to which the solution will improve information previously transferred between PowerPlan and SAP is still being assessed. • If the solution is implemented mid-year, rather than at the end of a full calendar year, then the transition between the two systems will need to be reconciled.
	Additional Benefits	

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$1.5M - $2.0M	$150K - $200K	$1.65M - $2.20M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$25k - $50k		
Source/ Method of Cost Data	Statements of work from external vendors.		

ALTERNATIVE 1: Maintain Current State *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Capital settlement continues to be performed in PowerPlan with a post back to SAP (maintain current state).	
In brief, why is this option not recommended?	Does not address the current problem statement.	
Assessment	**Analysis Against Criteria:** Process Standardization	• Continue to implement reporting workarounds to provide necessary cost reporting from SAP • This would not achieve process standardization, but rather requires each report to be adjusted. This pattern would continue for new reports used by the business. • This does not address the root cause of cost transparency, but rather mitigates the impact of the current issue.
	Analysis Against Criteria: Reporting	• Lack of transparency in reporting could make it more difficult to obtain detailed project data to support data requests • Continued challenges to identify and reconcile adjustments amongst thousands of lines of settlement records during monthly financial close • This approach would not prevent potential risk of erroneous cost reporting
	Analysis Against Criteria: Timing	• Overall elongated delays in the close and reporting processes as data must flow between systems.
	Additional Risks	• Challenge to deep dive on the cost drivers • Challenge to drive down to the actual costs associated with a project and O&M cost receivers
	Additional Benefits	• Sustains existing financial posting process

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	N/A	N/A	N/A
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	N/A	see below	
Source/ Method of Cost Data	Unable to estimate the ongoing maintenance and quantify the sustained risk of workarounds. The investment would continue in perpetuity as additional reporting capabilities of SAP are delivered through new versions and upgrades.		

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 2	N/A	
Alternative 3	N/A	
Alternative 4	N/A	

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

None needed at this time.

PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: SAP Treasury
Date: 06/01/2023
Project Sponsor: Nikki Sparley / Dina Thompson
Executive Sponsor: Brody Wilson / Jim Downing
Project Manager: Ashwini Prasad
Preparer: Jennifer Chiaratti
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Treasury processes are predominantly manual and performed in Excel, with the exception of electronic bank statements and payment monitoring/approval functions.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	Currently, the Treasury processes are predominantly manual, and performed in Excel. They are not housed in an integrated system such as SAP. This results in high manual effort, several resource hours for data entry (e.g., daily cash position report generation), as well as ongoing review and approval. There is also a level of risk associated with data entry. The project allows for automation of these processes for consistently accurate data, which will result in better reporting, significantly faster data entry processing, and allow for better use employee time. Automating these processes would be consistent with industry-standard practices of peer utilities, many of which have already automated basic Treasury functions. NWN is behind the curve in automating Treasury functions.
Desired Deliverables What high level output / scope / deliverables are core to this project?	The functionality that would enhance and increase efficiency in our processes are: • Providing granular visibility into payment processing • Automated bank account tracking • Incorporating industry-standard bank statements • Automating cash flow tracking to support day-to-day liquidity needs • Automating interest rate data instrument tracking, including developing amortization and interest rate schedules • Providing real-time visibility into market interest rate data • Ensuring successful integration with NWN systems and platforms

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	• Analysis conducted by the project team and external vendors to identify options, pros, cons, and potential risks and issues. • Project team agreed to a recommendation on implementation approach • Presented to the Steering Committee to gain approval to move forward with recommendation • Followed the Projects Governance Process for decision making

DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Ability to leverage this for future needs rather than a point solution.
Criteria: Cost-Benefit Analysis	Most cost-effective option for the business
Criteria: Timing	Ability to complete a project in time to meet a regulatory, business, product lifecycle, or safety requirement.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION – SAP TREASURY TRACK SELECTED FUNCTIONALITY *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	Implement SAP Treasury Track, with minimum essential functionality: • Payment Monitoring and Approvals • Bank Relationship Management • Electronic Bank Statements Cash Application • Cash Position • Cash Flow Forecasting & Liquidity Management • Debt & Investments • Market Data Integration • Treasury Accounting • Treasury Reporting	
In brief, why is this the recommended option?	The above modules will address the basic Treasury automation needs and support a more integrated and automated system. These modules and associated functionalities represent the minimum set needed to support the core Treasury business functions. Many of these functions are also mutually dependent (such as cash position and cash flow), meaning that automating one aspect of Treasury functions necessitates automating related processes as well.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	An initial portion of the SAP Treasury Track was implemented during Horizon 1, continuing with optimizing the Treasury Tracks is aligned to the IT Strategy.
	Analysis Against Criteria: Cost Benefit Analysis	Least costly option.
	Analysis Against Criteria: Timeline	Allows for implementation by year end, starting 2024 with a clean break for year end.
	Additional Risks	• Reconciliation work required during cutover. • Forecasting functionality is relatively near-term and not the solution for a long-term strategic solution.
	Additional Benefits	• Data integration with source systems, eliminating side excel spreadsheets, managed service supports backups, security patches, and upgrades.

		• Allow Treasury bank transfers and payments performed outside of SAP (primarily in WFB CEO) to be done in the system. Minimize month-end journal entries and streamline Treasury transactions. • Automation of daily cash positioning and more visibility into the short-term cash requirements. • Master sheet of bank accounts is currently maintained in an Excel spreadsheet. Implementing this module will allow a central repository of all bank information and authorized signer in SAP. It will help keep track of the different changes for SOX compliance. • Streamline the debt creation to amortization/interest schedule. We have different processes for handling different debt instruments, so it would be beneficial to have a standard repository for these transactions in SAP. • Automation will reduce the manual work currently done and free up time for other project work. • Systems integration allows for KPI reporting and Executive reporting. • Integration is a steppingstone to integrate Water into SAP. • The integration establishes infrastructure for growth.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$1.7M - $2.5M	$170k - $250k	$1.8M - $2.75M
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$100K - $200K		$xx - $xx
Source/ Method of Cost Data	Internal estimates of future project costs and vendor quotes.		

ALTERNATIVE 1: SAP TREASURY TRACK – FULL FUNCTIONALITY *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Implement SAP Treasury Track, with full functionality Everything included in Recommended Alternative, plus: • Advanced Payment Management • Multi bank connectivity • Market and Credit Risk • In House Bank and Payment Factory • Statutory & regulatory reporting • FX Hedging	
In brief, why is this option not recommended?	This is not the recommended option because it provides above and beyond the minimum viable product required to meet the Treasury business needs. This alternative would require additional product licensing, functionality in FX hedging and record keeping not necessary because NWN currently utilizes Horizon Allegro with no issues, and required reporting is provided in standard "can" reports. In sum, these modules are either unnecessary at this time or duplicative of other IT&S programs. Additionally, it is important to ensure that the core SAP Treasury functions are successfully implemented before considering whether to incorporate more sophisticated and complex modules.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	An initial portion of the SAP Treasury Track was implemented during Horizon 1, continuing with optimizing the Treasury Tracks is aligned to the IT Strategy.
	Analysis Against Criteria: Cost Benefit Analysis	• Higher implementation costs overall • Incremental license costs would be incurred

	Analysis Against Criteria: Timeline	• Project would have been extended by a duration of approx. 3 months to accommodate the additional scope. • Does not allow for implementation by year end.
	Additional Risks	
	Additional Benefits	

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.1M - $3.0M	$210k - $300k	$2.31M - $3.3M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$150K - $250K	$xx - $xx	
Source/ Method of Cost Data	Internal estimates of future project costs and vendor quotes.		

ALTERNATIVES CONSIDERED NOT VIABLE

Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why

	Description	**Why the Alternative is not viable**
Alternative 3	Do Nothing	Maintains manual process risks does not solve for current state problem.
Alternative 4	Implement non-SAP solution	Inconsistent with consolidated IT&S strategy to streamline and implement focused suite of technology platforms. Other applications would not integrate with NWN data systems and other departments.
Alternative 5		

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Resource Scheduling Optimization
Date: 3/21/2024
Project Sponsor: Dina Thompson / Jaime Ulestad /Cari Colton
Executive Sponsor: Jim Downing / Joe Karney / Dave Weber
Project Manager: Cal Gosla
Preparer: Jennifer Chiaratti
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking.

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	Workforce is the scheduling and timesheet tracking software used by NWN to manage field worker schedules and timesheets. Note: Workforce is used for timesheets by NWN a whole, but the Resource Management Center uses Workforce for both scheduling and timekeeping processes. Following deployment of Workforce and as the product was being used, NWN identified certain issues with the product's performance requiring additional follow-up work and refinement. These issues have resulted in the creation of several manual workarounds to enable critical processes: • Tracking field worker qualifications • Anticipating worker center/position changes • Facilitating field PTO auctions • Tracking and managing field shift vacancies • Managing On Call shifts • Tracking rest periods • Communicating worker schedules and availability to planners • Tracking timesheets needing auditing These manual workarounds are time consuming and have resulted in long RMC worker hours to ensure quality work and the hiring of additional contractors to handle the workload. NWN concluded that an optimization effort was needed to ensure the tool supports business processes to its capability. As a result, NWN developed a prioritized list of recommendations and a plan to improve WFS and related integrations for the RMC. NWN has recently completed an assessment and received recommendations and must now decide whether, and to what extent, to pursue the prioritized list of recommendations.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	The manual workarounds have resulted in excess labor hours (including the need for contractors) to execute key RMC processes.
Desired Deliverables What high level output / scope / deliverables are core to this project?	Improvements to Workforce and associated integrations, systems, and processes to increase the efficiency and effectiveness of RMC schedulers, planners, and timekeepers. Improvements will result in decreased workload through the automation of now manual workarounds. The key indicators of success are estimates of weekly hours spent on various process activities.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	• Conducted analysis with the project team and external vendor to identify options, pros, cons, and potential risks and issues. Team included: NW Natural field users, Enterprise Asset Management team (EAM), Information Technology and Services team (IT&S), and system integrator Rizing, which has expertise in Workforce • Project team and Project Sponsors agreed to a recommendation on implementation approach • Reviewed with Executive Sponsors and gained approval to move forward with recommendation
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Ability to leverage this for future needs rather than a point solution.
Criteria: Cost-Benefit Analysis	Near-term and long-term costs compared to functional benefits for system users.
Criteria: Timing	Ability to complete the project in time to meet a regulatory, business, product lifecycle, or safety requirement.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION: All Recommended Items (Mission Critical, High Priority, Fully Optimized) *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	During the review process, identified areas of improvement were compartmentalized based on degrees of urgency, into distinct buckets: (1) mission-critical, (2) high priority, (3) fully optimized. **Mission Critical** items address functions of Workforce that are core to business processes. This includes the following: • **System Cleanup**: Adjust features that drive manual behavior or interfere with business processes. For example, adjustment of exception messages that are not needed and distract from critical exceptions. This is expected to ease use of the system and make day-to-day processes more efficient. • **Enable Standard Features to Enhance Current Business Processes**: For example, color coding schedule boxes for quicker view, automations to vacate shifts when PTO is approved, scripts to automate some employee onboarding processes, and drag and drop functionality. These features will improve day-to-day use and enable the RMC to bring manual vacancy management processes into Workforce in an automated way to reduce workloads. • **Custom Reports**: Develop reports for payroll and for the RMC to enable faster communication between schedulers and planners and enable more efficient timesheet audits. • **Configure System to Decrease Manual Processes**: Standard shift patterns (rotation patterns), on-call shifts, and rest period calculations will be configured to better align with business processes. This will reduce the amount of rework needed to ensure the system accurately reflects scheduled shifts. In particular this will enable the management of on call shifts in-system, rather than on spreadsheets.

<table>
<tr><td></td><td colspan="2">

- **Training**: Foundations training and feature specific training to ensure RMC users understand how to use Workforce effectively.

High Priority items address connection points between Workforce and other systems. This includes the following:

- **Improving the Clevest to WFS Integration**: Reducing the volume of time slices from Clevest by aggregating adjacent and identical slices will reduce the time needed to audit timesheets.
- **Improving the SuccessFactors to WFS Integration**: Ensuring that adequate qualifications data is fed to WFS. This will increase the efficiency of scheduling processes, especially when performing callouts, as the schedulers and planners will be able to rely on information in the system, rather than on external spreadsheets. Additionally, this will enable schedulers to rely on in-system information for qualifications and future employee changes rather than tracking those manually outside the system.
- **Improving the WFS to Clevest Integration**: Ensuring accurate and timely schedule data is available for planners in Clevest. This will reduce the effort needed by the planners to confirm worker availability in Workforce.
- **Other improvements**: Restructuring the field hierarchy to better align with business processes, bringing manual spreadsheet creation processes into the system (around the forecasting spreadsheet), enabling vacation bidding (to automate a now manual process), training.

Fully Optimized items address opportunities for improvement that not critical but are expected to add value. This includes the following:

- **Implement new mobile features**: Shift bidding and swapping, time off requests, timesheet views. These features will reduce the email and phone call burden on RMC staff by using existing features in Workforce.
- **Custom reporting training**: NWN resources will be trained to customize reports. Significant time is spent pulling multiple reports to get needed information from Workforce. Additional training in this area is expected to reduce the burden on RMC staff for gathering information.

The chosen option includes all three buckets of work

</td></tr>
<tr><td>In brief, why is this the recommended option?</td><td colspan="2">This option allows NWN to not only improve core functionality, but also to optimize Workforce connection points, and add features useful for field resources.</td></tr>
<tr><td rowspan="5">Assessment</td><td>Analysis Against Criteria: Alignment to NW Natural's IT Strategy</td><td>• By resolving technical issues with the in-use program, this approach reduces technical debt and enables efficiency
• By engaging in a concerted, focused effort, enhancements can be delivered quickly to ensure the RMC has the tools it needs to manage field worker time.</td></tr>
<tr><td>Analysis Against Criteria: Cost Benefit Analysis</td><td>• A cohesive approach to address these improvements holistically is more cost effective and will result in better adoption than addressing each constraint individually.
• Executing a prioritized plan for optimization ensures the cost-effective allocation of resources for maximum user benefit.</td></tr>
<tr><td>Analysis Against Criteria: Timeline</td><td>• Targeting high-priority improvements for mission-critical items enables rapid improvements to product performance, while allowing for successful and efficient implementation of the high priority optimizations.
• Including all items in scope enables faster value realization than would be had if lower priority items were handled in a separate, later effort.</td></tr>
<tr><td>Additional Risks</td><td>• Implementing large collections of improvements at once limits the ability for incremental learning that may reveal further opportunities.</td></tr>
<tr><td>Additional Benefits</td><td>• Significantly improves user experience.
• Ensures that the platform will maintain functionality through future architecture enhancements.</td></tr>
</table>

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$1.4M to 1.5M	$150K	$1.55M to $1.65M
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$60k - $65k		N/A
Source/ Method of Cost Data	Internal and external estimates of project costs.		

<table>
<tr><th colspan="4">ALTERNATIVE 1: Only Mission Critical
Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.</th></tr>
<tr><td>Description</td><td colspan="3">• Deliver only the Mission Critical items described above</td></tr>
<tr><td>In brief, why is this option not recommended?</td><td colspan="3">• This alone will not result in optimal use of the platform, does not address needed improvements to integrations, and does not include important re-configurations. Multiple manual workarounds will remain:
o Tracking field worker qualifications
o Facilitating field PTO auctions
o Tracking rest periods
o Communicating worker schedules and availability to planners
o Tracking timesheets needing auditing</td></tr>
<tr><td rowspan="5">Assessment</td><td>Analysis Against Criteria: Alignment to NW Natural’s IT Strategy</td><td colspan="2">• Failing to implement needed improvements increases technical debt.
• Responding reactively to critical concerns while declining to proactively plan for optimal performance does not align with NWN’s IT strategy.</td></tr>
<tr><td>Analysis Against Criteria: Cost Benefit Analysis</td><td colspan="2">• Foregoing other improvements is actually more costly because issues that are not addressed in the efforts would continue to degrade RMC performance</td></tr>
<tr><td>Analysis Against Criteria: Timeline</td><td colspan="2">• Delays full implementation of process optimization to realize improved efficiencies.</td></tr>
<tr><td>Additional Risks</td><td colspan="2">• Negative end user experience impacted by continuing to rely on workarounds that are not efficient.</td></tr>
<tr><td>Additional Benefits</td><td colspan="2"></td></tr>
<tr><th colspan="4">POTENTIAL COST (EXCLUDING CONTINGENCY)</th></tr>
<tr><td rowspan="2">Capital Range</td><th>Direct</th><th>CURRENT COH</th><th>Total</th></tr>

</table>

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Do Nothing	The RMC is in need of improvements to their scheduling tool and related integrations to improve efficiencies and effectiveness. Existing workloads and the continued staffing of contractors is not sustainable over the long term.
Alternative 4	Implement an alternative scheduling system and vendor to replace Workforce.	• Implementing a fully new alternative is not cost effective as any new product would require the full design, development, and deployment process that Workforce required. • Implementing a new product option would take multiple years to complete, while improvement of the current product remains necessary. • A new alternative would affect all employees of the company, as the RMC is not the only user group for Workforce. • As designed, Workforce remains a useable and useful product and retains the potential to effectively enable business processes.

**Add rows for any additional alternatives considered not viable*

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Esri UN Migration
Date: 9/27/2023
Project Sponsor: Dan Kizer, Dina Thompson
Executive Sponsor: Joe Karney, Jim Downing
Project Manager: Kristin Powers
Preparer: Kristin Powers
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES
Why are we tackling this project?

Current State
What is happening now? Where are we starting?

Esri builds the mapping and spatial analytics software (ArcMap, part of the ArcGIS Suite) used at NW Natural (NWN) for viewing, editing, analyzing, and managing geospatial data. The GIS (geographic information system) team uses ArcMap to maintain NW Natural's gas asset records and connectivity model for our gas system. The connectivity model, or network, allows NWN to model how the gas facilities operate. The network controls how gas moves through our system and enhances operational integrity by highlighting potential gaps in the system. The underlying network model is what drives valve isolation, cathode protection, and pressure tracing, which are all critical to asset management and emergency response. We currently use Esri's geometric network (GN) for modeling gas connectivity.

There are several tools and products we use to interact with our GIS data at NWN. Below is a simplified table to provide more context and to show how the Esri products are related to other pieces. The driver for this project is based on the Esri tools, although there are other projects in flight to update/change/replace other tools in the ecosystem.

Items in green are Esri tools impacted by this project. All other tools are out of scope for this effort.

Application/Tool	Status	Uses	Users
ArcMap (Esri)	Near End-of-Life (2028)	Create, edit, and analyze GIS data and connectivity model.	GIS Team, Environmental Management, Pipeline Integrity
ArcGIS Pro (Esri)	Plan to implement as part of this project	Create, edit, and analyze GIS data and connectivity model – replaces ArcMap.	GIS Team, Environmental Management, Pipeline Integrity
Geometric Network, GN (Esri)	Not compatible with ArcGIS Pro, must transition from this model	Model network connectivity of NWN's gas infrastructure.	GIS Team, Pipeline Integrity, Visual Fusion users for Valve Isolation Tracing
Utility Network, UN (Esri)	Plan to implement as part of this project	Model network connectivity of NWN's gas	GIS Team, Pipeline Integrity, potentially other users for Valve Isolation and

		infrastructure – replaces GN.	Cathodic Protection Traces
ArcFM Viewer	Near End-of-Life (2028) – replacement is part of another project	Tracing cathodic protection network, limited feature editing	Corrosion Team
Visual Fusion	End-of-Life – replacement is part of another project	Custom maps for different business groups, critical functionality is the valve isolation tracing map for emergency response	Backoffice, including Gas Control that relies on valve isolation tracing
Fieldsmart View (MapFrame)	End-of-Life – replacement is part of another project	General map viewer, map correction creation	Field and back office
Clevest	Implemented in 2022	Limited view of asset information, crew and work locations	Primarily used by field users and RMC
IQGeo	Implemented in 2020	Viewing GIS and SAP assets, completing surveys, reporting leaks, creating as-builts	Field and back office

Notably, the mapping data displayed in the above applications is created and maintained in Esri's ArcGIS Desktop Suite (primarily ArcMap). These applications are where edits are made daily to GIS data based on as-builts and other changes made in the field. After the GIS data is edited in Esri, the mapping data can be viewed by the field and back office users in other connected tools like IQGeo or Clevest to allow employees to do their work.

Problem Statement
In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?

At a high level, we have a product nearing end-of-life (ArcMap) and a data model (GN) that we need to transition. Esri is requiring customers to move from ArcMap to ArcGIS Pro and will discontinue support for ArcMap on 3/1/2028. The GN is not compatible with ArcGIS Pro, so utilities using Esri need to simultaneously transition to the Utility Network (UN) to continue modeling gas connectivity in the GIS. Esri committed to providing only security patches and critical fixes for utility customers during Mature Support, 3/2024 – 2/2028, while utilities complete the transformation. Given that moving to a new tool suite is expected to take 18-24 months, planning for this transition now is particularly crucial.

Once transitioned, Esri products will receive software updates, patches, and hotfixes. We must make this, or some, transition eventually, because we need to manage our geospatial data on a tool that can be improved, patched, and made secure.

In addition, NWN's GIS systems are interdependent, meaning that upgrades to one section require us to ensure that other related systems are compatible. In this case, for instance, the Legacy Mapping Replacement (LMR) project cannot fully remove Mapframe or ArcFM Viewer without us transitioning to UN. As a result, careful coordination among the GIS suite is critical.

Desired Deliverables
What high level output / scope / deliverables are core to this project?

- Implement and transition to a replacement GIS solution
- Migrate identified data from the GN to the new solution and eventually turn off editing in the GN
- Implement a new data model and map old data to the new model for the solution
- Ensure all GIS processes and tools either work in the solution or are replaced with like-for-like tools (for example, replacing ArcMap with another tool, like ArcGIS Pro, to manage GIS data)
- Perform change management activities for all impacted stakeholders

	• Set up new architecture to support the solution • Review processes and update/streamline, if possible

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	• Conducted analysis with the project team and external vendors to identify options, pros, cons, and potential risks and issues. Project team agreed to a recommendation on implementation approach • Presented to the Steering Committee and the IT&S Alignment Team to gain approval to move forward with recommendation We evaluated options based on: • Gartner feedback on tools in the space • Use of tools at other utilities • Fit with the NWN IT&S landscape • Tool ease of use • Difficulty of migration efforts • Cost
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Cost of implementing solution	What are the costs associated with the different options?
Criteria: Familiarity with product	Since the GIS team will use this tool to maintain NW Natural's gas asset records and generate the connectivity model for our gas system, it is important to take into account how much training will be required to use the recommended solution – is it difficult to use, is this similar to what they do already, how complex is it for new users to learn, what resources are already available to support users?
Criteria: Existing place in NWN's IT&S landscape	How many IT&S applications will this solution touch? If we completely replace it with something new, what is the level of effort to keep connected systems functioning? If we use the new version of the existing tool, what impact does that have on integrations?
Criteria: New or improved solution functionality	While our main goal is a like-for-like transfer, does the solution considered provide any new or improved functionality? Will we be able to improve things like reporting outputs? Can we retire other third-party tools used prior to the implementation of the solution?

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description	Transition fully to the UN and retire the GN and related tools – ArcMap, ArcFM Desktop (extension), and ArcFM Viewer.
In brief, why is this the	Why stay on Esri and move to the UN:

<table>
<tr><td>recommended option?</td><td colspan="2">

Gartner confirmed that Esri is dominant in GIS space, and they were not seeing many other utilities moving off Esri despite the required transformation.
Esri has a good ecosystem of partners and 3rd party tools.
Esri UN is the most mature system of the modern, commercially available options.
It is already present in the NWN IT&S landscape, so while we will need to update integrations, it’s a much smaller lift than putting in an entirely new solution.
The team is familiar with using Esri products.
Other utilities have made this transition, so we are not the first to attempt it and we can use lessons learned from their migrations.

We recommend starting this immediately because:

We have a project team in place that is familiar with the assessment work and what needs to be done. If we postpone, we will need to spin up the project later and re-acclimate potentially different resources to the tasks at hand.
If we do this now, it allows for some time before current solution reaches end-of-life.
Cost are likely to go up over time if we wait, due to inflation and competition pressures.
If we wat, we will likely experience greater internal resource competition for other big projects like H2; by moving through the planning stage sooner and engaging third-party external vendors to aid the transition, we can avoid overlapping with the most resource-intensive efforts for H2 deployment.
If we wait, we will run into greater external competition for vendor resources as more utilities, now encountering the solid end-of-life deadline, undertake this work as well.

</td></tr>
<tr><td rowspan="6">Assessment</td><td>Analysis Against Criteria: Cost</td><td>The assessment project with the UN SME resulted in scope reductions for the UN migration, resulting in a less expensive overall project – no need to implement parts of the solution we will not use. Making this transition also allows us to retire some 3rd party apps like ArcFM. Staying with Esri is cheaper than moving to an entirely new application and data model.</td></tr>
<tr><td>Analysis Against Criteria: Familiarity</td><td>Our GIS users are familiar with Esri’s ArcGIS Suite, so the general look and feel will be similar and reduce time to learn the new tools. However, this move will necessitate usage of a new professional desktop solution, ArcGIS Pro, in favor of the current ArcMap solution. Training will be required. However, our newly-graduated GIS analysts are actually trained on ArcGIS Pro in school currently, so some of the team already has the necessary skills.</td></tr>
<tr><td>Analysis Against Criteria: Existing Place in landscape</td><td>This move will require all integrations to be refactored to leverage real-time services rather than direct database connections and exports. This transition also presents an opportunity to reevaluate our architecture (cloud vs. on prem decision to be made during the Plan phase) to support the new tooling. However, this is better than bringing in a new tool and building entirely new integrations from scratch with everything.</td></tr>
<tr><td>Analysis Against Criteria: New or improved solution functionality</td><td>By moving to ArcGIS Pro and the UN, we are gaining access to more tools and new functionality that will allow us to better manage our gas system.

This move will improve our ability to report on PHMSA-required data because UN provides more accurate pipeline footage calculations.
This will improve the accuracy of our GIS data and system modeling.
As part of the transition to the UN, NWN must adopt a gas industry standard data model. Adoption of an industry standard data model aids in more efficient data management and enhanced data quality.

</td></tr>
<tr><td>Additional Risks</td><td>

There are other projects underway impacting the GIS landscape at NWN, so we propose to sequence the project work to balancing interlocking needs, and internal capacity availability while we execute these transitions (e.g., Legacy Mapping Tool replacement will remove 3 applications this is currently integrated with – MapFrame, Visual Fusion, and ArcFM Viewer).

</td></tr>
<tr><td>Additional Benefits</td><td>Financial benefits:

This will allow us to stop using and paying for UN-incompatible 3rd party tools and switch to using tools within Esri.

Operational benefits:</td></tr>
</table>

		• Once transitioned, Esri products will be in full support and receive not merely basic security patches and critical fixes, but software updates, functional patches, and hotfixes, as well as full tech support. This will reduce the security risk of using the tool.
		• This will provide us an opportunity to clean up data and only transition information that is important to NWN.
		• This will allow us to review current processes and potentially streamline them where possible.
		• The ability to update and maintain our GIS data is integral to providing safe and reliable service to our customers. The GIS data is the system of record for the location of our gas facilities. The maps that display the GIS data to our end users provide location information for responding to emergencies, aid in locating infrastructure in the real world, and inform business planning and decision making.
		  ○ Implementing the Esri UN and service-based infrastructure would allow changes made in the GIS to be reflected in mapping applications, like IQGeo, more quickly. This will provide field users with the most current GIS data sooner than our current state, which can take more than 24 hours to reflect in field mapping applications.
		  ○ This project also implements linear pipeline referencing, which will enable NWN to model elevation changes and record events on our transmission assets. They will show as 3D instead of 2D, leading to more accurate asset management and reporting. Documenting events (changes) on 3D models of transmission pipelines will offer more accurate location and stationing information for field users.
		  ○ Access to higher accuracy pipeline inspection data with the ability to leverage better analytics will improve how we asses and manage pipeline risk.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$11.8M – $16M	$1.2M – 1.6M	$13M – 17.6M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$210K – 280K	$100K – $150K	
Source/ Method of Cost Data	• During the Assess phase, we worked with a UN migration SME to create an implementation plan with a detailed timeline to understand expected length of the project. • Internal labor and direct support contractors (PM, CM, etc.) were estimated based on this timeline. • The UN SME said many SI vendors are coming in between $7M-$15M for migration alone, but our project should be smaller based on completed pre-work, less complex data relative to other companies, the fact that we are a gas company and not electric, and other factors. • We reviewed license costs for the new Esri UN with our Esri rep for an initial estimate on ongoing costs.		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	A hybrid approach could be implemented - keeping ArcMap for editing short term but pushing data to a read-only version of the UN that could be integrated with other apps. So, we would start transitioning now and finish at a later date.

In brief, why is this option not recommended?	• This does not solve the long-term issue that ArcMap is reaching end-of-life, but it potentially buys time to get NWN GIS users transitioned to ArcGIS Pro and new editing workflows. • We would have to run a second project to move off ArcMap. The second project would need to conclude before March 2028 when ArcMap reaches end-of-life. This will extend the project timeline and increase costs in the long run.	
Assessment	**Analysis Against Criteria: Cost**	This would create additional costs when we spun up a second phase of the project later to finish the transition instead of doing it all at once. We would have to re-onboard a team of potentially different resources, which takes additional time and money.
	Analysis Against Criteria: Familiarity	Our GIS users already use ArcMap, so there would be no immediate change. However, by 2028, we will have to transition to ArcGIS Pro, so there would have to be a follow-up project for that. That would require training and change management efforts.
	Analysis Against Criteria: Existing Place in landscape	This move will still require all integrations to be refactored to leverage real-time services rather than direct database connections and exports. Same analysis as the recommended approach.
	Analysis Against Criteria: New or improved solution functionality	We will not have access to the improved tooling described in the recommended option until we move off ArcFM, so short term, it would be a like-for-like change, and long term, we would have improved functionality.
	Additional Risks	• If we segment this into two projects, we complicate resource commitment between the UN implementation and the Horizon 2 project commitments. • If we pick up the migration at a later date, external project resources familiar with the implementation may no longer be available. • The cost of the work and licenses may go up. • This scenario would involve significantly more complexity to transform the data between data models while also ensuring that third-party applications work correctly.
	Additional Benefits	Same as recommended option. Other benefits include: • Users could continue using ArcMap longer, so they would not need training immediately while we focused on connecting the UN to our integrated systems and stabilizing. • Users would have a longer time to get comfortable using ArcGIS Pro.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$12.3M – $16.5M	$1.2M – 1.7M	$13.5M – 18.2M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$210K – 280K	$100K – $150K	
Source/ Method of Cost Data	• Same as the recommended option, but with two months of time added on for restarting and ending the second phase of the project. • Software cost of maintaining ArcFM longer ($50k/yr) included.		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	Postpone the project until closer to the end-of-life date, then transition fully to the UN and retire the GN and related tools (ArcMap, ArcFM Desktop (extension), and ArcFM Viewer), completing everything before Mar 1, 2028.
In brief, why is this option not recommended?	• As we get closer to the end-of-life date of ArcMap, there will likely be an influx of companies trying to do the same thing, so there will be competition for vendors to support us. • With inflation and costs shifting, it will likely be more expensive a few years from now. • With Horizon 2 coming down the pipeline, we would be in competition for resources, money, and other IT&S assets. • The lead time to complete this work is 18-24 months, so we would not want to delay very long.

Assessment	**Analysis Against Criteria: Cost**	Cost of the entire effort will likely go up due to inflation and competition for resources. It appears there are no additional benefits gained from the increased cost.
	Analysis Against Criteria: Familiarity	No additional information relative to the recommended option.
	Analysis Against Criteria: Existing Place in landscape	No additional information relative to the recommended option.
	Analysis Against Criteria: New or improved solution functionality	No additional information relative to the recommended option.
	Additional Risks	• If we wait too long, we will likely experience greater internal resource competition for other big projects like H2; we could be at risk for overlapping with the most resource-intensive efforts for H2 deployment. • If we are close to ArcMap's true end-of-life, we will be competing for SI vendor resources with many other companies. • With that competition, the cost of experienced contractors could increase. • If we cannot get experienced contractors because they are on other projects for other companies, we will have to work with less experienced folks and that could cause project delays or poor implementation quality. • If something minor goes wrong with the ArcMap, Esri will not fix it. • If we need new functionality in the ArcMap, Esri will not build it, so we'll need to find a 3rd party tool for it. • If we add a new application to the NWN IT&S landscape that uses GIS information, we will need to update more integrations when we migrate (rework).
	Additional Benefits	• We have several years to transition to the UN before ArcMap is out of support, so there is no imminent threat of end-of-life. • If we wait, we may decommission more IT&S integrated tools so there could be less work to update existing integrations. • If vendors complete more migrations with other clients, they can bring that additional experience and those lessons learned to our migration to improve it.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$13M – $18M	$1.3M – 1.8M	$14.3M – 19.8M
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	$235K – 300K		$110K – $165K
Source/ Method of Cost Data	Same as recommended option, but with roughly 4% inflation added for two years assuming we start in 2025, plus an increase for expected resource costs.		

**Copy/Add table for any additional alternatives*

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Do not transition from ArcMap and do not replace the tool.	We would be keeping some of NWN's most important information on an application that was no longer receiving security patches, hotfixes, or any level of customer support. This is not acceptable and not viable.
Alternative 4	Build a custom, in-house solution.	We do not have the in-house development resources to do this, so it would require hiring developers, then keeping FTEs to maintain,

		update, patch, etc. the tool. There would be no external support, we would not be able to ask other utilities how they were handing tasks in the tool, there would be no how-to resources already available online to check out, there would be not 3rd party compatible tools. We would have to re-write all our integrations.
Alternative 5	Transition away from Esri entirely to another commercial GIS solution, like GE Smallworld.	Gartner confirmed Esri is dominant in the space, and they are not seeing many other utilities moving away from Esri despite the required data transformation. Esri has a good ecosystem of partners and 3rd party tools that work with them. Additionally: • If we rooted Esri out of our IT&S landscape, we would have to create new integrations to many critical systems (SAP, Clevest, CIS, IQGeo) which puts them at risk. • We would need to train all our GIS users and technical support personnel on how to use the new tools, so this would be a much larger change management effort. • Data may be stored differently and might not migrate as easily, requiring more data cleanup. • All of our annual reporting has models set up that process Esri data and provide reports on that data. We would have to recreate those models, which requires substantial investments of time and resources. • All of these changes would likely require external contractor support, so this would add millions of dollars more to the project and slow down the timeline of delivery.
Alternative 6	Transition to IQGeo Network Manager (specifically)	Per the explanation above in the document, we have implemented IQGeo mostly as a data-viewer application, but editing and managing network data is a much different, far more complex task. Therefore, we don't think this would be a good idea for all the reasons above, and: • IQGeo is unproven as a system-of-record so far within utilities. • Additional planning activities would be required before implementation could be executed with confidence • Network Manager *Gas* is significantly less developed compared to the Network Manager *Electric* product and it would present additional risks that we would be the first gas utility to implement that solution • This would solve the network modeling/data piece, but we would need a backend solution for editors and analysts, so there would still need to be some software solution (e.g., keep using Esri) to fully meet NWN needs.

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

NW Natural
Field Web Maps Phase 1 ALTERNATIVES NARRATIVE

Program/Project Name: Field Web Maps Phase 1
Date: October 31, 2024
Project Sponsor: Dina Thompson, Dan Kizer, Jaime Ulestad
Executive Sponsor: Brian Fellon, Joe Karney, Dave Weber
Project Manager: Kristin Powers
Preparer: Shivon Van Allen, Kristin Powers
Was this project part of IRP: No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which routes we end up taking.

OBJECTIVES
Why are we tackling this project?

Current State
What is happening now? Where are we starting?

High Level Overview of Current State

NW Natural (NWN) is in the process of a multi-year program to replace its field and web mapping solutions by phasing out end-of-life software tools and transitioning to a consolidated set of modern software solutions. NWN relies on its field and web mapping tools to view its infrastructure and other assets in a geospatial format and for collecting various types of data related to these assets. These mapping tools provide field and office personnel with online and offline visual representations of NW Natural facilities and assets, which they use for various business purposes, including inspection compliance programs. Below is a table of the applications, their statuses, uses, and users. Tools directly related to this project effort are in green.

Application/Tool	Status	Uses	Users
Visual Fusion	Past End-of-Life (no longer supported by vendor) – this Phase 1 project will transition out Valve Isolation Tracing functionality, and Phase 2 will move custom web maps and decommission the tool.	Custom web maps for different business groups, and the relevant project functionality for this AA is the valve isolation tracing map for emergency response	Back office, including Gas Control, Engineering, Resource Management Center, and GIS teams
ArcMap (Esri)	Near End-of-Life (2028) – replacement is part of another project	Create, edit, and analyze GIS data and connectivity model.	GIS Team, Environmental Management, Pipeline Integrity
ArcFM (Schnieder Electric)	Near End-of-Support (2026) – replacement is part of another project	Model gas network connectivity, productivity tools for editing GIS data	GIS Team, Pipeline Integrity
ArcFM Viewer (Schnieder Electric)	Near End-of-Support (2026) – replacement is part of another project	Create and edit data and run cathodic protection traces	Corrosion, GIS Team
Clevest	Implemented in 2022	Limited view of asset information, crew, and work locations	Primarily field users and RMC
IQGeo	Implemented in 2019	View GIS and SAP assets, complete surveys, report	Field and back office

		leaks, create as-builts. Intended to be the application to replace Visual Fusion for tracing users	

Notably, the mapping data displayed in the above applications is created and maintained in Esri's ArcGIS Desktop Suite, specifically in the ArcMap application. Esri's ArcMap is the application where edits are made daily to GIS data based on as-builts and other changes made in the field. After the GIS data is edited in Esri, the mapping data is viewable by the field and back office users in the integrated applications listed above, allowing employees and contractors to perform their work.

NWN will migrate Esri tools starting in 2025, so anything that uses data from these tools needs to be updated and have its integrations reworked as part of that project. If NWN can decommission any legacy applications before then, that will prevent rework that will ultimately be thrown out once decommissioning is complete.

Project-Specific Overview

The Field Web Mapping Phase I Project begins the company transition away from an existing end-of-life software system, Visual Fusion, by moving its most critical functionality elsewhere. Specifically, this project is focused on migrating Valve Isolation Tracing capabilities.

In the event of an emergency, NWN uses Valve Isolation Tracing to determine what valves need to be shut off to isolate an area of the gas system in order to repair a damage or perform a new gas main tie-in procedure. NWN currently completes tracing in Visual Fusion, a legacy tool that is no longer supported by its vendor (Everbridge) and uses products that are no longer supported by Microsoft (SharePoint 2010, SQL Server 2012, Internet Explorer, and Microsoft Silverlight). NWN installed Visual Fusion in 2014 and enabled tracing functionality through customization shortly after that. The last update deployed to SharePoint was in 2016.

A Valve Isolation Trace is performed when there is an emergency, like damage to a pipe, to create a map identifying the valves that need to be turned off to isolate an area and to generate an impacted customer list for outage notification and relight order creation. To provide a sense of scale, in roughly 10 years, NWN has run about 4,000 valve isolation traces.

Valve Isolation Traces are run by members of the GIS (geographic information system), Engineering, Gas Control, and Resource Management Center teams. There are about 75 users who trace in Visual Fusion and more stakeholders who consume the information the application produces (for example, the Emergency Contact Center uses trace results and creates work orders to relight gas that had been shut off during an emergency response).

In addition to being out-of-support, the performance in Visual Fusion has degraded over time. For example, multiple users attempting to run a trace simultaneously causes application errors, and the time to execute traces has increased over time and can be unresponsive for some users. Both of these issues present risk to performing traces and responding swiftly during emergency situations.

GIS Analysts are also able to run Valve Isolation Traces using ArcFM tools in ArcMap if there is a problem with Visual Fusion, but user access is limited to the GIS team because of the complexity of the software. A trace in ArcMap currently yields the same valve isolation result as a trace in Visual Fusion, and it is critical that results in any future tool also match ArcMap. This allows NWN to accurately and efficiently respond to emergency events regardless of who is running a trace (the GIS Team

	uses ArcMap, while all other users use Visual Fusion). If the systems produced different results, it introduces risk around selecting the correct plan to isolate events in the field. The Field Web Maps Phase 2 Project (dates TBD) would focus on removing any remaining functionality from Visual Fusion and decommissioning it completely.
Problem Statement In simple terms, what are we trying to solve? What is the business need to tackle this? Why is this a problem worth solving (e.g., why is the current state not working)?	Visual Fusion is an old application that increases risk within NWN from a security, support and stability perspective and impacts other NWN IT&S modernization efforts (such as the consolidation and retirement of mapping tools). • Visual Fusion is past end-of-life, meaning the application no longer receives security updates or defect fixes from its software provider. The last update deployed to SharePoint was in 2016. No new enhancements or support for operating systems are offered. This creates the risk of service interruption and possible breakage for end users who rely on this application in emergency situations. It also creates additional workload for NWN resources to maintain this application in its end-of-life state. • Visual Fusion runs on products that both Microsoft and NWN no longer support, including Internet Explorer, Microsoft Silverlight, SharePoint 2010, and SQL Server 2012. NWN must maintain a Silverlight extension for employees to download in the Company's intranet Software Center, and there are precise instructions end users have to follow so Visual Fusion will run. The detailed instructions that must be followed could result in end user errors since they do not use the tool often, which may lead to wasted time for incorrect IT help desk support tickets, and additional unnecessary requests to the GIS team for assistance. • ArcMap is a specialized tool for viewing, editing and analyzing GIS data used by only approximately a dozen geospatial professionals at NWN. A non-ArcMap tracing solution is necessary for office and field employees to quickly and intuitively perform a valve trace to support emergency events. • Visual Fusion consumes data from NWN's Esri tools to create traces, and the tracing service relies on a third-party geospatial tool (ArcFM) for modeling the connectivity of NWN's system and performing the trace. NWN's GIS data is migrating to a new data model (from Esri's Geometric Network (GN) to Esri's Utility Network (UN)). This migration is necessary because the tool NWN uses today for editing and analyzing GIS data (ArcMap) is near end of life, and the new tool we will migrate to (ArcGIS Pro) does not support our current data model (GN). ArcGIS Pro will also replace the third party ArcFM application NWN uses today for productivity tools and tracing. If NWN is still using Visual Fusion when the Esri UN implementation starts in 2025, NWN will need to rework the integration between NWN's GIS data, which will have a new connectivity model and tracing mechanism. Since Visual Fusion will eventually be decommissioned, this will be an ineffective use of resources.
Desired Deliverables What high level output / scope / deliverables are core to this project?	• Provide Valve Isolation Tracing functionality equivalent or superior to Visual Fusion on a modern platform that is still supported by its vendor • Produce Valve Isolation Traces on the new tool that also match the trace results produced by ArcMap/ArcFM • Set up new architecture to support the solution, as needed • Reduce the number of mapping applications used by employees at NWN • Review processes and update/streamline, if possible • Perform change management activities for all impacted stakeholders

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	• IQGeo was selected by NWN in 2018 as the product to replace FieldSmart (aka MapFrame), Visual Fusion, and ArcFM Viewer. NWN began the work to replace these applications with IQGeo solutions in 2019. To date, general map viewing, survey and inspection functionality, integration with the asset management system, as-builting and map correction functionality have been transitioned to IQGeo, allowing for the retirement of FieldSmart. • This project's goal is to replace like-for-like Valve Isolation Tracing functionality in Visual Fusion with functionality in IQGeo. • Analysis conducted by the project team and vendors (The Gartrell Group and IQGeo) identified options, pros, cons, and potential risks and issues associated with this project. • The project team presented to the Enterprise Asset Management (EAM) Steering Committee and the IT&S Alignment Team to gain approval to move forward with this recommendation. The project team evaluated options based on: • Assessment on tools in the space • Flexibility to consume future state UN-data and traces • Fit with the NWN IT&S landscape • Tool ease-of-use • Cost and licensing
DECISION CRITERIA	
Criteria: Alignment to NW Natural's IT Strategy	• Ability to leverage IQGeo for future needs, rather than a point-in-time (i.e. temporary) solution • Solution consolidates tools in the NWN mapping space • Solution aligns with known future GIS projects, including the Esri UN Migration
Criteria: Cost-Benefit Analysis	• Whether a solution should be built or bought • Level of customization needed to provide and maintain essential functionality • Whether a solution requires us to buy new tools or additional licenses • Cost of labor to support solution once delivered
Criteria: Timing	• Provide mapping solution before end of life of ArcMap and mandatory migration to Esri's Utility Network • Completing work before resources are pulled onto other higher priority projects in 2025
Criteria: Product Familiarity	• The mapping tool will be used by about 75 people on laptops or desktops. Training and adoption considerations should be evaluated for the solution selected, including ease-of-use, level of support needed, and amount of training required

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*	
Description (Full scope of project)	Transfer Visual Fusion's Valve Isolation Tracing functionality into IQGeo and wait to transfer any remaining Visual Fusion functionality into IQGeo until the Phase 2 project. Tracing will be performed using the existing ArcFM tracing web service and a custom user interface in IQGeo for running and viewing traces. Note: Phase 2 will include an upgrade to supported version of IQGeo, implementation of Network Manger Gas to replace the IQGeo Capture application (for as-builting, map corrections, and public

	notes), and creation of new maps for the Operations Department. At that point, we will decommission Visual Fusion.	
In brief, why is this option recommended?	This option ensures business continuity and removes the risk of NWN-critical operations running on an end-of-life platform that does not receive security patches. It allows NWN to expand platform functionality that will help technical growth in the future. This option aligns with NWN's geospatial strategy to work toward consolidating field and web mapping applications for end users and provides end users with a more streamlined and easy-to-use method for their tracing needs. It also aligns with timing for the Esri UN migration.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• The operational and security risk of running critical emergency response functionality on an unsupported application and infrastructure will be remediated. • Replacing Visual Fusion with IQGeo will move this functionality out of an old, depreciated mapping application without adding to the number of supported applications. • Migrating functionality out of Visual Fusion puts NWN closer to the goal of being able to fully decommission it after Phase 2. It also moves the most critical functionality out of the product. • Providing tracing functionality in IQGeo will allow end users a more streamlined, user-friendly method for their mapping needs within a single application.
	Analysis Against Criteria: Cost-Benefit Analysis	• Zero spend today would likely cause increased costs later in terms of rising project team costs, internal costs for keep-the-lights-on support for Visual Fusion and end-of-life Microsoft products, rising license costs for Visual Fusion, and difficult onboarding/user experience for new employees. • All end users already have IQGeo licenses and access, so there is no need to buy new licenses for them. Familiarity with the product also means training should be a lighter lift. • If NWN completes the work before the Esri UN Migration project, this will build the framework to make the transition simpler and more cost effective while also avoiding throwaway work. Otherwise, it will take more money and effort to update the connections between systems and will need to be redone anyway.
	Analysis Against Criteria: Timing	• All projects with a geospatial impact at NWN share critical internal and external resources, so planning and early execution tasks will compete for NWN and vendor resources. The sooner NWN starts, the less competition the company will have for key resources (internal and external). • If NWN starts this now, the work will be done well before the Esri UN Migration project finishes, so future rework with an end-of-life tool is avoided.
	Criteria: Product Familiarity	• IQGeo is available to all NWN employees and contractors. Many teams have been exploring and using IQGeo for years. • Most tracing end users are familiar with IQGeo and perform some of their mapping work there today. • Training will consist of new functionality, not core product use, which saves time and effort. • IT&S support for IQGeo is already in place with internal resources and contractors, so NWN does not have to teach the Day 2 support team new technology for the handoff. • NWN has an existing relationship with IQGeo as a vendor, so they are familiar with NWN's technology landscape, project team, and stakeholders.
	Additional Risks	• Enabling NWN's desired functionality in IQGeo requires customization, which IT&S prefers to avoid as it adds risk and complexity over the lifespan of the application. • Some rework is required when NWN completes the Esri UN Migration project (e.g., if we keep this on-prem but move Esri to the cloud (no decision in place yet), NWN will then need to move the solution to the cloud). However, the work would be to connect IQGeo, a tool we expect to use for a long time, not Visual Fusion, which we are trying to decommission.

	Additional Benefits	• Business continuity is already ensured for IQGeo. • The NWN tech lead estimates NWN can use the existing integration pattern as a foundation for the new solution, so it should decrease the level of effort to set up middleware/keep the data flowing.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$1.1M - $1.3M	$110K – $130K	$1.2M – $1.5M

	Program/Project	**Ongoing Maintenance & Support**
O&M Range	$15-$20K	• Support costs: Less than $10K annually • Licensing costs: No new licenses so no cost increase from this, but IQGeo currently costs NWN $202,955/year through 2025

Source/ Method of Cost Data	Capital range was estimated using a 10% accuracy for Assess Phase. So, range shows 90% to 110%. Costs were estimated using a planning resource sheet with utilization expectations and team member expertise and estimates on two vendor costs (IQGeo and The Gartrell Group (TGG)). • Hardware: If we stay on-prem, we will use the existing app server and there will be no cost. If we deploy to Azure, it will be around $2k/year. • Software: No additional IQGeo licensing costs expected due to an already existing enterprise license that covers all employees and contractors. That current cost is $202,955/yr as of 2025. • Support costs: Since this is not used frequently (less than 4000 traces in 10 years), NWN anticipates it is less than 100 hours of NWN internal support a year, so less than $10K. Project O&M is for Change Management activities.

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	Do nothing and leave the current legacy application in place for the foreseeable future.	
In brief, why is this option not recommended?	• Visual Fusion would continue to be past end-of-life and present significant risk, including from a cybersecurity perspective. • If Visual Fusion is inoperable, only the GIS team (staffed with around 12 people) would be able to run traces, which is a risk in emergency situations, including after business hours. • The cost of maintaining Visual Fusion will not provide any long-term value. • Future costs for replacing Visual Fusion will likely be higher due to inflation, and the Company may not have the key resources at that time to implement a replacement product. • We will not make progress on our strategic goal to reduce mapping applications.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	• This alternative would not allow NWN to move away from an application and supporting technology that is past end-of-life and end-of-support which represents significant cybersecurity risk. • Continuing to use this application places a burden on the NWN IT&S and GIS teams to maintain. • NWN would not meet application consolidation goals. • Ends users would do most of their work in IQGeo and then just perform traces in Visual Fusion, which increases job complexity, creates confusion, and incurs training costs.

	Analysis Against Criteria: Cost-Benefit Analysis	• By not transitioning away from Visual Fusion, NWN would continue the maintenance spend and licensing costs we have today, and we would still need to replace this application in the future. The project costs will be pushed into the future, since ultimately a new solution is needed. • If NWN does not complete this work before the Esri UN Migration project, it will take more money and effort to update the connections between systems and will need to be redone eventually anyway. More technical debt would be incurred at the time of implementation as well as create complexity and additional cost if we extend use of Esri tools in the future.
	Analysis Against Criteria: Timing	• The current project team members (internal and external) are not guaranteed to be available when work is restarted. • There are several large projects in the pipeline that will tap the same resources, causing further constraints to the project.
	Additional Risks	• NWN has only one internal resource that supports Visual Fusion on the backend. This creates significant risk. Even NWN's production support vendor for GIS activities and IQGeo does not support Visual Fusion. • Using Visual Fusion is difficult because of all the obsolete technical requirements – Internet Explorer, Microsoft Silverlight – so it is not a desirable end user experience.
	Additional Benefits	• Change management not needed • No immediate new capital costs incurred • Project team freed up to work on other priorities

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	N/A	N/A	N/A
O&M Range	**Program/Project**		**Ongoing Maintenance & Support**
	N/A		• VF Annual License Fee: $56,407 • Internal support cost: $10,000
Source/ Method of Cost Data	• Software: Visual Fusion - $56,407/year as of 2025 Support costs: Since this is not used frequently (less than 4,000 traces in 10 years), NWN anticipates it is less than 100 hours of NWN internal support a year, so around $10K.		

ALTERNATIVE 2 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*	
Description	Instead of implementing the current Valve Isolation Tracing process in IQGeo, switch to IQGeo's tracing solution, Network Manager Gas.
In brief, why is this option not recommended?	Network Manager Gas is a new product, and no other gas utilities are using this solution. NWN does not want to be the first customer to use this solution and take on the risks associated with an unproven product. Additionally, NWN did not go forward with this solution because IQGeo requires customers to use their data model to accomplish tracing, meaning NWN would have to maintain one data model for Esri GIS data and a second data model for IQGeo Network Manager Gas. Having two different manually maintained versions of the same data invites errors into the systems and makes it likely that running a trace in each system would provide different results, which is unacceptable in an emergency. Furthermore, maintaining two models also requires data editing and maintenance, which would expand the mapping responsibilities of the GIS team and be redundant work. It would be a time consuming for the GIS team to set up a new IQGeo data model and also set up the new Esri data model in early 2025 as part of the Esri UN Migration project.

Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	This would have the same positive outcomes as our recommended solution: • The operational and security risk of running critical emergency response functionality on an unsupported application and infrastructure will be remediated. • Replacing Visual Fusion with IQGeo will move this functionality out of one of the old, depreciated mapping applications in the portfolio without adding to the number of supported applications. • Migrating functionality out of Visual Fusion puts NWN closer to the goal of being able to fully decommission it after Phase 2. It also moves the most critical functionality out of the product. • Providing tracing functionality in IQGeo will allow the end users a more streamlined, user-friendly method for their mapping needs within a single application.
	Analysis Against Criteria: Cost-Benefit Analysis	This would have the same positive outcomes as our recommended solution: • Zero spend today would likely cause increased costs later in terms of rising project team costs, internal costs for keep-the-lights-on support for Visual Fusion and end-of-life Microsoft products, rising license costs for Visual Fusion, and difficult onboarding/user experience for new employees. • If we complete the work before the Esri UN Migration project, we will not waste money on rework updating connections between the systems. Unlike our recommended solution: • Our license agreement already covers use of Network Manager Gas as long as we don't use it as our system of record. However, there would be additional cost for time for the editing and maintenance activities required of the GIS team.
	Analysis Against Criteria: Timing	This would have the same positive outcomes as our recommended solution: • All projects with a geospatial impact at NWN share critical internal and external resources, so planning and early execution tasks will compete for NWN and vendor resources. The sooner NWN starts, the less competition. • If NWN starts this now, NWN will be done well before the Esri UN Migration project finishes, eliminating future rework with an end-of-life tool.
	Criteria: Product Familiarity	This would have the same positive outcomes as our recommended solution: • IQGeo is available to all NWN employees and contractors. Many teams have been exploring and using IQGeo for years. • Most tracing end users are familiar with IQGeo and perform some of their mapping work there today. • IT&S support for IQGeo is already in place with internal resources and contractors, so NWN does not have to teach our Day 2 support team new technology. • NWN has an existing relationship with IQGeo, so they are familiar with NWN's technology landscape, project team, and stakeholders. Unlike our recommended solution: • Training will consist of new functionality, not core product use, which saves time and effort. However, this would be more training effort than the recommended approach since it is a new module in IQGeo.
	Additional Risks	• Additional planning activities would be required before implementation could be executed with confidence. The timeline of the project would extend. • Enabling NWN's desired functionality in IQGeo will still require customization, which IT&S prefers to avoid as it adds risk and complexity over the lifespan of the application.

		• Maintaining two data models introduces opportunity for mistakes and data that is not in sync. • We would have to do extensive QA testing to make sure trace results were identical in both systems, and there is no guarantee we could reach a point where that was true every time. • There will be rework required when NWN completes the Esri UN Migration project. However, it would be work to connect IQGeo, a tool we expect to use for a long time, not Visual Fusion, which we are trying to decommission. • Other gas utilities of similar sizes are not using this tool currently, so we would be the first to adopt it. That means there's a lot of unknown risks that may be realized once we start using the tool.
	Additional Benefits	• Business continuity is already ensured for this application.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$1.3 - $1.6	$130K – $160K	$1.4M – $1.8M

	Program/Project	**Ongoing Maintenance & Support**
O&M Range	$18K – $24K	• Additional GIS team support costs: $166K (Some of this is capital, since mapping work is largely capital work) • IT&S Support costs: Less than $10K annually • Licensing costs: No new licenses so no cost increase from this, but IQGeo costs NWN $202,955/year through 2025
Source/ Method of Cost Data	We took the recommended project costs and then increased them by 20% as an estimate because this would be a new module to set up, which is a little more complex. We would also be the first gas utility to do it, so our vendor partners would not come into this with a strong foundation on how to execute. Ongoing maintenance will increase since we would need to maintain two data models. GIS Techs would have to update Esri and then work in IQGeo to update the connectivity model there. We assumed a 20% increase in mapping activities for 8 techs, so that's about 4 extra hours a week, which is about $166K. Mapping work is largely capital, but some of this would be an O&M hit.	

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 3	Do not transition from Visual Fusion and do not replace the tool ever.	NWN would be running a critical emergency response function on an application that was no longer receiving security patches, hotfixes, or any level of customer support. Performing valve isolation traces would be a GIS Team responsibility, and the business would need to adapt schedules and emergency planning and coordination efforts to include the GIS Team going forward. It would likely require additional

		headcount on the GIS Team to support. This is not acceptable and not viable. Traces can be necessary outside of business hours, so it would require an on-call model to support.
Alternative 4	Build a custom, in-house solution.	NWN does not have the in-house development resources to do this, so it would require hiring developers, then keeping FTEs to maintain, update, patch, etc. the tool. There would be no external support, NWN would not be able to ask other utilities how they were handing tasks in the tool, there would be no how-to resources already available online to check out, there would be not 3rd party compatible tools. NWN would have to re-write all our integrations. This is not acceptable and not viable.
Alternative 5	Transition away from IQGeo entirely to another commercial tracing solution, such as expanding NWN's use of ArcFM Viewer for valve tracing or building an Esri web application.	NWN wants to consolidate mapping tools, not bring new ones into the ecosystem. A new tool would require a new set of license fees, new training for both the foundational use of the tool as well as the tracing-specific functionality, and new training for IT&S resources to maintain it. If NWN brought in a new tool, the company would need to build many integrations from scratch. All of these changes would likely require external contractor support and a system integrator, so this would add significant cost to the project and slow down the timeline of delivery.

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Identity Governance and Administration (IGA) - Centralization of User Provisioning and Management (IGA 2.0)
Date: 2/12/2025
Project Sponsor: Matt Carlson
Executive Sponsor: Brian Fellon
Project Manager: Michael Castle
Preparer: Michael Castle
Was this project part of IRP: NO (enter "Yes, included", "Yes, Acknowledged" or "No")

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking.

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	NW Natural (NWN) is in the process of improving its overall IT security posture. The need for improvement is driven by both regulatory requirements and the evolving nature of the IT landscape (e.g., on-premises focused to cloud-centric). One of the priority areas for improvement is identity governance and administration (IGA) that includes consistent identification and tracking of personnel identities and access permissions as well as access management processes. As a result, a multiple-phased implementation of an IGA solution started with Phase 1 in 2023 to select, install and configure a state-of-the-art IGA solution (SailPoint Identify Security Cloud (ISC) product), establish connections and data collection for priority identity sources and key systems and establish foundational functionality. Additional project phases are planned to build upon the core IGA solution delivered in Phase 1.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g., why is the current state not working)?	**Problem Statement**: After implementation of the foundational IGA solution in 2024, the next phase of the project is needed for NWN to begin realizing the benefits of an IGA solution. This project will focus on extending the base functional capabilities, expanding to additional systems/applications, preparing for and implementing a pilot of Role Based Access Controls (RBAC) and solidifying the foundation for the IGA systems and processes, including establishing baseline SOX controls and disaster recovery plans for SailPoint ISC and NERM. Phase 3, planned to start in 2025, is expected to further deploy RBAC within the NW Natural environment and further expand automation of IGA processes. **Business Need / Why is this problem worth Solving?** When an employee or contractor is offboarded from NWN, there is no way to certify their access has been completely removed from all systems/applications until the IGA solution has been integrated with those systems/applications. The Sarbanes-Oxley Act (SOX) requires consistent, reliable removal of access permissions for offboarded employees as part of ensuring that unauthorized individuals cannot access sensitive financial information. Unfortunately, even with efforts to optimize and enhance NWN's current manual processes, this manual method has been unable to sustain consistent compliance due to the scale and complexity of NWN's systems. As a result, NWN needs to continue integration of the IGA solution with additional systems/applications.
Desired Deliverables What high level output / scope / deliverables are core to this project?	The key objective and outcome for the entire IGA initiative is to elevate the core function of an IGA tool to govern the lifecycle of identities across the enterprise. Automation and exception routing enhances the ability to respond to requests and issues quickly and efficiently.

	Once fully implemented, the IGA tool will eliminate many manual processes that are performed today. IGA will allow for policies to be engineered into the system, simplifying review and policy conformance. Through the course of IGA implementation, role-based access control within NWN will support least privilege access and timely provisioning and deprovisioning of the proper levels of access to technology systems and equipment.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	The options under consideration are straightforward: continue integration of the existing IGA solution with additional systems/applications, explore solutions from a different vendor, or maintain the status quo with the current manual processes. IGA is an evolutionary, multi-phased effort to build infrastructure, processes, tools and capabilities to improve IT identity and access management and overall NW Natural IT security, compliance and efficiency; therefore, Phase 2 has always been anticipated. The scope for Phase 2 has been established to pragmatically build on the foundation established in Phase 1 within realistic resource, budget, and timeline constraints, applying lessons learned from Phase 1 and anticipated activities within NW Natural that may pose challenges for resources. Generally, NW Natural expected to continue the evolution of IGA with a Phase 2 effort and evaluated alternatives around items to include in scope, size of budget/resources and what could realistically be delivered in the near-term given competing priorities and ability to absorb change.
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Level of effort to deploy	a. Complexity • How intricate or straightforward is each option to implement, irrespective of the nature of the change (upgrade, new solution or maintaining existing system) b. Resource Allocation • What people, technical, and financial resources are required for each option? • Does the option require new expertise, or can it be handled by the current resources on staff? c. Timeline • How long is the expected duration from the mobilization of the vendor to completion of each option? • Are there any anticipated delays or hurdles specific to an option?
Criteria: User Impact	a. Learning Curve • How quickly can users adapt to the changes or upgrades presented by each option? • Does a particular option require users to unlearn certain processes or habits? b. Training Needs: • How quickly can users adapt to the changes or upgrades presented by each option?

	• Does a particular option require users to unlearn certain processes or habits? c. Productivity • Is there expected downtime or a potential drop in productivity during or post-implementation for each option? • How soon can normalcy or improved performance be expected post-transition?
Criteria: Overall Cost Implications	a. Initial Expenditure • What are the upfront costs associated with each option, including licensing, hardware, and setup? b. Ongoing Costs: • Are there recurrent expenses, such as maintenance fees, subscription costs, or additional licenses?

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	Continue integration of the existing IGA solution with additional systems/applications	
In brief, why is this the recommended option?	NWN's IGA strategy is to roll out additional scope and functionality over multiple project phases. The current project is the second of at least three planned phases. Phase 1, which completed in 2024, established connections and data collection for priority identity sources and key systems and established foundational functionality. This option is recommended as it will focus on extending the base functional capabilities, expanding to additional systems/applications, preparing for and implementing a pilot of Role Based Access Controls (RBAC) and solidifying the foundation for the IGA systems and processes, including establishing baseline SOX controls and disaster recovery plans for the IGA solution.	
Assessment	**Analysis Against Criteria:** Alignment to NW Natural's IT Strategy	Comprehensive features and functionality paired with scalability, flexibility, user-friendly interface, integration capabilities, security and compliance, and vendor support.
	Analysis Against Criteria: Cost-Benefit Analysis	Should a solution be built or bought and which bought solution is the most cost effective while still achieving the project's goal.
	Analysis Against Criteria: Timing	Ability to complete a project in time to meet a regulatory, business, product lifecycle, or safety requirement.
	Additional Benefits	Overall, IGA benefits include: 1. Improved end-user experiences including faster access to applications and services, consistent data across application identities, and role creation allows for access consistency. 2. Security posture improvements will address our immediate need to handle personnel terminations in accordance with regulatory obligations. Long-term benefits include improving group membership discovery and facilitating adoption of zero-trust network architecture. 3. Compliance and regulatory needs continue to grow in all industries. IGA will help us provide auditors with timely evidence to demonstrate compliance with various rules and regulations.

		4. Reduced Administrative Overhead - reduction in manual processing will increase accuracy of IAM activities and frees up resources to perform more value-add work.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2,643,384 - $2,846,184	10%	$2,907,722 - $3,130,802
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$20,000 - $30,000	$250,000 - $315,000	
Source/ Method of Cost Data	SailPoint Identify Security Cloud licenses are $250,000 per year with installation occurring in 2024. Ongoing maintenance and support figures are for licenses only. The system support will be done by existing FTE and therefore is not incremental.		

ALTERNATIVES CONSIDERED NOT VIABLE

Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why

	Description	**Why the Alternative is not viable**
Alternative 1	Deploy a new IGA solution.	Deploying a new IGA solution would be more costly, more labor-intensive, and take significantly more time, without any assurance of achieving a superior outcome beyond where we are today with the existing SaaS solution. NWN's IGA strategy is to roll out additional scope and functionality over multiple project phases. The current project is the second of at least three planned phases. Other software vendors were evaluated as alternatives as part of the previous IGA project. This evaluation was summarized in the Alternatives Analysis for that project.
Alternative 2	Do nothing.	Opting to "do nothing" and retaining the existing IGA solution functionality would minimize the benefit of the $3.3M investment of implementing the foundational platform in the IGA 1.0 project which completed in 2024. The manual processes would need to be retained with their inherent compliance risk and reduced level of security.

**Add rows for any additional alternatives considered not viable*

Executive Summary

The Pipeline and Hazardous Materials Safety Administration (PHMSA) is issuing this report to highlight the strengths and limitations for pipeline risk models, and to support improvements in Gas Transmission and Hazardous Liquid pipeline risk models. Operators establish risk models to address risk and improve safety within their respective pipeline systems.

Pipeline risk models are a foundational part of the assessment of operational pipeline risk. Federal pipeline safety integrity management (IM) regulations require pipeline operators to use risk assessments.[1] Based on the results of pipeline inspections and failure investigation findings, both the Department of Transportation's PHMSA and the National Transportation Safety Board (NTSB) have identified general weaknesses in the risk models used by pipeline operators in performing risk assessments for their IM programs.

To help address this problem, PHMSA organized a Risk Modeling Work Group (RMWG) composed of representatives of state and federal pipeline regulators, pipeline operators, industry organizations, national laboratory personnel, and other stakeholders. The purpose of the RMWG was to gather information regarding state-of-the-art pipeline risk modeling methods and tools, the use of those methods and tools, and the resulting data in operator IM programs. This document provides an overview of methods and tools for improved implementation based on the results of the RMWG.[2]

This report considers the major types of pipeline risk models, and the effectiveness of each type in supporting risk assessments, as applied to pipeline operator decisions. The four major risk model types considered are: Qualitative, Relative Assessment/Index, Quantitative System, and Probabilistic. Each type is characterized by the model inputs, outputs, and algorithms, and was evaluated according to its ability to support pipeline risk management decisions and regulatory requirements.

This overview document focuses on the applicability of the different risk model types to various risk management decisions required by the Federal pipeline safety IM regulations, including:

1. Risk Priorities for Baseline Integrity Assessments
2. Identification of Preventive Measures and Mitigative Measures
3. Evaluation and Comparison of Preventive Measures and Mitigative Measures
4. Consideration of Threats and their Interactions in Risk Assessments
5. Benefit-Cost Analysis for Risk Reduction Options[3]
6. Integrity Assessment Interval Determination

---

[1] 49 Code of Federal Regulations (CFR) Part 192, Subpart O (Gas Transmission Pipelines) and 49 CFR Part 195.452 (Hazardous Liquid Pipelines).

[2] Documentation of RMWG activities, including all technical presentations and meeting notes, can be viewed on PHMSA's Pipeline Technical Resources web site in tab RMWG at https://www.phmsa.dot.gov/pipeline/risk-modeling-work-group/risk-modeling-work-group-overview.

[3] The IM rules require operators to reduce risks to high consequence areas (HCAs) by implementing preventive and mitigative measures (risk reduction actions) beyond those measures specifically required elsewhere in the pipeline safety regulations (49 CFR Parts 192 and 195). If limited operator resources require prioritization of measures that could be effective in reducing risk, then benefit-cost analysis, supported by the operator's risk model, provides an effective method of promoting efficiency as well as risk reduction.

7. Support of Continual Evaluation of Integrity and General Risk Management Decision Making

Conclusions

This report details discussions and technical recommendations related to the various aspects of pipeline risk modeling. PHMSA has derived the following summary conclusions:

1. The overriding principle in employing any type of risk model/assessment is that it supports risk management decisions to reduce risks.

2. While different risk model types have different capabilities for evaluating risk reduction actions, Quantitative System models or Probabilistic models are more versatile and provide greater capabilities to provide risk insights and support decision making. Such models can be more complex; however, they do not necessarily require more data than other types of risk models.
    - Small pipeline operators with limited but highly knowledgeable personnel resources will likely continue to use Relative Assessment/Index models.
    - Pipeline operators who continue to use Relative Assessment/Index models should seek to supplement personnel judgment with as much physical data as can reasonably be acquired over time.
    - Adequate and accurate data is needed for the application of all risk model types.

3. Pipeline operators should take ongoing actions to improve and update data quality and completeness over time. However, the type of risk model to employ in pipeline risk analysis should not depend primarily on the perceived initial quality and completeness of input data because all of the models utilize the available data. Instead, operators should select the best model approach and then populate the model with the best information currently available on risk factors or threats for each pipeline segment, and improve that data over time.

4. It is important for risk models to include modeling of incorrect operations, which includes human interactions and human performance, that are significant to the likelihood of failure or have a significant effect on consequences of a failure (e.g., inappropriate controller restart of pumps, realistic emergency response time scenarios, design and construction human errors).

5. It is important for pipeline risk models to include the potential effects of threats to interact in ways that can increase risk. Therefore, when risk analysis involves multiple threats, the effect of “interactive threats” or dependencies on likelihood of failure should be clearly evaluated.

6. Varying levels of sophistication are possible in the analysis of the consequences of a failure. However, it is important to consider an applicable range of scenarios (even if they do not have a high probability of occurrence) to capture the appropriate spectrum of possible consequences.

7. The characteristics of pipeline facilities that affect risk may be significantly different than those of line pipe, but the same basic risk assessment principles apply, and the same types of models may be applied.

PHMSA recommends that pipeline operators develop and apply risk models considering these summary conclusions and the associated technical recommendations contained in this document. This should result in an improved understanding of the risks from pipeline systems and should improve critical safety information provided for the broader integrity and risk management processes.

RMWG Meeting Technical Presentations

The RMWG conducted several meetings during 2016 and 2017 to define, review, and document best practices in applying pipeline risk models. The presentations on technical topics from the RMWG meetings have been used to develop this document. Pipeline operators may wish to consider these presentations when developing their own risk models. The below technical topics were presented at RMWG meetings, and are available at: https://www.phmsa.dot.gov/pipeline/risk-modeling-work-group/risk-modeling-working-group-rd-documents-presentations.

The RMWG and PHMSA thank the individuals and groups that supported this effort by presenting materials at our meetings.

PHMSA thanks the members of the RMWG for their efforts and time spent in attending meetings, presentations, discussion, and commenting during the development of this document.

I. Definitions & Acronyms

Definitions		
Term	**Definition**	**Source**
Terms Related to Defining Risk		
Consequence	Impact that a pipeline failure could have on the public, employees, property, the environment, or organizational objectives.	B31.8S-2004, ISO 31000:2009
Frequency	Number of events or outcomes per defined unit of time. Frequency can be applied to past events or to potential future events, where it can be used as a measure of likelihood/probability.	ISO 31000:2009
Hazard	Source of potential harm or potential consequences.	Muhlbauer, 2004 ISO Guide 73-2009
Likelihood	The chance of something happening, whether defined, measured, or determined objectively or subjectively, qualitatively or quantitatively, and described using general terms or mathematically (such as a probability or frequency over a given time period).	ISO 31000:2009
Probability	(1) Likelihood, or (2) Measure of the chance of occurrence expressed as a number between 0 and 1, where 0 is impossibility and 1 is absolute certainty.	(1) numerous sources use the terms likelihood and probability interchangeably (2) ISO 31000:2009
Risk	Measure of potential loss in terms of both the likelihood or frequency of occurrence of an event and the magnitude of the consequences from the event. [Note: In practice, "likelihood," "probability," and "frequency" are often used interchangeably. In each risk modeling approach, the associated units (e.g., events/year) for each variable must be carefully assigned/verified in order to assure proper usage.]	B31.8S-2004 CSA Z662 Annex B
Terms Related to Defining Risk Assessment and Risk Assessment Models		
Risk analysis	Process of using available information to comprehend the nature of risk and estimate the level of risk.	ISO 31000:2009
Risk assessment	Systematic process in which hazards from pipeline operation are identified and the probability and consequences of potential adverse events are analyzed and estimated.	B31.8S-2004
Risk assessment model (Risk Model)	A set of algorithms or rules that use available information and data relationships to perform risk assessment. A model is a simplified representation of a pipeline system and represents the relation of important risk factors.	Muhlbauer, 2004

February 1, 2020

Definitions		
Term	**Definition**	**Source**
Risk management	Overall program consisting of identifying potential threats to a pipeline; assessing the risk associated with those threats in terms of incident likelihood and consequences; mitigating risk by reducing the likelihood, the consequences, or both; and measuring the risk reduction results achieved.	B31.8S-2004
Terms Related to Different Types of Risk Models		
Index model	Scoring rules or algorithms that define how a risk index is calculated from input information. The scoring rules do not attempt to consistently adhere to the laws of probability.	RMWG
Probabilistic model	Model with inputs that are quantities or probability distributions and with outputs that are probability distributions. Model logic attempts to adhere to laws of probability.	RMWG
Qualitative	Expressible in relative terms, but not quantitatively or numerically; measured as relational categories (e.g., high, medium, low), but not as numerical quantities or amounts.	RMWG
Qualitative model	Model with inputs and outputs that are verbal or ordinal categories. Model logic defines output categories from combinations of input categories.	RMWG
Quantitative	Expressible in terms of numerical quantity or involving the numerical measurement of quantity or amount.	Dictionary (Merriam-Webster.com)
Quantitative model	A model with input that is quantitative and output that is quantitative. Model logic may or may not conform to laws of probability or to represent physical and logical relationships of risk factors (see definition of quantitative system model).	RMWG
Quantitative system model	A quantitative risk model with an algorithm that models the physical and logical relationships of risk factors to estimate quantitative outputs for likelihood and consequences and represents the outputs in standard units such as frequency, probability, and expected loss. This modeling approach is in contrast to index models that score and weight individual model inputs and calculate a unit-less index score.	RMWG
Relative assessment model	Synonymous term as a risk index model (see separate risk index definition).	RMWG
Risk index	Unit-less measure of risk derived from input information using ordinal scales.	ISO/IEC-31010-2009 – Risk management – Risk assessment techniques
Other Terms		
Data structure	A specialized format for organizing and storing data. A data structure is designed to organize data to suit a specific purpose so that it can be accessed and worked with in appropriate ways.	RMWG

February 1, 2020

Definitions		
Term	**Definition**	**Source**
Facility	Portions of a pipeline system other than line pipe: includes compressor units, metering stations, regulator stations, delivery stations, holders, fabricated assemblies, and underground storage facilities (gas); and pumping units, fabricated assemblies associated with pumping units, metering and delivery stations and fabricated assemblies therein, breakout tanks, and underground storage facilities (liquid).	49 CFR Part 192.3 49 CFR Part 195.2
Failure	(1) A part in service has become completely inoperable; is still operable but is incapable of satisfactorily performing its intended function; or has deteriorated seriously, to the point that is has become unreliable or unsafe for continued use. (2) A structure is subjected to stresses beyond its capabilities, resulting in its structural integrity being compromised. (3) Unintentional release of pipeline contents, loss of integrity, leak, or rupture.	B31.8S-2004 Muhlbauer, 2004 Muhlbauer, 2015
Gas pipeline	All parts of those physical facilities through which gas moves in transportation, including pipe, valves, and other appurtenance attached to pipe, compressor units, metering stations, regulator stations, delivery stations, holders, and fabricated assemblies.	49 CFR Part 192.3
Hazardous liquid pipeline	All parts of a pipeline facility through which a hazardous liquid or carbon dioxide moves in transportation, including, but not limited to, line pipe, valves and other appurtenances connected to line pipe, pumping units, fabricated assemblies associated with pumping units, metering and delivery stations and fabricated assemblies therein, and breakout tanks.	49 CFR Part 195.2
Line pipe	Cylindrical linear “mileage” portions of a pipeline system that transport commodities from one point to another; i.e., the part of a pipeline system outside of any facilities.	49 CFR Part 195.2
Linear reference system	A systematic method of associating pipeline characteristics or other risk factors to specific positions on the pipeline.	RMWG
Mitigative measure	Risk reduction action to reduce risk by modifying the consequences of failure.	RMWG
Preventive measure	Risk reduction action to reduce risk by modifying the probability of failure.	RMWG
Risk factor	Pipeline characteristic or other input that is used by the model algorithm to determine model outputs; can be a data attribute input to a risk model.	RMWG

Definitions		
Term	**Definition**	**Source**
Risk Modeling Work Group (RMWG)	A PHMSA-organized group composed of representatives of state and federal pipeline regulators, pipeline operators, industry organizations, national laboratory personnel, and other stakeholders. The purpose of the RMWG was to characterize state-of-the-art pipeline risk modeling methods and tools. RMWG members individually provided recommendations to PHMSA regarding the use of those methods, tools, and the resulting data in operator IM programs.	RMWG
Scenario	Sequence of events that, when combined, result in a failure.	Muhlbauer, 2015
Segment	A contiguous length of pipeline or part of a pipeline in a specific geographic location.	RMWG
Threat	Potential cause of failure; failure mechanism.	B31.8S-2004 Muhlbauer, 2015
Time-dependent	Failure rate for threat tends to increase with time and is logically linked with an aging effect.	Muhlbauer, 2015
Time-independent	Failure rate for threat tends to vary only with a changing environment; failure rate should stay constant as long as environment stays constant.	Muhlbauer, 2015

VSL	Value of Statistical Life
WROF	weather related and outside force

II. Introduction

A. Purpose of Document

Risk models are a foundational part of the assessment of operational pipeline risk and an integral part of gas and hazardous liquid pipeline integrity and risk management. A risk model provides a representation of the risks throughout a pipeline system by combining inputs associated with both likelihood and consequence aspects of unintended pipeline releases. The model supports risk analysis and helps operators evaluate and quantify the effects of various risk mitigation activities and make risk management decisions.

This document provides an overview of methods and tools to be used in risk modeling in support of pipeline integrity and risk management of gas and hazardous liquid transmission pipelines. Broader topics such as integrity management systems, quality management systems, overall risk management, and safety management systems are not addressed within this document.

Federal gas and hazardous liquid pipeline safety integrity management (IM) regulations (see Appendix E) contain requirements for the uses of risk assessments by pipeline operators. Based on the results of pipeline inspections and failure investigation findings, both the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration (PHMSA) and the National Transportation Safety Board (NTSB) have identified general weaknesses in the risk models used by pipeline operators in performing risk assessments for their IM programs. Generally, the models used have not enabled operators to systematically identify and effectively analyze risk reduction actions. PHMSA has previously communicated findings and concerns regarding risk models at past public meetings.[4]

B. NTSB Recommendations

In 2015, the NTSB published a safety study titled *Integrity Management of Gas Transmission Pipelines in High Consequence Areas* (https://www.ntsb.gov/safety/safety-studies/Pages/SS1501.aspx). The NTSB undertook this study because of concerns about deficiencies in the operators' integrity management programs and the oversight of these programs by PHMSA and state regulators. As a result of the study, the NTSB made three recommendations to PHMSA concerning the use of risk assessments:

- **Recommendation P-15-10**: Update guidance for gas transmission pipeline operators and inspectors on the evaluation of interactive threats. This guidance

[4] See meeting records for "Improving Pipeline Risk Assessments and Recordkeeping," Arlington, Virginia, July 21, 2011 (https://primis.phmsa.dot.gov/meetings/MtgHome.mtg?mtg=70), and "PHMSA Pipeline Risk Modeling Methodologies Public Workshop," Arlington, Virginia, September 9, 2015, (https://primis.phmsa.dot.gov/meetings/MtgHome.mtg?mtg=104).

should list all threat interactions that must be evaluated and acceptable methods to be used.

- This overview document discusses interactive threats in Section IV, Important Elements of Likelihood Modeling, Part E, Interactive Threat Modeling. The section lists different threats that can potentially interact as well as methods for incorporating threat interactions into risk models and provides discussions of the completed PHMSA-funded project DTPH56-14-H-00004 that provides tools and techniques for accounting for interacting threats in risk assessments (https://primis.phmsa.dot.gov/matrix/PrjHome.rdm?prj=557).

To promote the development and application of improved pipeline risk models and to respond to these recommendations, PHMSA committed to organize and work with stakeholders in a Risk Modeling Work Group (RMWG) to help inform the development of this overview of methods and tools document.

The RMWG[6] was organized with representatives from state and federal pipeline regulators, pipeline operators and industry organizations, national laboratories, and other stakeholders.

[6] The mission statement of the RMWG that developed this document can be found at https://www.phmsa.dot.gov/pipeline/risk-modeling-work-group/risk-modeling-working-group-rd-documents-presentations along with other pertinent background information. See also Appendix F of this document for the RMWG mission statement.

This overview document incorporates information gathered from the presentations, meetings, and comments from members of the RMWG with respect to the state-of-the-art of pipeline risk modeling.

C. Definition of Risk

Risk is defined[7] as a measure of potential loss in terms of both the likelihood (or frequency of occurrence) of an event and the magnitude of the consequences from the event. A standard conceptual definition of risk used to structure risk assessment is given by the equation:

$$Risk = Likelihood\ x\ Consequence$$

For hazardous liquid and natural gas pipeline systems, the basic undesired event is the failure of a pipeline or pipeline system that results in a release of the gas or hazardous liquid. Likelihood is the probability or frequency of failure due to threats that affect the pipeline, and consequence is the severity of impacts to different receptor categories (e.g., human safety, environment, property) because of a pipeline failure.

A risk analysis considers the likelihood of failure from all potential and existing threats at each location along the pipeline. In addition, each receptor category may experience different consequence levels from a pipeline failure, depending on the failure mode (e.g., leak vs. rupture event) and location of the failure (e.g., proximity to receptors such as population and environmentally sensitive areas).

D. Background

Federal pipeline safety regulations have included requirements for risk assessment and risk analysis in the hazardous liquid and gas pipeline integrity management (IM) rules since their inception. Gas transmission IM requirements are found in 49 Code of Federal Regulations (CFR) Part 192, Subpart O. Hazardous Liquid IM requirements are found in 49 CFR Part 195.452.[8]

Initially, many pipeline operators implemented relative risk models to prioritize their performance of baseline integrity assessments and remediation of pipeline segment threats. However, the application of risk analysis required by Federal pipeline safety regulations goes well beyond the simple prioritization of pipeline segments for baseline integrity assessments. Additional applications include the following broad areas of performance requirements:

- Identification (§§ 195.452 (i)(1) and 192.935(a)) and evaluation (§§ 195.452 (i)(2), 192.911(c), and 192.917(c)) of preventive measures and mitigative measures;

[7] See definitions used in Section I of this document.

[8] See Appendix E of this document for excerpts from these requirements that relate to risk assessment and risk models. Regulatory references are those in effect as of the date of this document.

- Continual integrity evaluation process to identify the risks of integrity threats (§§ 195.452 (j)(2) and 192.937(b)); and
- Continual integrity assessment interval determination process ((§§ 195.452 (j)(3) and 192.939(a)(1)(i)).

PHMSA inspections of operator IM programs include operator risk assessment processes and the risk models employed in those processes; inspection experience indicates that operators' risk assessment approaches, primarily qualitative and relative risk models, have been lacking in many cases to meet all IM requirements and provide meaningful insight into the risks in an operator's unique operating environment.

The IM regulations also require operators to continuously improve their IM programs, and overall industry integrity performance has shown general improvement over time. However, the continuing occurrence of significant pipeline incidents points to a continuing need for operators to upgrade their tools for risk assessment and risk management. Upgrades to risk assessment processes using quantitative or probabilistic risk models is a prudent step for operators to take to improve IM programs, allowing better definition of the risks on pipeline systems and better support for risk management practices.

PHMSA has communicated its findings and concerns regarding risk models at past public meetings[9] and worked with the stakeholder participants in the RMWG to develop this overview document in support of improved pipeline risk models and their usage, as appropriate.

E. Risk Model Categories

Risk models employed in pipeline risk analysis can be categorized based on the nature of the model's inputs, outputs, and the nature of the algorithms used to convert the inputs to outputs. This overview document evaluates each category for its suitability to support pipeline operator decision making.

Table II-1 below gives the breakdown of risk model categories:

[9] See meeting records "Improving Pipeline Risk Assessments and Recordkeeping," Arlington, Virginia, July 21, 2011 (https://primis.phmsa.dot.gov/meetings/MtgHome.mtg?mtg=70), and "PHMSA Pipeline Risk Modeling Methodologies Public Workshop," Arlington, Virginia, September 9, 2015 (https://primis.phmsa.dot.gov/meetings/MtgHome.mtg?mtg=104).

Table II-1
Risk Model Categories

Model Category	Inputs	Outputs	Algorithms
Qualitative[10]	Qualitative and Quantitative	Qualitative	"Matrix" Mapping Inputs to Outputs
Relative Assessment/Index	Qualitative and Quantitative	Quantitative – unit-less	Risk Index Scoring
Quantitative System	Quantitative[11]	Quantitative – with units	Quantitative System Model
Probabilistic	Quantitative, including probability distributions	Probability distributions	Quantitative System Model

The **Qualitative** model uses qualitative inputs and outputs. The model translates any quantitative inputs into ranges or qualitative outputs (e.g., high, medium, low). The algorithm in this model is a direct mapping of inputs to outputs, often represented by a matrix.[12]

The **Relative Assessment** or **Index** model uses quantitative *or* qualitative inputs to derive quantitative outputs using a scoring algorithm.[13] Scores assigned to inputs are combined to obtain a unit-less quantitative output "index" score. The most common method of combining inputs and obtaining model outputs is to sum the individual and sometimes weighted risk factor scores.

The quantitative outputs are not expressed in risk assessment units like probability, frequency, or expected loss. Instead, they are unit-less index scores for likelihood, consequence, and risk. This method of combining risk factor inputs and producing outputs distinguishes this model from quantitative system or probabilistic models. Index models were used widely by pipeline operators to establish priorities for integrity assessments as part of the baseline integrity assessment requirements of the pipeline IM rules.

[10] Includes "SME" approaches.
[11] These models can use qualitative inputs that have been converted to numerical equivalents for evaluation.
[12] See Appendix A and ISO/IEC 31010:2009 – *Risk management – Risk assessment techniques* Annex B.29.
[13] See Appendix A and ISO/IEC 31010:2009 – *Risk management – Risk assessment techniques* Annex B.28.

- The term "semi-quantitative" risk model is not used in this document, in part due to RMWG technical discussions that indicated a wide variance in how this term can be interpreted. ASME B31.8S also does not use the term semi-quantitative, but in the description of the relative assessment model approach states "*Such relative or data-based methods use models that identify and quantitatively weigh the major threats and consequences relevant to past pipeline operations. These approaches are considered relative risk models, since the risk results are compared with results generated from the same model.*" Consistent with this treatment, risk models that have incorporated quantitative elements into their algorithms, but retain the underlying relative model structure, are included in the Table II-1 "Relative Assessment/Index" model category.

The **Quantitative System** model also has quantitative inputs and outputs. However, it is distinguished from Relative Assessment/Index models in significant ways, including:

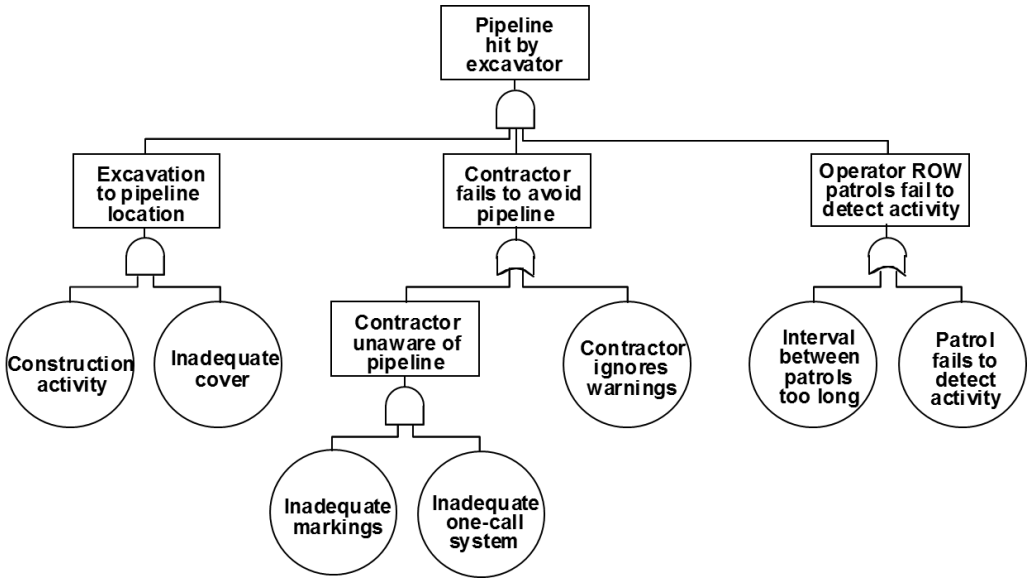
- Use of quantitative inputs and outputs that are expressed in risk assessment units like probability, frequency, expected loss, etc. Usage of risk assessment units is an important distinction from numerical/quantitative values used in Relative Assessment/Index models that are unit-less values, and only can be used to compare if they are higher/lower than other values within the model. For example:[14]
    - In a Relative/Index Model, a threat input value of "8" for coating condition on one pipeline segment versus a value of "4" on a different segment does not mean it is twice as likely to cause a failure due to poor coating, only that the segment with the higher value has relatively poorer coating than the segment with the lower value.
    - In a Relative/Index Model, a risk output value of "70" for a pipeline segment does not represent "twice" the risk of a different segment with an output value of "35"; only that the segment with the higher value has been determined to be of higher risk relative to the segment that has a lower score.
- Algorithms that model the physical and logical relationships of the pipeline system risk factors, the threats to system integrity, and the potential consequences of a product release from the system. This approach aims to combine risk factors in ways that more directly reflect physical reality (e.g., corrosion rates applied to effective wall thicknesses). The outputs from these models are likelihood, consequence, and risk measures expressed in recognizable units, such as probability or frequency of failure and expected loss.

  A minority of operators have employed models of this type in their IM programs.

[14] In these examples, higher values imply higher threat likelihood and higher risk.

As a simplified example of how Quantitative System models might model the relationship of risk factors in a pipeline system, consider part of a model of the probability of failure from third-party excavation damage. A failure from excavation damage may be modeled as the logical combination of factors such as the frequency of excavation activity in the area of the pipeline, one-call system probabilities, depth of cover, probability of an excavator hitting the pipeline, pipe resistance to a hit, and the effect of pipeline rights-of-way (ROW) patrolling. Figure II-1 (also shown in Appendix A.3) is an illustration of such a model for developing the probability of a pipeline hit by an excavator, using a fault tree to model the relationship of the relevant risk factors.[15] In this model, the probability of a hit is calculated by evaluating the likelihood of the individual risk factors (frequency of construction activity, probability of inadequate cover, probability of inadequate one-call, etc.) and combining these likelihoods according to the logical relationships in the model. The model's output likelihood is calculated in the units of frequency (per unit time) of a pipeline hit.[16]

Figure II-1
Simplified Example Fault Tree Model for Excavator to Hit Pipeline[17]



The **Probabilistic** model is a specific type of Quantitative System model. It is distinguished from other such models by using probability distributions to represent uncertainties in model inputs. Input distributions are propagated through the model to obtain probability distributions that represent uncertainty in the model outputs, such as failure probability, severity of consequences given a failure, or expected loss.

---

[15] See ISO/IEC 31010:2009 – *Risk management – Risk assessment techniques*, Annex B.14.

[16] In contrast, an index model would have unit-less output values based on the (possibly weighted) sum of the individual risk factor scores.

[17] From Stephens, Mark, C-FER Technologies, *Methods for Probability Estimation* presentation to PHMSA Risk Modeling Work Group, 2016.

See Appendix A for examples of these model types.

E.1 ASME B31.8S Risk Assessment Method Categorization

In choosing risk assessment approaches to evaluate, PHMSA chose the risk model categories listed in above Table II-1, Risk Model Categories, as they are applicable for both hazardous liquid pipelines and gas transmission pipelines and represented basic methods of modeling.

ASME B31.8S-2004[18] presented four alternative approaches for gas transmission integrity management risk assessment:

1. Subject Matter Experts (SMEs)
2. Relative Assessment Models
3. Scenario-Based Models
4. Probabilistic Models

While there is overlap between these and PHMSA's four categories, the RMWG members noted that the ASME categories were not strictly risk models, but instead a mixture of both risk assessment tools and models.[19]

For example, Subject Matter Experts perform an important role in all types of pipeline risk modeling, and SME input is fundamental to both qualitative and quantitative model input. As a risk assessment method, the Table II-1 "Qualitative" category is comparable to the "Subject Matter Experts" B31.8S risk assessment approach category. To minimize potential confusion with the more general role of SMEs for all types of pipeline risk models, the term "Qualitative" risk model is used in this document instead of "Subject Matter Experts (SMEs)."

The RMWG members also noted that stand-alone scenario-based methods were utilized by some (mainly hazardous liquid) pipeline operators in the early phases of integrity management program development. These approaches look at specific failures and seek to identify events that could lead to that failure (e.g., HAZOP is a type of scenario model). In practice, this approach has proved to be difficult to apply to significant lengths of line pipe, and more recent applications have generally been limited to specialized cases (e.g., where a particular consequence is of concern).[20]

In addition, the B31.8S description of the "Scenario-Based" risk assessment method notes that "*This method usually includes construction of event trees, decision trees, and fault trees*." As noted previously in this section, these types of tools are often employed in both quantitative and probabilistic risk models as part of their model algorithms. For instance, fault trees[21] may be used to break down failure due to threats into more specific constituent events that can lead

[18] ASME B31.8S-2004 is incorporated by reference in the gas transmission IM rule, 49 CFR Part 192, Subpart O.
[19] Muhlbauer, *Pipeline Risk Assessment: The Definitive Approach and its Role in Risk Management*, 2015.
[20] PHMSA Risk Modeling Work Group, 08.09.16 Meeting Notes, Washington, DC (Likelihood).
[21] See ISO/IEC 31010:2009 – *Risk management – Risk assessment techniques*, Annex B.14.

to failure. Figure II-1 shows an example fault tree approach for excavation damage using a logical combination of contributing factors. The system can be modeled to the level of specificity where data and SME input can be applied to quantify the failure probability or frequency. Given that the application of this document is for both hazardous liquid pipelines and gas transmission pipelines, and that scenario-based tools can be used for various types of risk models, use of scenario-based tools were folded into the quantitative system and probabilistic risk model categories of this document.

III. Overview Information for Use of Risk Model Types

A. Selecting an Appropriate Risk Model

Pipeline operators should select risk models capable of supporting risk management decisions required as part of pipeline IM programs as well as more general risk management decisions that may be required. Table III-1 characterizes and compares the suitability of the different risk model categories defined in Section II.D to for each decision type.

Table III-1
Risk Model Types and Applicability to Decisions

Decision Type	Model Category			
	A. Qualitative Model	**B. Relative Assessment/ Index Model**	**C. Quantitative System Model**	**D. Probabilistic Model**
Risk Priorities for Baseline Integrity Assessment	A	A	A	BP
Preventive and Mitigative Measure Identification	A	A	A	BP
Preventive and Mitigative Measure Evaluation and Comparison	AI	AI	A	BP
Benefit-Cost Analysis for Risk Reduction Options	AI	AI	A	BP
Integrity Assessment Interval Determination	AI	AI	A	BP
General Risk Management Decision Making	AI	AI	A	BP

Key:

Can be Applicable with Additional Inputs to Risk Assessment Process	AI
Can be Applicable	A
Best Practice	BP

Qualitative Models and Relative/Index Models (Model Category A and Category B)

The initial application of risk models required by the hazardous liquid and gas transmission IM rules was to establish risk-based priorities for baseline integrity assessments. Relative assessment/index models, and to some extent qualitative-oriented models, were widely used by pipeline operators to support this requirement. This allowed large numbers of pipeline segments to be ranked based on risk factors. As indicated in Table III-1, the relative nature of assessment prioritization is an applicable application of these models. In the event a situation arises that would require the prioritization of a several new pipeline segments for a baseline assessment, relative/index models would still be applicable.

In addition to the broad scope of pipeline accident likelihood and consequence factors considered when using these type of risk models, Qualitative and Relative Assessment/Index models may be applied to support identification of preventive and mitigative measures, by considering model inputs and measures that change these inputs to values that are estimated to reduce risk. This application is essentially qualitative in nature, indicating the general effect proposed measures on the risk, so is appropriate for identifying P&M measures.

In general, application of Qualitative and Relative/Index models is more challenging for applications where the degree of difference between different scenarios, options, etc., or the risk as compared to a quantitative risk criterion is important, in addition to simply knowing which is a relatively higher or lower risk. Outputs from Qualitative and Relative Assessment/Index models may not be based on consistent units and cannot be assumed to be proportional to outputs like failure frequency, probability, or expected loss.

Qualitative or Relative Assessment/Index models do not produce this kind of output directly, so additional analysis or evaluation of the results is needed when these models are used to support comparison of alternative preventive or mitigative measures or benefit-cost analysis. Results from both Qualitative and Relative Assessment/Index models should be supplemented with additional analysis or data processing to be effective in supporting risk decisions.

Risk models that produce consistent quantitative output in standard risk units (probability of failure, expected loss, etc.) provide an easier format for evaluating and comparing risk alternatives, particularly for larger multi-regional pipeline systems. For applications, such as the comparison of alternative preventive or mitigative measures, or benefit-cost analysis, some form of a quantitative type of risk model output in standard risk units is generally needed.

In practice, continued use of qualitative and relative assessment/index models is best suited for small, less complex pipeline systems, where the effects of preventive and mitigative measures

on risk can be reasonably be understood via changes to the model inputs.[22] These systems can be characterized by limited geographic extent and lower mileage; simple system configuration; uniform risk factors throughout the system; affected HCAs limited in extent and similar in nature; and single, small operating organization.

Operators planning to continue the use of Qualitative and Relative Assessment/Index models should seek to supplement personnel judgment with as much pipeline physical attribute data as can reasonably be acquired over time. Operators should also ensure their risk model is capable of supporting risk management decisions required as part of pipeline IM programs, such as the selection of preventive and mitigative measures, and can be utilized for threat identification, risk analysis, and general risk management decisions.

Quantitative System Models (Model Category C)

Quantitative System models can be applicable for all decision types. The algorithms and outputs of quantitative system models produce quantitative estimates of overall risk, using consistent units. These models can be used to estimate the risk before and after risk reduction measures are implemented. Because a quantitative system model represents the physical and logical relationships of model inputs, the inputs can be varied to define alternatives and compare the risk reduction effects of each alternative. Candidate risk reduction measures at different locations along the pipeline can be compared via quantitative estimates using consistent input units. Quantified risk reduction benefits can be combined with data on implementation costs to perform benefit-cost analysis to further enhance decision making.

Probabilistic Models (Model Category D)

Probabilistic models are considered a best practice for supporting all decision types. Probabilistic models have the added feature of representing the uncertainty (i.e., realism) in model inputs by probability distributions, and the resulting ability to produce distributions for model outputs. This allows a systematic representation of uncertainty and unique risk insights for decision making not allowed by other model types. When utilizing the same data as a Relative model, the probability distribution outputs from the Probabilistic model inform the operator on the range of possible outcomes, regardless of data quality, which allows for more consistent decision making.

An example of the application of both Quantitative System and Probabilistic models is the incorporation of integrity assessment results and associated defect findings and remediation. In these models, the probability of failure and overall risk can be estimated using different integrity assessment intervals. Results can then be used to define optimal integrity assessment intervals consistent with the operator's risk tolerance. A Probabilistic model with input and output distributions is particularly effective for identifying integrity assessment intervals through its

[22] See ISO/IEC 31010:2009 – *Risk management – Risk assessment techniques*, Annex B, Section B.28, for additional discussion on the strengths and limitations of risk index models.

ability to support evaluation of the uncertainty in the predicted probability of failure given actual integrity assessment results. Also, uncertainties due to tool tolerances and other risk model inputs, such as corrosion growth rates, excavation damage statistics, and equipment reliability can be represented by input probability distributions, which may be propagated through the risk model along with other inputs to give an output distribution for probability of failure that more accurately portrays risk.

It should be noted that the IM rules require operators to reduce risks to high consequence areas (HCAs) by implementing preventive and mitigative measures beyond those measures required elsewhere in Parts 192 and 195 of the pipeline safety regulations. If limited operator resources require prioritization of risk reduction measures, then benefit-cost analysis, supported by the application of an effective risk model, can optimize the prioritization results. [Note: Risk analysis results should not be used to defer/delay the normal process of pipeline system remediation of known deficient conditions.]

A.1 Moving from Qualitative or Relative Assessment/Index Models to Quantitative System or Probabilistic Models

Quantitative System and Probabilistic models are considered more robust and capable of supporting all risk reduction decisions. Operators should consider moving to these risk modeling categories, as appropriate.

Developing and implementing Quantitative System models does not necessarily require more resources than Relative Assessment/Index models, despite some perceptions to the contrary. The structure of Quantitative System models can be more complex; however, they do not necessarily require more data than Index models and may be developed and implemented with common tools such as Microsoft Excel.

Many Relative Assessment/Index and Qualitative risk models include relatively large numbers of inputs representing pipeline characteristics and other risk factors. These inputs can serve as a starting point for development of a Quantitative System model that provides failure probability and risk in standard units. The inputs for Relative Assessment/Index models are often already quantified and can readily be incorporated in a Quantitative System model. PHMSA believes that operators using Relative Assessment/Index models should consider taking steps to develop Quantitative System models that utilize the inputs from their existing models. This would enhance the risk reduction decision making ability for those operators.

Probabilistic models are sometimes perceived as being excessively complex and requiring significant additional data. While it is true that quantifying a Probabilistic model involves more than a basic “spreadsheet” type of calculation, applying probabilistic analysis to basic Quantitative System models can be a more powerful use of available data. And while Probabilistic models are frequently believed to require more data, effective Probabilistic models can be developed with the same data used in Relative risk models. Effective Probabilistic model development is dependent upon appropriate use of data to accurately represent both the

certainty the data provides and the uncertainty the data implies. Modeling uncertainty in a Probabilistic model better informs the operator regarding the spectrums of the consequence and likelihood of failure that are possible, which, in turn, allows the operator to identify more effective risk reduction actions and improves assessment tool selection.

Probabilistic models include a more accurate representation of uncertainties than those provided by a Relative Assessment/Index risk model that uses point estimates of the same data as inputs.

A pragmatic approach is to evolve from the use of Relative Assessment/Index risk models to Quantitative or Probabilistic models over time. Organizational experience in developing and implementing quantitative system models for a limited number of threats can then be applied in a way that maximizes the benefits and optimizes the level of resources needed as the quantitative system model and probabilistic approaches are applied to an increasing number of threats.[23] Appendix D outlines one process for evolving Relative Index models to more of a Quantitative System modeling approach.

B. Understanding Uncertainty and Critical Model Parameters

The output of any risk model is an estimation of actual risk, so it is important to consider how much uncertainty may be involved with the model outputs. Variations in risk model inputs impact results, and different parameters have different influences on the results.

For Quantitative System models, input parameters can be represented by ranges of possible values, and the effect on the output of varying each input can be calculated. For Probabilistic models, the uncertainty in model inputs can be represented by probability distributions.

It is important to review the impact of input uncertainty to identify which uncertainties should be reduced by obtaining additional information. For example, the operator's SMEs may assign input variables a wide range of values given a lack of data or lack of SME agreement. If the range has a significant impact on the risk model results, efforts to obtain better data to reduce that uncertainty may be appropriate, particularly if the additional information could improve the evaluation of alternative risk reduction measures. In a probabilistic model, important model inputs (distributions) can be directly reviewed to help identify where there is significant uncertainty in the inputs (which ultimately impacts the confidence of model results). These inputs can be targeted for updating to reduce uncertainty and improve the fidelity of model results. [Appendix A Figure A-3 provides example distributions that represent uncertainties for model inputs as an illustration of this approach.]

Inputs that have the biggest impact on risk model output results are sometimes referred to as the "risk drivers." It is important when reviewing the risk drivers for a segment of line pipe or a

[23] Section IV.C addresses the potential for employing threat-specific risk models instead of a single modeling approach for all threats.

pipeline facility to determine if the model output results make basic technical sense. Examples are: risk model results are as expected by SMEs, no errors in the risk model or the inputs, or SME expectations are incorrect. (See Section III.C, Model Validation.)

Investigation of risk drivers can also suggest preventive and/or mitigative measures, by indicating the factors that could lead to the greatest reduction in risk if changed. Risk models should include the risk factors that change because of preventive measures and mitigative measures. If evaluated risk reduction measures do not result in differences in the model outputs, then analysts should ensure that this is not merely because the model does not include the applicable risk factors.

The relative importance of risk factors depends on the particular risk model output(s) of interest. Inputs may be important risk drivers over specific pipeline segments, but not significant system-wide or operator-wide. For example, the risk of failure due to a landslide might be negligible for the large majority of pipeline segments but could be the single most important risk factor for some segments with certain topography and soil conditions. The risk assessment model should accurately account for segment-specific parameters that are critical to the segment of pipeline being evaluated that experience similar threats and consequences.

C. Validating Risk Analysis Results

Risk model development requires the review of risk assessment results and validation of the model input and output data, both periodically and whenever significant changes are made to the model or its inputs (e.g., if operational experience demonstrates that data needs to be revised). Figure III-2 depicts typical risk model validation steps to ensure quality and the most accurate representation of pipeline risk.

Figure III-2
Model Validation

Validation of model **inputs** typically includes:

1. Model inputs should be validated against existing data/operational history and SME estimates, including inputs to both the likelihood and consequence analyses.
2. Model inputs need to represent the most accurate available information on each pipeline location. To accomplish this, input data should be reviewed and updated, as appropriate, by trained and qualified personnel. Management of risk model input

datasets should include clearly defined requirements, definitions, process owners, process maps, and governance structures to ensure compliance with ANSI/ASME B31.8S-2004 Section 5.7b. This clear definition of roles and responsibilities also applies if portions of the work are contracted to external organizations.

3. Consequence variables such as failure mode, response times, conditions affecting dispersion, and the locations of receptors need to cover the range of possibilities to ensure a representative selection of outcomes, particularly so that high-consequence outcomes are identified and can be selected for the application of risk reduction activities.
4. The structure of the risk model and algorithm(s) used to calculate risk measures should be checked to ensure the relationships of risk inputs are appropriately represented. The structure, analytical functions, analytical content, and technical computing structure detailed within the model should be continually reviewed and updated, as appropriate, by applicably trained and qualified personal.

Validation of model **outputs** typically includes:

1. Model outputs should be validated against SME review. The review includes operator-specific knowledge to ensure results are appropriate for operator-specific risks. The highest frequency sources of risk predicted by the model and risk drivers should be consistent with applicable historical data.
2. The results should be consistent with failure history data. If operating history of the analyzed pipeline or similar pipelines include failures or consequences that are not captured by the model, then changes to the model should be considered to include factors related to such historical events.
3. If model results vary sharply from SME expectations or operating history, the model and input values involved should be examined to identify the source(s) of the variance. It is possible that the discrepancy points to a need for data correction or modification to the model to accurately represent risk. It is also possible that the risk model results will yield new insights that are not consistent with SME expectations, so there may be variance in the operator's understanding of risk-important characteristics and what is produced by the model. These new insights into risk drivers are a valuable benefit of a risk model.

D. Configuration Control of Risk Models

Risk models are no different than other analytical tools supporting safe pipeline operation. They should be reviewed and updated on a regular, defined basis to assure they continue to accurately reflect the pipeline system's configuration and operation. A structured management of change process also applies to pipeline risk models. For example, data about the pipeline system is constantly being acquired, and updates to risk model inputs should be performed routinely to incorporate the latest information.

While the details of achieving management of change will vary for differing aspects of a risk model, the process for control and update of the model should assure that risk estimates provided to decision makers are accurate and incorporate the latest system information. For example, information on the population near the pipeline may change less frequently than cathodic protection information and may need less frequent updating in the model.

E. PHMSA Key Recommendations – Overview Information for Use of Risk Model Types

- The overriding principle in employing any type of model to support risk assessment is that it be capable of supporting risk management decisions.
    - A quantitative system or probabilistic model utilizes many of the same inputs as a relative assessment/index model. However, quantitative system and probabilistic models have algorithms that represent the physical relationships of model inputs, and model outputs that are risk measures in standard units. Consequently, the outputs from quantitative system models or probabilistic models are directly applicable to support evaluation and comparison of preventive measures. In general, a quantitative system or probabilistic model is more versatile for such an evaluation, with greater capabilities to provide risk insights and support decision making.
    - Outputs for qualitative and relative assessment/index models are not risk measures in standard units that are easily comparable for different segments or different preventive measures. Therefore, additional processing and interpretation of the results may be required to apply model risk evaluations to decision making by the operator. This additional processing and interpretation necessarily takes place outside of the risk model as part of the operator's overall risk assessment and risk evaluation process.
- Identification and evaluation of preventive measures is an important application of risk assessment, and required by IM regulations. This application can be supported by a risk model that has the following characteristics:
    - The model can indicate the change in risk from implementation of the risk reduction measure.
    - The model includes all threats to the pipeline segment that can be addressed by preventive measures.
    - Model inputs represent the pipeline characteristics and other risk factors affected by the preventive measures, so that the effect of each measure can be evaluated through changes in inputs or changes to the structure of the model.

IV. Likelihood Modeling for Line Pipe

This section[24] on line pipe covers important characteristics of the likelihood part of the risk definition and formula.[25] Likelihood represents the chance of an unwanted event occurring. In the context of pipeline risk modeling, the primary "unwanted event" for hazardous liquid and natural gas pipelines is the failure of a pipeline or pipeline system to contain the gas or hazardous liquid product. The likelihood part of a pipeline risk model encompasses the scenarios for failure and uses the model input variables in those scenarios and the interrelationships among inputs to estimate an overall likelihood of failure. To accomplish this, the model should specify:

1. Input variables representing characteristics of a pipeline segment and the environment around the segment, representing all factors important for estimating the likelihood of failure for the segment: They represent the prevalence of threats, the resistance of the pipeline system to threats, and the effectiveness of existing preventive measures. These variables may include pipe condition, coating condition, cathodic protection (CP) effectiveness, operating pressure, operating stress level, depth of cover, excavation activity around the pipeline, landslide potential, and product transported.
2. How to combine the model inputs in the overall evaluation of the likelihood of failure. The model should accurately represent threat interactions that could increase the likelihood of failure, and specify whether an input variable can cause failure on its own or must occur in combination with other factors.

Different model types have different output likelihood measures. Output likelihood measures from different model types[26] can be qualitative categories, relative indexes, or quantitative measures of probability or frequency in standard units. Output measures in standard units, such as failures per unit distance per unit time (e.g., failures per mile per year) are the most flexible and widely applicable model outputs, allowing a consistent measure of failure likelihood for a pipeline segment, specifying *time* and *distance* (length):

1. The likelihood of failure varies depending on the time interval being considered. For example, the likelihood of failure for a specific pipeline segment is higher over a 10-year period than during a single year. Consequently, likelihood measures are typically expressed as frequencies per unit time (e.g., failures per year).
2. The likelihood of failure also varies depending on which portion of a pipeline system is being evaluated. As a system that can extend over long linear distances, a pipeline has different likelihoods of failure for different portions, because risk

[24] Sections IV and V of this document consider modeling of likelihood and consequences primarily for line pipe segments. Risk modeling for pipeline facilities (e.g., pump and compressor stations, tank facilities) is considered in Section VII.

[25] See Section II.C of this document for definitions and formula.

[26] See Section II.D of this document.

factors vary at different locations. A pipeline risk model should be able to evaluate the likelihood of failure for specifically defined segments.

Sections IV.A through IV.H below provide additional information on risk model treatment of likelihood.

A. Pipeline Threats

The likelihood of pipeline failure is derived from the collective likelihood of all threats acting on the pipeline and leading to pipeline failure. Pipeline risk models break down broad threat categories into more specific inputs that can be quantified using data or judgment and combined by a model algorithm to obtain the likelihood estimate.

Pipeline IM regulations (see Appendix E) require identification and evaluation of preventive measures to reduce the likelihood of failure. Most preventive measures implemented by pipeline operators attempt to reduce the likelihood of failure due to a single threat or a subset of threats. To evaluate these potential preventive measures, the operator determines the impact of the potential measure on the likelihood of failure for each threat (also accounting for interacting or dependent threats) and sums all the threats to identify the final impact of the potential change to the likelihood of failure.

Historical pipeline failure experience has resulted in a generally consistent scheme for categorizing threats. Different sources employ similar categorization of threats that should be considered for a complete evaluation of pipeline failure likelihood. The Risk Modeling Work Group considered the threat categorization from four sources:

a. ASME Standard B31.8S-2004 identified threats[27]
b. Muhlbauer identified failure causes [28]
c. Canadian incident reporting failure causes[29]
d. U.S. DOT accident and incident report causes[30]

PHMSA compared and integrated the categories from these four sources to develop the following categories of threats recommended for the likelihood portion of risk models:

1. External Corrosion
2. Internal Corrosion
3. Environmental Cracking (including SCC)
4. Structural/Material Degradation (non-steel pipe)

---

[27] ASME B31.8S-2004, *Managing System Integrity of Gas Pipelines*, 2005. Although developed specifically for application to gas pipelines, the threat categories in this document are applicable to hazardous liquid pipelines.
[28] Muhlbauer, *Pipeline Risk Assessment: The Definitive Approach and its Role in Risk Management*, 2015.
[29] CAN/CSA-Z-662-15, *Oil and Gas Pipeline Systems*, Annex H.
[30] PHMSA F 7000-1-Accident Report Form, F 7100.1-Incident Report Form, and F 7100.2-Incident Report Form can be accessed on PHMSA's web site at: https://www.phmsa.dot.gov/forms/operator-reports-submitted-phmsa-forms-and-instructions.

5. Manufacturing-related Defects (includes defective pipe and seam acted on by fatigue or other failure mechanisms)
6. Construction-, Installation-, or Fabrication-related Defects (includes defective girth weld, fabrication weld, wrinkle bend or buckle, stripped threads, broken pipe, coupling failure acted on by fatigue or other failure mechanisms)
7. Equipment Failure (includes failure of control/relief equipment, pump, compressor, seal/pump packing failure, threaded or non-threaded connection, tubing or fitting, gasket O-ring, equipment body)
8. Excavation Damage (includes damage by operator, contractor, or third party; includes immediate failure or damage that results in later failure)
9. Other Accidental Outside Force Damage (includes causes such as vehicle impacts, other fire or explosion, electric arcing)
10. Intentional Damage/Vandalism/Sabotage
11. Incorrect/Improper Operation (includes human errors such as tank overfull, valve misalignment, over-pressurization, improper equipment installation)
12. Geohazards/Weather/Natural Force Damage
13. Other/Uncategorized/Emerging Threat

Models should include all applicable threats, including any emerging threats found by pipeline operators that do not fit easily into the categories listed above. Even threats that have a low likelihood of causing a pipeline failure at a given location should be considered in the model (e.g., if the potential consequences due a failure from a low likelihood threat at the location could be high, the overall risk might be significant).

B. Selection of Approach for Representing Likelihood

The development of algorithms for assessing likelihood using a quantitative system model can employ a variety of approaches. The overall likelihood of failure is built threat by threat, by considering the factors affecting the likelihood of failure for each threat.[31] The structure and approach to estimating the likelihood of failure due to different threats can vary widely in Quantitative System models. The choice of approach may also differ for different threats within the same model, based on the available data and information. Some different likelihood modeling approaches include:[32]

1. **SME opinion** – SME opinion is converted into quantitative probabilities.
2. **Historical data** – Historical failure rates from available databases are used to estimate baseline failure rates, which are modified to reflect system specific attributes.

[31] Including accounting for threat interactions; see Section IV.E of this document.

[32] This list of approaches is taken from Skow, J., C-FER Technologies, Inc., *Critical Review of Candidate Pipeline Risk Models*, presentation at Pipeline Risk Modeling Methodologies Public Workshop, September 2015. See also Koduru, et al., C-FER Technologies, *Critical Review of Candidate Pipeline Risk Models*, 2016.

3. **Reliability Analysis Methods** – Detailed engineering models are used to estimate probability and consequence.

Another method for assessing the likelihood of failure for different threats is the "triad" approach recommended by Muhlbauer.[33] This approach envisions the modeling of pipeline failure mechanisms as assessing "exposure," "mitigation," and "resistance," defined as:

> *"…**Exposure (attack)** -…defined as an event which, in the absence of mitigation, can result in failure, if insufficient resistance exists…*
>
> ***Mitigation (defense)** -…type and effectiveness of every mitigation measure designed to block or reduce an exposure.*
>
> ***Resistance** – measure or estimate of the ability of the component to absorb the exposure force without failure, once the exposure reaches the component…"*

The application of relative assessment/index models in IM programs led to questions regarding "weights" for likelihood scores of individual and interacting threats and their relative contributions to failure likelihood. This issue arose because some models treated the likelihood contributions from all threats equally in the total risk estimates, and did not consider interacting threats. This is a distortion because, historically, different threats have caused failures with different frequency. [For example, past failure history indicates threats like corrosion, material cracking, and third-party damage have been the cause of failures with greater frequency and impact than other threats.]

To correct this distortion, some models apply fixed numerical weights as multipliers to each threat's likelihood score and add the weighted scores to obtain a total likelihood score. However, the weights are often based on risk model vendor's historical averages using data from diverse pipelines. Consequently, applying such averaged weights introduces additional distortion in the likelihood estimates intended to represent specific segments on specific pipelines with location-specific risk factors. To represent risk in the most accurate way possible, the risk assessment model should accurately account for segment-specific parameters of each segment of the pipeline being evaluated.

This is an issue affecting relative assessment/index models or qualitative models only, because Quantitative System models do not use fixed weights to normalize threat-specific likelihood of failure estimates for specific segments, although the quantitative estimates may use historical data as an input to the model.

[33] Muhlbauer, *Pipeline Risk Assessment: The Definitive Approach and its Role in Risk Management*, 2015. The reference includes examples of the modeling approach for different threats.

C. Single Approach or Threat-Specific Approach

When considering different modeling approaches, it is important to keep the overall purpose of risk modeling in mind – to understand the likelihood of threats to and consequences of a failure for a pipeline segment, and to identify measures to reduce and manage the risks. When a single approach is applied to all threats, the detail needed to model more complex threats adequately may be applied to other threats, even if a simpler approach is sufficient. Some operators may choose a threat-specific approach to risk modeling rather than a single approach for all threats to optimize available resources and reduce model complexity.

In practice, pipeline operators, particularly for smaller systems, often select approaches to risk modeling with the primary consideration of resource availability. Some modeling approaches are viewed as complex and costly, whereas other approaches may not be detailed enough to adequately model risk for specific threats. In addition, there can be a natural tendency for analysts to seek a single measure to characterize the overall risk for a pipeline segment. This can lead to the assumption that only a single approach should be taken to model pipeline risk.

A single risk value is of interest when evaluating the relative level of risk between different parts of a pipeline system, or when an absolute estimate of risk is needed. However, different threat-specific risk modeling approaches may be preferable, even if they do not result in a singular measure of likelihood or risk. For example, if one threat is thought to require a more detailed evaluation than others (e.g., stress corrosion cracking), operators should not feel like they must treat all threats with the same level of heightened sophistication if it is not needed. Less sophisticated models may be sufficient for the other threats.

Finding an appropriate balance of complexity, cost, and applicability of results is a challenge unique to each pipeline being analyzed. Figures IV-1 and IV-2 show the general outlines of these differing approaches (the multiple arrows in Figure IV-2 indicate threat-specific modeling approaches vs. the singular modeling approach shown in Figure IV-1).

One challenge to a threat-specific approach is the comparison of output results from the different approaches. The ability to compare results is important to evaluating which risks are the most important to address and promoting the efficient use of resources for implementing preventive measures across the pipeline operator's assets. One way to address this challenge is to extend the threat-specific analysis to include consequences, and then comparing threat-specific risk estimates, combining likelihood and consequences. Comparison of consequence estimates is generally more straightforward, as consequence estimates can be characterized by a common output such as expected loss.

Figure IV-1
Threat Category Modeling (Single Approach)

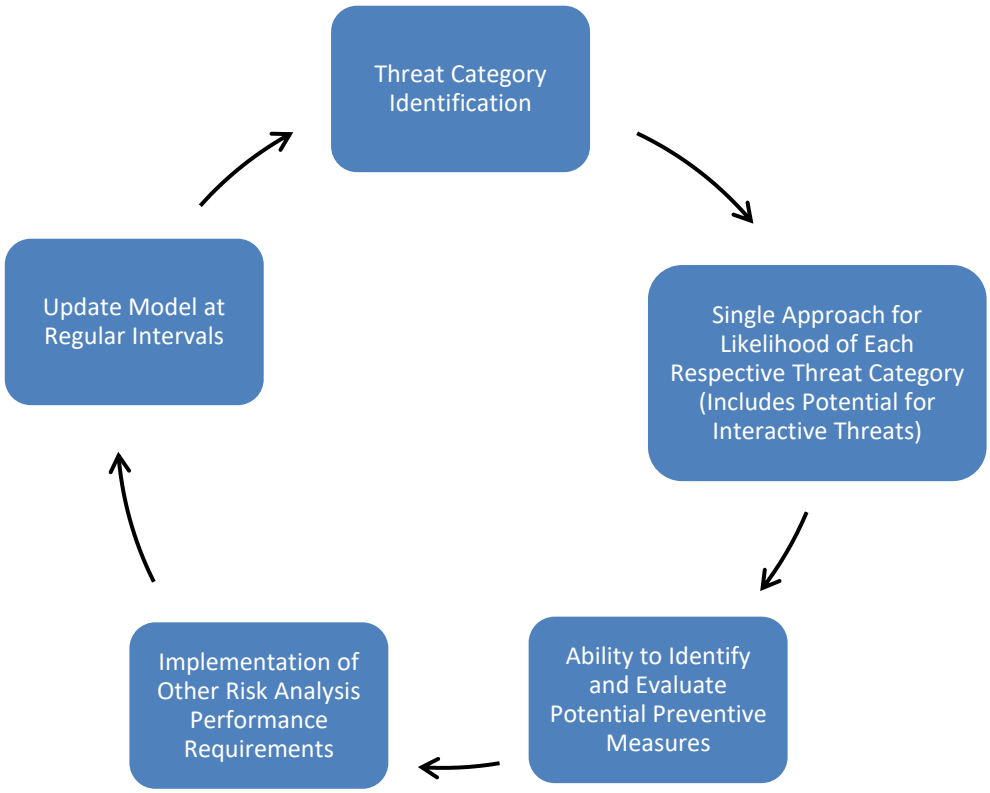


Figure IV-2
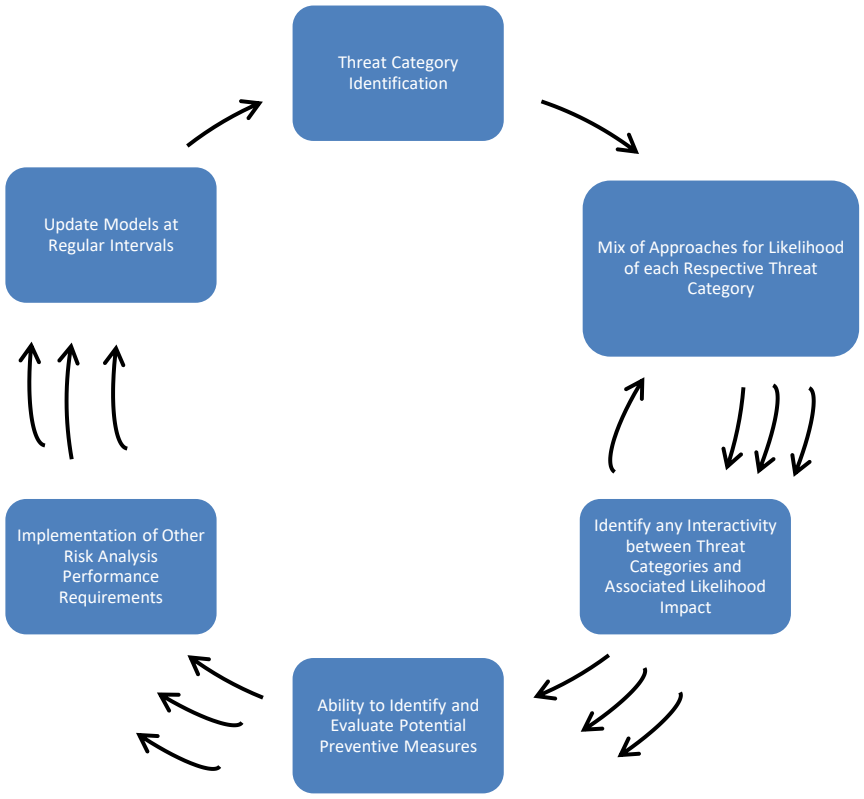
Threat Category Modeling (Threat-Specific Approach)



D. Human Performance Modeling

Historical failure experience shows that pipeline operator actions can have a significant effect on the likelihood of failure and the level of consequences following a pipeline failure. PHMSA has observed that these risk factors may be underrepresented in operator risk models. To fully represent the likelihood of failure, the risk model should include inputs related to human performance, and the model algorithms should include the relationship of these factors to other risk factors in the overall evaluation of risk. Risk modeling of human errors can be accounted for in various ways for likelihood estimates, including:

1. A threat category that represents operator actions that are the apparent cause of failures, e.g., "incorrect operation." While PHMSA incident and accident data often list "small" percentages for "incorrect operation" as an apparent cause,[34]

[34] https://www.phmsa.dot.gov/data-and-statistics/pipeline/pipeline-incident-20-year-trends

probable and root cause analyses commonly find human performance as a leading contributory cause and cause of incidents and accidents as well as exacerbating the consequences of the failure.

2. Failures in other threat categories may stem from human errors. For example, "equipment failure" may result from maintenance, or design and construction human errors.
3. Consideration of interactive threats includes interactions between threats due to operator actions. For example, the threat category "incorrect operation" has potential interaction with threats in multiple categories. One example is a crack-like defect introduced during the manufacture of a seam weld along with failure of the operator to properly account for the effects of pressure-cycle-induced fatigue on potential seam defects.[35]
4. Potential human errors added to the uncertainty in the likelihood of failure given integrity assessment results, i.e., assessment results are subject to mischaracterization and misidentification of repair conditions.

Operator actions, or lack of actions, can often overlap between likelihood and consequence aspects of pipeline risk modeling. Actions taken in response to failures can affect the severity of consequences. They can also directly impact likelihood modeling when differing characteristic of pipeline releases is involved (e.g., likelihood of small vs. medium vs. large releases). Dependencies of potential release levels on operator actions should be considered in the model to correctly characterize risk.

E. Interactive Threat Modeling

The threats represented in a pipeline risk model may be interactive, because mechanisms that drive the likelihood of failure from one threat may be intensified by mechanisms driving the likelihood of failure from another threat. The interaction of the mechanisms driving both threats increases the total likelihood of failure from the combined threats. Multiple threats may also interact and result in an otherwise premature failure at a location on the pipeline. A study sponsored by PHMSA[36] uses a similar concept to define interacting threats as "two or more threats acting on a pipe or pipeline segment that increase the probability of failure to a level greater than the effects of the individual threats acting alone."

This study further points out that "…In order for threats to be interacting, they must act to cause a condition or situation that is more severe than that created by individual threats. It is important to note that threats are not necessarily interacting simply because they exist at the same location on a pipe or pipeline."

[35] See Section IV.E, Table IV-1 of this document.

[36] Munoz and Rosenthal, *Improving Models to Consider Complex Loadings, Operational Considerations, and Interactive Threats*, Kiefner and Associates, U.S. DOT / PHMSA DTPH56-14-H-00004, 2016.

To provide an appropriate likelihood of failure estimate, the risk model should account for the interaction of multiple threats. In addition, identification of effective preventive measures and evaluation of the effect of preventive measures on reducing the likelihood of failure should include consideration of interacting threats.

One example of threat interaction is external corrosion or cracking on pipe damaged by denting that has not yet failed. If the pipe damage caused external coating damage or coating shielding in an area of ineffective cathodic protection, then the pipe is more susceptible to external corrosion and cracking and the resulting likelihood of failure is increased. Another example is earth movement around a pipeline that exacerbates construction-related imperfections such as wrinkle-bends or certain vintages of girth welds.

The likelihood of failure from each threat includes a portion that involves that threat alone and a portion that involves interaction with other threats. To evaluate the likelihood of failure from multiple threats, the risk model should appropriately account for both portions. To illustrate, consider the following example of two threats. The likelihood of failure (probability) from the two threats can be expressed as:

$$P_T = P_1 + P_2 + P_i$$

Where P_1 = failure probability from threat 1 individual factors
P_2 = failure probability from threat 2 individual factors
P_i = failure probability from threat 1 and threat 2 interactions

P_i in this expression is evaluated by considering the increased conditional probability of failure from threat 2, given the interactive factors from threat 1. In this example, the increased likelihood of failure from external corrosion due to ineffective CP combined with the existing coating damage from previous pipe damage will be higher than the likelihood of failure from external corrosion if no coating damage is assumed. Accordingly, that will increase the probability P_i in the above expression[37] used to evaluate the probability of failure from either threat.

Defining the interactions between different threats is an important activity in pipeline risk model development. It enhances the accuracy of the model as a representation of the risk of the pipeline. Additionally, the process of investigating and defining potential threat interactions can uncover failure causes that may not be immediately apparent. For a complete risk analysis, the definition of risk factors and assignment of values to model inputs for a pipeline segment should involve consideration of threat interactions. Both historical data and SME input should be employed to define potential threat interactions. Analysis of historical failure data may point to failures resulting from interactive threats where pipe characteristics are similar to the

[37] The expression for the probability of failure from either threat is simplified by assuming the multiplied terms of the probability expression ($P_1 \times P_2$, $P_1 \times P_i$, $P_2 \times P_i$, etc., are small relative to the probabilities P_1, P_2, and P_i.

pipeline being modeled. SMEs with local knowledge can identify segments with characteristics that make them susceptible to interacting threats.

Munoz and Rosenthal[38] identified combinations of threat types that could potentially interact. The study, based on a literature search, SME surveys, and analysis of accident/incident historical data, identified 98 threat interactions considered "reasonably possible" and depicted these threat interactions in a matrix, shown below in Table IV-1.[39] Interacting threats are indicated by a "1" in the matrix entry for each pair of threats that interact. Footnotes to the table give conditions when the threats might interact.

Table IV-1
Interacting Threat Matrix

			Time-Dependent			Stable									Time-Independent							
			EC	IC	SCC	MFR		CON			EQ				IO	TPD			WROF

Table IV-1 Footnotes:

1. A 1 applies unless the history of the segment indicates the construction damage has not contributed significantly to corrosion.
2. A 1 applies if the segment has not been subject to a pressure test to at least 1.25 times MAOP.
3. A 1 applies if the Dresser-coupled segment has no CP or has CP but no bonds across the Dresser couplings.
4. A 1 applies unless it can be shown either that little or no coating damage exists or that the segment is not susceptible to SCC.
5. A 1 applies if the pipe is seam-welded and was installed with wrinkle bends
6. A 1 applies if the pipe was manufactured with low-frequency welded ERW seam or flash welded seam.
7. A 1 applies unless it is known that the pipe material exhibits ductile fracture behavior under all operating circumstances.
8. A 1 applies only to pipe joined by acetylene girth welds or girth welds of known poor quality.

[38] Munoz and Rosenthal, *Improving Models to Consider Complex Loadings, Operational Considerations, and Interactive Threats*, Kiefner and Associates, U.S. DOT / PHMSA DTPH56-14-H-00004, 2016.

[39] Munoz and Rosenthal, *Improving Models to Consider Complex Loadings, Operational Considerations, and Interactive Threats*, Kiefner and Associates, U.S. DOT / PHMSA DTPH56-14-H-00004, 2016, Table 1.

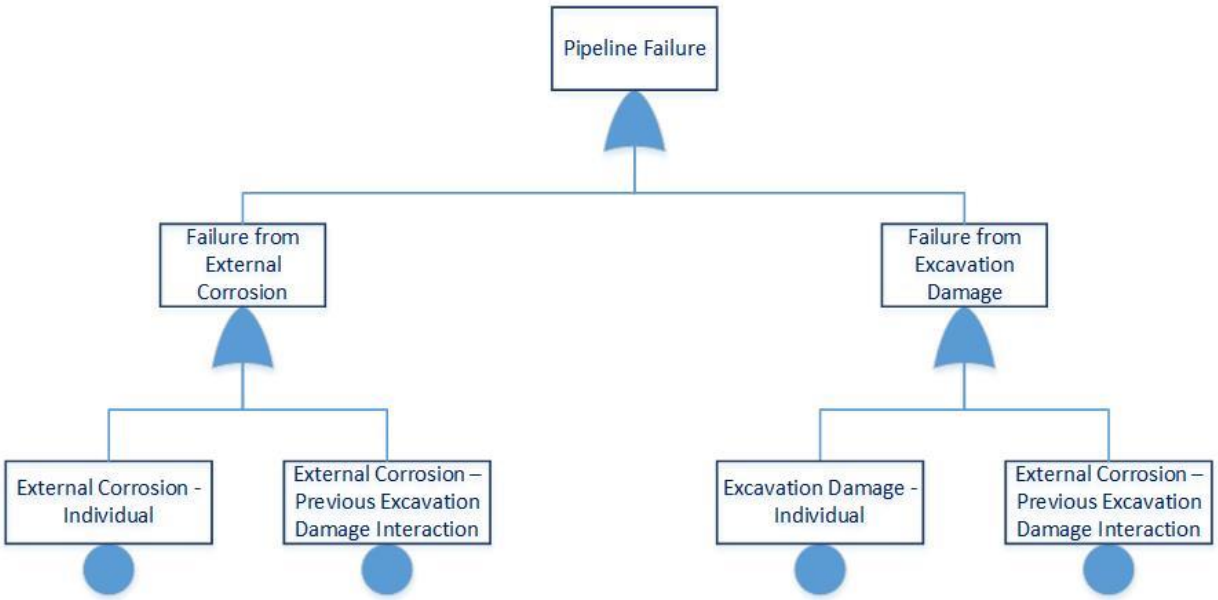
The codes used in the matrix to represent different threats are:

- External Corrosion (EC)
- Internal Corrosion (IC)
- Stress Corrosion Cracking (SCC)
- Manufacturing Related (MFR)
- Defective Pipe (DP)
- Defective Pipe Seam (DPS)
- Construction Related (CON)
- Defective Fabrication Weld (DFW)
- Defective Girth Weld (DGW)
- Construction Damage (CD)
- Equipment Related (EQ)
- Malfunction of Control or Relief Equipment (MCRE)
- Stripped Threads, Broken Pipe, or Coupling Failure (TSBPC)
- Gasket Failure (GF)
- Seal or Pump Packing Failure (SPPF)
- Incorrect Operations (IO)
- Third Party Damage (TPD)
- Third Party (includes First and Second Parties) (TP)
- Previously Damaged Pipe (PDP)
- Vandalism (V)
- Weather Related or Outside Force (WROF)
- Earth Movement (EM)
- Heavy Rains and Floods (HRF)
- Lightning (LIGHT)
- Cold Weather (CW)

Threat interactions such as shown in Table IV-1 should be incorporated in risk models at locations where they are found applicable.

Fault trees may be used to model interacting threats explicitly by representing shared failure mechanisms as the same basic event in the models for each of the interacting threats. When the likelihood of failure due to the interacting threats is quantified using the fault tree logic, then the combined likelihood of failure from the threats will correctly represent the contribution of the interactions. This is shown in Figure IV-3 below, using the example of external corrosion and excavation damage. Note that the threat interaction event under both external corrosion and excavation damage is identical.

Figure IV-3
Example Fault Tree Model of Interactive Threats



Threats that act on pipelines independently (e.g., external and internal corrosion) may also act simultaneously at the same location on a pipeline. If such conditions are identified, by integrity assessment methods or otherwise, then this would impact the evaluation of the likelihood of failure at the location where both threats are impacting the pipeline. For a valid estimate of likelihood of failure, the risk model should reflect the composite effect of both threats, based on the identified condition of the pipe.

Muhlbauer[40] states that some threat interactions may be considered in the "triad" approach to failure modeling (see Section IV.B of this document) by modeling varying "resistance" according to the mechanisms that define the interaction. In the external corrosion/excavation damage interaction example discussed previously, this would mean that modeling the resistance of the pipeline to the external corrosion threat is reduced in areas of excavation activity, by a factor that represents the likelihood that the excavation activity results in coating damage.

F. Threshold for Threat Consideration

Screening threats can have a distinct impact on risk analysis results. As part of IM rule requirements, operators must determine the applicability of specific threats to pipeline

[40] Muhlbauer, *Pipeline Risk Assessment: The Definitive Approach and its Role in Risk Management*, 2015.

segments for the purposes of conducting integrity assessments[41] and repairing anomalies. However, PHMSA has noted in pipeline inspections and failure investigations that operators are applying the threat screening criteria for integrity assessments to risk models, causing threats deemed insufficiently significant to require an integrity assessment to be inappropriately excluded from risk models.

IM regulations require pipeline integrity assessment and repairs of identified pipe anomalies for pipeline segments that could affect HCAs. Operators may also carry out integrity assessments beyond the HCA-affecting segments. Integrity assessment methods are employed for specific threats of concern (corrosion, cracking, mechanical damage). Operators base decisions on which integrity assessment methods to apply on an evaluation of the susceptibility of pipeline segments to specific threats. If a particular threat is not considered significant on a segment, then an integrity assessment method associated with that threat is not specifically required.

However, when a threat is eliminated from consideration for integrity assessment, the threat must not be eliminated from inclusion in a risk model used to evaluate other risk reducing measures. In other words, if a threat is not deemed significant enough to warrant application of a specific integrity assessment method, it does not necessarily mean that threat can be discarded from the likelihood analysis in the overall risk model nor can data stop being collected on that threat. To do so may lead to an incomplete risk evaluation and erroneous determinations of risk reduction measures. Many threats do not warrant that a unique integrity assessment technique be applied but are nonetheless valid for the consideration of risk reduction measures. The basis for screening out threats from consideration for integrity assessment must be documented and maintained for the useful life of the pipeline (in accordance with §§ 192.947 and 195.452(l)).

The pipeline risk model should represent all relevant threats. It is important that the threats included in the model are not limited only to those that have caused pipeline failure historically. Rather, the model should include other threats that have caused failures within the pipeline industry and could do so in the future because of pipe characteristics and changing conditions affecting the pipeline. On some segments, pipeline characteristics may result in the model estimating a negligible likelihood of failure for one or more threats (e.g., several orders of magnitude lower than higher likelihood threats). Such a result can be justification for reduced priority of additional measures to prevent failures from the negligible threats. However, such decisions must be made carefully to ensure a complete and accurate risk analysis. Additional considerations include:

[41] "Integrity assessment" refers to method(s) used to assess the integrity of the line pipe for identified threats. More than one method may be required to address all the threats to a pipeline segment (49 CFR Part 192, Subpart O). Current pipeline code sections can be accessed at the U.S. Government Printing Office web site at: https://www.ecfr.gov/cgi-bin/text-idx?SID=1d49a3b137cb1b6fc45251074e634b44&c=ecfr&tpl=/ecfrbrowse/Title49/49cfrv3_02.tpl.

1. Threat screening should consider the severity of consequences, as threats presenting a low likelihood of failure may be risk-significant if the failure modes could result in especially severe consequences.
2. If measures are taken to reduce the likelihood of failure from other threats, then the likelihood of failure from the screened-out threats should be reconsidered to determine if they are significant for a segment.
3. Interactions with other threats should be evaluated. Threats with low risk when considered individually may still interact with other threats and result in a significant risk.
4. Uncertainties in the assumptions and basis for model parameter values should be examined to determine if the likelihood of failure from a threat could be higher with small changes. If the uncertainties indicate that the likelihood of failure from the threat could be considerably higher, then evaluation of the threat should be included in the model. Understanding the shape of probability distributions for inputs can provide important insights into the effect of uncertainty and identify when actions to reduce uncertainty can impact decisions and yield significant risk reductions.

G. Application of Risk Models to Identify and Evaluate Preventive Measures

Integrity Management regulations require risk assessment to support identification of risk reduction measures to prevent and mitigate the consequences of a pipeline failure that could affect a high consequence area[42] and evaluation of the likelihood of a pipeline release occurring and how a release could affect the high consequence area.[43] Section 192.935(a) requires that an operator take additional measures beyond those already required by Part 192 to prevent a pipeline failure and to mitigate the consequences of a pipeline failure in a high consequence area. Section 195.452(i) requires that an operator must take measures to prevent and mitigate the consequences of a pipeline failure that could affect a high consequence area. "Preventive" measures reduce the likelihood of failure through additional protection against threats.

A risk model that supports an evaluation of the effect of implementing preventive measures has an output measuring likelihood of failure that is capable of reflecting changes due to preventive measures and estimating the differences in risk due to the changes. Changes can be represented in the model by changing the values assigned to variables or by making changes to the model structure (e.g., adding a variable to represent increased redundancy of measures combatting a threat).

The effectiveness of different types of models in supporting risk-based decisions, including decisions on preventive measures, was discussed in Section III.A. A risk model can support

[42] 49 CFR §§ 195.452 (i)(1) and 192.935(a).
[43] 49 CFR §§ 195.452 (i)(2), 192.911(c), and 192.917(c)).

identification and *evaluation* of preventive measures. To assist *identification*, sensitivity analysis can be conducted to help examine which threats and model inputs are driving the risk results. Preventive measures can be defined to address the most important risk drivers.

One method of performing such a sensitivity analysis is to reduce the value assigned to each model input variable one by one by a fixed percentage (e.g., 25-50 percent), leaving the other variables fixed at their best estimated values. The risk is then reevaluated using the revised input value. After this is repeated for all variables, the results can be compared. The variables that drive the biggest changes in the likelihood of failure could represent the risk factors with the best potential for risk reduction by preventive measures.

This evaluation can be performed on the entire pipeline or on specific pipeline segments. If considering the entire pipeline, the analysis results would show risk factors that have the greatest overall potential for risk reduction. If conducted separately for specific pipeline segments, the results indicate the factors that have greatest potential for risk reduction on those segments. If relatively few segments dominate the risk of the entire pipeline, then concentrating on the risk factors and potential preventive measures for the high-risk segments may present an efficient path to reducing risk.

Once risk drivers are identified, preventive measures may be defined to reduce the likelihood of failure. The risk reduction that may be achieved by implementing a measure is estimated by evaluating the baseline risk (i.e., *without* the preventive measure), evaluating the risk assuming the preventive measure is implemented, and calculating the difference as the estimated risk reduction. When this evaluation is performed for each preventive measure under consideration, the estimated effectiveness of all individual preventive measures is compared, necessary resources to complete each measure are calculated, and the most effective set of measures given available resources will be shown.

When estimating the significance of risk factors or the risk reduction achieved by preventive measures, the effects of interacting threats should be evaluated (see Section IV.E above). In addition, although the analysis may include *preventive* measures, the analysis to evaluate the potential benefit of a preventive measure should also include consequences to determine the overall risk reduction (versus just the reduction of likelihood). Any dependencies between likelihood and consequences should also be included, since these can affect the overall risk estimates.

For example, reducing the likelihood of failure from a particular threat may affect the distribution of failure modes (e.g., rupture vs. leak), which may then affect the distribution of release volume or the likelihood of different operator actions to limit a release. If a threat is reduced that has a higher than average proportion of failure by leak rather than rupture (e.g., corrosion), then the remaining distribution of failure modes will have a higher proportion of

failure by rupture, and the consequence and risk model outputs will need to be adjusted accordingly.[44]

H. PHMSA Key Recommendations – Likelihood Modeling

- The use of fixed numerical weights applied to risk factors and/or categories can introduce distortions in the likelihood of failure estimates from relative assessment/index models for specific pipeline segments. These distortions should be corrected as part of the necessary adjustments to apply the output from these models to the evaluation of risk reducing measures affecting specific segments.
- Uncertainties in the values of model variables can be important to the conclusions of a risk analysis and should be carefully evaluated. The likelihood of failure due to a threat should be evaluated in the context of uncertainties and the potential for consequences given the threat.
- Estimates of the likelihood of failure should be periodically validated, including evaluation of model inputs and outputs, to ensure the risk model accurately represents pipeline system risks.
- Identification of the most important model inputs or risk "drivers" is critical to understanding if the model outputs are technically valid. Risk model factors found to be important to the output risk levels should be reasonable when reviewed by SMEs or compared with historical data (both industry-wide and operator-specific).
- When risk analysis involves multiple threats, the effects of threat interactions or dependencies on the likelihood of failure should be evaluated. The threat interactions shown in Table IV-1 are recommend for inclusion where applicable. Other interactions found to be applicable at specific locations or in unique operating environments should be evaluated.
- The risk assessment should include modeling of human interactions that are significant to the likelihood of failure or have a significant effect on consequences following a failure.
- Different modeling methods may be applied to assessing the likelihood of failure due to different threats. Threat-specific modeling methods may necessarily vary and may not always be amenable to characterize risk as one composite risk value.

[44] While the leak to rupture threshold has been historically set at operating pressures of 30 percent SMYS (specified minimum yield strength), it is important to note that recent work by Kiefner and Associates and Kleinfelder has demonstrated that ruptures occur below 20 percent SMYS when interacting threats are present (see http://kiefner.com/wp-content/uploads/2013/05/Study_of_pipelines_-that_ruptured_at_stress_below_30pct_SMYS__PPIM_2013_paper.pdf). Operators should be aware of threat interactions when minimizing the consequence of a failure based on their assumption that the failure will only leak and not rupture.

V. Consequence Modeling

This section provides information on important characteristics of consequence, the second fundamental part of the risk definition and formula.[45] In the general risk definition, consequence represents and evaluates the severity and loss associated with an unwanted event. In pipeline risk modeling, the unwanted event is failure of a pipeline system or portion of a pipeline system. The consequence portion of a pipeline risk model encompasses the scenarios following a pipeline failure. The risk model uses the factors driving those scenarios and the interrelationships among risk factors to estimate the overall consequence of failure to potential receptors. Depending on the release characteristics, receptors may be at the point of failure of the segment or may be some distance away. To estimate consequences, the model should therefore include input variables representing important characteristics of a pipeline segment, including the product being transported and the location of the segment, and the potential paths of release dispersion between the segment and consequence receptors. These variables represent all factors needed to estimate the consequences of failure for all points along the segment.

The consequence analysis begins with consideration of a pipeline failure at a specific location and ends with estimates of the impacts that could occur from a release following the failure at that location. To evaluate the consequences of failure, the model includes and estimates the following dependent elements of a release:

1. **Product Hazard**: What kind of damage could the pipeline's transported product cause to receptors (e.g., flammability, toxicity)?
2. **Release rate and volume**: How much liquid or vapor could be released?
3. **Release dispersion characteristics**: Where, how, and when could the released product travel?
4. **Receptors**: Who or what could be impacted negatively by the release given the product hazard, volume, and dispersion?
5. **Expected Loss**: What is the estimated worth to the operator and other stakeholders of avoiding impacts to receptors and direct losses from a release?
    a. Receptors of a release may be diverse (e.g., the public, operator personnel, the environment, private and public property). Consequences can be measured individually for the different types of receptors, but optimal decision making can be facilitated if consequences can be translated into a single value equivalent that represents total loss from the consequences (e.g., dollars). If a unified measure of consequence is needed for risk assessment or decision-making, then a consistent and defensible method to measure the magnitude of consequences to different receptors is needed.

The first four[46] elements are estimated based on data and information on the objective characteristics of the pipeline and its location. However, "Expected Loss" is a more subjective measure that ultimately

[45] See sections I and II.B of the document above.
[46] Muhlbauer, *Pipeline Risk Assessment: The Definitive Approach and its Role in Risk Management*, 2015.

represents the realities, attitudes, and preferences of the operator organization and other stakeholders. For example, respective pipeline operators conduct operations in widely varying population densities, physical environments, regulatory environments, have varying levels of ability to cope with accident costs, etc., and have organization-specific levels of risk tolerance.

Conceptually, the evaluation of consequences is a function of these elements, with the estimates for each element dependent on previous elements:

$$Consequence\ of\ Pipeline\ Failure = f(H, Q, D, R, L(R))$$

Where:

$H = Product\ Hazard\ to\ Receptors$
$Q = Release\ Rate\ and\ Volume$
$D = Release\ Dispersion\ Characteristics$
$R = Receptors\ Impacted\ by\ the\ Release$
$L(R) = A\ Measure\ of\ the\ Loss\ given\ the\ Impacts\ to\ all\ Receptors$

Sections V.A through V.D of this document provide additional information on risk model treatment of consequence.

A. Selection of Approach

Consequences of pipeline failures can differ widely because of a variety of factors, including the differences in hazards and dispersion characteristics of different commodities. Table V-1 shows the names of commercially available consequence analysis models that have been used to estimate safety consequences for different commodities.[47] These models cover different elements of the consequence analysis described in Sections V.A.1 through V.A.4.

Table V-1
Safety Consequence Models for Different Commodities

Commodity	Hazard	Model Type	Models
Natural Gas	Jet Fire, Flash Fires, Blast Pressure, Thermal Radiation	Simplified Models	PIR calculation
		Detailed proprietary Models	PIPESAFE DNV PHAST
HVL		Hazard Area Estimate	API RP 581

		CFD Modelling	

A consequence analysis approach should address all elements of a product release following a pipeline failure, including hazards of the released product, release rate and volume, dispersion characteristics, and receptor impacts. Exclusion of any element results in an incomplete analysis and unreliable results. Sections V.A.1 through V.A.5 below provide information on each of the consequence analysis elements, the inputs and outputs of each element, and the needs from risk models to support each element.

A.1 Hazard

Input: Pipeline commodity properties.

Output: Hazards to consequence receptors.

The analysis should consider acute hazards of the released products such as flammability, toxicity, and mechanical effects of a release, as well as chronic hazards such as environmental contamination. Acute thermal hazards can include effects from immediate or delayed ignition.

For a complete analysis, all hazards of all commodities that are transported in the pipeline should be included in the risk model. If multiple commodities are transported, then the hazards of all of them should be included. For example, a hazardous liquid pipeline could transport different types of HVLs, crude oil pipelines can carry sour crude and non-sour crude, refined products pipelines can carry jet-A fuel and high-octane gasolines, and natural gas pipelines can carry high BTU gas as well as lower BTU gas and some natural gas condensates. Each product that a pipeline transports comes with distinct hazards to humans and the environment and distinct dispersion characteristics over land, water, and air.

Even if the pipeline transports a single commodity type, release of the commodity could result in multiple hazards. Limiting the scope of the consequence analysis to only the most frequently transported commodity or the "most significant hazard" could result in

[48] "CFD" stands for "Computational Fluid Dynamics."

excluding risk-significant scenarios from the risk analysis. Often, the consequences of one hazard will dominate some locations, but for other locations, multiple hazards will each have an important contribution to risk.[49]

A.2 Volume

Input: Pipeline characteristics, location characteristics, failure modes, and commodity properties.

Output: Release volumes at each location following a failure.

For a complete risk assessment, the consequence analysis should include consideration of a wide range of scenarios to estimate the volume of commodity that might be released following a pipeline failure. Volume is an uncertain quantity, so a complete analysis may require consideration of multiple scenarios to estimate the range of volumes that could be released. Volume estimate scenarios are defined by input variables that affect release volumes, including the leak or rupture size, the flow rate through the pipe failure, the time required to detect the leak or rupture, the effect and timing of operator actions, the location of valves that could be used to isolate and limit the release, and the elevation profile of the pipeline. Considering of a range of possible scenarios, including both large and small failure sizes, better ensures that the highest risk scenarios are covered. Concentrating on only on one scenario (e.g., largest rupture) may not result in the highest release volume or the highest risk level.

At each potential release location, the range and distribution of failure sizes is dependent on the distribution of failure modes (leak vs. rupture). The distribution of failure modes is dependent on the distribution of the likelihood of failure from different threats, because threats have varying frequencies of failure in different modes. For example, corrosion failures on pipe with higher toughness properties tend to have a lower likelihood of rupture than seam and cracking failures or excavation damage. Therefore, the range of release volumes at each location is dependent of the distribution of threats at the location. For an accurate consequence estimate, the risk model algorithm should preserve this dependency.

To properly represent risk, the volume estimate should encompass the range of possibilities experienced in applicable historical releases. Historical data beyond the specific pipeline being analyzed should be included when considering the range of possible release volumes. If historical releases are considered inapplicable, the analysis should explain exclusion of these scenarios from consideration.

[49] For example, the 1999 Olympic Pipeline/Bellingham, Washington, accident caused three fatalities, two resulting from fire and one from fumes causing loss of consciousness. Document can be accessed at: https://www.ntsb.gov/investigations/AccidentReports/Reports/PAR0202.pdf.

It may be useful for an operator to consider a fixed set of hole sizes based upon types of expected failures (e.g., pinhole, corrosion hole, small rupture, etc.) Release rates can then be calculated for each size and used as the basis for determine release volumes while incorporating other information, such as estimated response times.

A.3 Dispersion

Input: Release rate and volume, commodity properties, location and dispersion path characteristics, emergency response to spill.

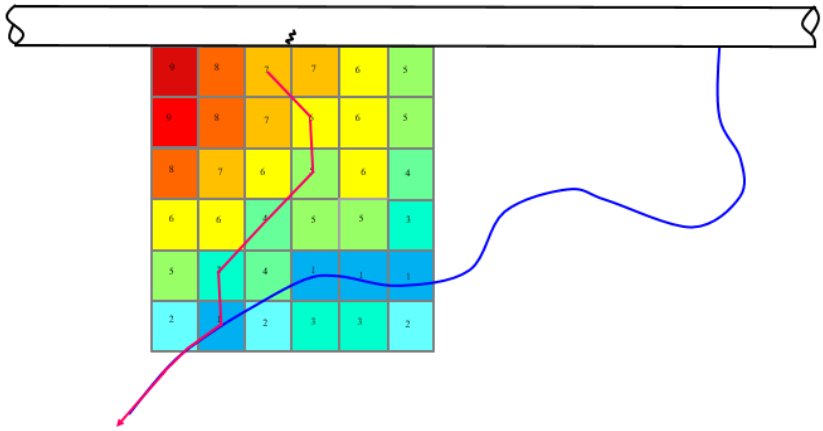
Output: Locations where receptors are subject to hazards from released commodities.

To support a complete consideration of potential consequences, the analysis should consider all dispersion methods and pathways that could result in adverse consequences to receptors, recognizing that pathways and magnitudes of dispersion are uncertain. The consequences of a pipeline release to impact potential receptors depend on the extent and direction of release dispersion. Dispersion depends on the product characteristics, volume released, geographic features around the pipeline, and environmental conditions. Depending on the released commodity and location characteristics, the release may disperse by air, soil, or water. Variable atmospheric and waterway conditions (e.g., wind direction and speed, water flow velocity) should be considered to include the full range of possible dispersion of the released commodity. Consideration of both high-likelihood and high-consequence dispersion scenarios is essential to a full evaluation of risk. It may also be that the most likely scenario is not the highest-risk scenario.

For released liquids, dispersion by land and water is frequently modeled using a digital elevation model (DEM) to trace potential spill flow paths, along with stream locations integrated in a GIS (see example in Figure V-1). Dispersion by water is particularly important to analyze, since waterways provide paths for the spill to reach more receptors further from the spill location. For very small spill volumes that occur away from waterbodies, detailed dispersion modeling may not be warranted, if the spill is unlikely to disperse beyond the immediate vicinity of its origin.

To initiate integrity management programs, pipeline operators were required to identify which of their pipeline segments could affect high consequence areas. Operators continue to update those analyses as an ongoing part of their IM programs. The analyses may involve use of elements of consequence models that include hazard identification, spill volume estimates, and dispersion estimates.

Figure V-1
Spill Plume Dispersion over Model of Relative Elevation Near Pipeline



A.4 Receptors

Input: Locations subject to hazards following release.

Output: Receptors in locations subject to hazard after release and dispersion.

The magnitude and direction of release dispersion defines the areas subject to release hazards, the potential receptors of release consequences in the hazard areas, and the severity of impacts. Depending on the hazards involved, potential receptors may be near the failure location on the pipeline, or they may be some distance away (particularly in scenarios where the released commodity may be transported by water). Potential receptors include:

- Persons occupying the hazard area (homes, workplaces, schools, hospitals, etc.) that could be injured or killed.
- Features of the natural environment (water resources, flora and fauna, etc.) that could be damaged or contaminated.
- Structures and other property that could be damaged or destroyed.

A.5 Expected Loss

Input: Consequences to receptors from a release.

Output: Expected loss due to consequences.

A measure of loss is needed to allow comparison of the expected loss from a pipeline failure to the resource expenditure of risk reduction measures, to help evaluate their relative effectiveness. Some consequences, such as the direct monetary costs of a release, including property damage, relocation costs, environmental cleanup costs, and paid civil and legal penalties, are directly comparable to the increased capital and operating costs required to implement risk reducing measures. However, release consequences could include additional impacts that are not readily measured by direct

monetary costs, including human casualties, ecological damage, damage to company reputation with regulators or the public, and product supply problems. If the analysis includes only monetary costs, it could understate the total loss from releases. Depending on the type of pipeline and the release, the societal impacts of such consequences could far exceed the direct monetary costs to the operator.

A common method for establishing a single-valued measure of the loss from diverse consequences is to convert all consequences to monetary equivalents. Operators are often reluctant to express losses due to fatalities and injuries in monetary terms. However, if human safety consequences are not included in the calculation of expected loss from failures, then the loss will be understated and the benefits of potential risk reducing measures will be undervalued. To fully characterize the loss from pipeline failure consequences, operators should include the cost of human casualties, along with other non-monetary costs, in the overall measure of consequences. The U.S. Department of Transportation has provided guidance[50] on the value of avoiding human casualties, prescribing a Value of Statistical Life (VSL) figure of $9.6 Million (2015 dollars) for DOT analyses.

In some applications, operators may choose one type of consequence, such as potential human casualties or environmental damage, and set decision criteria based on risk measures of this consequence only (e.g., expected fatalities per year). An example of this approach is given in Appendix B.1, which uses "FN" curves[51] as a guide for evaluating consequences based on human impacts. If a single consequence type is used to evaluate risk reduction measures, then the benefits of the risk reduction measures could be understated, because risks in other categories that are not included in the decision criteria may also be reduced by the risk reduction measures being considered.

Risk models may use an alternative to monetary equivalents to combine different types of consequences in a common measure of loss. If so, the method chosen should reflect the organization's relative valuation of the types of consequences involved. Scales used to measure loss for different receptors (e.g., human casualties, environmental damage, economic) should be internally consistent, so that the same values are assigned to loss levels that are valued equivalently for all receptors.

B. Operator and Emergency Responder Response

The responses of operator and emergency responders during an event are key factors in the severity of consequences from pipeline releases. Failure detection capability and the speed and

[50] U.S. DOT, *Guidance on Treatment of the Economic Value of a Statistical Life (VSL) in U.S. Department of Transportation Analyses – 2016 Adjustment*, 2016. Document can be accessed at: https://cms.dot.gov/sites/dot.gov/files/docs/2016%20Revised%20Value%20of%20a%20Statistical%20Life%20Guidance.pdf.

[51] See ISO/IEC 31010:2009 – *Risk management – Risk assessment techniques*, Section B.27.

efficacy of the emergency response can significantly impact the severity of the consequence of a release.

Consequence analysis should consider ability to detect leaks of various sizes as well as time to respond and shut down and isolate the pipeline. Overly optimistic expectations and assumptions about leak detection capabilities will likely lead to underestimating spill volumes and the associated consequences.

For hazardous liquid pipelines, operators have often used spill response plan assumptions in risk models to estimate spill volume and dispersion direction and distance as the basis for consequence estimates. Accident history indicates that although most pipeline accidents do not involve "maximum" or worst-case release estimates, in some cases, the anticipated level of consequences can be significantly underestimated. For a balanced assessment of consequences, operators should avoid non-conservative assumptions or estimates regarding spill response actions that impact release volumes or dispersion.

For example, the NTSB pipeline accident report for the July 25, 2010 Marshall, Michigan, crude oil pipeline rupture[52] stated "During interviews, first responders said that they were unaware of the scale of the oil release; this lack of knowledge contributed to their poor decision-making." In addition, NTSB concluded "that although Enbridge quickly isolated the ruptured segment of Line 6B after receiving a telephone call about the release, Enbridge's emergency response actions during the initial hours following the release were not sufficiently focused on source control and demonstrated a lack of awareness and training in the use of effective containment methods."

The NTSB pipeline accident report for the September 9, 2010, San Bruno, California, incident[53] concluded "…that the 95 minutes that PG&E took to stop the flow of gas by isolating the rupture site was excessive. This delay, which contributed to the severity and extent of property damage and increased risk to the residents and emergency responders, in combination with the failure of the SCADA center to expedite shutdown of the remote valves at the Martin Station, contributed to the severity of the accident."

While not typical, historical high-consequence releases such as the Marshall, Michigan, and San Bruno, California, incidents illustrate that variability in human actions in response to a failure can compound other factors to significantly affect the consequences of the failure. Emergency response time variation can depend on factors such a procedural complexity, logistical challenges, and the experience/training level of responders. Identification of the actual release location and the ability to isolate the release can vary widely depending on pipeline location and

[52] NTSB Accident Report NTSB/PAR-12/01 PB2012-916501, Enbridge Incorporated Hazardous Liquid Pipeline Rupture and Release, Marshall, Michigan, July 25, 2010. This document can be accessed on the internet at: https://www.ntsb.gov/investigations/AccidentReports/Reports/PAR1201.pdf.

[53] NTSB Accident Report NTSB/PAR-11/01 PB2011-916501, Pacific Gas and Electric Company Natural Gas Transmission Pipeline Rupture and Fire, San Bruno, California, September 9, 2010. This document can be accessed on the internet at: https://www.ntsb.gov/investigations/AccidentReports/Reports/PAR1101.pdf.

configuration, and surrounding population density. Therefore, it is important for a complete and valid modeling of consequences that the model:

1. Identify and incorporate all key human actions or decision points that can have a substantial impact on the level of consequences following a failure. Even complex responses can generally be broken out into a relatively few major steps that should be accomplished to minimize the consequence of a release.
2. Estimate the range of time that may be required to perform the key actions. The estimate should include a sufficient range to cover the full uncertainty in response time. Using a single point estimate for potentially important parameters such as the time to stop stream flow spill migration is not appropriate without substantial justification and can potentially skew consequence calculations.
3. Estimate the key parameters that have a substantial impact on spill volume and dispersion given the range of possible response times and the effectiveness of the response.

Given the uncertainty in response times, it may be useful to develop best-estimate, minimum, and maximum estimates (or a probability distribution for key response times) to more fully define the range of expected consequences for the releases being analyzed. Consideration of a range or distribution of impacts from emergency response allows more insight on the range of risks than reliance on point estimates that might have originally been developed for other purposes.

C. Application to Identification of Mitigative Measures

Integrity management regulations require risk assessment to support identification[54] and evaluation[55] of risk reducing (preventive and mitigative) measures. Section 192.935(a) requires that an operator must take additional measures beyond those already required by Part 192 to prevent a pipeline failure and to mitigate the consequences of a pipeline failure in a high consequence area. Section 195.452(i) requires that an operator must take measures to prevent and mitigate the consequences of a pipeline failure that could affect a high consequence area. "Mitigative" measures reduce the consequences of failure, through actions that reduce the product hazard, release volume, the dispersion of the release, or the exposure of receptors to the release.

Risk models can support *identification* and *evaluation* of mitigative measures. The effectiveness of different types of models in supporting decisions, including decisions on mitigative measures, was discussed in Section III.A. To assist *identification*, sensitivity analysis can be conducted to

[54] 49 CFR §§ 195.452 (i)(1) and 192.935(a). Current pipeline code sections can be accessed at the U.S. Government Printing Office web site at: https://www.ecfr.gov/cgi-bin/text-idx?SID=1d49a3b137cb1b6fc45251074e634b44&c=ecfr&tpl=/ecfrbrowse/Title49/49cfrv3_02.tpl.

[55] 49 CFR §§ 195.452 (i)(2), 192.911(c), and 192.917(c). Current pipeline code sections can be accessed at the U.S. Government Printing Office web site at: https://www.ecfr.gov/cgi-bin/text-idx?SID=1d49a3b137cb1b6fc45251074e634b44&c=ecfr&tpl=/ecfrbrowse/Title49/49cfrv3_02.tpl.

examine which consequence analysis inputs are driving the risk results. Risk reduction measures can then be defined to address the most important risk drivers and mitigate the consequences of failure. Consequences may be reduced by actions, such as:

1. Reducing potential release volumes by:
    a. Installing new emergency flow restriction devices, remote control valves, or automatic shutoff valves.
    b. Improving leak detection systems or operator response to rupture indications.
    c. Installing more SCADA measurement points to allow for more precise monitoring and quicker determinations of pressure, flow, or temperature data reflective of pipeline operating conditions at specific locations.
2. Reducing the potential for spill dispersion through such measures as secondary containment, positioning emergency equipment, or improving emergency response.
3. Relocating receptors or relocating the pipeline to lower the potential for receptor impacts.

These measures have varying levels of practicality and potential effectiveness.

For a risk model to adequately support an analysis of the effects of additional mitigative measures, the model's consequence evaluation should be capable of reflecting changes due to the projected mitigative measures and showing the differences in risk due to the changes, whether they be changes to the pipeline, operations, dispersion pathways, or location of potential receptors. Changes can be represented in the model by changing the values assigned to variables or by making changes to the model structure.

The potential risk reduction from implementing a measure is estimated by evaluating baseline risk (i.e., *without* the measure), evaluating risk assuming the measure is implemented, and calculating the difference as the estimated risk reduction. The results can then be fit into a benefit-cost analysis of the risk-reducing measures under consideration. When this evaluation is performed for each measure under consideration, the estimated effectiveness of all measures is compared, necessary resources to complete each measure are calculated, and the most effective set of measures given available resources will be shown.

D. PHMSA Key Recommendations – Consequence Modeling

- To support decision making and the identification and evaluation of mitigative measures, the consequence analysis should encompass the five elements of hazard, release volume, dispersion, receptors, and estimated loss. The impact of operator response actions and timing on these elements should be appropriately evaluated.
- Varying levels of sophistication are possible in the consequence analysis, while still allowing for useful results, but it is important to consider a range of scenarios, defined by a range of values for key consequence variables, to capture the full spectrum of possible consequences. Also, it is important to consider high-consequence scenarios, even if they have a low probability of occurrence.

- The quantitative information in the consequence analysis should represent the operator's best current understanding of important variables that affect estimates of hazards, release volume, and dispersion. Equally important is a consistent and complete measure of losses from estimated consequences. If index scores, monetary equivalents, or other measure are used to represent the cost of consequences to diverse receptors, then the relative values assigned to different consequence levels should be internally consistent and represent the values of the operator organization or values used in societal decision making.
- The risk analysis should include modeling of human interactions that have a significant effect on consequences following a failure.

VI. Facility Risk Modeling

Pipeline facility risk assessment is different from line pipe risk assessment, because facilities have different component types with different failure mechanisms and failure modes. Consequence assessment can also be different because facilities are most often located on property controlled by the pipeline operator and not on public rights-of-way (ROW). In general, facility risk models will measure the likelihood of failure for the facility location (or specific areas within a facility), rather than a likelihood per mile.

Gas Transmission Facilities include:

- Compressor stations
- Regulator and Metering Stations

Hazardous Liquid Transmission Facilities include:

- Tank Facilities
- Pump Stations
- Metering Stations

The liquid and gas IM regulations require HCA identification, risk assessment, and evaluation of preventive measures and mitigative measures for facilities as well as line pipe. The IM regulations require integrity assessments for line pipe only.

A. Comparison with Line Pipe Risk

The same basic principles apply for risk assessment of facilities as for risk assessment of line pipe. Risk assessment models for facilities should model likelihood and consequence. All threats to integrity at the facility should be considered in the likelihood assessment. All product hazards, dispersion paths, and receptors should be considered in the consequence assessment.

Risk assessment of facilities includes consideration of the failure modes considered for line pipe as well as additional failure modes introduced by the inclusion of other components, such as motive equipment (e.g., pumps, compressors).

Some important aspects of facility risk include:

- The concentration of complex equipment at facilities can result in a higher likelihood of failure due to threats like equipment failure and incorrect operation (as shown in historical incident data).
- Equipment failure can be a more significant threat for facilities. Factors such as vibration, excessive and varying temperatures, start-ups and shut-downs, wear, design and construction errors, and other aging/cycling effects affect motive equipment like compressors and pumps and can cause failures of equipment or associated piping.
- Because of the complexity of most pipeline facilities, their failures represent a higher likelihood of service interruption. Standard designs and regulations for facilities include alarms systems, emergency shut-down systems (ESD), site grading for control of lost product, and facility evacuation planning. Most operators employ reliability engineering practices and predictive maintenance schemes to manage facility risk. These factors should be included in the inputs of the facility risk model, as appropriate.
- Facilities that are above ground may be more susceptible than buried assets to some outside force damage threats.
- The operator's analysis should consider the difference between risks for manned and unmanned facilities.

Overall, facilities may have a smaller risk "footprint" than line pipe, and the geographic extent of consequences may not be as widespread. Many facility components are above ground and accessible for inspection and maintenance activities, in contrast to mainly underground line pipe.

To support improved facility operation, operators sometimes perform facility reliability analyses. The data and models for such analyses may be used as the basis for facility risk assessments, if they are augmented to include evaluation of consequences to receptors (e.g., human safety and environmental protection) both on and off the facility site. Operators may use tools often applied to analyze the failure of facilities, such as HAZOP, FMEAs, fault trees, LOPA, or "bow-tie" analysis,[56] as a starting point, expanding the analysis to consider failures that have offsite consequences and evaluating the risk of those failures. Operators may also be able to apply the data sets developed for risk assessment for those other tools and analyses.

[56] ISO/IEC 31010:2009 – *Risk management – Risk assessment techniques*, Sections B.13, B.14, B.18, B.21.

The following are other examples of threats and related risk factors for consideration in a facility risk assessment model:[57]

- Equipment Malfunction
  - Effect of Preventive Maintenance Program
  - Effect of Routine Inspections
  - Effect of Secondary Containment
  - Valve Releases
  - Pump Releases
  - Automation
- Pipe Corrosion
  - External Corrosion
    - External Corrosion Monitoring Program
    - Cathodic Protection Systems
    - Soil/air Interface
    - Historic Releases from External Corrosion
  - Internal Corrosion
    - Internal Corrosion Monitoring Program
    - Product Type
    - Low Flow/Dead Legs Piping
    - Historical Releases from Internal Corrosion
  - Atmospheric Corrosion
    - Facility Proximity to Coastal Area
    - Previous Atmospheric Corrosion Issues
    - Effect of Routine Inspections
- Pipe Outside Force Related failures
  - Existence of Underground Pipe Markings
  - Existence of Underground Pipe Maps
  - Effect of Monitoring of Excavations
  - Historic Outside Force Damage Failures
- Incorrect Operation[58]
  - Inadequate Procedures
  - Human Error
  - Quality of Station Documentation
  - Inadequate Training
  - Debris from Pigging and Hydrotesting
- Natural Force Damage

- Whether Located in Hurricane / Storm Prone Area
- Whether Located in Earthquake Prone Area
- Historic Natural Force Damage

Appendix C contains an example qualitative risk model used for facility risk assessment.

B. Application to Preventive Measures and Mitigative Measures

IM requirements for identification and evaluation of preventive measures and mitigative measures apply to facilities as well as line pipe. These regulations require operators take additional measures to prevent a pipeline failure and to mitigate the consequences of a failure that could affect a high consequence area.[59] The same model types (Section II.D) are available for facility risk assessment as line-pipe risk assessment, with the same capabilities to support decision making (Section III.A), although the threats and consequences evaluated using the models will be somewhat different for facilities.

For example, one hazardous liquid pipeline operator uses a relative assessment (index) model to assess risk at tank facilities. The model includes a likelihood index and leak impact factor (consequence) index. The likelihood index scores factors in the following categories:

- Design and Materials
- Incorrect Operations
- Corrosion
- External Forces

The design and materials category includes scores for such factors as:

- Material operating stress and cyclic stress
- Material vibration
- Safety systems predictive and preventive maintenance program
- Failure history of equipment like pumps, valves, tubing, and control and instrumentation

The leak impact factor index scores factors for product hazard, receptors, and spill size.

The design of many facilities includes telemetry, monitoring, and automatic shutdown and isolation systems. These instrument and control systems continuously monitor for leakage, explosive gas mixtures, fire, vibration, component temperature, intrusion, operating pressure, etc., and automatically isolate the system when alarm thresholds are exceeded. The required

[59] 49 CFR §§ 192.935 and 192.452(i)(1). Current pipeline code sections can be accessed at the U.S. Government Printing Office web site at: https://www.ecfr.gov/cgi-bin/text-idx?SID=1d49a3b137cb1b6fc45251074e634b44&c=ecfr&tpl=/ecfrbrowse/Title49/49cfrv3_02.tpl.

maintenance for these facilities often follows manufacturers' recommendations along with reliability engineering concepts to develop preventive actions to assure system availability, reducing the risk of failure. Risk models should support the evaluation of enhancements to equipment design, maintenance, inspection, and operation and the effects of such enhancements on risk.

With a risk model, changes in the likelihood of failure of different equipment can be made to represent reliability enhancements from changes to design, maintenance, testing, or operating practices. The risk model's algorithm can be altered to represent design changes that add redundancy or introduce automation. The risk model can be used to evaluate the likelihood of failure with and without the improvements to estimate the resulting changes in risk. The changes in risk values can be compared to the cost of implementing the enhancement if alternative risk reduction measures are being compared or benefit-cost analysis is being conducted to evaluate the measures.

C. PHMSA Key Recommendations – Facility Risk Modeling

- Facility characteristics that affect risk may be significantly different than those for line pipe. Different failure causes may be important and failures may have different consequences than nearby line pipe. However, the same basic principles apply for risk assessment of facilities as for risk assessment of line pipe and the same types of models may be applied.
- Incorrect operation, human error, and equipment failure can be important failure threats for facility risk and should be represented thoroughly in facility risk models.
- Existing operational approaches to assess facility reliability can often be adapted for evaluation of risk and off-site consequences and should be utilized where possible.

VII. Risk Modeling Data

Previous sections of this document concentrated on the structure of risk models and their use in supporting decisions on operator activities to control risks. This section discusses developing the values for input variables to risk models.

Model inputs should represent the best currently available information on risk factors for both the likelihood and consequences of pipeline failures. Inputs should draw data from both pipeline system records and the knowledgeable and informed opinion of subject matter experts (SMEs). Both data from records and SME input should be validated to ensure applicability as risk model inputs.

Using pipeline records to develop risk model inputs can be a large-scale effort, because of the wide variety of records involved and because pipeline characteristics can change considerably over the length of the pipeline. The operational and inspection history of pipeline segments can also vary significantly over the length of the pipeline. Other model inputs related to the environment in which the pipeline

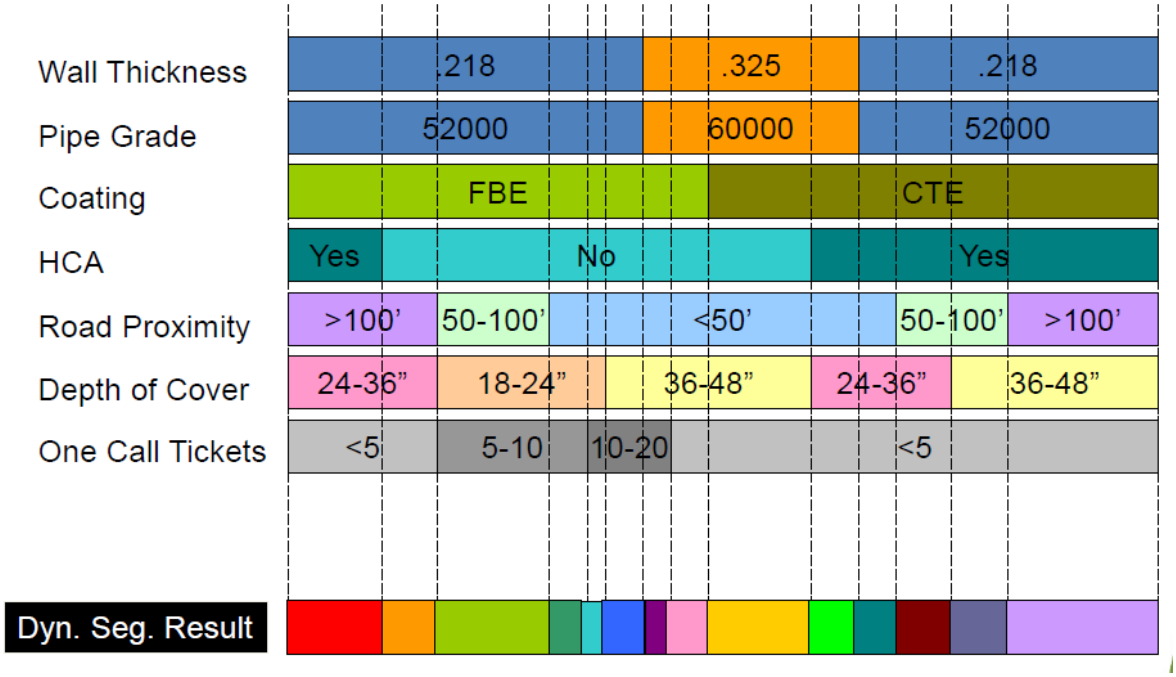
operates (e.g., terrain, soil types, and area characteristics around the pipeline) can also change significantly over the entire pipeline route. SME information should be used to fill gaps in information for model inputs as data from records is being assembled and validated and when inputs cannot be derived from any available records. Operators should revise field data acquisition forms to capture the data and information required to support their risk assessment and Geospatial Information Systems (GIS). Staff responsible for completing field data acquisition forms should be trained on the forms' requirements to meet the data quality expectations of the groups relying on this data to make decisions.

An important feature of input data for a pipeline risk model is a "Linear Reference System" (LRS) to tie risk factors to specific points or segments on the pipeline. Factors can be "linear" (e.g., pipe segments, HCA-affecting segments, class locations, inline inspection (ILI) ranges, MAOP/MOP, test pressure) or single "points" (e.g., facilities, valves, crossings, features or anomalies identified by ILI, girth welds). The reference system that specifies risk factor locations within the pipeline is integrated with a "geographical" location system to tie points and segments on the pipeline with the location of specific features around the pipeline (e.g., HCAs, buildings, bodies of water, elevation changes). In the context of risk models, this is necessary to align risk factors, affecting both the likelihood and consequences of a release, so that each location on the pipeline is appropriately represented by inputs to the risk model. This allows the risk model outputs to reflect the unique combination of risk factors representative at each location.

A GIS is useful to house data on the locations of pipeline characteristics and geographical features. If the operator does not use a GIS, then other methods should be used to accurately assign risk factors to the correct locations along the pipeline. SME knowledge on the relative location of pipeline-related factors and geographic features may be necessary to align these factors for input to the risk model.

In a risk model, sufficient distinction of model outputs at specific locations and insights about pipeline segment risks is enhanced by "dynamic segmentation," where separate risk model results are generated for pipe segments that have significantly different risk factors or significantly different levels of risk. Operators should define criteria for defining the segments with separate risk estimates. Under this approach, illustrated in Figure VII-1, a model would estimate risk separately for each segment where risk factors are distinct. In the figure, the distinct segments are indicated by the dashed vertical lines. For example, the first (leftmost) segment extends to where the "HCA" factor changes from "Yes" to "No"; the second segment extends from this point to where the "Road Proximity," "Depth of Cover," and "One-Call Ticket" factors all change value.

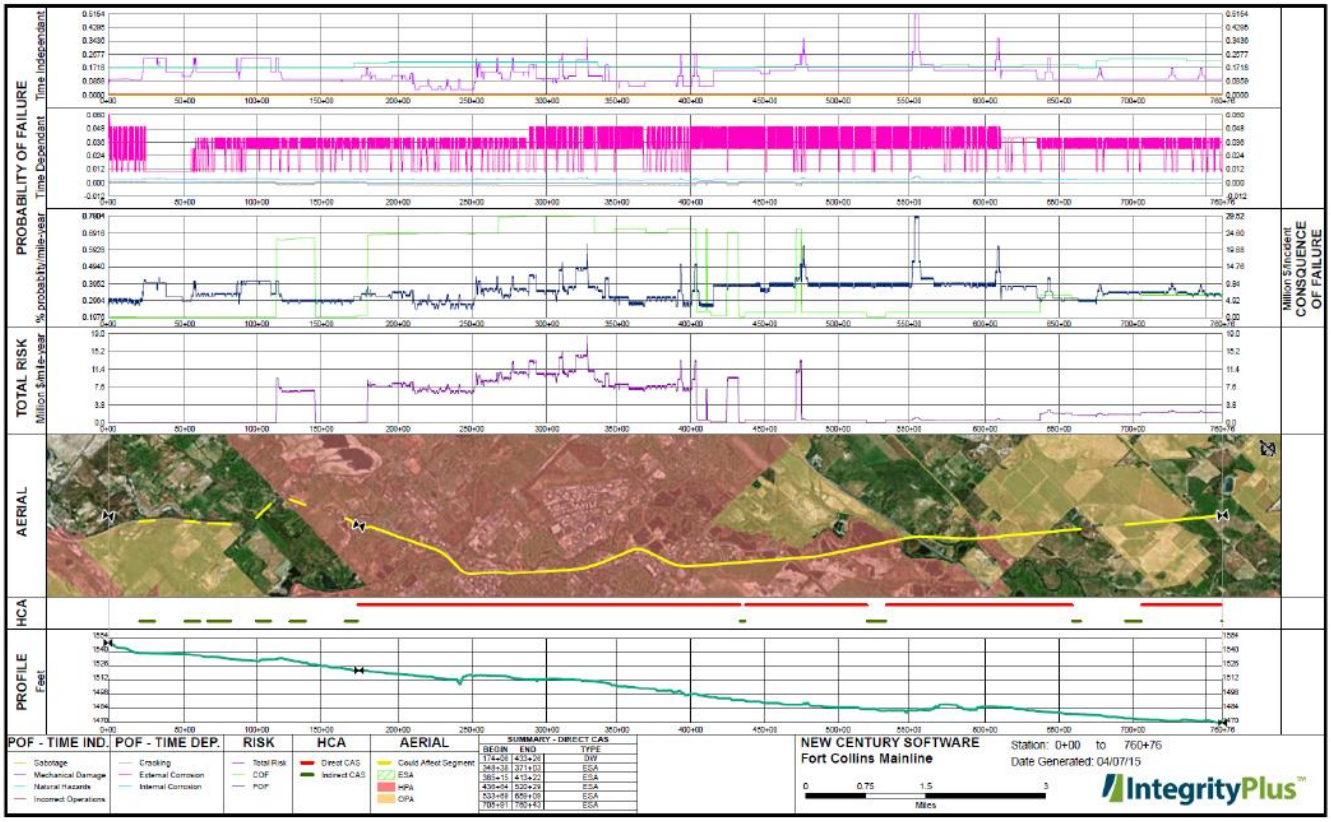
Figure VII-1
Dynamic Segmentation[60]



Observing the change in multiple risk factors along the pipeline route can suggest locations where preventive measures and mitigative measures to reduce risk could be most effective. Figure VII-2 depicts an example of a "risk alignment sheet," where changing risk model outputs along a pipeline route are shown in a visual form. As risk factor data changes and is used to generate estimates of likelihood, consequences, and risk, these outputs fluctuate.

[60] Both Figures VIII-1 and -2 are taken from a RMWG presentation by R. Brush, New Century Software, *PODS Data Management*, March 7, 2017. This presentation can be accessed on the internet at: https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/docs/technical-resources/pipeline/risk-modeling-work-group/65786/podsdatamanagementrmwg0317.pdf.

Figure VII-2
Sample "Risk Alignment Sheet"



A. Relation of Data to Risk Model Types

The most important reasons to choose specific risk model types include: 1) how the models relate to and represent the pipeline system, 2) the output risk measures provided by each model type, and 3) the capabilities of model types to support decision making (see section III.A). While the type and quality of data that are available as model inputs are discriminating factors for applying different types of models, they should not be the primary factor. All model types can employ a combination of location-specific data from records, industry or operator averages, and SME-sourced information. PHMSA does not believe that any specific model type is preferable simply based on the level of data quality available to support the model inputs. However, it should be acknowledged that the accuracy of a specific model is relative to data quality. All models are dependent on data quality and it is important that data quality be addressed consistent with improving the accuracy of model results.

A quantitative system model, if it represents the logical and physical combination of risk factors to produce likelihood and consequences, can produce useful results even if uncertainties exist in the input data. Although optimal results are obtained with a high degree of accurate location-specific data, system risk insights and support for decisions can be achieved with different levels

of data quality and completeness, including situations when significant reliance is placed on SME input or generic data.

B. Data Sources

Operator records of segment-specific characteristics are the primary source of data used for risk model inputs. Operators collect data from routine operating, maintenance, and inspection activities. For example, operating logs record pressures, indicative of stresses on the pipeline, and transients to which the pipeline may be subjected. Exposed pipe reports record data about the condition of the pipeline that is gathered whenever the pipeline is exposed by excavation for other reasons. Records of patrols and surveillance show nearby construction activities that could pose threats to the pipeline, and evidence of changes in local flora that may be indicative of changes in soil conditions. Data sets from in-line inspection integrity assessments also provide information about pipeline integrity.

Operators should ensure that their data acquisition forms are collecting the data needed for their risk model inputs. Construction, operations, maintenance, and inspection personnel responsible for completing data acquisition forms should be trained on requirements for completing forms with the needed data quality and completeness.

Table VII-1 lists typical data elements that apply to risk model inputs. Table VII-2 lists important sources for these data elements. Both tables were duplicated from ASME B31.8S (in some operating environments, operators may need to add additional data elements). Further information on data sources for risk model inputs may be found in ASME B31.8S, section 4.3.

Pipeline alignment drawings
Original construction inspector notes/records
Pipeline aerial photography
Facility drawings/maps
As-built drawings
Material certifications
Survey reports/drawings
Operator standards/specifications
Industry standards/specifications
O&M procedures
Emergency response plans
Inspection records
Test reports/records
Incident reports
Compliance records
Design/engineering reports
Technical evaluations
Manufacturer equipment data

Merging large amounts of data from diverse sources is facilitated by a consistent structure for storing and retrieving the data. As an example, the pipeline industry has developed the "Pipeline Open Data Standard" (PODS) database architecture as a structure for organizing pipeline data (see http://www.pods.org). Figure VII-3 depicts the top-level structure of PODS. Figure VIII-4[63] shows an example of the data structure for a PODS module, showing the structure for data items such as CP type, CP Criteria, Nominal Wall Thickness, Outside Diameter, Pipe Grade, and Pipe Long Seam. The full scope of PODS modules may be found at http://www.pods.org/wp-content/uploads/2015/06/PODS-6.0-Logical-Models1.pdf and a depiction of the full architecture showing relationships among modules may be found at http://www.pods.org/wp-content/uploads/2015/08/PODS-6.0-ERD1.pdf.

C. Data Quality and Uncertainty

It is important to evaluate the quality of the current data supplied to a risk model. For many pipeline risk models, improving the scope and quality of input data is a long-term process. The operator should understand the overall characteristics of the risk model data set and implement actions to ensure needed data quality and seek continuous improvement in the data gathered and input to the model. Risk model data quality issues can increase uncertainty in the results from the model. If the results are used to support decision making, then the results should be interpreted in light of those uncertainties.

There are many ways to measure data quality,[64] but, in the context of risk models, two central aspects can be identified:

1. Data Completeness
   For any model, there may be input variables that are not always known, or not verified to be accurate. Often in these cases, generic default values based on general industry information or SME knowledge and experience are applied. Accounting for this, a simple measure of data quality is the "unavailability" of pipeline-specific data in situations where default or generic average values are being used. This data quality measure can be further refined by considering the relative importance of the respective input data elements according to their impact on the risk model results.

   The lack of pipeline-specific data does not imply that certain model types should not be used and the results should not be applied to support decisions. If a model is thought to be a better representation of the pipeline system but input data is incomplete, then informed default inputs can be used as an interim step, and data needs can be prioritized as familiarity with the model, model results, and real-world application to pipeline integrity management develop.

   If a probabilistic model is being used, priorities for additional data collection may be developed systematically using a value-of-information analysis. This analysis estimates how additional data collection is expected to affect risk assessment results and thereby potentially change decisions on risk reducing measures. If the analysis finds that collecting specific additional information could change decisions significantly, then risk reduction could be significantly enhanced by collecting the additional information. To ensure complete and accurate data for risk model, operators should ensure that records are preserved and retrievable.

2. Data uncertainty
   In addition to data completeness, it is also important to understand the uncertainty in data inputs to a model, regardless of the modeling approach. It is straightforward to estimate the basic statistical attributes for each model input (e.g., mean, variance). Bayesian updating[65] (a technique where a set of existing information – e.g., industry level component failure rate – can be updated by additional pipeline-specific data) is one approach to providing updated statistical estimates as

[64] For example, see "Dimensions of Data Quality: *Toward Quality Data by Design"; Wang, Guarascio (1991)* (http://web.mit.edu/smadnick/www/wp2/1991-06.pdf), cited in presentation by P. Westrick, *Using Data in Relative models with Respect to Decision Criteria*, March 8, 2017.

[65] See *Probabilistic Risk Assessment Procedures Guide for Offshore Applications (DRAFT),* BSEE-2016-xxx (Draft), October 25, 2016, and presentation by R. Youngblood, Idaho National Laboratory, *Bayesian analysis approaches to risk modeling,* August 9, 2016 (https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/docs/technical-resources/pipeline/risk-modeling-work-group/65686/bayesian-data-analysis-phmsarmwg0816.pdf).

additional data for a variable are obtained. Applying methods to estimate input variable uncertainty is especially important for risk models that apply only point estimates as input values rather than probability distributions. Applying a point estimate to represent a variable's underlying data is convenient, but if the data is spread over a wide range, this should be understood and handled in a deliberate manner (e.g., sensitivity analysis). This is particularly important for the input variables that have the largest effect on model results.

If SME input is used, then the uncertainty associated with this input should be understood, particularly for the most important input variables. Applying point values for SME-based input variables with little attention to the uncertainty in those inputs can introduce substantial bias into risk results.

A persistent issue often mentioned by pipeline operators is data loss during new construction and during asset acquisition. To ensure complete and accurate data for risk model, operators should ensure that records are preserved and retreivable after construction and acquistion events.

D. SME Input

Accurate records of pipeline characteristics (including operational, maintenance, and inspection history) and the geographic features in the pipeline vicinity should be the primary source of risk model inputs. However, complete and accurate records are not always available for every pipe segment, and some risk model inputs may not be obtainable from records. In some cases, operator or industry average values may be available as inputs where segment-specific data are not available. In other cases, operators are dependent on the knowledge and experience of personnel who are familiar with the pipeline and important risk factors. Although accurate data from records may be a preferable source, SMEs are a valuable source for significant portions of the information used as risk model inputs.

For greatest effectiveness, a structured process is needed to integrate and balance personnel knowledge on risk factors to ensure consistency and minimize bias. Steps in the process may resemble:[66]

1. Establish members of the SME group that will provide data estimates.

   Each SME should be an actual "expert," in that the individual has authoritative or unique knowledge on the risk factors being evaluated. Criteria for SME status include factors such as credentials demonstrating expertise (not just years in a job or longevity at a company), certificates and training records, industry recognition, professional/ongoing education, etc.

[66] The basic steps given here are adapted from Ayyub, B., *A Practical Guide on Conducting Expert Elicitation of Probabilities and Consequences for Corps Facilities*, U.S. Army Corps of Engineers, IWR Report 01-R-01, 2001.

2. Identify SME group facilitator and information integrator.

   The facilitator should be familiar with the risk model, know how to interpret and calibrate expert opinion accounting for individual biases, and know how to integrate the information to obtain useful inputs for the risk model.

3. Define each variable or model input that is being estimated by expert opinion.

   All quantities should be precisely defined so that the experts clearly understand the scope and boundaries of what is being estimated. All relevant records and maps should be available to the SME group to help clarify the variable definitions and guide the evaluations.

4. Define specific criteria for SME evaluation of variables.

   Specific rules should be established for how SMEs assign input values to ensure consistent application by different SMEs and consistent application across all pipeline segments covered by the risk model. For example, if "external coating condition" is being evaluated on a segment, then SMEs need specific criteria for what constitutes "good," "medium," "poor," "disbonded," or "shielding" coating conditions, so that the process can be consistently applied across the operator's pipeline assets. Quantitative criteria are preferable where practicable.

5. Elicit SME information to obtain values for variables.

   The process should involve a facilitated discussion to elicit risk factor inputs from the SME group. The facilitator should train the SMEs on the objectives of the evaluation, the process for eliciting SME input, and the evaluation criteria.

   Group discussion should be facilitated and opinions obtained and made available to the entire SME group for consideration before a conclusion is reached. Although knowledgeable, SMEs can still have biases that influence their estimates of variables. A discussion should endeavor to draw out any biases[67] and correct for them. Any available applicable data (including information on pipeline characteristics, operational history, or inspection history) that can be used for comparisons is useful for this purpose.

6. Aggregate and present results.

   The SME evaluations should be assessed for internal consistency and aggregated. The process should have documented rules for handling differences of opinion among SMEs[68] and methods for evaluating uncertainties in the inputs that are based

[67] Muhlbauer, W., *Pipeline Risk Management Manual*, 2004, Table 1.2, for a list of biases that can affect expert evaluations. See also Ayyub, 2001, Appendix C.

[68] Ayyub, B., A Practical Guide on Conducting Expert Elicitation of Probabilities and Consequences for Corps Facilities, U.S. Army Corps of Engineers, IWR Report 01-R-01, 2001. Different methods for combining expert opinions are summarized in Appendix C of Ayyub, 2001.

on SME information. SME input should always include measures of uncertainty that capture the range of possible values estimated by the expert for each variable and the relative weighting of the values in the range. Probability distributions are a convenient way to capture information on uncertainty and can be used as direct input to probabilistic risk models. One method for expert elicitation[69] involves assembling the evidence that each expert has used to formulate estimates, and deriving probability distributions for each variable consistent with that evidence.

7. Review and revise results.

   The aggregated results should be presented to the SMEs for review, additional discussion, and potential revision. SMEs should be given the opportunity to revise their assessments after presented with the aggregated evaluation results. Any revised estimates should be incorporated in the aggregated results and Step 6 repeated.

Further details on processes for obtaining information from SMEs may be found in the following references:

E. PHMSA Key Recommendations – Risk Modeling Data

- An operator's choice for the type of risk model to employ in pipeline risk analysis should not primarily depend on factors related to quality and completeness of input data. Operators should take actions to improve data quality and completeness over time, but risk model inputs should represent the best currently available information on risk factors for each pipeline segment and operators should endeavor to employ segment-specific and location-specific data whenever possible to develop risk model inputs.
- Field data acquisition forms should be consistently checked against the data needs in the risk assessment and the GIS processes to assure the data that is needed to support these processes is being collected in the formats and quality expected. Personnel responsible for completing data acquisition forms should be trained on requirements for completing forms with the needed data quality and completeness.

[69] S. Kaplan, *'Expert information' versus 'expert opinions.' Another approach to the problem of eliciting/combining/using expert knowledge in PRA, Reliability Engineering and System Safety*, 35 (1992).

- Risk models that rely on generic estimates or SME information for a significant portion of input data can be useful to gain insight on risk issues and support decisions. This is especially so if the model algorithm reflects the physical and logical relationships of the input variables and the model output risk measures are expressed in standard units.
- Risk model results should be generated using dynamic segmentation to account for changes in characteristics of the pipeline and its operating environment along the pipeline route, so that the results best reflect the segment-specific and location-specific combinations of risk factors.
- SME input should be elicited carefully to best reflect expert knowledge on risk factors. A structured process should be employed to systematically obtain estimates from SMEs. All SME estimates should include a measure of the uncertainty in the estimates and effort should be made to minimize bias in the estimates.

Appendices

Appendix A – Likelihood Models

A.1 Qualitative Models

In qualitative models, inputs and outputs are developed as qualitative categories rather than numerical scores. In processes that use such models, the likelihood, consequence, and output risk levels are obtained by consideration of pipeline risk factors and assignment to a qualitative risk level. These models should have a defined logic for assigning risk levels.

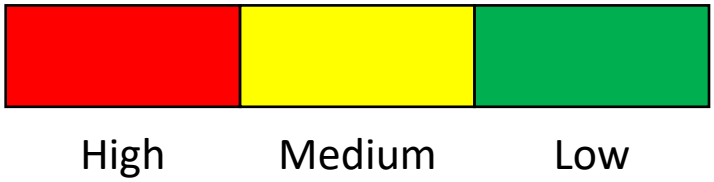
Risk levels may be assigned via an SME discussion. If so, a structured process is needed to integrate and balance the panel's knowledge on risk factors (see section VII.D).

A simplified example of the representation of qualitative results is given in Figure A-1. In the matrix shown, the different shaded regions represent areas of equivalent risk based on different combinations of likelihood and consequence.

Figure A-1
Example Qualitative Model

Consequence	Likelihood		
	High	Medium	Low
High			
Medium			
Low			

Qualitative Risk Scale



A.2 Relative Assessment (Index) Models

Relative Assessment (index) model inputs represent the major risk factors for failure of a pipeline segment, including characteristics of pipeline segments and the surrounding area. These inputs are assigned numeric scores that represent the relative effects on failure likelihood of a pipeline characteristic. Each input may also be assigned a numerical weight, which reflects a subjective assessment of the importance to the potential for a pipeline failure represented by the input. The weighted scores are then combined to calculate an index or score representing the risk presented by each segment. Weights are commonly applied to threat scores to account for the pipeline segment's or operator's failure cause history. Typically, a likelihood index score and consequence index score are calculated separately. They are then combined to obtain a total risk index score. The most common method of combining a likelihood and consequence index to calculate a risk score is by multiplying them.

The index model algorithms often combine likelihood factors according to categories representing major threats to pipeline integrity. For example, index model likelihood categories might include:

- External Corrosion
- Internal Corrosion
- Stress Corrosion Cracking
- Manufacturing Related Defects
    - Defective pipe seam
    - Defective pipe
- Welding/Fabrication Related
    - Defective pipe girth weld
    - Defective fabrication weld
    - Wrinkle bend or buckle
    - Stripped threads/broken pipe/coupling
    - Failure
- Equipment
    - Gasket O-ring failure
    - Control/Relief equipment malfunction
    - Seal/pump packing failure
    - Miscellaneous
- Third Party/Mechanical Damage
    - Damage inflicted by first, second, or third parties (instantaneous/immediate failure)
    - Previously damaged pipe (delayed failure mode)
    - Vandalism
- Incorrect Operations

    - Incorrect operational procedure
- Weather Related and Outside Force
    - Cold weather
    - Lightning
    - Heavy rains or floods
    - Earth Movements

The models typically include several inputs in each threat category. As noted above, each input is assigned a numerical score based on the characteristics or "attributes" of the pipeline segment or the area surrounding the section and is weighted according to its importance. The attribute information is stored in a pipeline risk database. Individual likelihood and consequence indexes can be calculated for each threat, using only the scores and weights of inputs included for the threat category.

For example, a risk index algorithm used by one pipeline operator includes the input "Construction Activity" under the category of "Third-Party Damage." This input has four possible levels, or "attributes," corresponding to different levels of construction activity along a pipeline segment. A numerical score is associated with each attribute so that the variable can be assessed on a consistent basis from pipeline segment to pipeline segment. The attributes and their associated scores for "Construction Activity" are as follows:

Construction Activity	
Attribute	Score
High	10
Medium	7
Low ("typical")	5
Very Low or None	1

Specific rules should be established for assigning attributes to ensure consistent application of the process across different SME groups. SMEs need specific guidance on what constitutes "high," "medium," "low," and "very low," so that the process can be consistently applied across the operator's pipeline assets.

Continuing the example, the weight for "Construction Activity" within the third-party damage threat category would be assigned a value (e.g., perhaps "13%"). In this algorithm, the attribute score for the "Construction Activity" variable is multiplied by this weight and summed with the weighted attribute scores for all other inputs in the third-party damage category to calculate a likelihood index score for the relative probability of pipeline damage due to third-party damage. This threat-specific index score is weighted and summed with the weighted index scores developed for the other cause categories to obtain the total likelihood index. The likelihood index is multiplied by the consequence index to obtain the total risk score for the pipeline segment.

Some operators use one of the "standard" risk-index models that have been developed by various industry consultants, while other operators have developed their own in-house index models. One commonly used industry model is the model, presented in the Muhlbauer *Pipeline Risk Management Manual.*[70]

Significant differences exist among index models in the specific input variables that are included in the quantification of the likelihood index, how scores are assigned to these variables, how the scores are weighted, and how the weighted scores are combined to provide an overall index. In the most common approach, the likelihood index is calculated simply as a weighted sum of the variable scores. Each variable weight is multiplied by the corresponding variable score for a segment and the products of the variable weights and scores are summed to calculate the likelihood index. If any interacting threats were applicable, an additional score would be added to the likelihood index to reflect the additional likelihood of pipeline failure (i.e., the "P_i = failure probability from threat 1 and threat 2 interactions" discussed in Section IV.E).

In the Muhlbauer[71] approach, an index model algorithm calculates the likelihood index as a weighted sum of variable scores. The Muhlbauer *Pipeline Risk Management Manual* provides a set of nominal variable scores and weights that are intended to be starting points for the incorporation of segment-specific data. Additional variables can be defined by the operator.

In-house models developed by operators have been similar in nature to these two models. In some models, the algorithm that translates the individual variable scores into the likelihood index is more complex than a simple weighted sum.

A fundamental characteristic of index models is that the quantitative output is not an actual estimate of the likelihood of failure, consequence of failure, or risk. Instead, it is a numerical index that represents these measures. In most cases, a higher index value is meant to indicate higher likelihood, consequence, or risk and a lower index value is meant to indicate lower values. Thus, the indexes provide a relative measure of risk that has been useful for comparison between different segments or sections of the pipeline (e.g., for setting integrity assessment priorities). Relative model risk results can be challenging to use for applications requiring absolute estimates of likelihood or risk.

A.3 Quantitative System and Probabilistic Models

In this category of risk model, the characteristics of segments of the pipeline and the surrounding area are used to derive an actual estimate of the risk for each segment. Likelihood is estimated as the frequency of failure along each segment over a year's time (or over some other relevant period). Expected levels of consequences in different categories (e.g., human health and safety, the environment, or the potential for economic losses) are estimated. The various consequence measures may be combined using some common units, such as equivalent

[70] Muhlbauer, W. Kent, *Pipeline Risk Management Manual*, 2004.
[71] Muhlbauer, W. Kent, *Pipeline Risk Management Manual*, 2004.

dollar cost. If so, this requires consequences such as human deaths and injuries and adverse environmental impacts to be represented by dollars in the risk equation.

The total risk for the segment is estimated as the product of the likelihood of failure and the expected consequences given failure. If the model calculates the likelihood of different pipeline failure modes (i.e., small leak, large leak, rupture), then the likelihood and consequences corresponding to each failure mode would be estimated as well. The total risk would be estimated as the sum of the product of the likelihood of failure in each failure mode and the expected consequences, given failure in that mode.

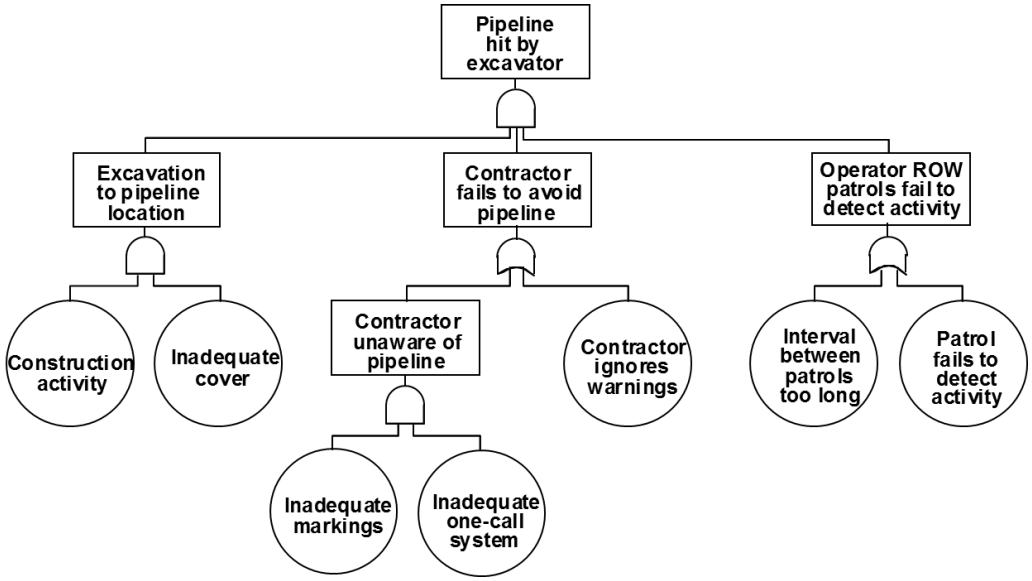
Quantitative System models calculate the likelihood and consequences of a failure along each pipeline segment using the same general types of information on pipeline segment characteristics and the surrounding area that relative assessment (index) models use. Like index models, they can use a combination of data and SME judgment to evaluate inputs in categories corresponding to important threats and consequences.

The algorithm for a Quantitative System model typically includes numerous calculations based on the physical and logical relationships that translate pipeline segment characteristics into estimates of failure likelihood and consequences.

In one model of this type, a nominal or base likelihood estimate is provided based on historical failure rates for the cause categories. This nominal failure rate is modified according to segment-specific characteristics to estimate a segment-specific failure rate (i.e., the expected number of failures for each of the different failure modes per year). The algorithm for modification of the base failure rate may be based on statistical analysis of incident data or on analytical models (e.g., fault tree models or structural reliability models). In addition, the estimate for likelihood of failure may be modified by assumptions about the inspection and maintenance history and practice along the segment. For example, segments that have had recent integrity assessment and repair of discovered defects would typically have different failure likelihood estimates than other segments whose characteristics would otherwise be similar. In addition, as shown in previous Figure IV-3, the additional threat potential from interacting threats can be explicitly accounted for in quantitative system and probabilistic models.

As an example of how an analytical tool is utilized to estimate the likelihood of pipeline failure for one threat category, see Figure A-2, which is a simplified fault tree that models the likelihood of an excavator hit on a pipeline. This model would be part of the model used to estimate the likelihood of failure from excavation damage.

Figure A-2
Simplified Example Fault Tree Model for Excavator to Hit Pipeline[72]



The frequencies or probabilities of the basic events of this fault tree (construction activity, inadequate cover, etc.) are model inputs that would be evaluated based on data or SME inputs. These quantities would be combined according to the model logic to estimate the probability of a pipeline hit by an excavator. This estimate would be combined with an estimate of pipe failure probability, given a hit, to obtain the estimated failure likelihood due to excavation damage. The failure probability, given a hit, is estimated using the probability of a hit imposing specific loads on the pipe and the probability of pipe failure to maintain integrity given those loads (based on pipe characteristics).

For time-dependent threats (e.g., corrosion), a similar "load vs. resistance" approach may be taken that includes evaluation of operating pressure, pipe properties, identified defect characteristics, and the likelihood of failure given pipe, defect, and operating characteristics. For these threats, however, defects grow over time, so the likelihood of failure is time dependent.

Consequences in some risk estimation models are estimated using analytical models to derive quantities such as economic loss and fatalities.

The CFER PIRAMID model is an example of a risk estimation model that has been employed by some pipeline operators.

Because Quantitative System model outputs are actual estimates of probability, consequences, and risk in standard units, they may potentially be applied appropriately to IM program areas

[72] From Stephens, Mark, C-FER Technologies, *Methods for Probability Estimation*, presentation to PHMSA Risk Modeling Work Group, 2016.

requiring absolute measures of risk, as well as when relative measures are needed. They may also be used in other applications that require absolute quantitative estimates of risk.

A.4 Probabilistic Models

Probabilistic models are distinguished from other quantitative system models by the use of probability distributions, rather than single point value estimates, to represent model inputs. The model algorithms combine the distributions according to the system model and obtain output distributions for standard risk measures such as probability of failure, and expected loss from consequences. The difference between a Quantitative System model and a Probabilistic model is not necessarily in the logic of the model algorithm, but a probabilistic model should utilize tools (e.g., Monte Carlo simulation[73]) that allow probabilistic input, in the form of distributions, to be processed and derive output distributions.

Some important inputs to pipeline risk models, such as integrity assessment results and consequences to receptors, can be highly uncertain. Allowing probabilistic input is an advantage when the input values are uncertain, so that the model output can reflect the input uncertainties. The output risk measures then give a fuller representation of the range of possible values, including potential high-consequence outcomes.

Figure A-3[74] depicts an example of distributions to represent uncertainties for inputs to a model for the time-dependent probability of failure due to corrosion. Uncertain inputs that are assigned distributions include operating pressure, pipe yield strength and toughness, defect characteristics from ILI, and defect growth. The model calculates a failure probability as a function of time, given these distributions.

Input distributions should be chosen by considering the range of possible values for the inputs and how the possible values are distributed over the range. Statistical methods, such as Bayesian analysis, may be used to choose distributions given data or SME estimates for an input.

Appendix B – Consequence Models

B.1 Gas Transmission Consequence Models

Example of Use of FN Curves and "ALARP" by a Gas Pipeline Quantitative Risk Model

One scheme that has been used in application of the *PipeSafe*[75] quantitative risk model for a natural gas pipeline operator is a combination of the ALARP (As Low As Reasonably Practicable) principal with three societal risk bands on a frequency vs. number of fatalities ("FN") scale.[76]

Three risk bands for societal risk are defined to determine the relative value of measures to reduce risk at a location on the pipelines:

- At the top end of the scale there are risks that judged to be so great that they are not acceptable/tolerable. [Region above the red line in Figures B-1 and B-2.]
- At the bottom end are situations where the risk is, or has been made, so small that no further precaution is necessary – a 'broadly acceptable' region. [Region between the red line and blue line in Figures B-1 and B-2.]
- In between these two extremes is a region where risks are tolerable only if their level has been reduced to one that is ALARP (As Low as Reasonably Practicable). [Region below the blue line in Figures B-1 and B-2.]

See the Figure B-1 below for an illustration of an FN curve representing the societal risk of fatalities at a specific location on the pipeline. In this example, a portion of the risk curve is in the "ALARP" region, so risk reduction measures were sought to reduce risk at the location.

Figure B-2 shows FN curves for proposed preventive measures for the location with the risk illustrated in Figure B-1. Multiple risk-reducing measures are shown to move the entire FN curve into the "broadly acceptable" risk band.

Figure B-1
FN Curve for a 1-mile section of natural gas pipeline

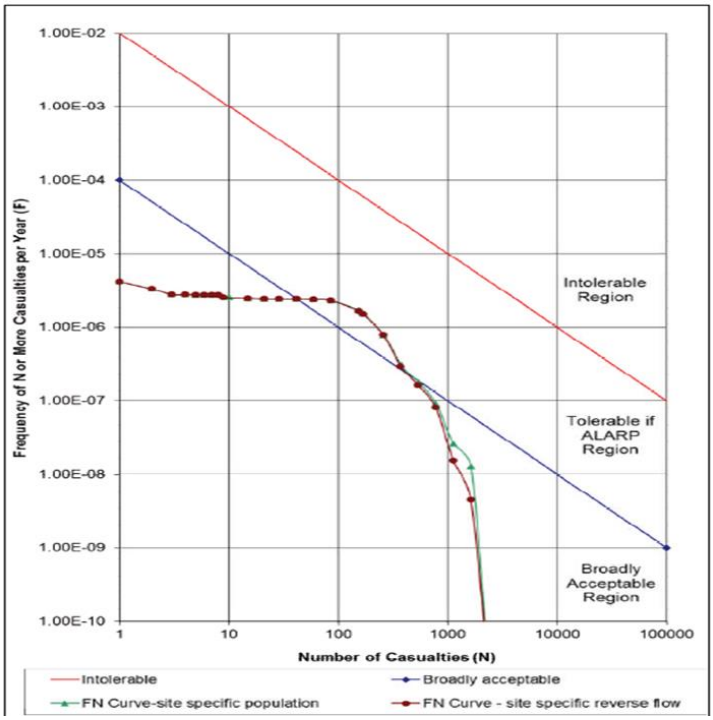

Figure B-2
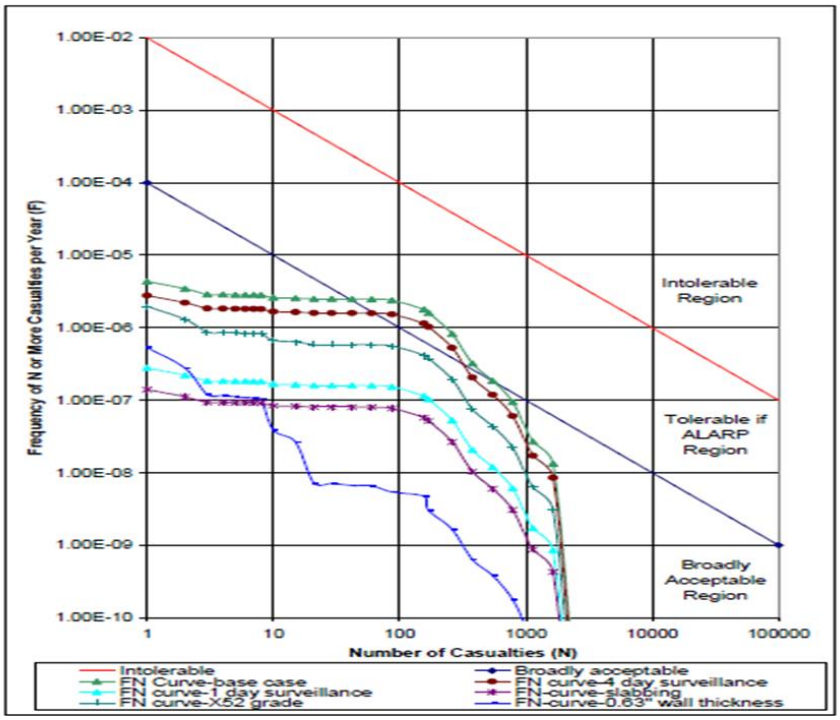
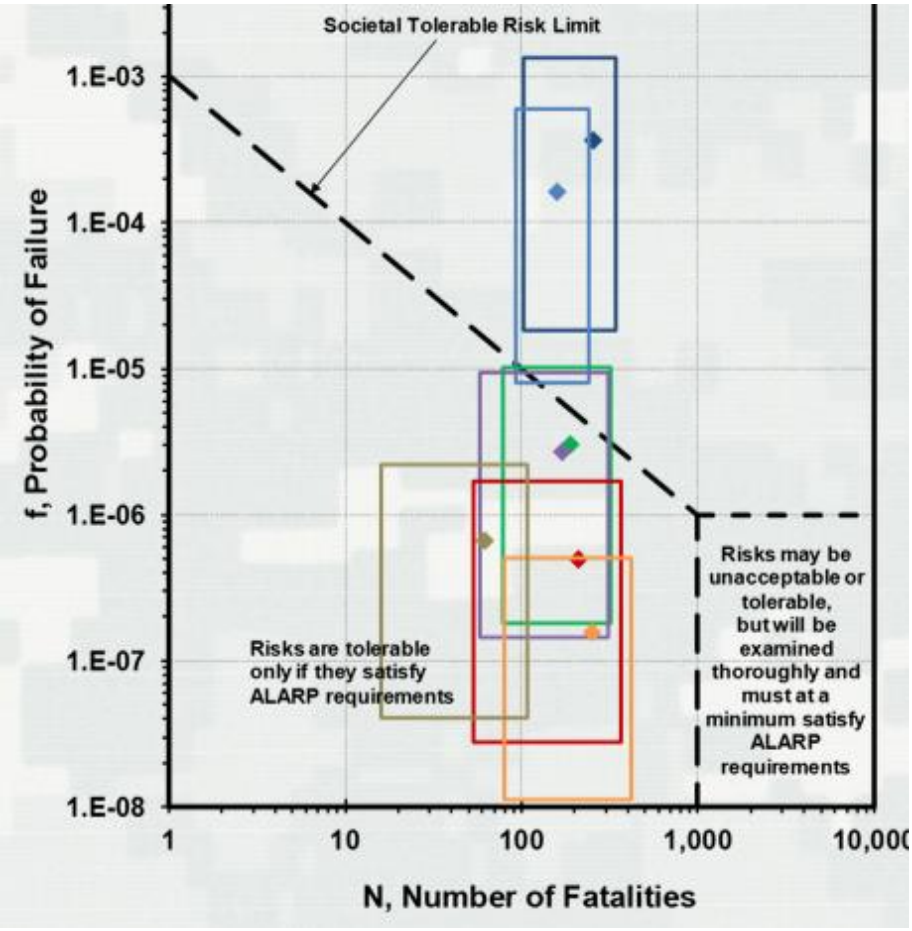
FN Curves preventive measures for a 1-mile section of natural gas pipeline



An alternative application of FN curves is shown in Figure B-3. In this application, the black dashed lines indicate different risk bands. Differences with the previous example include:

1. A different upper limit is used to define the border between the intolerable risk region and the "ALARP" region.
2. There is no "broadly tolerable" risk region where risk is considered low enough so that ALARP criteria are not applied.
3. There is a separate region at the lower right end of the FN graph to indicate low probability, high consequence outcomes. Risks in this area are noted for special scrutiny and application of ALARP.

Figure B-3
Alternative Application of FN Curves



B.2 Hazardous Liquid Consequence Models

Example: Relative Risk Model Consequence Model

A risk index model, developed by Dynamic Risk,[77] and used by an operator for pipelines with diverse hazardous liquid commodities, calculates hazard areas for multiple hazards posed by a potential pipeline failure:

- Flammability
- Toxicity (based on H_2S content)
- Overpressure

For flammability and toxicity, the size of the hazard area is based on equations from API RP 581 for different commodities, considering estimated release rates, likelihood of ignition, liquid or gas release, and instantaneous or continuous release. For overpressure, the hazard area calculations use estimated release rates and "…TNT equivalent Equation for Hard radius..."[78] Estimated release rates are based on an average of assumed hole sizes assumed for failure from different threats and equations for sonic and subsonic flow.

The largest hazard area of the three hazards considered for each location is chosen to estimate consequences. Human safety consequences are derived from the product of the estimated hazard area and the assumed population density within the hazard area (units are the estimated number of persons impacted). Different population densities are assumed based on which HCA types (High-Population, Other Populated, No HCAs, etc.) are within the hazard area.

Environmental consequences are estimated as the cost to clean up spills, which is considered applicable to commodities released as liquids (including some HVLs). Different costs per gallon to clean up spill are assumed for liquids and HVLs and for different HCA types. Total costs are estimated by applying this cost per gallon to the estimated spill volume, which is based on leak detection and shut down time, volume in line between valves, and drain down factor. The units are estimated total clean-up costs in dollars.

The human safety impact measured in estimated number of persons impacted and environmental impact measured in estimated total clean-up costs are weighted to obtain a total consequence score (Figure B-4 below). Note that safety and environmental consequence scores are assigned the same weight in the overall consequence score and economic consequences are assigned zero weight.

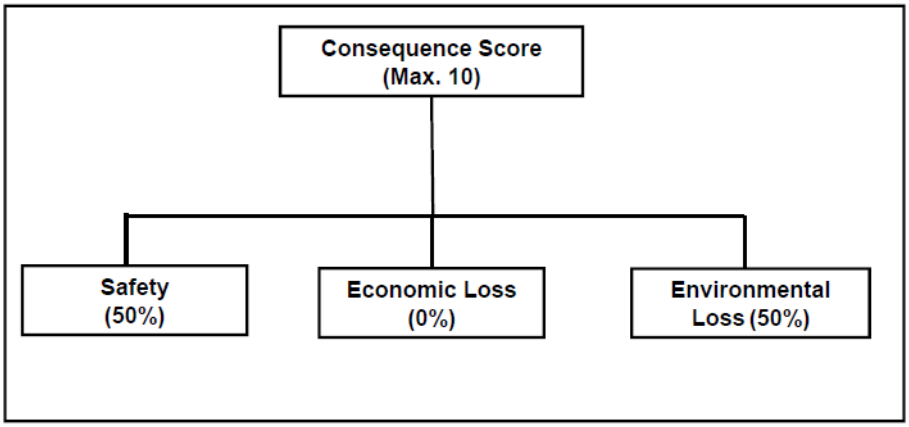
Relative Risk Model Consequence Score



Appendix C – Facility Risk Models

Example Tools for Gas Facility Risk Assessment[79]

Three examples are shown of risk assessment tools used by an operator for facility risk assessment. These examples indicate threats and risk factors that should be included in facility risk models.

Figure C-1 shows an example "threat matrix" indicating threats and risk factors for a qualitative gas system facility risk assessment. Note that this process includes threats to facility reliability and emergency response as well integrity threats. The figure shows candidate preventive measures for each threat.

Figure C-2 shows an example table of threats and failure causes to be considered in a gas facility risk assessment process.

Figure C-3 shows a portion of a "risk register" used as a qualitative risk assessment model. The model includes:

- Seven frequency levels (the highest 2 are shown), from "Common" (>10 times per year), down to "Remote" (once every 100+ years)
- Seven impact (consequence) levels (highest 2 shown), from "Catastrophic" down to "Negligible
- Impact levels are defined for six categories (two are shown), including:
  - Safety
  - Environmental
  - Compliance
  - Reliability
  - Reputational
  - Financial

Primary CAUSES	1) Transitions 2) Inadequate coating 3) Atmospheric conditions	1) Liquids 2) Sulfur 3) Erosion	Not a high risk for asset family	1) Poor quality manufacture 2) Inadequate specifications 3) Strength test documentation	1) Poor construction practices 2) Inadequate QC/inspection	1) Age, Obsolescence 2) Incorrect sizing/design 3) Maintenance related 4) Sulfur 5) Liquids entering the system 6) Vault flooding (LP)	1) Vandalism 2) Excavation Damage 3) Vehicular Damage 4) Cyber Threat	1) Inadequate procedures 2) Human error 3) Quality of station documentation 4) Inadequate training 5) Debris from pigging & hydrotesting	1) Flooding 2) Seismic events

Figure C-3
Portion of Example "Risk Register" for Gas Facility Risk Assessment

Frequency Description	Frequency per Year	Frequency Level
> 10 times per year	F = > 10	Common (7)
1 - 10 times per year	F = 1 - 10	Regular (6)

Impact Level	Safety	Environmental
Catastrophic (7)	o **Fatalities:** Many fatalities and life threatening injuries to the public or employees.	o **Duration:** Permanent or long-term damage greater than 100 years; or o **Hazard Level/Toxicity:** Release of toxic material with immediate, acute and irreversible impacts to surrounding environment; or o **Location:** Event causes destruction of a place of international cultural significance; or o **Size:** Event results in extinction of a species.
Severe (6)	o **Fatalities:** Few fatalities and life threatening injuries to the public or employees.	o **Duration:** Long-term damage between 11 years and 100 years; or o **Hazard Level/Toxicity:** Release of toxic material with acute and long-term impacts to surrounding environment; or o **Location:** Event causes destruction of a place of national cultural significance; or o **Size:** Event results in elimination of a significant population of a protected species.

Appendix D – Migration from Older Risk Analysis Methods to Quantitative Models

A-D.1 Introduction

This appendix discusses an example "risk model type" conversion of a scoring-type pipeline risk assessment into a quantitative model that better quantifies risks. The benefits of such an upgrade are numerous, as is discussed in Section III.A.

This model type conversion process is intended to salvage and utilize previously-collected data wherever practical. When the underlying scoring assessment is robust, only a few data sources will need to be added to supplement the existing data used in a scoring type risk assessment.

This conversion process involves four general steps:

1. Convert data currently expressed as scores into data with verifiable measurement units,
2. Establish risk estimation equations that utilize this measurement data,
3. Produce risk assessment results using the converted data and the appropriate algorithms, and
4. Perform QA/QC on results.

A-D.2 Applicability

This information applies to risk assessments performed on components or collections of components of a pipeline system. Components include line pipe, fittings, valves, appurtenances, tanks, pumps, compressors, etc. Collections of components includes typical groupings such as all types of pipeline systems (gathering, transmission, distribution, offshore, onshore, etc.), and all types of facilities (tank farms, pump or compressor stations, etc.), or to specific components such as tanks, pumps, and compressors when such equipment are assessed based on their sub-components.

A-D.3 Level of Effort

Performing the basic conversion process will take a varying level of effort, depending on factors such as those shown below. However, experience has shown that the level of effort is not as significant as some may think, and the benefits to safety and reduced consequences of a failure have been shown to significantly outweigh the costs.

- Knowledge and skills of personnel performing upgrade
    - General pipeline knowledge
    - Risk knowledge
    - Software skills
- Data previously collected for previous risk assessments
    - Data quantity
    - Data condition

    - Correctly aligned to common centerlines
    - Consistent formatting
    - Level of modifications previously done for scoring purposes
- Level of QA/QC performed

The data conversion portion of the upgrade will often require the majority of the effort. Performing the subsequent QA/QC on the assessment results will require on going attention, with more effort at initial stages as practitioners become accustomed to the upgrades.

A-D.4 Definitions

The following definitions are offered to clarify how the terms are used specifically in this appendix.

Algorithm: An equation that calculates some aspect of risk for a component of a pipeline system. Calculation are typically done using location-specific input data describing characteristics and conditions.

CoF: Consequence of failure. Multiple CoF scenarios are generally possible for each failure event.

Exposure, Mitigation, Resistance: These are essential components of a calculation of PoF for each potential failure mechanism. Synonyms for these terms are, respectively, attack, defense, and survivability. They measure:

- Exposure or attack: A measure of the aggressiveness of each failure mechanism, either 1) the frequency of integrity-threatening events or 2) the degradation rate associated with a time-dependent failure mechanism (corrosion or cracking).
- Mitigation: A measure of the effectiveness of all mitigation measures that serve as barriers, preventing or reducing the effect of the exposure.
- Resistance: A measure of the ability of the component to absorb the exposure without failing.

Mpy: Mills-per-year of pipeline degradation.

PoD (or FoD): Probability of Damage (or Frequency of Damage). A part of the PoF estimate that shows the likelihood of a component being damaged by a failure mechanism.

PoF (or FoF): For purposes of this appendix, failure means loss of integrity; i.e., a leak or rupture.

PXX: A point in a distribution of possible values, where the distribution takes into account uncertainty.

QRA: Quantitative Risk Analysis.

Receptor: Anything that can be harmed – receive damage – from a spill/release. Examples include people, property, soil, groundwater, etc.

Risk, Expected Loss (EL): An estimate of the damages or losses associated with possible failure-and-consequence pairings on a component or collection of components (e.g., a pipeline system) over a specific time period. Typically, Risk = PoF x CoF.

Time to Failure (TTF): An estimate of remaining life, based on a definition of 'failure', obtained by algorithm calculation performed on input data. For purposes of this appendix, 'failure' means loss of integrity (i.e., a leak or rupture). Considerations for either a leak or a rupture are included in the TTF value, with the one resulting in earlier failure normally dominating the final estimate of TTF.

A-D.5 Units of Measurement

In order to overcome many of the limitations of scoring type assessments, and to better understand and communicate risks, all input data and subsequent risk assessment results should be expressed in verifiable measurement units.

Verifiable measurement data is always expressed in common units of measurement. Data is obtained by either direct measurement or by estimation. These values are distinct from assigned values such as points or scores since they can be replicated without the need of a translation tool (e.g., a scoring, indexing, or point factor assignment system).

Ensuring a consistent and appropriate set of verifiable measurement units is simply ensuring that the measurement units of all inputs combine algebraically to arrive at the desired risk estimate units of measurement.

A-D.6 Input Data

Examples of typical input data with verifiable and non-verifiable units of measure, include:

Risk Issue Measured	Measurement/Verifiable Example Units	Not Deemed Verifiable Units
Pipe specification	Inches diameter, psi pressure, psi allowable stress	Diameter = "large" Stress level = 7 risk points
The frequency of excavator damage potential at a specific location	Excavations per mile-year	Excavator activity level = 'high' = 9 risk points
Soil Corrosivity	Mills-per-year pitting corrosion rate	"medium" = 4 risk points
Benefits of additional depth of cover	% reduction in excavator contact events	-11 risk points
CoF	$ / incident, fatalities / failure	'low' = 2 on risk matrix

There are multiple measurement units that can support the CoF estimates. The units used for input data will be determined by the desired units in which the final CoF will be expressed. Whichever set of units are chosen, the algebra used to combine the information (see algorithm discussion below) should result in the desired units of CoF. For example, if units of dollars per failure are sought, units of measure might be:

CoF = hazard zone x receptors x damage rate = (ft2 of hazard zone generated per failure) x (number of receptors per ft2) x (damage rate per receptor, $ / receptor) = Dollars per failure

In this example, simply adding an estimate of 'failures per year' to this chain of calculations results in risk units of 'dollars per year':

Risk = EL = PoF x CoF = (failures/year) x ($/failure) = $ / year of expected loss[81]

A-D.7 Risk Assessment Results

Since all data input into the risk assessment carry verifiable measurement units, the risk assessment results also are expressed in verifiable measurement units. For instance, units of events per year, events per mile-year, dollars per incident, TTF, expected loss per mile year, etc. are all verifiable and appropriate outputs for a QRA, as shown below.

Risk, Expected Loss (EL):

Typically, Risk = PoF x CoF. Common units of measure include dollars per year, fatalities per mile-year, and overlap units used in PoF when the consequence is defined as the failure, as was defined for PoF. For example, failures per mile-year can be a measurement unit for both FoF and Risk.[82] When risks are fully monetized, risk can be expressed as EL where EL ($/ year) = PoF (failures/year) x CoF ($/failure)

PoF (or FoF):

Common measurement units include: chance of failure per year, failures per year, failures per mile-year, incidents per year, ruptures per mile-year, etc. For time-degradation failure mechanisms, TTF in units of time (often 'years') is an intermediate calculation of the PoF estimation.

PoF Components:

Only two sets of units are needed to describe all possible failure mechanisms. When time-independent failure mechanisms are involved, units are, for example:

PoF (failures/year) = Exposure (number of potential failure-causing events/year) x Mitigation (fraction of potential failure-causing events that are not avoided) x Resistance (fraction of potential failure-causing events failure)

When time-dependent failure mechanisms are involved, units are, for example:

PoF (failures/year) = f[TTF (years to failure)] where TTF (years to failure) = Resistance (inches of effective wall thickness) / [Exposure (mpy) x Mitigation (fraction of exposure not mitigated)]

Alternate measurement units are also possible. The user should ensure that, algebraically, the units combine to result in the units of the final risk value being estimated. See overall examples in Attachment A for numerical examples using these units of measure.

[81] This example uses $/year for expected loss. Other risk units could also be utilized.
[82] However, this does not acknowledge the differences in consequences associated with various types of failures.

CoF:

Common measurement units include: dollars of loss per incident, fatalities per incident, dollars per failure, dollars per leak, dollars per rupture, consequence units per failure, etc.

A.D-8 Weightings
