Weightings introduce inappropriate bias into a risk assessment and are to be avoided. The use of verifiable measurement data will automatically address all concerns that were previously attempted to be addressed by using weightings, thereby negating the need for weightings of any kind in a modern risk assessment.

When upgrading a previous risk assessment that used weightings, the intent of those weightings should be understood. The intent of weightings was typically to compensate for limited mathematical capabilities of the scoring models (e.g., limited range of possible point values with inability to capture real world orders of magnitude differences). If the intent is valid, then the intended effect of the weighting should automatically be captured either in the conversion of the previously collected data or in the set-up of algorithms. A QA/QC process should be established to confirm this.

A.D-9 Uncertainty

Every risk assessment representing real world phenomena will have at least some amount of uncertainty. This is due to natural variability in all phenomena, the probabilistic nature of the real world, and simple lack of complete information. Consideration of uncertainty results in a range of possible answers. Every risk assessment should document how it is taking uncertainty into account.

There are several ways to deal with this uncertainty in a risk assessment. A rigorous option is to generate a distribution of possible values for each input, including considerations for both lack of information and 'natural' variation in each input. All input distributions are then combined using the risk assessment algorithms. This generates distributions of all calculation results and ensures that uncertainty is accounted for in final risk estimates. Practitioners pursuing this option should seek background and information from the fields of statistics, engineering, and pipeline-specific materials science, design, operations, and maintenance practices.

A less rigorous, but usually sufficient approach is discussed here.[83] Since an understanding of the range of possible answers is sought, treating uncertainty in terms of conservatism is an efficient option to avoid the complexities of combining numerous distributions. A risk assessment can document its consideration of uncertainty by declaring the target level of conservatism used in producing its risk estimates. For regulatory compliance as well as practical utility, the recommendation is to not exclude input values that are thought to be "rare," thereby erring on the side of overstating the actual risks. By instead including all input values and specifying their perceived rarity used in the assessment, the role of

[83] While this discussed approach requires at least an approximation of the range and frequency of possible values (a distribution), similar to the more rigorous option, that distribution can often be simply approximated rather than be derived from rigorous analyses.

uncertainty is acknowledged and the entire range of risk is more readily understood. This "range of risk" concept is important for decision makers to understand when managing pipeline integrity.

"PXX" terminology, taken from probability theory, can be used to convey the way in which uncertainty/conservatism is being handled in a specific risk assessment. PXX refers to a point in a distribution of possible values, where the distribution takes into account uncertainty. The values assigned for various conservatism levels – i.e., PXX levels – arise from a known or posited distribution of all possible actual values.

A higher PXX means more conservatism – tending to overstate actual risk – is being incorporated into the risk assessment. P50 normally means the value most likely to occur[84] is being used, so zero conservatism accompanies this value. P90 means a rare value, erring on the side of overstating actual risk, is being used, thereby ensuring conservatism (tending to overstate actual risk) is being used. Numerically, P90 suggests that risk is being overstated 9 times out of ten – a negative surprise occurs once time out of ten when a P90 value is used. A P99 value means that risk has been underestimated only one time out of a hundred – i.e., actual risk will be lower 99 times out of a hundred.

Specifying the level of conservatism that is being employed in the choice of input data effectively turns distributions of possible values into point estimates of possible values. Different levels of conservatism support different intended uses of the risk assessment. The risk assessor declares the level of conservatism used in each assessment, often performing two or more assessments to show the range of possible results. A common strategy is to produce risk estimates at a high (P90 or P99) level of conservatism, for use in location-specific risk management and also to produce a P50 risk assessment for use in communications with outside stakeholders.

A.D-10 Data Conversion

The objective of this phase of the upgrade is to create a new database of converted information, where each entry in the new database carries units of verifiable measurements. The 'rules' and processes used to create the new database should be documented and preserved since they memorialize this aspect of the risk assessment upgrade.

Since a pipeline is an engineered structure placed in an often constantly changing natural environment, numerous sets of data are normally required to fully assess risk. This is true for any risk assessment methodology. Therefore, previously-collected information used in a scoring type risk assessment can often be readily upgraded for use in a quantitative risk assessment (QRA).

The first step is to identify data that is already captured in absolute terms – i.e., in verifiable units of measure. This includes all data in measurements units such as inches, feet, psi, mills-per-year (mpy), counts, frequency, etc. This data generally requires no conversion.

Next, data whose underlying measurement units can be easily extracted from its expression as a 'score' should be returned to those units. For example, if depth of cover of 24-inches was previously assigned a

[84] The mode of the distribution; also, the mean and median, if the distribution is 'Normal.'

value of 7 points in a scoring system, all values of '7' in the old risk database should be should generate a record showing 24 inches in the new database.

The next step is to assign each piece of input data to one of four categories, based on the risk information that is contained in the data.

Data Category	Examples of Data/Information	Example Units of Measure
PoF: Exposure	excavator activity, mpy external corrosion, mpy fatigue cracking, human error rates, etc.	events/mile-year
PoF: Mitigation	depth of cover, patrol, signage, coatings, procedures, training, etc.	% reduction in exposure
PoF: Resistance	wall thickness, SMYS, toughness, weaknesses (dents, gouges, seam issues, etc.), etc.	% of damage resisted without leak/rupture OR[85] effective wall thickness (inches)
CoF	population density, thermal radiation distance, dispersion distances, explosion potential, overland flow distances, soil permeability, etc.	Ft2, Count/ft2, value per unit (remediation costs), cost per incident, etc.

This categorization adds much clarity to the risk assessment since the role of each piece of information is better understood and its use in the risk assessment is transparent.

Most data will fit logically and uniquely into just one category, although it might impact several aspects within the category. Some data has application in more than one category. As an example of both, the input variable 'flow rate' can influence risk estimates of four different PoF exposures: surge potential, fatigue, internal corrosion, and erosion. Flow rates also influence CoF estimates of spill size, dispersion, leak detection, and others.

Some data might be more efficiently converted using a risk assessment algorithm, rather than a data conversion algorithm. Recall the previous example of restoring a depth of cover 'score' to the actual depth – "score of 7 is 24 inches." The record showing 24-inches of cover is important. But the risk assessment should also 'understand' the benefits of the 24-inches of cover. This can be done either by storing the risk-reduction-value of 24-inches of cover in another database or by using an algorithm that translates 24-inches into a risk reduction value.[86] The risk assessment algorithms are discussed in the next section. Either option – building a separate database of values ready to be used in the risk assessment or equating 'raw' data into risk terms using an algorithm – is viable and the choice is a matter of preference for the model designer.

[85] Two types of units are commonly used, depending on whether the failure mechanism is time dependent (corrosion or cracking) or time-independent (third party damage, geohazards, etc.).

[86] Note that translating 24" of cover into a risk reduction benefit is not the same as scoring. The understanding that equates 24" into a mitigation benefit is a measurement, can be verified, and has meaning beyond a relative comparison. The understanding underlying this translation can arise from anywhere in a range of rigor: from a detailed analysis to a simple estimate provided by a knowledgeable individual.

A.D-10.1 CoF Data Sub-Categories

As with PoF data to be used as risk assessment inputs, previously collected data for CoF will generally fall into one of only a few categories. Those categories, and sample data inputs for each, are:

1. Spill/Release size: The volume or mass released in a failure, as a function of hole size, product characteristics, operational parameters (e.g., flow rates, pressures, elevation, etc.), detection time, reaction time.
2. Dispersion: The distance traveled by the spill/release, as a function of product characteristics, terrain, atmospheric conditions, detection time, reaction time, surface flow resistance, etc.
3. Hazard area estimates: The footprint or area of the leak/rupture, in which damages to one or more receptors may occur.
4. Receptors: The types and counts of receptors that are potentially damaged by a leak/rupture.

A.D-11 Algorithms

The objective of the algorithm upgrade is to have a set of calculations the makes correct and efficient use of all relevant input information and produces complete and verifiable estimates of risk in terms of PoF, CoF, and TTF.

Algorithms should quantify all aspects of risk at all locations along each pipeline system being assessed. Algorithms to calculate risk in a modern QRA should ensure that measurement units of all inputs combine appropriately to express risks in units that are also verifiable. The upgrade algorithms should be intuitive and easily established in any calculating software platform.

This section discusses algorithm set-up concepts.

A.D-11.1 PoF

Algorithms supporting a modern QRA's PoF estimate should use or produce values for exposure, mitigation, and resistance, for each potential failure mechanism. That is, each failure mechanism should have values assigned to exposure, mitigation, and resistance at all points along each pipeline system being assessed.

Exposure, mitigation, and resistance combine to provide estimates of both PoD and PoF for each failure mechanism. However, the initial step of measuring each independently is critical. Measuring exposure independently generates knowledge of the 'area of opportunity' or the aggressiveness of the attacking mechanism. Then, the separate estimate of mitigation effectiveness shows how much of that exposure will likely be prevented from reaching the component being assessed. Finally, the resistance estimate shows how often the component will failure, if contact with the exposure occurs.

In risk management, where decision-makers contemplate possible additional mitigation measures, additional resistance, or even a re-location of the component (often the only way to change the exposure), this knowledge of the three key factors will be critical.

The PoF algorithms will differ slightly depending on which of the two types of failure mechanisms are being assessed.

A.D-11.2 Time Independent Failure Mechanisms

Each time independent failure mechanism, including excavation damages, impacts of any other kind, geohazards, human errors, sabotage, etc., that contributes to an overall PoF should have its specific PoF estimated. That estimate is made from combining the three aspects of PoF as discussed previously.

A.D-11.3 Time Dependent Failure Mechanisms

Quantifying PoF for time-dependent failure mechanisms can be more challenging than for time-independent failure mechanisms. The additional challenge arises from 1) the need to produce an intermediate estimate of TTF and 2) the need to assess the effectiveness of commonly used mitigation measures.

As a modeling convenience that generally produces PoF estimates of sufficient accuracy, each time-dependent failure mechanism can be modelled in terms of:

- Exposure expressed as mills-per-year (mpy)
- Mitigation expressed as a probability that, at a specific location, some amount of mpy degradation is occurring.
- Resistance expressed as the effective wall thickness that experiences the mpy degradation.

These terms produce an estimate of TTF. That estimate should then be expressed also as an equivalent PoF. A simple and conservative relationship to do this could be simply: PoF = 1/TTF. More accuracy is achieved when expanded relationships are used, capturing, for example, instances where failures early in the TTF time range are virtually impossible.

A.D-11.4 CoF

Consistent with the categorization of CoF input data (previously discussed), the CoF algorithms will use those same categories to produce estimates of direct CoF resulting from leak/rupture.

Many sophisticated analyses routines are available to model hydrocarbon releases and potential thermal events associated with leaks/ruptures. A review of these is beyond the scope of this appendix.

Critical to the risk assessment upgrade recommended here, is the estimation of a hazard area that could arise from a leak/rupture. The hazard area estimate should include considerations of spill/release size and duration, dispersion (travel from origination point), ignition potential, potential thermal events (fire/explosion), contamination/toxic effects.

Once a hazard area has been estimated, an accounting should be made of the types, quantities, and sensitivities of the various receptors within the hazard area. Receptors typically include human populations, property, and environmental resources.

Multiple scenarios of CoF are generally required in order to properly assess CoF at all points along a pipeline. Scenarios are generated by varying aspects of each of the four CoF categories. Spill size and dispersion are varied by varying the underlying factors such as hole size, detection time, response time, ignition potential, and terrain. Likelihoods of the respective scenarios should also be considered and reflected in the risk assessment.

A.D-12 Example

A key aspect of modern QRA is that units of measurement for all risk assessment inputs and outputs are transparent and intuitive. The following example illustrates this.

In common applications of the exposure, mitigation, resistance triad, units are as follows. Each exposure is measured in one of two ways – either **in units of 'events per time and distance,'** i.e., events/mile-year, events/km-year, etc. or **in units of degradation** – metal loss or crack growth rates, i.e., mpy, mm per year, etc. An 'event' is an occurrence that, in the absence of mitigation and resistance, will result in a failure. To estimate exposure, we envision the component completely unprotected and highly vulnerable to failure (think 'tin can' wall thickness). So, an excavator working over a buried pipeline is an event. This is counted as an event regardless of type of excavator, excavator reach, depth of burial, use of one-call, signs/markers, etc.

Mitigation and Resistance are each measured in units of percentage, representing 'fraction of damage or failure scenarios avoided.' A mitigation effectiveness of 90% means that 9 out of the next 10 exposures will not result in damage – mitigation has blocked 90% of the exposures that would otherwise have occurred. Resistance of 60% means that 40% of the next damage scenarios will result in failure, 60% will not.

For assessing PoF from time-independent failure mechanisms—those that appear random and do not worsen over time – the top-level equation can be as simple as:

PoF_time-independent = exposure x (1 - mitigation) x (1 - resistance)

With the above example units of measurement, PoF values emerge in intuitive and common units of 'events per time and distance' such as events/mile-year, events/km-year, etc.

A.D-12.1 PoF Excavator Contacts

As an example of applying this to failure potential from third party excavations, the following inputs are identified for a hypothetical pipeline segment:

- Exposure (unmitigated) is estimated to be three excavation events per mile-year.
- Using a mitigation effectiveness analysis, experts estimate that 1 in 50 of these exposures will not be successfully kept away from the pipeline by the existing mitigation measures. This results in an overall mitigation effectiveness estimate of 98%.
- Of the exposures that result in contact with the pipe, despite mitigations, experts perform load/stress analyses to estimate that 1 in 4 will result in failure, not just damage. This estimate includes the possible presence of weaknesses due to threat interaction and/or manufacturing and construction issues. So, the pipeline in this area is judged to be 75% resistive to failure from these excavation events, if mitigation fails and contact occurs.

These inputs result in the following assessment:

(3 excavation events per mile-year) x (1 - 98% mitigated) x (1 - 75% resistive)

= 0.015 failures per mile-year [87]

This suggests an excavation-related failure about every 67 years along this mile of pipeline.

This is a very important estimate. It provides context for decision-makers. When subsequently coupled with consequence potential, it paints a valuable picture of this aspect of risk.

Note that a useful intermediate calculation, probability of damage (but not failure) also emerges from this assessment:

(3 excavation events per mile-year) x (1 - 98% mitigated) = 0.06 damage events/mile-year

This suggests excavation-related damage occurring about once every 17 years.

This damage estimate can be verified by future inspections. The frequency of new top-side dents or gouges, as detected by an ILI, may yield an actual damage rate from excavation activity. Differences between the actual and the estimate can be explored: e.g., if the estimate was too high, was the exposure overestimated, mitigation underestimated, or both? This is a valuable learning opportunity.

A.D-12.2 PoF Corrosion

This same approach is used for other time-independent failure mechanisms and for all portions of the pipeline.

For assessment of PoF for time-dependent failure mechanisms – those involving degradation of materials – the previous algorithms are slightly modified to yield a time-to-failure (TTF) value as an intermediate calculation in route to PoF.

PoF_time-dependent = f(TTF_time-dependent)

TTF_time-dependent = resistance / [exposure x (1 - mitigation)]

As an example, experts have determined that, at certain locations along a pipeline, soil corrosivity creates a 5 mpy external corrosion exposure (unmitigated). Examination of coating and cathodic protection effectiveness leads experts to assign a mitigation effectiveness of 90%.[88] Recent inspections, adjusted for uncertainty, result in an 'effective' pipe wall thickness estimate of 0.220 inches (resistance). This includes allowances for possible weaknesses or susceptibilities, modeled as equivalent to a thinning of the pipe wall.[89]

Use of these inputs in the PoF assessment is shown below:

TTF = 220 mils / [5 mpy x (1 - 90%)] = 440 years.

---

[87] [Exposure vents/mile-yr.] x [damage events/exposure event] x [failures/damage events] = failures/mile-yr.
[88] This is not necessarily a trivial estimate, often requiring significant analyses.
[89] This can be a complex calculation and captures 'threat interaction' as noted in a previous column.

Next, a relationship between TTF and PoF for the future period of interest, is chosen. For example, a simple and conservative relationship yields the following.

PoF = 1 / TTF = [5 mpy x (1 - 90%)] / 220 mils = 0.22% PoF.

A.D-12.3 Total PoF

In this example, an estimate for PoF from the two failure mechanisms examined – excavator damage (see Section A.D-12.1) and external corrosion (see Section A.D-12.2) – can be approximated by 1.5% + 0.2% = 1.7% per mile-year. If risk management processes deem this to be an actionable level of risk, then the exposure-mitigation-resistance details lead the way to risk reduction opportunities.

The exposure-mitigation-resistance analyses is an indispensable step towards full understanding of PoF. Without it, understanding is incomplete. Full understanding leads to the best risk management practice – optimized resource allocation – which benefits all stakeholders.

Appendix E – Regulatory Drivers[90]

E.1 Requirements for Hazardous Liquid Pipelines

The requirements for hazardous liquid pipelines are found in § 195.452 (Pipeline integrity management in high consequence areas):

§ 195.452 (f) What are the elements of an integrity management program?

> An integrity management program begins with the initial framework. An operator must continually change the program to reflect operating experience, conclusions drawn from results of the integrity assessments, and other maintenance and surveillance data, and evaluation of consequences of a failure on the high consequence area. An operator must include, at minimum, each of the following elements in its written integrity management program: … (3) An analysis that integrates all available information about the integrity of the entire pipeline and the consequences of a failure (see paragraph (g) of this section); …

§ 195.452 (g) What is an information analysis?

> In periodically evaluating the integrity of each pipeline segment (paragraph (j) of this section), an operator must analyze all available information about the integrity of the entire pipeline and the consequences of a failure. This information includes:
>
> (1) Information critical to determining the potential for, and preventing, damage due to excavation, including current and planned damage prevention activities, and development or planned development along the pipeline segment;
>
> (2) Data gathered through the integrity assessment required under this section;
>
> (3) Data gathered in conjunction with other inspections, tests, surveillance and patrols required by this Part, including, corrosion control monitoring and cathodic protection surveys; and
>
> (4) Information about how a failure would affect the high consequence area, such as location of the water intake.

§ 195.452 (h) What actions must an operator take to address integrity issues? —

> … (4) Special requirements for scheduling remediation—
>
> … (iv) Other conditions. In addition to the conditions listed in paragraphs (h)(4)(i) through (iii) of this section, an operator must evaluate any condition identified by an

[90] Regulatory references are those in effect as of the date of this document.

integrity assessment or information analysis that could impair the integrity of the pipeline, and as appropriate, schedule the condition for remediation.

§ 195.452 (i) What preventive and mitigative measures must an operator take to protect the high consequence area? —

(1) *General requirements.* An operator must take measures to prevent and mitigate the consequences of a pipeline failure that could affect a high consequence area. These measures include conducting a risk analysis of the pipeline segment to identify additional actions to enhance public safety or environmental protection.

(2) Risk analysis criteria. In identifying the need for additional preventive and mitigative measures, an operator must evaluate the likelihood of a pipeline release occurring and how a release could affect the high consequence area. This determination must consider all relevant risk factors, including, but not limited to:

(i) Terrain surrounding the pipeline segment, including drainage systems such as small streams and other smaller waterways that could act as a conduit to the high consequence area;

(ii) Elevation profile;

(iii) Characteristics of the product transported;

(iv) Amount of product that could be released;

(v) Possibility of a spillage in a farm field following the drain tile into a waterway;

(vi) Ditches along-side a roadway the pipeline crosses;

(vii) Physical support of the pipeline segment such as by a cable suspension bridge;

(viii) Exposure of the pipeline to operating pressure exceeding established maximum operating pressure.

§ 195.452 (j) What is a continual process of evaluation and assessment to maintain a pipeline's integrity? —

… (2) Evaluation. An operator must conduct a periodic evaluation as frequently as needed to assure pipeline integrity. An operator must base the frequency of evaluation on risk factors specific to its pipeline, including the factors specified in paragraph (e) of this section. The evaluation must consider the results of the baseline and periodic integrity assessments, information analysis (paragraph (g) of this section), and decisions about remediation, and preventive and mitigative actions (paragraphs (h) and (i) of this section).

(3) Assessment intervals. An operator must establish five-year intervals, not to exceed 68 months, for continually assessing the line pipe's integrity. An operator must base the

assessment intervals on the risk the line pipe poses to the high consequence area to determine the priority for assessing the pipeline segments. An operator must establish the assessment intervals based on the factors specified in paragraph (e) of this section, the analysis of the results from the last integrity assessment, and the information analysis required by paragraph (g) of this section.

E.2 Requirements for Gas Transmission Pipelines

The requirements for gas transmission pipelines are found in respective portions of 49 CFR Part 192, Subpart O (Gas Transmission Pipeline Integrity Management):

§ 192.911 What are the elements of an integrity management program?

An operator's initial integrity management program begins with a framework (see § 192.907) and evolves into a more detailed and comprehensive integrity management program, as information is gained and incorporated into the program. An operator must make continual improvements to its program. The initial program framework and subsequent program must, at minimum, contain the following elements. (When indicated, refer to ASME/ANSI B31.8S (incorporated by reference, see § 192.7) for more detailed information on the listed element.)

(c) An identification of threats to each covered pipeline segment, which must include data integration and a risk assessment. An operator must use the threat identification and risk assessment to prioritize covered segments for assessment (§ 192.917) and to evaluate the merits of additional preventive and mitigative measures (§ 192.935) for each covered segment.

§ 192.917 How does an operator identify potential threats to pipeline integrity and use the threat identification in its integrity program?

(a) *Threat identification.* An operator must identify and evaluate all potential threats to each covered pipeline segment. Potential threats that an operator must consider include, but are not limited to, the threats listed in ASME/ANSI B31.8S (incorporated by reference, *see* § 192.7), section 2, which are grouped under the following four categories:

(1) Time dependent threats such as internal corrosion, external corrosion, and stress corrosion cracking;

(2) Static or resident threats, such as fabrication or construction defects;

(3) Time independent threats such as third party damage and outside force damage; and

(4) Human error.

(b) *Data gathering and integration.* To identify and evaluate the potential threats to a covered pipeline segment, an operator must gather and integrate existing data and

information on the entire pipeline that could be relevant to the covered segment. In performing this data gathering and integration, an operator must follow the requirements in ASME/ANSI B31.8S, section 4. At a minimum, an operator must gather and evaluate the set of data specified in Appendix A to ASME/ANSI B31.8S, and consider both on the covered segment and similar non-covered segments, past incident history, corrosion control records, continuing surveillance records, patrolling records, maintenance history, internal inspection records and all other conditions specific to each pipeline.

(c) *Risk assessment.* An operator must conduct a risk assessment that follows ASME/ANSI B31.8S, section 5, and considers the identified threats for each covered segment. An operator must use the risk assessment to prioritize the covered segments for the baseline and continual reassessments (§§ 192.919, 192.921, and 192.937), and to determine what additional preventive and mitigative measures are needed (§ 192.935) for the covered segment.

§ 192.935 What additional preventive and mitigative measures must an operator take?

(a) *General requirements.* An operator must take additional measures beyond those already required by Part 192 to prevent a pipeline failure and to mitigate the consequences of a pipeline failure in a high consequence area. An operator must base the additional measures on the threats the operator has identified to each pipeline segment. (*See* § 192.917) An operator must conduct, in accordance with one of the risk assessment approaches in ASME/ANSI B31.8S (incorporated by reference, *see* § 192.7), section 5, a risk analysis of its pipeline to identify additional measures to protect the high consequence area and enhance public safety. Such additional measures include, but are not limited to, installing Automatic Shut-off Valves or Remote Control Valves, installing computerized monitoring and leak detection systems, replacing pipe segments with pipe of heavier wall thickness, providing additional training to personnel on response procedures, conducting drills with local emergency responders and implementing additional inspection and maintenance programs….

§ 192.937 What is a continual process of evaluation and assessment to maintain a pipeline's integrity? ...

(b) *Evaluation.* An operator must conduct a periodic evaluation as frequently as needed to assure the integrity of each covered segment. The periodic evaluation must be based on a data integration and risk assessment of the entire pipeline as specified in § 192.917. For plastic transmission pipelines, the periodic evaluation is based on the threat analysis specified in § 192.917(d). For all other transmission pipelines, the evaluation must consider the past and present integrity assessment results, data integration and risk assessment information (§ 192.917), and decisions about remediation (§ 192.933) and additional preventive and mitigative actions (§ 192.935). An operator must use the results from this

evaluation to identify the threats specific to each covered segment and the risk represented by these threats.

(c) *Assessment methods.* In conducting the integrity reassessment, an operator must assess the integrity of the line pipe in the covered segment by any of the following methods as appropriate for the threats to which the covered segment is susceptible (*see* § 192.917), or by confirmatory direct assessment under the conditions specified in § 192.931.

§ 192.939 What are the required reassessment intervals?

An operator must comply with the following requirements in establishing the reassessment interval for the operator's covered pipeline segments.

(a) *Pipelines operating at or above 30% SMYS.* An operator must establish a reassessment interval for each covered segment operating at or above 30% SMYS in accordance with the requirements of this section. The maximum reassessment interval by an allowable reassessment method is seven years. If an operator establishes a reassessment interval that is greater than seven years, the operator must, within the seven-year period, conduct a confirmatory direct assessment on the covered segment, and then conduct the follow-up reassessment at the interval the operator has established. A reassessment carried out using confirmatory direct assessment must be done in accordance with §192.931. The table that follows this section sets forth the maximum allowed reassessment intervals.

(1) *Pressure test or internal inspection or other equivalent technology.* An operator that uses pressure testing or internal inspection as an assessment method must establish the reassessment interval for a covered pipeline segment by—

(i) Basing the interval on the identified threats for the covered segment (see § 192.917) and on the analysis of the results from the last integrity assessment and from the data integration and risk assessment required by § 192.917; or

(ii) Using the intervals specified for different stress levels of pipeline (operating at or above 30% SMYS) listed in ASME B31.8S (incorporated by reference, *see* § 192.7), section 5, Table 3.

Appendix F – Risk Modeling Work Group Mission Statement

Preamble

PHMSA has identified a need to provide technical overview information on

- Methods, and tools to be used in pipeline risk modeling, and
- Application of these methods and tools in pipeline risk management.

PHMSA's technical overview needs to be based on the state of the art of pipeline risk modeling, as reflected in the views of the technically informed community of practice.

Risk Modeling Work Group Mission Statement

The mission of the Risk Modeling Work Group is to:

- **Characterize the state of the art of pipeline risk modeling** for gas transmission and liquid pipelines,
- **Identify** and, if necessary in specific areas, develop **a range of state-of-the-art methods and tools capable of addressing the spectrum of pipeline risk management applications**, and
- **Provide recommendations** to PHMSA regarding the use of these methods, tools, and data requirements.

Appendix G – Federal Register Notice Commenters

PHMSA would like to thank the following individuals and organizations that provided comments on this document via the Federal Register Notice process (Docket ID PHMSA-2018-0050).

- George Alexander (Del-Chesco United for Pipeline Safety)
- B. Arrindell (Damascus Citizens for Sustainability)
- Rob Benedict (American Fuel & Petrochemical Manufacturers)

REDACTED VERSION

August 29, 2025

NW Natural
PROGRAM / PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: E202718 - JANA Probabilistic Risk Model
Date: 03/21/2023
Project Sponsor: Daniel Kizer
Executive Sponsor: Joe Karney
Project Manager: Scott Lundgren
Preparer: Scott Lundgren

The purpose of the Alternative Analysis requirement is to choose the best solution for NWN's need and to make sure we are utilizing resources in the most efficient manner.

BUSINESS NEED/JUSTIFICATION

What is the issue intended to be addressed and why is it needed?

As part of the NW Natural Distribution Integrity Management Program (DIMP) a risk model is performed to estimate the risk associated with gas distribution system threats. This risk model is developed by integrating facility data in GIS, compliance maintenance data and Subject Matter Expert (SME) input within an algorithm to establish and rank risk to the system. The risk model is required by the Federal Code (CFR 49 Part 192) and is an integral part of the NW Natural DIMP Program Plan.

The current risk model is a relative risk model which measures the likelihood of a failure associated with a threat. This project will transition the risk model to a probabilistic risk model which determines the probability of a failure in the system and measures the expected consequences. This risk model will be provided by a JANA Corporation product titled the Lighthouse integrity risk management software.

DIMP risk models are at the minimum run once a year as required by the Federal Code and the DIMP Program Plan. Risk models are also run to risk rank an industry or NW Natural threat to the system where these threats need to be risk ranked to address the threat.

OBJECTIVE

Clearly define the objective.

In 2020 Probabilistic risk models were identified by PHMSA as a best practice to allow natural gas operators the ability to remediate risks on the natural gas system on a risk-cost optimized basis and demonstrate proper actions are being taken on the system to regulators.

The improved interface of the JANA probabilistic risk model allows Integrity Engineers to easily produce scenario-based analysis to identify risks on the system based on 'what-if' scenarios. The improved interface also allows for more effective communication to NW Natural leadership and state regulators on future DIMP programs and the effectiveness of those programs.

RECOMMENDED OPTION

Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option.

Description	JANA probabilistic risk model software is an improved data analysis software which will help better manage risks associated with the NW Natural distribution system. This probabilistic model will incorporate NW Natural GIS data, NW Natural Compliance Management data, along with officially known data and JANA research to develop a fully quantitative risk model approach which will provide an absolute measure of risk
Decision Criteria	The most effective long-term option
Pros	• JANA probabilistic risk model software is an improved data analysis software which will help better manage risks associated with the NW Natural distribution system.

	• The model will incorporate NW Natural GIS data along with officially known data and JANA research to develop a fully quantitative risk model approach which will provide an absolute measure of risk • Complies with PHMSA best practice. • JANA risk model is not directly tied to updates to ESRI and the GIS system. The JANA risk model has full functionality and is adaptable to different versions of ESRI and the compliance data management systems. • JANA showed itself to be much more adaptable and willing to work with NW Natural regarding the data that will be used to perform the risk analysis. • JANA was more adaptable to perform "what if" scenarios and predicting future risk. • JANA model will significantly reduce workload on GIS team when the model work is performed.
Cons	• Cost of the installation.

POTENTIAL COST			
Capital	**Direct + Contingency**	**COH (43%)**	**Total**
	$1,680,000	$722,400	$2,402,400
O&M	**Program/Project**	**Ongoing Maintenance & Support**	
	$320,000 over 5 years	No forecasted costs	
Source/ Method of Cost Data	NWN estimate/JANA contract		

ALTERNATIVE 1 Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option	
Description	Transition existing risk model using [redacted] Uptime Migration to Synergy Pipeline with [redacted] Transmission and Distribution Probabilistic Risk Assessment Models. This probabilistic model will incorporate NW Natural GIS data, NW Natural Compliance Management data, along with publicly known data to transition the existing Uptime DIMP risk model to a [redacted] Synergy risk model
Pros	• Cost
Cons	• During the demonstration of the [redacted] Risk model and JANA risk model, it was not user-friendly. JANA was the program that was shown to be much more intuitive and configurable for both the GIS technicians and the Integrity Engineers. • [redacted] offers limited functionality until GIS transitions to the ESRI Utility Network, and that timeline is being determined. • During demo [redacted] was unable to produce usable results with their demonstration data. • Performing scenario-based models in [redacted] system is very time consuming for GIS technicians.

POTENTIAL COST			
Capital	**Direct + Contingency**	**COH (43%)**	**Total**
	$1,000,000	$430,000	$1,430,000
O&M	**Program/Project**	**Ongoing Maintenance & Support**	
		No forecasted costs	
Source/ Method of Cost Data	NWN estimate/[redacted] estimate		

Explain why this alternative is not recommended	

ALTERNATIVE 2 Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option	
Description	• Continue utilizing existing risk model.
Pros	• No installation cost.
Cons	• The current DIMP risk model is a relative risk model, PHMSA best practices and industry peers recommends a probabilistic risk model which is the type of risk model proposed to be implemented as part of this project. • The current DIMP risk model is tied to the current version of ESRI utilized by the GIS/Mapping team. That group is pursuing long range plans to upgrade to a utility network version which will render the current model to be out of date and require a change in risk models. • Continuing to use a risk model that is linked to a software system like ESRI presents challenges since other compliance data used in the risk model is stored in other data formats and software interfaces. The JANA risk model allows mapping and compliance software systems to evolve based on individual need with limited impact to the DIMP risk model. • The current risk model is very time-consuming and not user friendly for the GIS technicians. Implementation of the JANA risk model will reduce workload to that group.

POTENTIAL COST			
Capital	**Direct + Contingency**	**COH (43%)**	**Total**
	$0.00	$0.00	$0.00
O&M	**Program/Project**	**Ongoing Maintenance & Support**	
	$0.00	No forecasted costs	
Source/ Method of Cost Data	N/A		
Explain why this alternative is not recommended	Continually using the existing risk model does not follow PHMSA best practices and is an increased workload on the GIS technicians.		

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 2	*Do not implement a risk model*	*Performing a risk model analysis is required by Federal Code and the NW Natural DIMP plan*
Alternative 3		
Alternative 4		

**Add rows for any additional alternatives considered not viable*

FURTHER ANALYSIS NOT REQUIRED *Describe why further analysis is not required. Please explain in enough detail that others can assess whether the existing justification is sufficient.*

PMO USE ONLY ***ELECTRONIC APPROVALS***

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: SAP Update
Date: February 1, 2025
Project Sponsor: Dina Thompson / Karen Hayson
Executive Sponsor: Brian Fellon / Brody Wilson
Project Manager: Michael Crotty
Preparer: Jennifer Chiaratti
Was this project part of IRP: (enter "Yes, Included", "Yes, Acknowledged" or "No"): No

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	SAP S4 is our key enterprise application used to support work in the field, our financial operations, ability to pay suppliers and vendors. Current version of the application will no longer be supported at the end of 2025. Update is required to maintain supportability and security. By keeping software and equipment at supported levels, NW Natural can continue to receive critical system and security patches, take advantage of the latest technology features, and maintain license compliance as defined by support Agreements. This work is part of NWN Application Lifecycle Management.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	SAP S4 is our key enterprise application used to support work in the field, our financial operations, ability to pay suppliers and vendors. It is necessary to update SAP S4 to mitigate risks of technical failures of the Company's essential ERP system. As with other software products, SAP requires periodic updates to address bug fixes, incorporate product improvements, and maintain support services. In this case, NW Natural's current 2020 SAP S4 version will no longer be fully supported by SAP at the end of 2025. An unsupported platform would put the Company's operations at risk, as any security patches or other system issues could not be resolved without SAP's assistance. Therefore, updating SAP S4 to the latest version is critical in ensuring the essential functionality of NW Natural's SAP system.
Desired Deliverables What high level output / scope / deliverables are core to this project?	This project will update our major version of SAP S4 Hana from 2020 which is out of support at the end of 2025 to version 2023.

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process Summarize how options were chosen, who was involved in the choice and how options were evaluated. If some criteria were considered more important based on the type of project, please explain here.	SAP has provided notice that our version of the software will be unsupported at the end of 2025. Only two alternatives are possible: Update or Do Nothing.

DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Alignment to NW Natural's IT Strategy	Maintaining application supportability
Criteria: Cost-Benefit Analysis	Most cost-effective option for the business
Criteria: Timing	Ability to complete a project in time to meet a regulatory, business, product lifecycle, or safety requirement.

SECTION 3: ALTERNATIVES DETAIL

RECOMMENDED OPTION *Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A*		
Description	Update SAP S4 HANA 2020 to remain in support window	
In brief, why is this the recommended option?	Given the importance of the SAP platform to NWN's financial and compliance needs, an unsupported platform presents significant risk to NWN's regulatory requirements. It is necessary for NWN to stay within SAP product support to ensure fixes, patches, and support for any issues is maintained.	
Assessment	**Analysis Against Criteria:** Alignment to NW Naturals IT Strategy	NW Natural IT Strategy requires critical business systems maintain vendor supportability.
	Analysis Against Criteria: Cost	Although there are costs associated with updating the SAP S4 ERP, $2.2M - $2.75M, this known cost is likely far less than the cost of attempting to maintain business operations without vendor support, up to and including potential significant impacts to business continuity and regulatory compliance.
	Analysis Against Criteria: Timing	Work needs to be completed prior to end of 2025 and prior to NWN busy winter season.
	Additional Risks	Overall business resource availability for testing; same as with any significant testing effort.
	Additional Benefits	SAP S4 is our key enterprise application used to support work in the field, our financial operations, and the ability to pay suppliers and vendors. Having an unsupported platform would put NWN at risk in the event we have a defect that requires SAP support to resolve or security fixes.

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$2.0M - $2.5M	$200k - $250k	$2.2M - $2.75M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0 - $4k	$xx - $xx	
Source/ Method of Cost Data	Statement of Work, Internal and External Resource Costs		

ALTERNATIVE 1 *Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.*		
Description	N/A	
In brief, why is this option not recommended?	N/A	
Assessment	**Analysis Against Criteria:** Alignment to NW Naturals IT Strategy	N/A
	Analysis Against Criteria: Cost	N/A
	Analysis Against Criteria: Timing	N/A
	Additional Risks	N/A
	Additional Benefits	N/A

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	N/A	N/A	N/A
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$0 - $0	$xx - $xx	
Source/ Method of Cost Data	N/A		

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description	**Why the Alternative is not viable**
Alternative 2	Do nothing. Remain on NWN's current SAP system as-is without updating SAP S4 HANA 2020 to a supported version.	The only alternative to an update is remaining on the current SAP S4 version. This would place NW Natural at significant risk as it results in limited vendor support for its critical enterprise application. The reduction in support would prevent the delivery of legal and regulatory changes, support for integrations, and functional enhancements. In addition, there is no guarantee of technical updates including support of new operating systems and database versions, and if available, the updates may include additional fees for problem resolution.
Alternative 3		
Alternative 4		

**Add rows for any additional alternatives considered not viable*

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

CDM Optimization – Project Options

January 2024

Ron Wagner (PM) & Laura Mumford (CM)

NW Natural®

The Journey to Today

NW Natural®

CDM Assessment and Project Planning

- Completed assessing CDM process, technology, and people gaps and presented findings in December
- With approval from leadership, focus has shifted to planning remediation project options to put CDM on a stable, sustainable footing for future success
- With 36+ gaps identified, team has developed a project approach with 4 possible approaches:
  - Bare – address bare minimum mission critical gaps
  - Base - Base project plus remaining mission critical gaps
  - MVP – Bare plus Base projects plus high criticality gaps
  - Full Scope – Bare plus Base plus MVP projects plus medium and low criticality gaps

CDM Remediation Project Options

Recommended Option

	Bare	Base	MVP	Full	
Percent of CDM Gaps Remediated	**6%**	**27%**	**68%**	**100%**	
Approximate Cost	**$799k**	**$2.1M**	**2.5M**	**$2.7M**	**Comments**
Gap Remediation Scope	Minimum Mission Critical	Bare + Remaining Mission Critical	Bare + Base + High Severity	Bare + Base + MVI + Medium/ Low Severity	
Automation of Maintenance Plan Creation	●	●	●	●	
IQGeo Integration with CIS	●	●	●	●	
Revamping CDM Referral Process and Consolidate		●	●	●	
Linking Repair Orders for Full Traceability		●	●	●	
Management of Change Tracking for Compliance Parameters		●	●	●	
Automation of Functional Location and Equipment Data Creation			●	●	
Improved Data Collection and Processing in SAP and Clevest			●	●	
Object Types for Tagalongs, Master Sets, Landslides, Grace Period Mgt, Audit Reports, Historical Data			●	●	
Dedicated Supervisory Role for CDM			●	●	
Role-Based LMS Training Materials			●	●	
Automated Notification to Field Groups for New Assets/Compliance Obligations				●	
Permits for Key Operating Valves				●	
Streamline Heath Reported Leaks and Improve Clevest and IQGeo Data Capture				●	

CDM Remediation Project Options

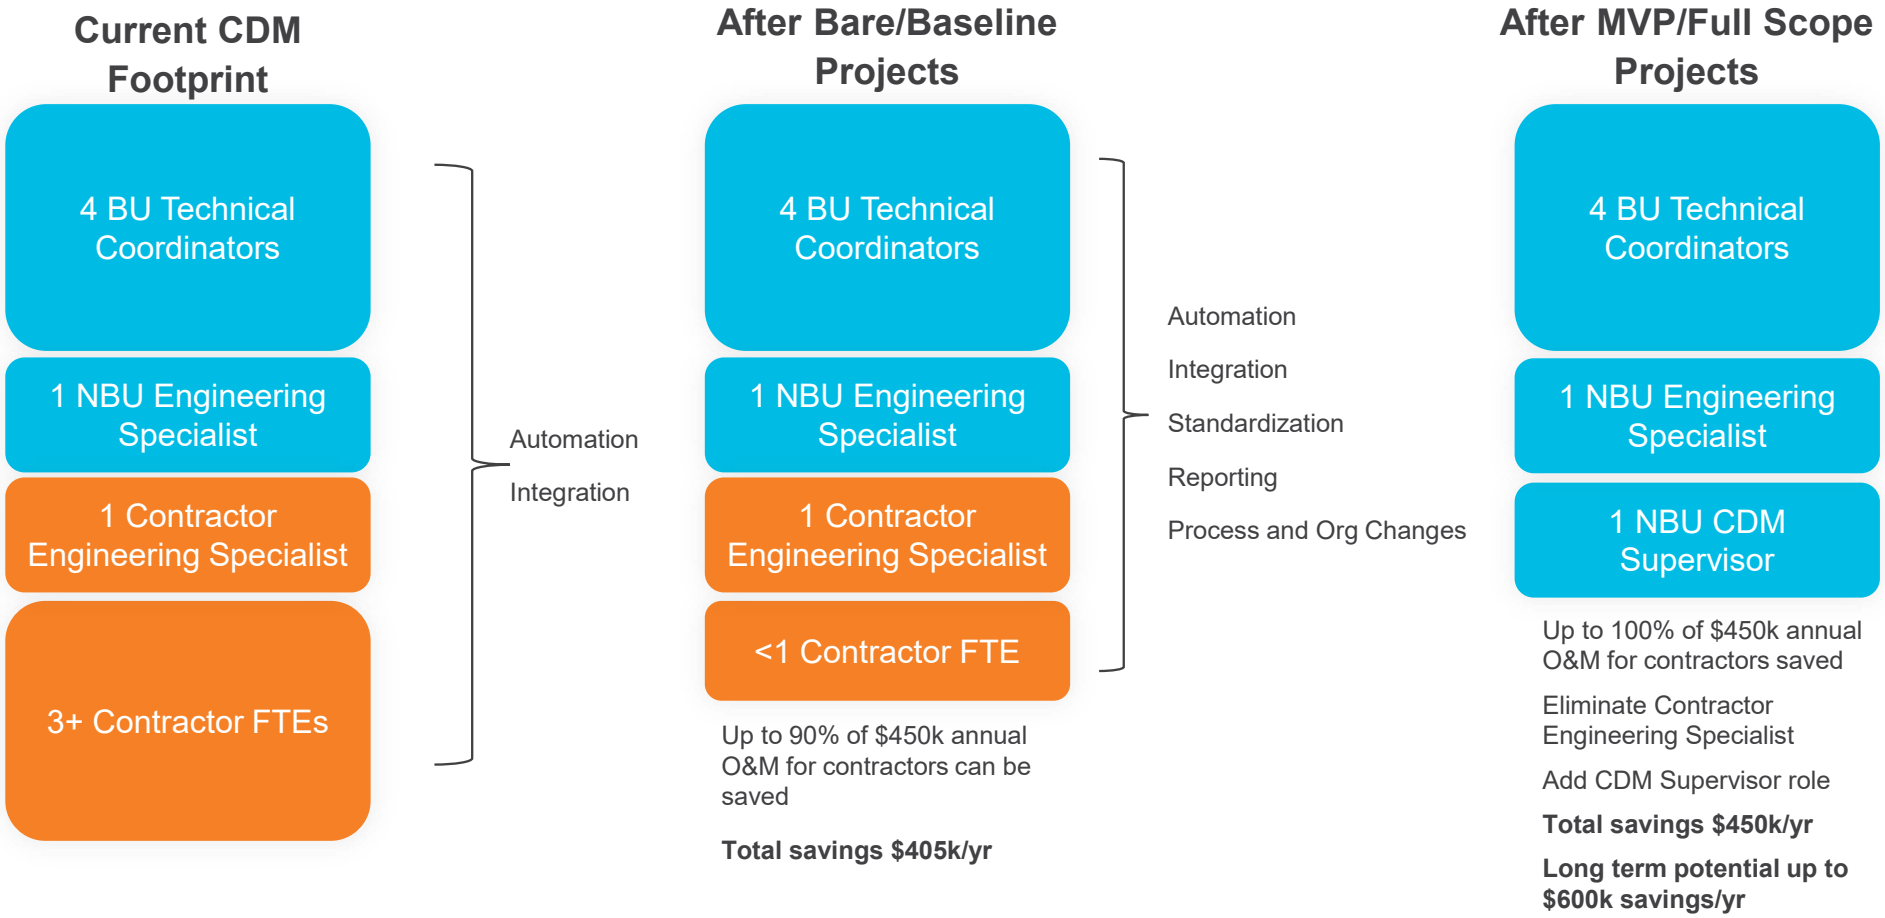
Recommended Option

	Bare	Base	MVP	Full	
Percent of CDM Gaps Remediated	**6%**	**27%**	**68%**	**100%**	
Approximate Cost	**$799k**	**$2.1M**	**2.5M**	**$2.7M**	**Comments**
Gap Remediation Scope	Minimum Mission Critical	Bare + Remaining Mission Critical	Bare + Base + High Severity	Bare + Base + MVP + Medium/ Low Severity	
Benefits					
Elimination of error prone manual effort to setup recurring compliance plan data	●	●	●	●	Elimination of manual effort; avoid need for contractor support
Eliminate contractor support to enter field referrals from IQGeo into CIS	●	●	●	●	Up to $405k contractor costs in O&M saved per year
Ensuring integrity of referral process and avoiding lost or delayed reporting		●	●	●	
Integration of Follow-On Orders into CDM Lifecycle		●	●	●	Elimination of manual effort; up to 2 FTE refocus incl above
Elimination of effort to clean up data errors in missing or incorrect FLOCs and equipment			●	●	Up to $45k contractor costs in O&M saved per year
Improved Field Data Capture / Data Integrity / Real Time Feedback to Field			●	●	
Standardized Master Data and Parameters, Data Integrity, and Historical Data Access			●	●	
Improved Compliance Oversight and Management			●	●	Avoidance of regulatory fee assessment risks
Improved Ability to Forecast and Allocate Work		●	●	●	
Field Alignment and Awareness of CDM Obligations		●	●	●	Improved capability, employee experience, retention
Improved CDM User Experience, Turnover and Staff Retention		●	●	●	
Improved Contractor Data Capture to Support CDM Master Data Collection and Compliance				●	
Streamlined Ad Hoc Master Set Inspections Process				●	
Achieve CDM Steady State and Avoid Future Business Disruption				●	Full scope = highest chance of returning to steady state
Fully Documented End2End Process for Comprehensive Training and Compliance Support Program		●	●	●	Full scope = full LMS training program for sustainability
Systems Aligned for Future Growth			●	●	
Systems and Processes Aligned with Gas Industry Leading Practices		●	●	●	

Benefits Level ● Low ● Med ● High

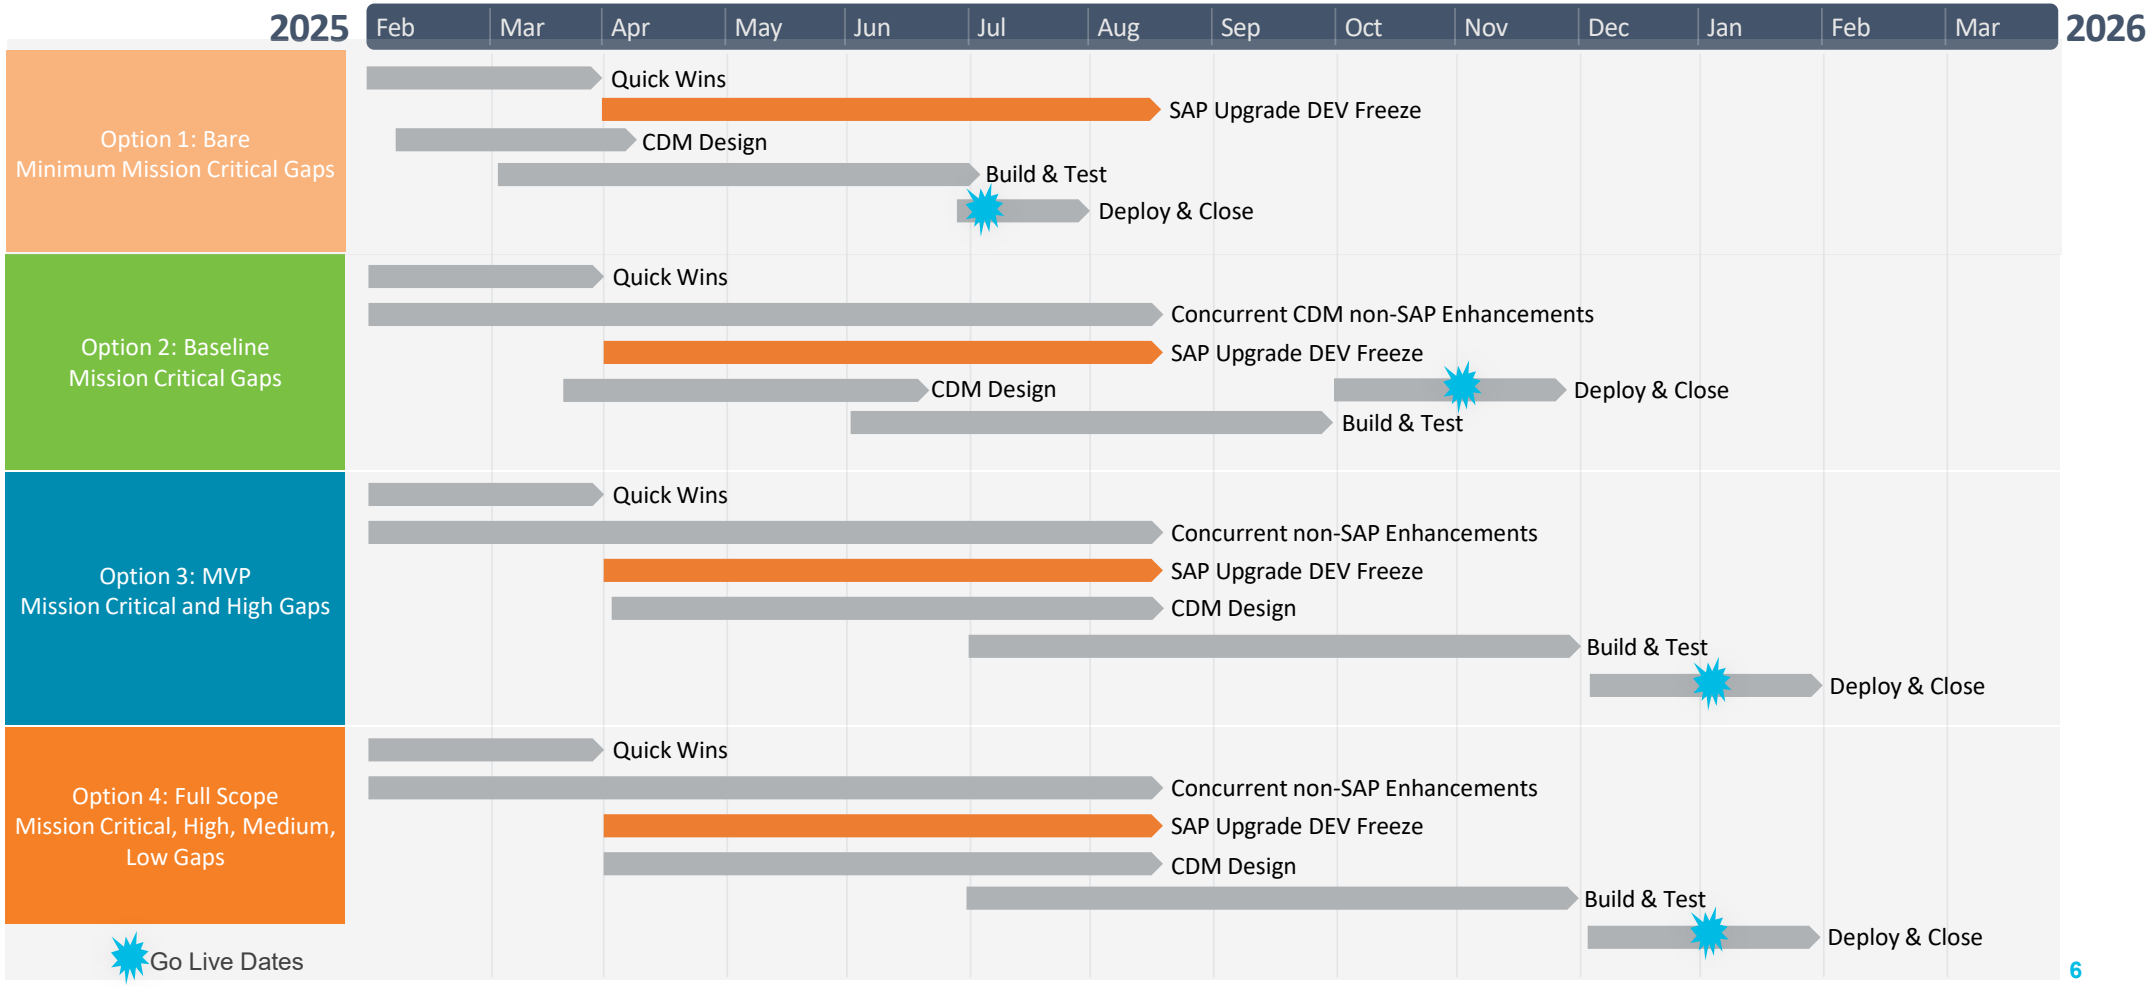
CDM Staffing Model Changes by Project

NW Natural®



Project Option Timelines

NW Natural®



Target State Options Overview

	Bare	Baseline	Minimum Viable Product	Full Scope Project
Guiding Principles / Costs	Minimal cost option to eliminate most contractor support	Low-cost option to remediate only mission critical gaps	Medium cost option to remediate all mission critical, high, and medium priority gaps	Full cost full scope option to remediate all gaps

2026

Budget Constrained Option: *Complete Bare Project in 2025 and remaining scope in Full Project in 2026. Assumed same total $2.7m cost but only $799k in 2025. All benefits realized but over a longer timeframe.*

Recommendation Summary

NW Natural®

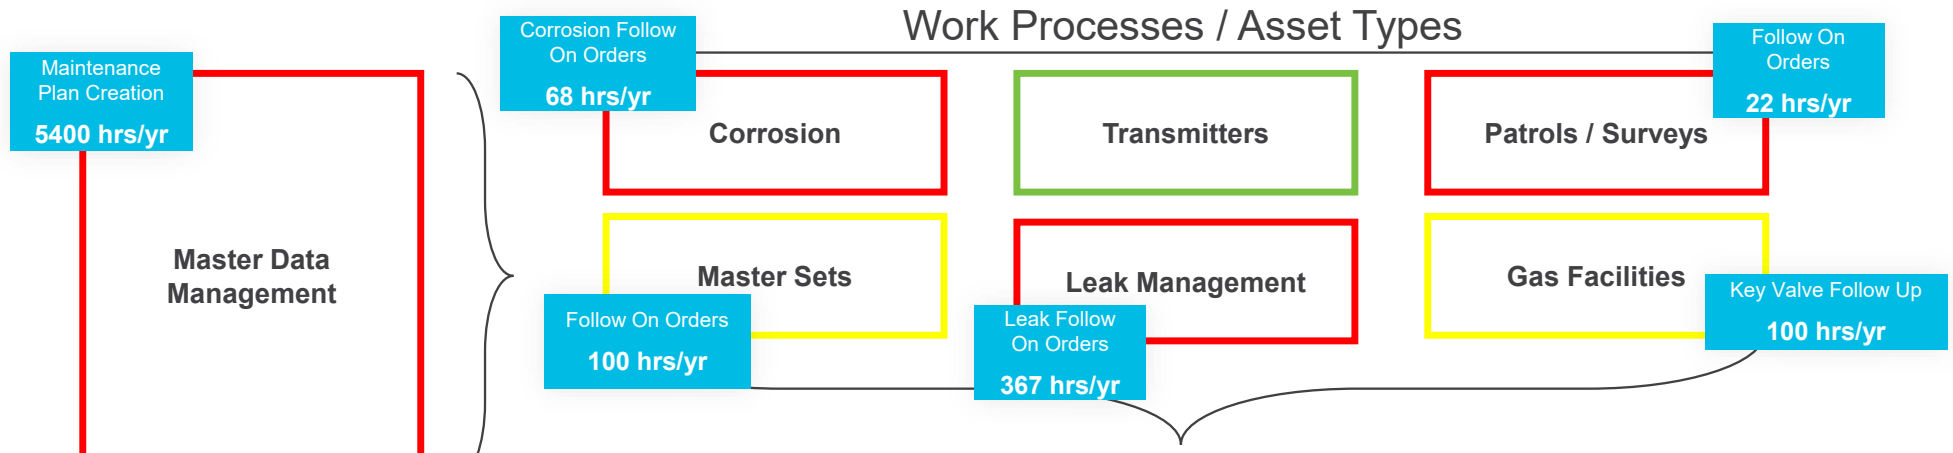
- Option 1: Bare Project – proceed to PMC now, confirm resource requirements and commitments needed – may need to defer start depending on constraints. Need to cover funding for delta between $250k authorized and $800k budget estimate.
- Option 2: Baseline Project
- Option 3: MVP Project
- Option 4: Full Scope Project – work on alternative analysis, confirm justification of full spend amount, seek funding for Jan 2026 start as second leadership review and PMC submission

Approvers:
- ☑ Brian Fellon
- ☑ Joe Karney
- ☑ Dan Kizer
- ☑ Dina Thompson
- ☑ Joe Sciacca
- ☑ Jaime Ulestad

Appendix

CDM Scope and Challenges/Gaps

NW Natural®



- Multiple disparate intake sources, methods, tools for master data creation
- High level of manual input leads to inconsistent plan setup

- Disparate processes and ownership for compliance plans and orders based on asset type
- Lack of common tools and processes to ensure coordination between CDM, RMC, Field
- Stranded alerts and referrals (e.g. IQGeo)

- Multiple intake sources and methods for follow-on work and lack of traceability for repairs

High Gaps/Pain Points
Medium Gaps/Pain Points
Minimal Gaps/Pain Points

Summary of Gaps by Bucket - Appendix

NW Natural®

CDM Discovery Log Gaps Categorized by Project Bucket

- **Mission Critical (11)**

Automation of maintenance plan creation

Linking repair work orders to inspection orders

Revamping of CDM referral process including automation of IQGeo alerts into CIS

IQGeo dashboard

MoC

- **High Priority (15)**

Automation of FLOC and EQP creation and full integration of GIS-SAP

Improve data collection and processing in Clevest and SAP

Object types for Tagalongs, Master Sets, Landslides (low effort, Clevest impacts)

Grace period management

Conversion of required history

Supervisory role for CDM

GIS/SAP audit report

Role based training program

- **Medium/Low Priority (10)**

Process documentation

Automated notifications to responsible field groups when plans are added

Fully document task list design

Permits for KOVs (Loy Clark contractors)

Adding characteristics (low effort)

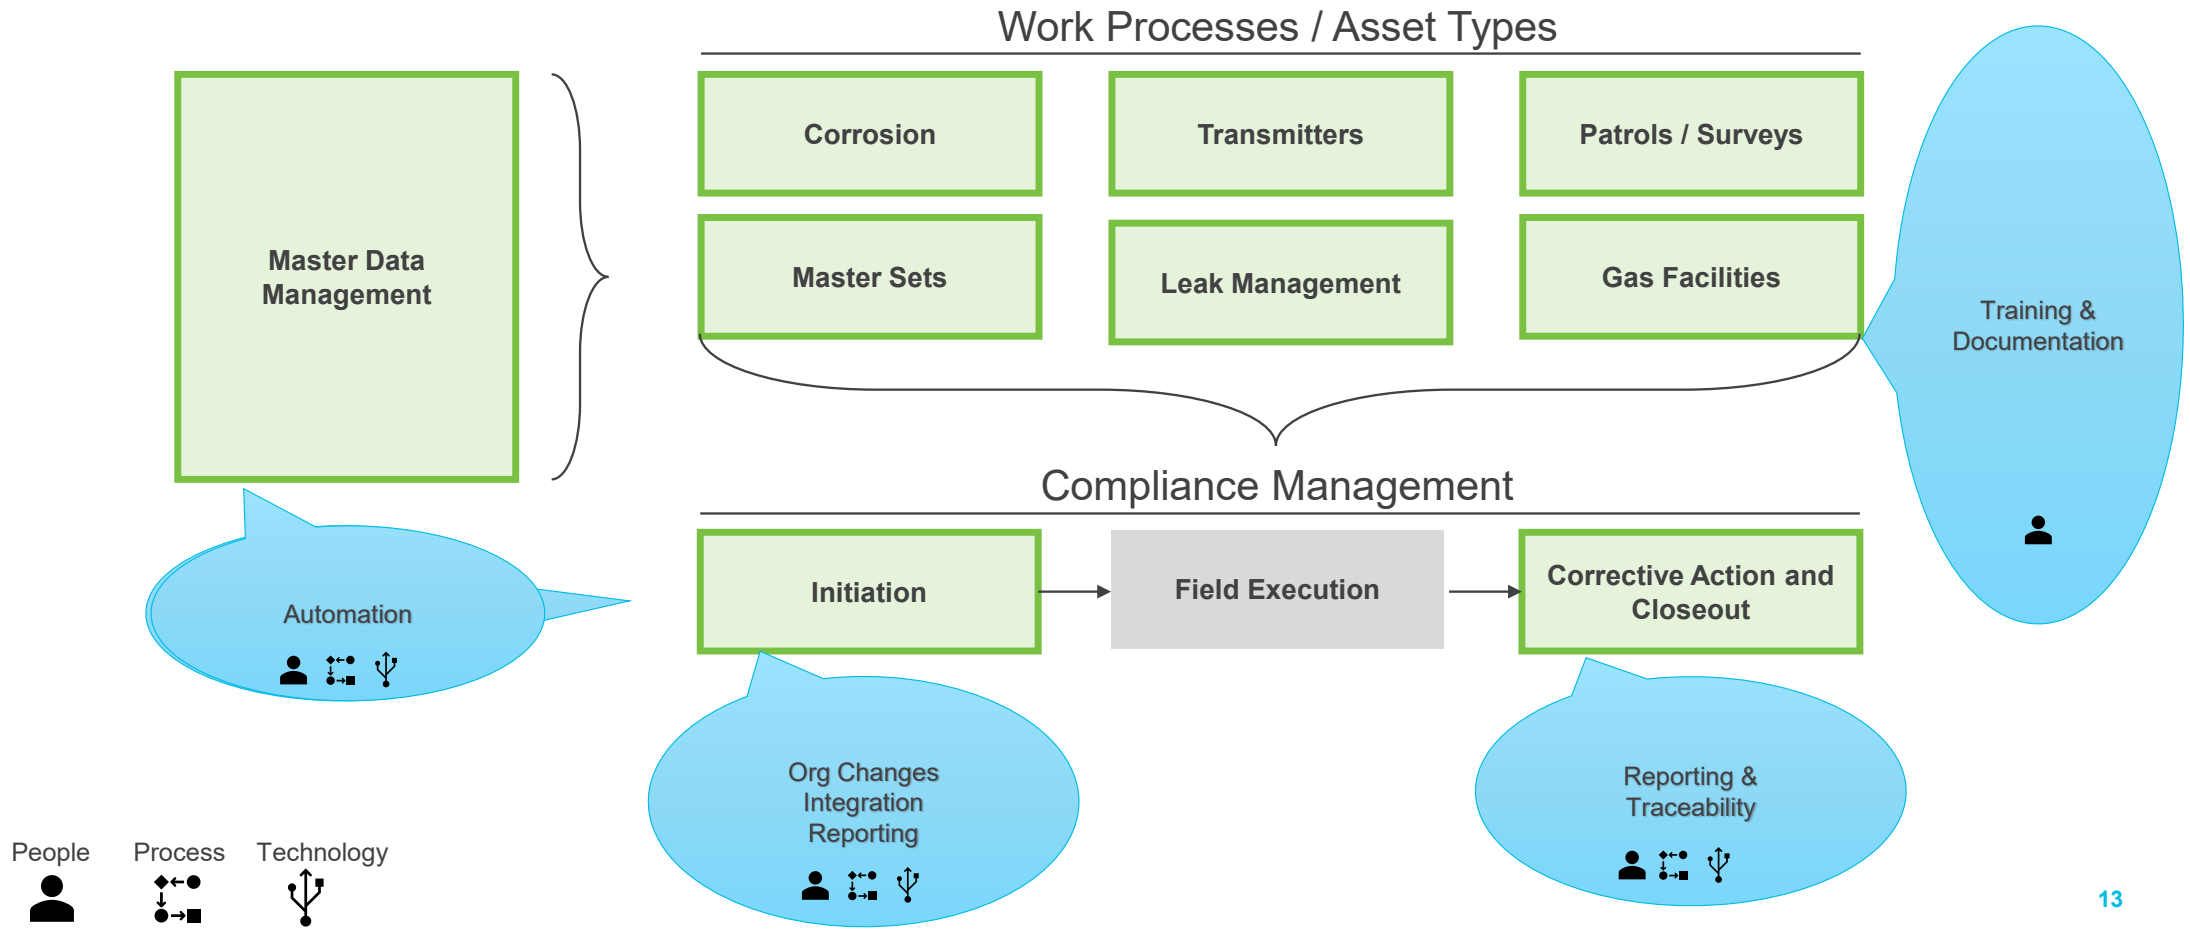
Heath reported leaks – streamline

Asset data capture in IQGeo and Clevest

Creation of partial orders

CDM Scope and Challenges/Gaps

NW Natural®

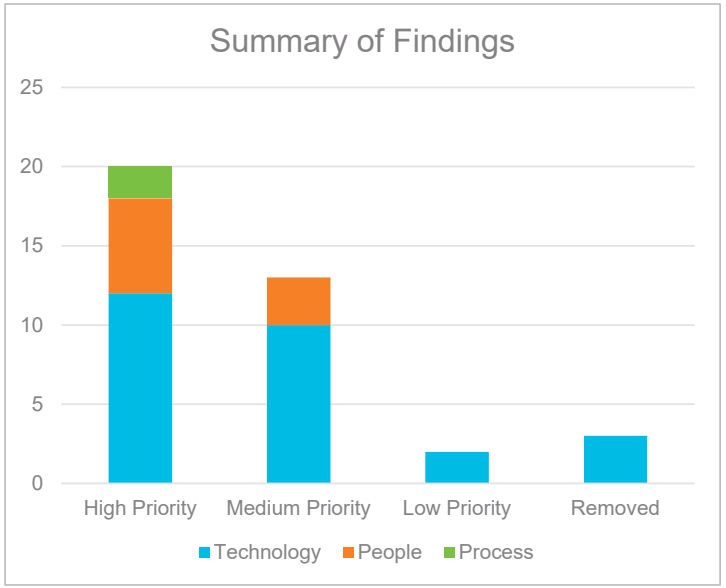


Summary of Findings

- The team identified **38 gaps** to improve operational efficiency that fall into the categories below. Many items are interconnected, and **project team recommends solutions for all areas are addressed in parallel**.
  - People: Org Design, Roles & Responsibilities, Training
  - Process: Business Process Gaps, Data Cleanup
  - Technology: Enhancements, Reports, Integrations

- Overall assessment is that core operating model is sound, but efficiency gains are required for current headcount to manage workload. Recommendation is to invest in technology solutions to create a scalable operating model aligned with industry best practices. This will create capacity for the CDM team to focus their time on the greatest value add tasks.

Technology investment paired with People & Process support measures Short term pain, long term gain	People & Process support measures alone would still demand significant headcount investment Long term O&M spend



People, Process, & Technology

NW Natural®

Once proposed efficiency gains are realized, CDM's responsibilities are appropriately aligned with business operations and NWN's tactical and strategic goals

Asset Creation	Master Data Management	Compliance Management			Asset Retirement
		Monitoring	Ad hoc support and follow up	Data Integrity Maintenance	
Wide ranging inputs	Highly manual processes	Lack of reporting *Recently rectified for CDM*	Wide ranging alerts and notifications	High volume of issues requiring research and mitigation	Manual tracking

In current state, significant human effort is required to manage the workload. O&M overhead is high.

Leadership team spread thin to provide oversight, strategic solutioning, and lead cross functional collaboration. Contractor support required. Lack of clarity on division of labor with RMC/Field Supervisors. Documentation Gaps: Role based training, cross functional business process maps, etc..

Enhanced GIS/SAP integration	Master Data, FLOC, & Maintenance Plan Automation	EDP reporting suite for compliance Field leadership	Z3 notifications enhancement Enhanced field referrals Required reason for accepted out of tolerance reading CIS order automation for IQGeo Exception alerts	GIS/SAP Audit report + automation at asset creation Change management tracking solution	Construction orders linked to originating compliance order

Investment into solutioning People & Process gaps is best made ***as efficiencies are gained*** through technology enhancements and steady state is achieved

CDM Staffing Model

NW Natural

Current CDM Footprint

- 4 BU Technical Coordinators
- 1 NBU Engineering Specialist
- 1 Contractor Engineering Specialist — *2025 O&M $156k*
- 3+ Contractor FTEs — *2025 O&M $450k*

90% of time spent on data creation and fixes, rest on IQGeo alert creation and field support

Firefighting, issue remediation, training and support for TCs

90% of time spent on IQGeo alert processing, rest of time on data fixes

Automation

Automation, Reporting, & Training

Automation Integration

80% of data creation and fixing time is eliminated Focus on field support, and compliance management

Value added support, less data firefighting, more compliance management based on robust dashboards

Up to 2/3 of IQGeo alerts can be automated, and longer term possibly all. Over time reduce contractor support to zero

CDM Footprint After Enhancements Delivered

- 4 BU Technical Coordinators
- 1 NBU Engineering Specialist
- 1 NBU CDM Supervisor — *Est $170k*

Up to $450k O&M saved per year

Prioritize automation of CIS orders from IQGeo Exception alerts – would enable earlier realization of O&M savings

**Savings would help offset cost of proposed new supervisor and newly approved addition to TC headcount*

Full Project Charter

Final Objectives and Outcomes

The planning and discovery scope of work aims to ensure a comprehensive approach to the Website upgrade project, extending beyond supporting system version upgrades. This requires effort to address the current state, functionalities, support, and security gaps, helping identify a path forward that meets technical and functional challenges, including but not limited to the platform's effectiveness, user experience, and support will identify key areas for improvement. Potential solutions, including replacing outdated components and integrating new technologies if required, will be evaluated for feasibility and cost-effectiveness. The intent is to reduce complexity, address gaps and implement improvements that will enable NWN to enhance support and enabling a better support and administrative experience.

Final Cost / Benefit Analysis

This Discovery and Planning project will cost $1.3M, inclusive of Accenture fee of $565K, and team cost of $651K

Benefits of program are to reduce complexity, address gaps and implement improvements that will enable NWN to enhance support and enabling a better support and administrative experience.

Final Scope

Document current state and future state requirements:
a. Work with NW Natural stakeholders to gather and organize existing website business and technical requirements and document gaps in requirements where further investigation and requirement definition will be necessary.
b. Conduct workshops and meetings with NW Natural stakeholders, to deep dive into the following areas and document findings to support Deliverables outlined in Section 6 (additional areas maybe identified during project planning):
• High Level business objectives and capabilities
• Self-service objectives and capabilities
• Authoring & Workflows
• Search
• Future capabilities (CDP/Personalize/Portals)
• Detailed Component Discovery
• Images and Video
• Detailed Template Discovery
• Content Serialization
• User Management, Authentication
• Forms, Form APIs, Tools, and Calculators
• Current UX walkthrough / Functionalities
• DevOps pipelines
• Marketing Automation use cases
• Personalization using use cases.
• CLM and CIS Roadmaps Reviews
c. Document business and technology requirements captured during the stakeholder workshops and meetings and documentation provided by NWNNW Natural or gathered by Accenture through review of the site.
d. Review all legacy documentation, identify and document gaps (including all aspects detailed within RFP such as functional, technical, and logic details), update reviewed documentation to accuracy, create user story and business logic documentation to fill identified gaps, provide a summary/overview of findings to be leveraged.
e. Create a gap analysis indicating for which features requirements currently exist which features are undocumented; will include an

Known Assumptions at Assess Phase

NW Natural team has identified approximately 450 features for as-is functionality. This does not include future state considerations (self service + CLM technical roadmap) and findings.

Key architectural, solution and technical decisions need to document as ADRs and approved by NW Natural as part architecture prior to any new implementation.

Per discussion, NW Natural estimates 2500 test cases.

We Accenture estimates that a core base of 22 epics covers majority new and existing functionality; and test cases

Known Constraints at Assess Phase

TIming of project is constrained by key NWN resource availability and conflicts with other ongoing projects.

Project must be complete by August, 2025

Final Change Control Plan

Change identified in the project will be discussed within the project team and assessed for impacts. Change propos discussed with Stakeholders and Executive Sponsors with project team recommendation. With alignment on chang change request creation and approval will be done in Planview following our project governance structure.

Final Project Governance Structure

Project Governance Structure
This Project is part of the CLM project portfolio 'pod' following this below governance structure:

IT&S Alignment Team:
• Communicates with CEO, stakeholders, and leadership as appropriate

Exec steering committee
• Provide vision, goal strategy, priority, budget, and direction for program.
• Significant changes to scope, timeline, and budget.
• Provide oversight and guidance to all team members.
• Resolve non-projects relegated roadblocks.
• Resolve enterprise level strategic issues as they arise

Program Stakeholders
• Responsible for overall business priorities for the workstream
• Approve deliverables and project completions
• Advocate for required process changes within their business areas
• Resolve across functional issues as they arise
• Reallocate team members responsibilities as needed to meet project requirements
• Communicate with exec steering committee

NW Natural
PROJECT ALTERNATIVES NARRATIVE

Program/Project Name: Gas Control Daily Operations Platform Implementation project
Date: August 15, 2025
Project Sponsors: Jeremy Coleman, Steven Foster
Executive Sponsors: Dave Weber, Brian Fellon
Project Manager: Josh Mathis
Was this project part of IRP: Yes

SECTION 1: BUSINESS CASE

This section should be solution-agnostic, and about the overarching problem we're trying to solve no matter which route we end up taking

OBJECTIVES *Why are we tackling this project?*	
Current State What is happening now? Where are we starting?	NW Natural's Gas Control Daily Operations Platform Implementation project is a strategic initiative to ensure the Gas Control team is able to operate the NW Natural distribution and transmission gas system during all operating conditions, develop accurate forecasts of system demand for daily system operating plans, and produce all required reports and compliance documentation. The current 20-year-old custom-built Supervisory Control and Data Acquisition (SCADA) system utilizes a set of software designed for controlling industrial plants in the pharmaceutical and manufacturing environments developed by GE called iFIX. iFIX provides the capability to manage repetitive standard control processes to ensure consistent manufacturing results e.g. are fixed in structure and only change when major product changes are required. Local Gas Distribution Company (LDC) gas control systems continually evolve as system distribution and transmission resources are added and sensors are upgraded or replaced. Since the development of the current system, software vendors have developed LDC and electric specific SCADA frameworks and software designed to evolve with the distribution/transmission system and operating needs of LDCs. These systems are modular and provide a more cyber secure SCADA platform. The current system has reached the end of its planned 15-year lifespan and has experienced numerous outages caused by several factors including a defect in the underlying iFIX software, which was only recently fixed by GE. GE doesn't support NWN architecture and implementations of our custom software that sits on top of iFIX. It is unlikely we will receive additional support for any defect that is discovered in the future. This is partly due to the customized software NW Natural has developed, which uses iFIX to execute system controls and telemetry functions and calculations. This project will evaluate the alternatives to the current system and select an implementation partner to enhance operational performance and reliability, improve maintenance and distribution capabilities, and position NW Natural to meet future demands in gas control operations. In 2023, NW Natural engaged Accenture to conduct an initial system assessment and explore options that would provide another 15-year lifespan solution. Accenture recommended [redacted] In 2024, IBM was engaged for requirements gathering, gap analysis, and to lead a comprehensive RFP process targeting full replacement of foundational SCADA components. NW Natural received responses from a number of vendors, selected Aspen Technologies OSI ("Aspen Tech") and [redacted] as finalists

	and conducted substantial due diligence into both options. [redacted] Based on this assessment, NW Natural selected Aspen Tech as the lower-cost and better service option to provide a new SCADA software platform. This project will implement the Aspen Tech platform, interfaces and baseline reports.
Problem Statement In simple terms, what are we trying to solve? What is the business need this is tackling? Why is this a problem worth solving (e.g. why is the current state not working)?	The Company's current SCADA platform is currently stable after a long timeframe of increasingly unstable and unreliable operation caused by a defect in iFIX, interfaces with unsupported software components, and issues with reporting failures caused by the growth of the historical database. As the existing software was modified over time to accommodate changes in NW Natural's gas distribution pipeline system, the system software developed defects, and the underlying architecture reached storage boundary limits and is unreliable at times resulting in system disconnects and manual restarts. While NW Natural has a back-up server to respond to such outages, transitioning to this back-up is a manual process, which can take between 30 minutes and 2 hours. During this manual transition, the SCADA system, including Gas Control's real-time situational awareness, is offline. NW Natural is the developer of the NW Natural SCADA system and the only company using this solution, so NW Natural must maintain the system and respond to any changes GE may put into the iFIX without support from any other LDC or software vendor. This represents a significant risk in the future if GE decides to significantly change the interfaces to the product, end support for the iFIX product, or replace it with another product. Any of these changes could require the complete replacement of the system with another system prior to the end of the desired 15-year lifespan. Forecasting and reporting are essential tools for the gas control and gas supply team. The current system reporting is based on SQL Server Database tools. These tools are extremely effective for a number of implementations and provided an effective tool for data capture and reporting when the current system was developed over 15 years ago. Unfortunately, after 15 years of data capture, the underlying data storage has reached the limits of the tool's storage addressing and indexing capability and must be modified continually for the forecasting and reporting functions to be performed. This requires external contract experts to support, and this component of the existing system must be reimplemented or replaced to stabilize this essential function.
Desired Deliverables What high level output / scope / deliverables are core to this project?	This project will provide a long-term stable platform for NW Natural's central gas system operations and management system, while improving reliability and ensuring accurate, consistent reporting. In addition, the new system will feature: • A secure architecture. • Centralized management of display maintenance and distribution. • Streamlined product and patch releases through vendor-managed source code. • Cybersecurity compliant with ISO-27001 standards. • Simplified database administration and improved system release efficiency. • Enhanced system administration and operational resiliency. • Enhanced user experience

SECTION 2: ALTERNATIVES SUMMARY

OVERVIEW *How did we review these options?*	
Review Process	Accenture conducted an initial system assessment and explored options that would provide another 15-year lifespan solution including redeveloping the current iFIX-based solution. IBM facilitated an RFP process which identified twelve potential vendors; eight vendors were asked to submit proposals in the process. [redacted] The NW Natural Controller team, the SCADA Engineering team and the IT Enterprise Architecture teams completed detailed review and scoring of each vendors technical capabilities, pricing and overall ability to meet NW Natural Gas Control Platform and SCADA requirements. Two vendors were considered finalists, Aspen Tech and [redacted]
DECISION CRITERIA *Describe the criteria used to determine the selection from the various alternatives considered. For example, is this a program/project where the least cost option should be selected? Are there other factors, such as safety or quality that come into play? Include both quantitative and qualitative factors as appropriate.*	
Criteria: Meeting NW Natural Objectives	Industry standard • Is the solution based upon shared industry standards that are implementable with no or minimal modifications? Meets foundational needs • Does the solution meet foundational needs but has extensible functionality for future improvements through configuration, utilizing primarily commercial-off-the-shelf solutions? • Does the solution offer a single solution for Alarm and Event management that is integrated and extensible? • Is it a solution that can combine duplicated components of the current infrastructure, e.g., Historians? • Does the solution meet all requirements for a Critical Cyber System (CCS) as defined by SD2E? Meets the functional and non-functional requirements - examples • Functional: Simplified SCADA system architecture and simplified Network systems integration. • Functional: Real time monitoring and Record keeping. • Non-functional: Usability: quick access to critical measurements and high level of controller usability • Non-functional: Data management- automated data processing ability
Criteria: RFP Written Responses	Vendors submitted detailed written responses to questions on their ability to meet the functional business, functional technical and non-functional technical requirements across the following areas: • UX/HMI • SCADA • Integration • Architecture • Alarms and Incident Management • System resilience/continuity • Gas management applications • Historian • Asset Management • Compliance

	• Data management • Training/learning management
Criteria: Oral Presentations/Demonstrations	Each vendor completed on-site demonstrations of solutions to representations of Gas Control, SCADA Engineering, Enterprise Architecture, Cybersecurity, and other IT&S functions. **Demonstrations included:** Controller User experience: • Customization of user interfaces and system dashboards. • Advanced forecasting, trend analysis, and data overlay capabilities. • Training enhancements using SCADA simulators and digital learning platforms. • Solution alarms that enhance Controller awareness. • Navigation techniques and features to improve user experience. SCADA Engineer experience: • RTU Site Setup and Configuration • Develop a Custom Operational Screen • Ad-hoc Trend Analysis and Reporting • Maintenance and Updates Integrations: • Integrations with current Core NWN systems. • Integration with existing network management tools and platforms. • Simplification of system configurations for new SCADA applications. • Unified system log integration across platforms. System Performance: • Live failover tests to show minimal downtime and quick recovery. • Redundancy demonstrations to highlight the system's stability during updates. • Telemetry system's feedback rate improvements showcasing real-time operational capabilities.
Criteria: Overall Cost Implications	Initial Expenditure: • What are the upfront costs associated with each option, including licensing, hardware, and setup? Ongoing Costs: • Are there recurrent expenses, such as maintenance fees, subscription costs, or additional licenses?

SECTION 3: ALTERNATIVES DETAIL

<table>
<tr><th colspan="4">RECOMMENDED OPTION
Describe the option selected/recommended for approval. Explain in detail how the option measured against the decision criteria, whether it was the lowest cost option, and if there were qualitative factors considered in selecting the option. Provide all information necessary to understand the decision process that was undertaken with respect to the recommended option. If positive /neutral/negative observations do not exist, enter N/A</th></tr>
<tr><td>Description</td><td colspan="3">Implement a vendor supplied LDC SCADA platform and configure it to meet the requirements of NW Natural.

In 2024, IBM was engaged for requirements gathering, gap analysis, and to lead a comprehensive RFP process targeting full replacement of foundational SCADA components. Based on the review of the RFP responses, NW Natural selected two vendors as finalists for substantial due diligence, Aspen Tech and [redacted]. Based on this evaluation, NW Natural selected Aspen Technologies OSI (“Aspen Tech”) as the lower-cost and better service option to provide a new SCADA software platform.</td></tr>
<tr><td>In brief, why is this the recommended option?</td><td colspan="3">This option is recommended to ensure:

• Integrated Gas LDC SCADA platform with integrated data capture and reporting capabilities.
• Safe, reliable and efficient management of the distribution/transmission pipeline system.
• Able to maintain and update system configuration and software using vendor provided system tools to centrally manage display maintenance and distribution while leveraging a modularized approach to add increased capabilities in the future.
• Built in connectivity of pipeline asset-enabling.
• Improved Controller information and web user interfaces with Geographic Information System (GIS) capabilities, facilitating display creation and addressing situational awareness challenges.
• Enhanced cybersecurity measures with ISO-27001 certification.

As explained in the Alternative 1 analysis, after NW Natural had moved forward with an RFP, GE issued a patch for iFix after five years of NW Natural requesting fixes to the software. This patch resolved a critical functionality issue with iFix. At this point, NW Natural evaluated whether remaining on the iFix system was a viable alternative to Aspen Tech.</td></tr>
<tr><td rowspan="4">Assessment</td><td>Criteria</td><td colspan="2">Aspen Tech achieved the highest scoring in our initial RFP response and finalist evaluation.
• Functional and technical evaluations
  ○ Ability to meet NW Natural objectives/requirements
  ○ Scoring vendor RFP written responses
  ○ Scoring of oral presentations/demonstrations
  ○ Scoring of sandbox demo/simulations
• Commercial Pricing Evaluation</td></tr>
<tr><td>Cost to implement</td><td colspan="2">The cost of this option has been evaluated to be the most flexible and leverages opportunities for lowering costs as this solution is targeted to the foundational layer with options to expand the functionality as costs can be supported. This option still requires NW Natural to keep existing integration licenses as well to include TiPs/Logmate, Kepware, and J5/Hexagon.</td></tr>
<tr><td>Additional Risks</td><td colspan="2">Requires significant investment over a three-year period</td></tr>
<tr><td>Additional Benefits</td><td colspan="2">Delivery of the foundational project allows us to improve and increase future capabilities to include reporting, communications, and integrations.</td></tr>
<tr><td colspan="4">POTENTIAL COST (EXCLUDING CONTINGENCY)</td></tr>
<tr><td rowspan="2">Capital Range</td><td>Direct</td><td>CURRENT COH</td><td>Total</td></tr>
<tr><td>$17M
• Study & Foundational RFP $2.4M</td><td>12%</td><td>$19M</td></tr>
</table>

	• Implementation Costs $14.7M		
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$250,000	2028-2035 = $3M	
Source/ Method of Cost Data	Aspen Tech team/study provided solution costs. COH was calculated based on duration of project. O&M was estimated based upon the license agreement and the shelf life of the solution.		

<table>
<tr><th colspan="3">ALTERNATIVE 1
Provide details of any viable alternatives for meeting the objective, other than the option above. Please provide enough detail so that the reader can understand how the alternative compares to the recommended option.</th></tr>
<tr><td>Description</td><td colspan="2">Rebuild and re-architect the existing GE iFIX solution, removing customizations to enable an upgrade and address SCADA system resilience and known support concerns.</td></tr>
<tr><td>In brief, why is this option not recommended?</td><td colspan="2">NW Natural is the developer of the NW Natural SCADA system and the only known LDC using the iFIX software solution for an LDC SCADA. NW Natural must maintain the system and respond to any changes GE may introduce into the iFIX product. As the only known LDC customer using iFIX for an LDC SCADA solution, NW Natural does not have any other LDC peers to encourage GE to support iFIX as a Gas Control SCADA solution. This represents a significant risk in the future if GE decides to end support for the iFIX product, make significant changes to the operating interfaces of iFIX, or decide to replace it with another product. Any investment made in the iFIX platform is at risk for replacement before the desired 15-year lifespan of the investment.

Additionally, reliability issues have remained consistent since the last upgrade (2017), with alarm mismatch (4 years) and workspace crashing (5 years) plaguing the environment. GE issued a patch that addressed the cause of the SCADA system's crashes over the past five years. This patch has substantially reduced the need for manual restarts. As a result, the Company reevaluated whether to update and maintain the existing hybrid iFIX SCADA platform solution as an alternative to replacement but determined the history of reliability and instability issues to be an unacceptable risk.

NW Natural's existing SCADA platform was customized to enhance the iFIX software to meet the operational requirements for a gas distribution pipeline control room. The iFIX system is based on a human-machine interface (HMI) server that is designed to manage plant operations, rather than a gas distribution pipeline system for an enterprise control room. When the platform was installed in 2005, this type of HMI-server based software was commonly used because it was (a) cost-effective; (b) readily transitioned between the preexisting hardware systems to networking with field telemetry devices; and (c) allowed development of custom applications to fill gaps in functionality required for enterprise control room. The iFIX system platform did not provide enterprise solutions and integrations required for gas distribution system operations. NW Natural substantially modified the iFIX platform over time with custom gas management services that are now offered by SCADA vendors. The system has also been customized to meet compliance requirements.

Forecasting and reporting tools are essential components of the Gas Controller and Gas Supply team's daily, monthly, and yearly planning. These reports are based on collecting telemetry data over time and matching it with weather and other demand dynamics. The existing system relies on SQL Server databases to collect the data and provide the reporting needed. The underlying database has grown beyond its design limitations which has caused numerous reporting failures and will continue to do so until the data capturing and reporting system is rebuilt under a new framework. The reporting mitigations have been provided by highly paid external contract resources. Going forward with the SQL Server architecture may result in loss of valuable reporting information.

As the only known LDC with this SCADA solution, NW Natural is also the only LDC investing in enhancements for future needs and optimization of operations. There are a number of operational enhancements NW Natural would benefit from that are available within vendor-provided SCADA systems. If NW Natural identifies an urgent need for one of these enhancements, NW Natural must develop the solution without any support from the vendor or cost sharing with other LDCs. The development and lifecycle risk for the iFIX based SCADA is entirely NW Natural's.</td></tr>
<tr><td rowspan="2">Assessment</td><td>Planning and Deliverables</td><td>While this option utilizes the existing architectural approach and software platform instead of upgrading to a new platform, it will still involve substantial modifications to existing software systems, infrastructure, and network, as well as comprehensive testing and validation.</td></tr>
<tr><td>Solution complexity</td><td>This option maintains the high level of complexity in the existing system and the high level of software development effort which would be carried out by NW Natural SCADA Engineering, Enterprise Architecture and the Controller teams, which has been noted as problematic within the existing infrastructure.</td></tr>
</table>

		Hiring people and maintaining the skills needed to maintain and support software updates for the existing system is a major risk factor over time. Currently the needed resources and skills are on the SCADA team but there is uncertainty about hiring and replacing them over time to address attrition
	Cost to implement	This is a lower cost option in the short term than implementing a new SCADA system, but the ongoing support costs for the existing solution coupled with the high risk of the operational instability of the system make the cost of ownership of this option difficult to budget for. Additionally, the iFIX-based solution would eventually have to be replaced with an LDC industry specific solution. The useful life of this option is unknown and timing of replacement unpredictable.
	Additional Risks	Complexity and time to address foundational issues may be beyond the organizational capacity and expertise of the NW Natural Gas Control, SCADA Engineering, IT Enterprise Architecture & Infrastructure organizations, requiring either expensive external support or eventual replacement (Recommended Option)
	Additional Benefits	

POTENTIAL COST (EXCLUDING CONTINGENCY)			
Capital Range	**Direct**	**CURRENT COH**	**Total**
	$9.4 million	12%	$10.1M
O&M Range	**Program/Project**	**Ongoing Maintenance & Support**	
	$237K	2028-2035 = $1.1M	
Source/ Method of Cost Data	For O&M: Current software costs are **$134K** per year: (GE/iFIX SW $76K; Logmate $30K; J5 licenses $21K; KEPServer = $5K)		

ALTERNATIVES CONSIDERED NOT VIABLE *Provide a description of any additional alternatives that were considered but rejected up front as not viable, and explain why*		
	Description Remain on the existing iFIX solution without upgrading and rebuilding.	No vendor support; application will be insecure and will continue to have reliability and instability issues. Infrastructure is nearing end of life and will need to be replaced.

SUPPLEMENTARY INFORMATION

As needed, you may include any useful information gathered during the assessment phase including analysis like cost benefit / risk analysis / sensitivity analysis, etc.

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position at Northwest Natural Gas Company ("NW Natural" or "the Company").

A. My name is Joe S. Karney. I am the Vice President of Engineering and Utility Operations and Chief Engineer for NW Natural. I am responsible for the design, construction, emergency response, operations, maintenance, and operational regulatory compliance of the Company's distribution system.

Q. Please describe your education and employment background.

A. I graduated from the University of Illinois at Urbana-Champaign with a Bachelor of Science in Mechanical Engineering, and I am a registered Professional Engineer. Before being promoted to my current position at NW Natural in April 2023, I was the Senior Director of Operations and Field Services. In that role I was responsible for internal construction, external contractor construction, customer field services, emergency response, pressure regulation, operation, and maintenance of the Company's distribution system. Prior to holding that role, I served as the Engineering Senior Director and Chief Engineer for NW Natural. In that role, I was responsible for design, construction, operation, and maintenance of the gas distribution system and utility storage plants, as well as operations support services, including work management functions, mapping and compliance. Prior to holding that role, I served as the Engineering Director. I have also previously served as the Senior Manager of Code Compliance for the Company, managed the regulatory compliance department, and represented the Company during safety audits performed by the Washington Utilities and Transportation Commission. I also reviewed and ensured Company

compliance with pending regulatory changes from the United States Department of Transportation Pipeline and Hazardous Materials Safety Administration ("PHMSA"). Previously, I managed the Company's Construction and System Operations groups. I started my career at the Company with the Integrity Management group and worked on the development and implementation of the Transmission Integrity Management Program ("TIMP") and the Distribution Integrity Management Program ("DIMP"). Before joining NW Natural, I worked as an Integrity Management Engineer for Colonial Pipeline Company for four years.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to explain the Company's Meter Modernization Program ("MMP"), including the background and drivers for the MMP, NW Natural's evaluation of technology options, MMP deployment plans, and new employees associated with the MMP. I also describe the Company's cost recovery proposal for the MMP.

Q. Please provide a summary of your testimony.

A. NW Natural has an immediate need to replace portions of its aging metering system, and has embarked on a four-year process from 2024 to 2027 to replace metering infrastructure nearing end-of-life, including both Periodic Cause for Change ("PCC") meters, which are meter families that have been tested and are determined to run fast, and failing Encoder Receiver Transmitter ("ERT") devices. The MMP is also designed to ensure meter modernization and diversity and to meet the challenges of mechanical meter procurement by implementing new meters with new capabilities like ultrasonic meters. New ultrasonic meters are now part of the Company's purchasing strategy and

are being used for meter exchanges within the MMP as well as for the normal daily exchanges that occur outside of this program. Additionally, the MMP addresses a need to update current meter reading software. The four primary components of the MMP are as follows:

1. ERT Replacement: Due to ERTs in the Company's service territory reaching the end of their approximately 20-year battery life, a replacement program was needed for approximately 500,000 ERTs on a system basis over the duration of the program (2024 through 2027). NW Natural will continue utilizing current technology (500G ERTs).
2. PCC Meter Replacement: Within the population of the 500,000 ERTs, on a system basis, there is a subset of meters (90,000) that are also eligible for meter replacement as PCCs. These meters, along with the aging ERTs attached to them, will be replaced throughout the duration of the program (2024 through 2027).
3. Field Collection System ("FCS") replacement with Temetra: The current meter reading software in use, FCS, is being retired by the vendor, Itron Inc., meaning that it will not be supported in late 2028. As part of the MMP, the Company will migrate from its existing metering software to its replacement Temetra. The use of Temetra will ensure meter reading functionality in 2028 and beyond and allow cellular backhaul as a communication method for collecting meter reads.

4. Introducing new metering technologies: NW Natural has purchased and installed various different meters throughout its history, and in 2024, the Company added ultrasonic residential meters to its meter complement. The key reasons for adding ultrasonic meters include: meter diversification and preparing for an eventual transition away from mechanical meters; supply chain issues creating long lead times for mechanical meters (52 weeks) in comparison with ultrasonic meters (28 weeks); safety related benefits such as remote shutoff capability; alerts/alarms related to high flow and high temperature; and reduction of ERT purchasing needs due to ultrasonic meters not requiring separate ERTs.

The MMP is a four-year program that began in 2024 and will continue through 2027.

II. BACKGROUND REGARDING NW NATURAL'S METERING SYSTEM

Q. Please describe NW Natural's existing Washington metering system prior to the MMP.

A. NW Natural operates a metering system containing a mix of residential, commercial, and industrial meters. The meters are located on the premises of the customer, and system-wide were a mix of diaphragm, rotary, and turbine meters, which are all mechanical meters.

Q. What types of meters are the focus of the MMP?

A. The MMP focuses on residential meters. Prior to 2024, NW Natural used primarily mechanical diaphragm meters for most residential customers. These meters use a flexible membrane, or diaphragm, to measure the volume of gas passing through the

meter. As gas flows through the meter, it causes the diaphragm to flex, which moves a set of gears that drive the mechanical counter. The index displays the amount of gas that has passed through the meter in cubic meters or cubic feet.

Q. How does NW Natural collect usage data from its mechanical meters?

A. For mechanical meters, the meter data is collected and transmitted through the use of an Encoder Receiver Transmitter device, or ERT. ERT devices are lithium battery powered devices that electronically record and transmit metered gas consumption data from meters via radio frequency protocol. The radio frequency signals from these devices are picked up via data receiving devices placed in NW Natural's trucks, which allows the Company to pick up meter readings as the trucks drive by the premises. NW Natural's meter reading system uses automated meter reading ("AMR") technology.

Q. What is the typical life of the lithium battery within the ERT?

A. The lithium battery within an ERT carries a typical life of approximately 20 years. However, the batteries within the ERTs may begin to perform poorly earlier than 20 years—and by year 17 or 18, the failure rate begins to increase, requiring the Company to plan for replacement several years before the end of the 20-year life.

Q. When NW Natural began planning the MMP, were there a significant number of ERTs that were approaching the age at which a replacement is required?

A. Yes. As shown in Figure 1 below, many ERTs across the Company's service territory were entering their 18th year post-installation and starting in 2024, there was a significant uptick in ERT change-outs required.

Figure 1. End-of-Life ERTs (18-Year Life)

Q. What timing considerations are relevant to replacing end-of-life ERTs?

A. There are three key timing considerations relevant to the replacement of these ERTs: (1) replacing ERTs early enough to avoid malfunction; (2) optimizing ERT replacement on a geographic basis for efficiency; and (3) navigating supply chain issues to avoid procurement delays. Regarding the risk of malfunction, NW Natural needed to be proactive about ERT change-outs and began installations of ERT replacements during the 18th year of an ERT's lifespan, as they begin to start failing in meaningful quantities after 17.5 years. Additionally, to optimize ERT replacement on a geographic basis, NW Natural plans to replace ERTs strategically in geographically organized batches across its service territory rather than responding to individual ERT failures as they occur. As a result, the Company deploys its resources more efficiently. Finally, regarding supply chain issues, the current lead time for the ERTs used by the Company—Itron 500G AMR ERTs—is approximately 1 year, meaning ERT purchase orders must be made approximately 1.5 to 2 years prior to installation.

Q. In addition to replacing end-of-life ERTs, are there other metering issues driving NW Natural's MMP?

A. Yes. Through routine testing, the Company has identified certain meters requiring a "periodic cause for change." These are the PCC meters.

Q. What meters are identified as requiring a "periodic cause for change"?

A. Periodic cause for change meters are meter families that have been tested and are determined to run fast. Because the problem is associated with the family of meters (meters of the same manufacture, model, and vintage), the entire family of meters needs to be replaced.

Q. What does it mean when NW Natural identifies a "fast" meter?

A. A "fast" meter is a meter that inaccurately measures consumption. Instead of capturing the gas volume within the accurate range, the meter is instead producing a number higher than the actual metered volume. NW Natural defines a "fast" meter as one that is reading at 102 percent of the actual metered volume or more.

Q. How does NW Natural define an "accurate" meter?

A. Consistent with NW Natural's tariff Schedule M, "Meter Testing Procedures," for existing meters in service, NW Natural considers an "accurate" meter to be one that captures the metered volume within two percentage points from the true metered volume. NW Natural assesses the true metered volume by using a calibrated meter-proving device. As long as the meter is between 98 percent to 102 percent of the true metered volume, NW Natural considers that meter to be "accurate." However, for all new meters, NW Natural requires the meter be measuring at 99 – 101 percent to be

"accurate," and NW Natural rejects meters outside of that range and returns them to the supplier.

Q. How does NW Natural test the accuracy of its meters and identify PCC meters?

A. NW Natural has a Meter Sampling Program[1] to evaluate the accuracy of its in-service diaphragm meters. Each in-service meter is part of a group of meters, referred to as a "family." NW Natural aims to group meters into "families" based on several criteria, one of which is performance records. Families allow NW Natural to pull a random sampling of similarly performing meters to assess a group of similar meters more efficiently.

NW Natural typically groups meter families based on manufacture date or date placed in service. For example, for all meter sets prior to 2020, a family is created based on manufacturer, meter size, meter type, and installation year. For all meters from 2020 onward, a family is created based on the manufacturer, meter size, meter type and meter manufacture date, to better align with manufacturer warranties. NW Natural can modify these families based on performance of certain meters to ensure similarly performing meters are in the same family. Similarly, some families have sub-families according to additional criteria. Sub-families permit NW Natural to remove underperforming meters without affecting the performance of the larger family.

At least once per year, NW Natural utilizes meter test data for all meters tested within the previous 5 years, and additionally takes a random sample from meters where additional test data is needed to determine each meter family's performance. Any

[1] NW Natural's Meter Sampling Program is described in its tariff Schedule M – Meter Testing Procedures, pursuant to WAC 480-90-348(3).

meter in the family is eligible to be used in the random sample. Meters selected for sampling are removed from service and tested in accordance with the relevant standards, ANSI B109.1 and B109.2 (2000 version).[2] Because the sampling is intended to be an evaluation of working meters, NW Natural excludes data on meters which are damaged, meters which do not register, meters which do not pass gas, and meters that measure either less than 90.0 percent or more than 110.0 percent on the accuracy scale. NW Natural keeps records of and refers to the samples taken from the past five years to make calculations relating to the accuracy of the meter family and whether the meter family should be categorized as "fast" or "not fast."[3]

Q. What are the criteria for meter replacement?

A. For all meters, NW Natural uses the sampling acquired either through the Meter Sampling Program or per the schedule applicable to that meter type and calculates whether a proportion of 80 percent of the family results in "accurate" readings and at least 90 percent of the family is not "fast." To make this determination, NW Natural uses methods defined in ANSI/ASQ Z1.4 "Sampling Procedures and Tables for Inspection by Attributes."[4] First, the sampling measurements are compared to threshold proportions and control limits on a control chart. Second, NW Natural determines whether the meter family's performance meets a satisfactory level based on the control standards. Third, NW Natural determines the accuracy of the family, then

[2] See confidential Exh. JSK-2C, Engineering Procedure Z-1 for an explanation of these standards.

[3] See also confidential Exh. JSK-2C, Engineering Procedure Z-1, which explains how the Company addresses meters that are "slow" (i.e., under-recording actual customer deliveries) and is addressed in further detail below.

[4] Confidential Exh. JSK-2C, Engineering Procedure Z-1.

the proportion of meters that are "not fast." If the results of these calculations exceed the control, and the sample size is determined insufficient, an additional random sample is obtained for families that are more than 10 years old. Based on where the samples fall within the control standards, NW Natural determines whether the sample readings are satisfactory, at or below limits, or insufficient.

Meters in families that are acceptable—or satisfactory—will remain in service and be tested again during the next period for sampling. If a meter family passes the "not fast" test but fails on "accuracy," it is determined to be slow and under-recording usage. NW Natural has the option to remove these meters based on economic and operating factors. NW Natural may also leave the meters in service and continue to test the meters during the next period for sampling. Meters that fail the sampling, are not accurate, and are fast are determined "non-conforming" and are scheduled for change out by NW Natural.

Q. Please provide the amount of meters that are non-conforming.

A. NW Natural identified a total of 144,229 meters that were determined non-conforming from 2021 to 2025, with approximately 15,134 meters located in Washington. Out of these 144,229 meters, 73,499 meters remained in service as of February 2025, with approximately 10,465 of those meters located in Washington.

Q. What is the timeline for replacement of meters identified for change-out?

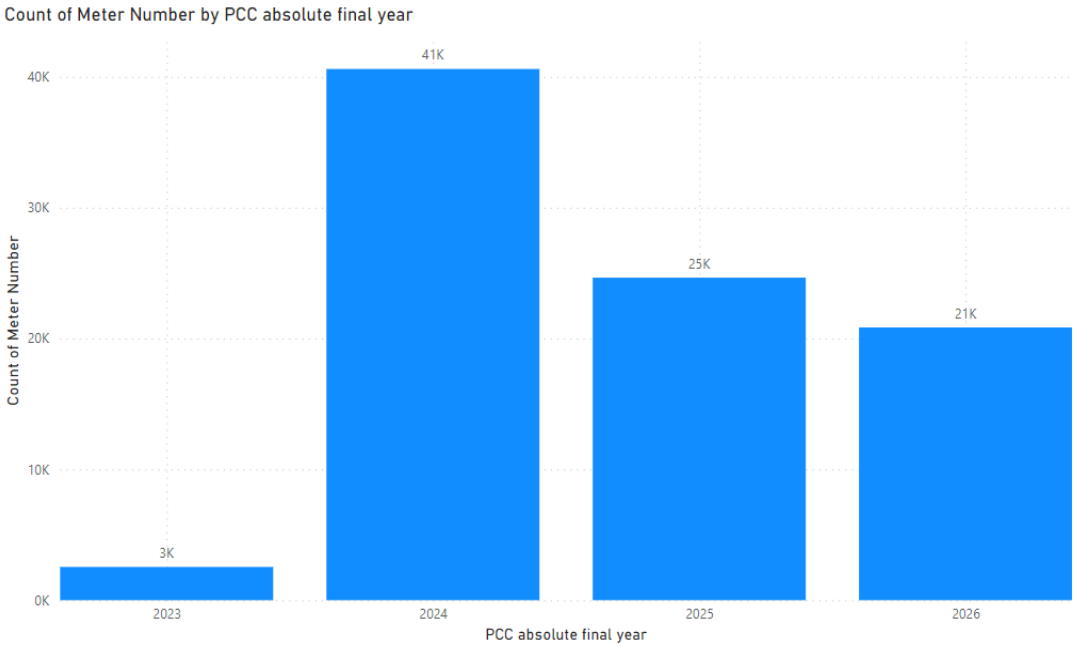
A. Meters that are identified as needing to be replaced will be changed out by December 31st of the year following the year in which the need for replacement was determined. However, in the case where in any given year the number of meters identified for change-out exceeds 3 percent of the total population of meters in the Meter Sampling

Program, NW Natural may extend the timeline so that the meter family is changed within four years of determining the need for replacement.

Q. How many PCC meters did the Company identify across its service territory at the beginning of the program?

A. When the project began, there were almost 90,000 identified PCC eligible meters across NW Natural's service territory on a system basis, 10,000 of which are in Washington, that required replacement between 2024 and 2026. While the MMP continues until 2027, PCC exchanges end in 2026.

Figure 2. PCC Meters

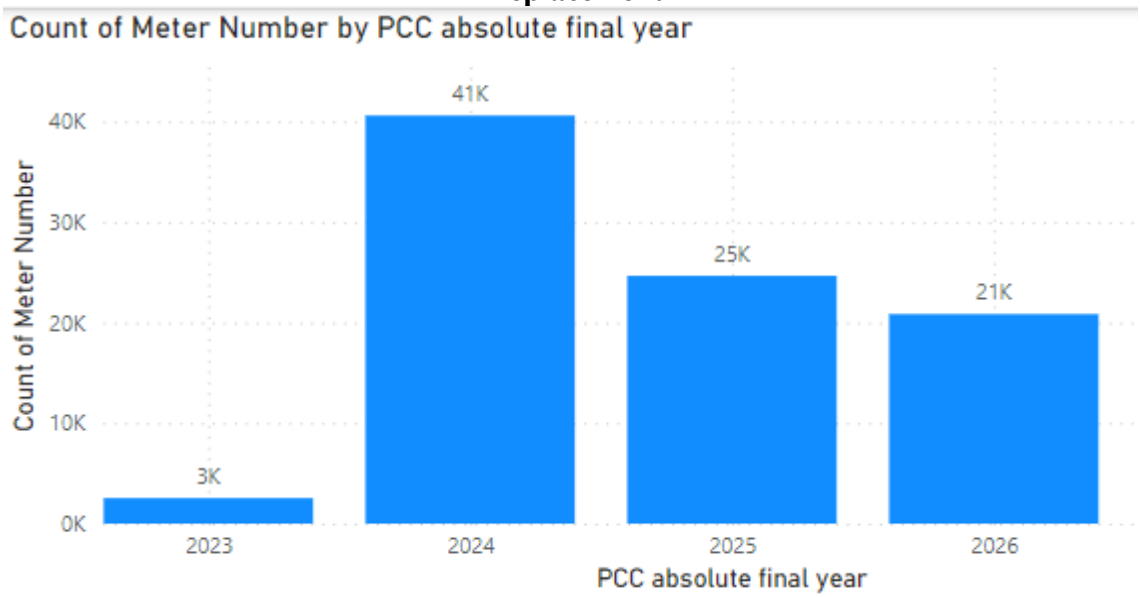


The graphic in Figure 2 above depicts PCC figures by the year in which the PCC meters must be replaced (within four years of the date identified) and shows a significant uptick in PCC meters requiring replacement during the term of the MMP. Figure 2 includes dying meters identified in 2023 and therefore need replacement in the MMP.

Q. Is there any overlap among the PCC meters and the meters requiring ERT replacements?

A. Yes. The PCC meters shown above in Figure 2 also fall into the ERT replacement timeline during the 2023 – 2026 years, as shown below in Figure 3. Thus, regardless of PCC status, over 99 percent of these meters would require ERT replacement, independent of being identified as a PCC meter.

Figure 3. Timing for Replacement of PCC Meters Also Requiring ERT Replacement



Q. Beyond the need to replace the end-of-life ERTs and PCC meters, are there other issues that are informing NW Natural's meter modernization strategy?

A. A key issue that informed the meter modernization strategy was the lack of available supply from vendors for both mechanical meters as well as ERTs. The mechanical meter lead times at the beginning of the program's planning stretched to approximately 85 weeks, while ERT lead times were approximately 52-60 weeks. Current lead time on ERTS are still 84 weeks and mechanical meters currently are averaging 52 weeks.

Due to supply chain issues, the Company has established a minimum safety stock metric of 9,800 meters as a standard. At this inventory level, Sherwood (the Company's central warehouse headquarters) did not hold any meters, as any available meters were held at satellite warehouses across the Company's service territory.

Q. Under normal circumstances—meaning without the supply chain issues that have been experienced recently—how quickly does NW Natural replace PCC meters?

A. Prior to 2018, NW Natural would typically determine that approximately 5,000 PCC meters were eligible for replacement per year, and the PCC meters would be replaced in the year after they were identified through the meter sampling process. However, more recently, volumes have been in the 15,000 to 40,000 yearly range for meters that have been identified as part of the PCC sample testing process. The maximum number of meters changed out internally during a one-year period was 26,000 meters during the COVID-19 pandemic, which was possible because a number of other work orders had ceased due to COVID-19 restrictions. But this recent uptick in volume coupled with supply chain issues has caused NW Natural to target a four-year window to change out these meters as part of the MMP, as described above.

Q. Why is it important for NW Natural to have fully functional metering equipment?

A. Having fully functional metering equipment is a best utility practice and key to ensuring accurate billing. NW Natural's metering equipment is an essential component of the Company's system, and thus must work properly. The Washington Administrative Code ("WAC") requires the Company to provide meters with a tolerance of no more

than two percent fast or slow,[5] and specify meter test procedures and corrective actions in its tariff.[6] Consistent with the WAC, NW Natural must ensure that all customer meters accurately meter gas usage, and meters that do not conform to the testing program be replaced with accurate meters.

Q. Are there other aspects of NW Natural's metering system that require updating?

A. Yes. The Company's current meter reading technology (FCS) is set to be removed from service by the vendor, Itron in 2028. In order to ensure the Company can retain a functional meter reading system, the Company will implement a new software solution (Temetra) in 2026.

III. ULTRASONIC METERS

Q. What is an ultrasonic meter?

A. Ultrasonic meters use a metering technology that has been available on the U.S. market since the 1980s and was initially used primarily in industrial applications but has not been widely adopted for residential application until recently. Many utilities in the U.S. are moving toward the use of ultrasonic meters as they need to replace meters on their system. In particular, Southwest Gas, CenterPoint, Spire, NiSource, Northwestern Energy, and Dominion are using ultrasonic metering technology.

Q. How do ultrasonic meters measure the flow of gas?

A. Ultrasonic meters use sound waves to measure gas flow. Specifically, ultrasonic sound waves are transmitted through the gas flowing through the meter and then the

[5] WAC 480-90-338.

[6] WAC 480-90-343.

measurement is produced by recording the time it takes for the sound waves to travel between two transducers placed in the pipe. The difference in the time it takes for the sound waves to travel upstream and downstream gives an accurate measurement of the gas flow rate.

Q. How is the ultrasonic meter different from the mechanical meter?

A. While a diaphragm gas meter uses mechanical components to measure the flow of gas, an ultrasonic gas meter uses non-invasive sound waves to make its measurements. As a result, ultrasonic gas meters are generally more accurate and have fewer moving parts, which means they require less maintenance. Additionally, ultrasonic gas meters are suitable for a wider range of applications, including corrosive or dirty gas environments, where mechanical meters may be less reliable. Ultrasonic meters also have a number of operational and safety benefits in comparison with mechanical meters. The Itron Intelis meters have been tested with renewable natural gas and hydrogen blends, preparing NW Natural for a higher capacity of blended gas flowing through to customers.

Q. Do ultrasonic meters require the use of an external 500G ERT?

A. No. The recording and transmitting equipment is included as an integral component of the ultrasonic meters, and thus these meters do not require the use of an external ERT (as the ERT is embedded within the meter) to enable the collection and transmission of usage data.

Q. How do ultrasonic meters transmit data?

A. Ultrasonic meters are designed to use either radio frequency or cellular technology to transmit meter data. At this time, the cellular ultrasonic meters are not yet in production, though they are expected to begin to be produced in 2026.

Q. Are the ultrasonic meters compatible with NW Natural's data collection system?

A. Yes, the Itron Intelis ultrasonic meter in AMR mode can integrate with the current meter reading system (FCS). The Company expects that ultrasonic meters will integrate seamlessly with Temetra, the Company's new system for collecting customer usage data in 2026.

Q. What are the safety-related benefits associated with ultrasonic meters?

A. Ultrasonic meters include the following features that are not available through mechanical meters:

- Automatic high temperature and high flow shut off;
- Additional tamper alarms (examples: air in pipe, valve status, communication error); and
- 70 percent smaller in size, which means a reduction in field worker injuries due to a lighter meter size.

Q. Please describe the operational benefits of ultrasonic meters.

A. Ultrasonic meters provide measures to a higher degree of precision and are less likely to drift and require re-calibration. Due to these meters' electronic design, they have self-diagnostic capabilities. The ultrasonic meters are also approximately 70 percent smaller than the mechanical meters, which allows more flexibility in storage and shipping of meters as well as an ability to optimize the Company's multi-family installs

with smaller meter sets. The meters have a high heat and high flow threshold that when triggered will automatically close the meter's outlet valve preventing the passage of gas into the customer's home.

Additionally, it is easier to forecast end-of-life for ultrasonic meters because there is only one device (the ultrasonic meter) rather than two devices (mechanical meter and ERT), and when those meters reach end-of-life, ultrasonic meters are less complex than mechanical meters and thus allow for easier and faster meter change outs.

Q. What is the typical life span for an ultrasonic meter?

A. The typical life span of an Itron Intelis meter is 20 years.

Q. What is the cost difference between a mechanical meter and an ultrasonic meter?

A. In March 2023, at the time NW Natural was performing its analysis in support of the MMP, a mechanical meter with an ERT was approximately $164 per unit, and an ultrasonic meter with radio frequency (AMR) capabilities was $200 per unit. Current costs are $179 per unit for a mechanical meter with ERT and $200 per unit for an ultrasonic meter with ERT included.

IV. OVERVIEW OF MMP

Q. What is NW Natural's Meter Modernization Program, or MMP?

A. NW Natural has initiated a four-year process to replace end-of-life ERTs and meters that are both PCC eligible and have ERTs that are end-of-life. The MMP will help modernize and maintain the Company's current metering system, including maintenance of existing assets, enabling the integration of a more diverse meter complement, and facilitating an expanded array of backhaul options into its billing

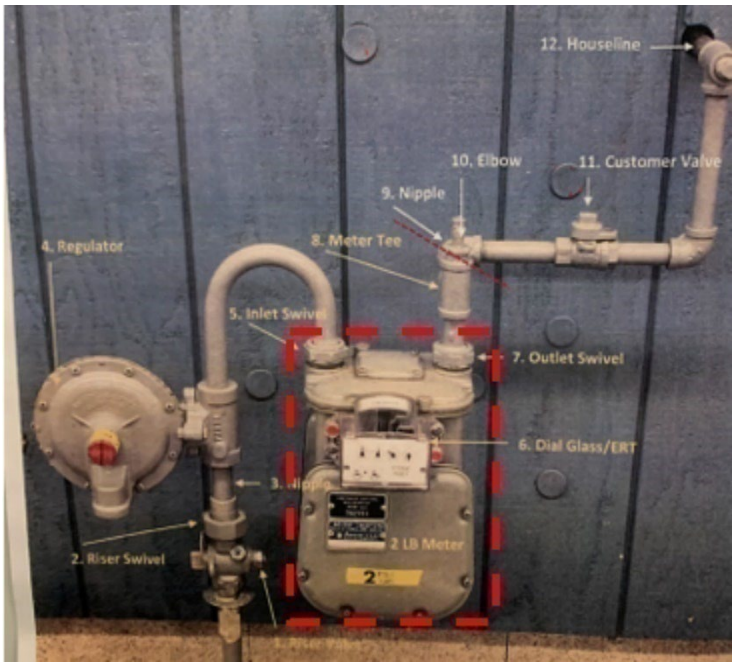
system. This new complement will help alleviate supply chain challenges and leave us in a less homogenized metering position.

Q. What components of a meter will be replaced under the PCC program versus the ERT replacement program?

A. Figure 4, below, shows the components of a mechanical meter. The MMP includes both the meter and ERT device as outlined in the red dashed box in Figure 4.

- **Meter Replacement.** When a meter is changed out, the entire meter and ERT are removed and replaced with a new meter and ERT combination or an ultrasonic meter (containing communication device built in).
- **ERT Replacement.** An ERT change out does not impact the meter itself; instead, the plastic ERT covering is removed and the ERT device gets removed for recycling.

Figure 4. Photograph of Mechanical Meter



Q. How long has NW Natural been planning ERT replacements?

A. The Company initiated planning for the replacement of ERTs in 2019.

Q. Did NW Natural's plans for the MMP change over time?

A. Yes. Prior to the MMP, NW Natural initially developed a plan for the replacement of ERTs that would include the installation of an advanced metering infrastructure ("AMI") Mesh Network and would be deployed over the timeframe 2020-2049. At the outset of the COVID-19 pandemic, NW Natural put its planning for the ERT replacements on hold, and then in 2022 reinitiated planning. This pause provided NW Natural an opportunity to reassess the project, which led to two significant changes in project scope, ultimately resulting in lower costs to customers. Specifically, NW Natural reevaluated the prior decision to use AMI technology, and NW Natural combined the ERT replacement project with the PCC replacement project to capture operational efficiencies compared to replacing ERTs and PCCs as two stand-alone projects. Please see confidential Exh. JSK-3C, NW Natural Meter Modernization Implementation (Nov. 3, 2022) for additional context regarding the Company's reevaluation of the use of AMI technology leading to the changes in project scope.

Q. Please describe NW Natural's reevaluation of AMR and AMI technologies.

A. NW Natural studied scenarios including AMR and ultrasonic, AMI (network), and AMI (cellular). NW Natural has used AMR technology for nearly 20 years. AMR eliminated the need for manual meter reading (physical visits to the meter to record gas usage) by transmitting usage through a radio frequency signal. Trucks are rolled across NW Natural's service territory with data collector devices that pick up the radio frequency signal being transmitted from the AMR ERTs. In an AMI system, these

truck rolls would not be needed for meter reading as the usage can be backhauled via cellular transmission, through a mesh network, or through cellular enabled access points. Ultimately, as described below, an AMR system is a lower cost than other solutions and provides NW Natural with the necessary data required for billing.

Q. Why did NW Natural decide to combine the PCC meter replacement program with the ERT replacement program to create the MMP?

A. As noted above, the combination of these two programs created operational efficiencies, resulting in lower costs to customers. The PCC meter replacement program is a daily operational activity requiring the change out of meters across the Company's service territory. The ERT replacement program is also a daily operational activity centered around replacing end-of-life ERTs with replacement ERTs. Each of these two projects requires a visit to the premises with an asset replacement of either the meter, the ERT, or both. During NW Natural's strategic planning for each of these projects, it calculated an approximate $10 million, on a system basis, cost reduction by combining these two projects into the MMP, reducing the need to touch a meter premise twice for one customer. Please see confidential Exh. JSK-4C, NW Natural Meter Modernization Proposed Strategy (Jan. 14, 2023) and confidential Exh. JSK-5C, NW Natural Meter Modernization Program (June 2023) for additional information regarding the Company's decision to proceed with the MMP.

Q. What were the estimated costs of the MMP associated with the different ERT technologies?

A. For the AMR and ultrasonic technologies, the estimated costs ranged from $90-120 million. For the AMI (network) technology, the estimated costs ranged from $150-180

million. And for the AMI (cellular) technology, the estimated costs ranged from $160-190 million. See confidential Exh. JSK-5C.

Q. Why did NW Natural initiate the MMP in 2024?

A. NW Natural had an immediate need to replace ERTs nearing the end of their useful lives, and to replace PCC meters. Critically, this is a multi-year project, and due to the age of the ERTs and the number of ERTs that reached end-of-life in 2024, the work on this project was mandatory.

Q. Were there additional refinements to the MMP after it was initiated?

A. Yes. In 2024, the Company was informed that the ultrasonic cellular meter that had been previously forecasted for installation within the project's timeline had been delayed. The delay resulted in this meter type not being included within the program's deployment schedule. This resulted in the project adapting its buying forecast to supplement the number of forecasted ultrasonic cellular meters to be purchased with ultrasonic AMR meters, which saved $30 per meter from the forecasted population.

Q. You had previously mentioned that the four key elements of the MMP include the replacement of PCC meters, gradual transition to ultrasonic meters, replacement of end-of-life ERTs, and installation of the new software system. Please elaborate on the Company's decision-making regarding the selection of these resources.

A. In the testimony that follows, I will describe the selection of the ERTs, meters (including exhausting existing inventory and integration of ultrasonic meters), and software, in turn.

A. Selection of ERTs Used in MMP

Q. What ERT technologies are currently available?

A. In general, there are three types of ERT communication available for purchase at present, as shown in Table 1, below.

Table 1. Available ERT Technologies

	AMR – Radio Frequency	AMI –Mesh Network	AMI – Cellular
500G	Current technology. Read through radio frequency drive by reads.	Read through a network of end points. NW Natural considered with solar powered access points	Read through cellular backhaul via sim card within the ERT

Q. Why did the Company select the 500G AMR ERT technology?

A. NW Natural has been using the 500G AMR ERTs since 2019, which are capable of storing 40 days of hourly data and more interval data. The Company selected this technology as the least cost option and because it allows for maintaining billing functionality. In order to ensure that the Company received a fair and reasonable quote for ERTs, it issued a request for information for ERTs to five ERT vendors.[7] A decision was made to choose Itron for ERT purchases due to the reasonable price and ease of software integration.

[7] See confidential Exh. JSK-3C, NW Natural Meter Modernization Implementation (Nov. 3, 2022).

B. Selection of Meters Used in MMP

Q. What meter technology options are currently available or expected to become available in the near term?

A. As shown in Table 2 below, the two primary technology options are mechanical and ultrasonic, with variations in AMI and AMR meter reading capabilities. As discussed above, the current technology used by NW Natural is both mechanical and ultrasonic AMR meters that allows for radio frequency drive-by reads.

Table 2. Meter Technologies

	AMR – Radio Frequency	AMI – Radio Frequency	AMI – Mesh Network	AMI – Cellular
Mechanical	Mechanical (AMR – Radio Frequency)	Mechanical (AMI – Radio Frequency)	Mechanical (AMI – Mesh network) – with 500G mesh network ERTs and solar power access points	Mechanical (AMI – cellular) – with 500G cellular ERTs
Ultrasonic	Ultrasonic (AMR – Radio Frequency)	Ultrasonic (AMI – Radio Frequency)		Ultrasonic (AMI – Cellular) – embedded communication device with cellular backhaul capability-forecasted for production in 2026

Q. What technology did NW Natural select for the MMP?

A. NW Natural plans to replace the PCC meters with 30,000 mechanical and 60,000 ultrasonic meters. All ultrasonic meters will be AMR, as ultrasonic meters that use cellular technology delivery times do not align with the deployment timeline of the MMP.

Q. How did NW Natural decide to use a combination of mechanical meters and ultrasonic meters in the MMP?

A. NW Natural had approximately 30,000 mechanical meters at its warehouse inventory prior to the program's deployment in 2024. In 2024, NW Natural had committed to purchase an additional 20,000 mechanical meters from two separate vendors. In addition to the safety and operational benefits previously described in my testimony, the industry appears to be adding capacity for the manufacturing of ultrasonic meters, while moving away from mechanical meters. In fact, the Company's current ERT supplier, Itron, used to make mechanical meters but has since stopped production to focus on ultrasonic meters. The Company must ensure it is moving where the industry is moving so the Company's hardware does not become obsolete with regard to replacement.

Q. In light of the changes in the industry toward the adoption of ultrasonic meters, did NW Natural evaluate a fully ultrasonic ERT replacement program?

A. Yes, early in the ERT study process, in 2019, the Company modeled a budget for a scenario with ultrasonic meters—and even considered replacing its entire meter population in the short-term (800,000 meters) with ultrasonic meters. The Company ultimately determined that the approach of replacing the entire meter population with ultrasonic meters over a short period of time would be far too burdensome on the Company's customers. The Company also believes that there will be benefits in moving towards ultrasonic meters gradually over a longer time horizon and will ensure it is providing the best possible service at an appropriate cost. Importantly, the plan to use a combination of ultrasonic meters and mechanical meters will allow the Company

to make use of its existing inventory and committed contracts while taking steps towards diversifying its metering system.

Q. Why is NW Natural including ultrasonic meters in the MMP instead of simply replacing the PCC meters entirely with mechanical meters?

A. The key reasons for including ultrasonic meters include additional meter diversity, supply chain issue curtailment, safety related benefits, and operational improvements.

Q. Please elaborate on the meter diversity rationale.

A. Including ultrasonic meters supports meter diversity amongst NW Natural's meter population. This is particularly important because the large volumes of PCCs the Company has been seeing since 2018 have a direct correlation with purchasing and installing large populations of the same meter families at the same time. By diversifying its meter complement, the Company avoids all of its meters having issues at the same time.

C. Selection of Software to be Implemented in MMP

Q. Please describe the software updates that are included as part of the MMP.

A. As detailed above, the current meter reading technology will reach its end of life in 2028. Accordingly, the Company is updating to Temetra, which is supported by the vendor Itron and will continue to be supported for the foreseeable future. The Company's plan is to fully adopt Temetra by the end of 2026.

Q. What are the primary features provided by Temetra?

A. Temetra supports meter reading for drive-by and cellular enabled devices, and with certain meter types (ultrasonic meters), provides capability for over-the-air upgrades.

An additional benefit of the Temetra system is that the user experience for internal field force will not be significantly impacted.

Q. Please discuss whether the Company considered alternatives to updating to Temetra.

A. There were no viable alternatives to Temetra. Itron only has one service that primarily serves utilities that read meters via AMR. That current software is FCS, and its replacement system is Temetra. Other vendors that offer metering head end systems would require a hardware replacement at every meter in the Company's system in order to be compatible.

Q. After deploying Temetra, are there additional software modifications needed to accommodate ultrasonic meters?

A. The ultrasonic AMR meters that are installed will need to be compatible with the Company's current AMR-meter reading technology until the system is replaced. The vendor for the current system, Itron, stated they will be discontinuing the system used by the Company for meter reading, which will be replaced by Temetra. Itron has indicated that when ultrasonic cellular meters become available, and if NW Natural wanted to purchase them, add-on software will be required.

D. FTEs Required for the MMP

Q. Are additional employee resources required to implement the MMP?

A. Yes. NW Natural needs significant resources to complete the MMP. Two of the hired resources were incremental NW Natural full-time employees. NW Natural is also using short-term contractors, which were not proposed for inclusion in base rates because the

Company does not intend to retain them beyond the duration of the MMP. I will address the permanent full-time employees here.

Q. Please describe the additional full-time resources that were required for the MMP.

A. The two positions were:

1. Itron Applications Suite Application Engineer 2: Because the MMP scope includes implementing new hardware and software from Itron, it was necessary to add a fully dedicated employee to manage the Itron suite of applications that will continue to grow in complexity as the MMP onboards new metering types. This role maintains all metering-related technology and is responsible for technical configuration and application administration of Itron-related apps (Temetra, Temetra Mobile, Field Tools, ISM, FDM).
2. Metering Business Lead: This role is responsible for the MMP and all related/dependent projects or workstreams, supporting long-term MMP strategy, managing scope, budget, and program outcomes, and ensuring integration with other critical transformation programs such as H2: Vista (which is discussed in the confidential Direct Testimony of Brian E. Fellon, Exh. BEF-1CT).

Q. What is the status of these roles?

A. The Itron Applications Suite Application Engineer 2 was filled in Q4 of 2023 and the Metering Business Lead was filled in Q3 of 2023.

V. MMP DEPLOYMENT

Q. What steps have been taken to procure and install the ERT hardware?

A. As discussed above, the Company is using 500G ERTs to replace ERTs with end-of-life batteries. The Company executed a $28.8 million agreement with Itron on December 31, 2022, to facilitate hardware purchases over the 5-year period, 2023-2027. Entering into the agreement with Itron was intended to support supply and reduce constraints. The Company expects to deploy approximately 400,000 500G AMR ERTs that will be supplied by Itron, system wide. 40,000 of those ERTS are within NW Natural Washington service territory. As of June 30, 2025, 35,975 ERTs have been installed in the Company's Washington service territory. And, 1,154 ERTs will be changed out towards the end of the project due to their location in the Columbia Gorge.

Q. What steps have been taken to procure and install the meter hardware?

A. The Company is depleting its existing current stock of mechanical and ultrasonic meters and will also purchase new meters (a combination of both mechanical and ultrasonic) to replace PCC-eligible meters. NW Natural has an outstanding purchase order for 10,000 ultrasonic AMR meters in addition to Sensus and Honeywell mechanical meter purchase orders totaling approximately 1,000 meters. The Company expects to deploy:

- On a system basis, approximately 30,000 mechanical meters with ERTs attached.
- Approximately 60,000 ultrasonic meters in AMR (to be supplied by Itron) on a system basis.

As of June 30, 2025, 1,704 meters have been installed in the Company's Washington service territory for PCC replacements within the MMP. An additional 7,657 additional meters are planned for PCC change out in Washington by the end of the project.

Q. How has NW Natural implemented the MMP in Washington?

A. ERT deployment forecasts for ERT changes are determined based on geography and based on their age. The primary focus is to exchange the ERTs before their batteries stop communicating. All ERTs in Clark County were forecasted for installation January through June of 2025. The area of the Columbia Gorge that is within Washington is slated for 2027.

VI. COST RECOVERY PROPOSAL

Q. How is the Company seeking to recover the costs of the MMP?

A. The MMP is a sizeable project for NW Natural. The total capital cost of the project, on a system basis, is approximately $83.9 million. As discussed previously, this is a four-year project and the Company expects to recover the capital investments in rate cases. On a Washington-allocated basis, in this rate case, NW Natural is proposing to recover the following capital investments in Table 3 below:

Table 3. MMP Capital Additions

	Rate Year 1[8]	Rate Year 2[9]	Rate Year 3
Capital Investment	$10,279,937	$3,453,949	$0

[8] All of the capital additions for the MMP in Rate Year 1 are in-service prior to the start of Rate Year 1.

[9] Due to end of period treatment applied in July 2026 for Rate Year 1, the capital additions recognized in Rate Year 1 are proposed to be recovered in Rate Year 2.

Q. Is the MMP similar to a traditional capital project from a cost recovery perspective?

A. No. There are two main differences between the MMP and traditional capital projects. The first difference is that the MMP has significant structural lag associated with the timing of the daily installations. For most of NW Natural's major capital projects, the work is performed during the summer construction season, and the projects are placed in service in the fall, prior to the winter heating season. The MMP, on the other hand, involves daily installation of meters and ERTs over a four-year period. After installation, the meters and ERTs are used and useful, but the Company will experience significantly more lag on recovery due to the daily deployment of the MMP. The second difference is that the MMP has a significant amount of non-routine, one-time O&M expense associated with the deployment of the MMP. In other words, there are several key aspects of the project that cannot be capitalized and result in a significant O&M expense increases over a short period. These costs are not appropriate to be included in base rates, however, because the costs will immediately drop off at the conclusion of the program and, consequently, would result in the Company unnecessarily over-recovering its costs at that time. For these reasons, NW Natural is deferring these one-time costs for later recovery.

Q. Has the Company made any other regulatory filings concerning cost recovery for the MMP in Washington?

A. Yes, as detailed above, the MMP will involve a significant amount of limited duration O&M expense incurred over the four-year term of the program. Because the O&M expense will only be incurred during the term of the MMP and will include an initial

ramp up at the beginning of the program and a ramp down at the end of the program, the Company does not propose building this O&M expense into base rates. Instead, the Company filed an accounting petition for the one-time O&M expense incurred for the limited duration of this program, which NW Natural estimates will be approximately $14.2 million, or $2 million on a Washington-allocated basis. The deferral was approved on February 22, 2024 in UG-240012 Order 01. Please refer to Mr. Walker's Direct Testimony (Exh. KTW-1T) for details on cost recovery of the deferral.

Q. What is included as O&M expense in the deferral?

A. The preliminary estimate for Washington-allocated costs that cannot be capitalized and are included within the O&M deferral include the following categories:

- Meter and ERT replacement: $0.8 million, which covers Southern Cross' installation labor costs for approximately 30 field-techs and supporting positions working across NW Natural's service territory to replace PCC meters and end-of-life ERTs.
- ERT and PCC Hardware Recycling: $0.4 million, which covers shipping and recycling approximately 400,000 lithium-ion batteries (40,000 on a Washington basis) in ERTs and shipping, testing, and recycling of approximately 90,000 (10,000 on a Washington basis) PCC meters and ERTs. Due to the materials in meters and ERTs, the Company must "dispose" of these items in accordance with stated regulations.
- Incremental Non-field Labor: $0.7 million, which includes incremental resource costs (non-field) to support the MMP. These positions will provide customer call

support with increased customer touch points, scheduling support, billing support, internal change communication, external communications, quality assurance inspection of installations, meter shop support, and support in deploying field techs for change-outs. Each of these roles contributes to an increased operational workload for the program due to the elevated number of ERT and meter change-outs required during the coming four-year period. Internal resources will transition to support the program, and their role will be backfilled to ensure business as usual operations. Additional contractor support from Ernst and Young supplements these efforts.

- Other external expenses: $0.1 million, which includes bill inserts and door hangers related to communicating and educating the customer base about the MMP. Due to the increased presence of field workers during the four-year deployment, NW Natural will need to inform customers of the reasoning for trucks and field technicians being in their neighborhoods.

Q. How has NW Natural tracked O&M expenses throughout the program?

A. The Company tracks both actual expenditures and the remaining forecasted costs for the entirety of the MMP. The actual expenses and remaining forecast are compared against the originally approved budget to ensure alignment. While the Company's forecast reflects current estimates of what it expects to spend through the remainder of the MMP, the original budget remains unchanged. This approach allows the Company to monitor spending in real time while staying aligned with the original approved budget. The budget was approved by NW Natural executives during the planning phases of the MMP.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

VIII. List of Exhibits 25

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position at Northwest Natural Gas Company ("NW Natural" or "the Company").

A. My name is Melinda B. Rogers. My title is Vice President, Chief Human Resources and Diversity Officer. I am responsible for overseeing various administrative functions at NW Natural, including Human Resources, Diversity, Equity and Inclusion, Safety, Labor Relations, and Payroll.

Q. Please describe your education and employment background.

A. I received a Bachelor of Business Administration from Bryant University in 1987. Prior to NW Natural, I was employed by the Atkinson Graduate School at Willamette for three years as Director of Executive Education. Before joining Willamette, I served as Vice President of Enterprise Learning and the Vice President of Human Resources for four years at Knowledge Universe in Portland. I was employed in other senior human resource roles and management positions at Qualcomm and Hewlett Packard for 14 years prior to joining Knowledge Universe. I joined NW Natural in September of 2015 and have been an officer for the Company since August of 2018.

Q. Please summarize your testimony.

A. In my testimony, I:

- Describe the Company's compensation practices, which result in total compensation that is at the market median for comparable companies;
- Describe the employee benefits program offered by NW Natural, demonstrate that it is aligned with the market, and that the Company has carefully managed benefits to ensure reasonable costs;

- Describe the overall level of compensation and benefits costs included in the Company's multi-year rate plan requested revenue requirements; and
- Describe the Company's requested employee headcount for Full-Time Equivalent ("FTE") positions during the multi-year rate plan.

II. NW NATURAL'S COMPENSATION PHILOSOPHY

Q. What is NW Natural's approach to determining the compensation it provides to its employees?

A. NW Natural's approach is to provide a level of total compensation that is necessary to attract, motivate, and retain qualified employees needed to run a safe and reliable natural gas delivery business, with high-quality customer service and at a cost that is reasonable. To do this, we provide a competitive total compensation package for employees that allows us to hire and retain a qualified workforce.

Q. Please explain what you mean by "competitive total compensation."

A. Total compensation is the combination of base pay, merit-based incentive pay, medical benefits, and retirement benefits. Total compensation is competitive when its total value is at the median level for total compensation offered in the marketplace for comparable jobs. It is through offering a competitive total compensation package that NW Natural is able to compete in the job market to attract, hire and retain the employees it requires to run a safe, reliable, customer service-focused gas utility.

Q. How does NW Natural determine that its total compensation is at the median level?

A. As I will explain in my testimony, the Company performs research to ensure that each aspect of its compensation is at the median level and is therefore competitive with the compensation offered by its competitors for comparable jobs.

Q. Are there established practices that allow you to be confident that you are offering a competitive total compensation, and not more?

A. Yes. There are well-established methodologies that we employ in order to ensure that we offer competitive compensation, based on comparable jobs. I will describe those in more detail in my testimony.

III. BASE PAY

Q. You mentioned that "base pay" is a major component of offering competitive total compensation. How are you defining base pay?

A. Base pay is the guaranteed financial compensation provided to employees for the work performed. It is delivered on either an hourly or salaried basis. Base pay excludes the other important components of compensation (*e.g.*, merit-based incentive pay) that are not guaranteed but are nevertheless a critical component of offering competitive compensation to attract qualified employees.

Q. How does the Company determine Non-Bargaining Unit ("NBU") employees' base pay?

A. NW Natural purchases and regularly analyzes comprehensive survey data to ensure that its base pay is aligned with the median of the market for comparable jobs with other companies that would typically compete with NW Natural for employee talent.

See confidential Exh. MBR-2. A summary of NW Natural's most recent analysis, as completed by the Company in 2024, is attached as Exh. MBR-3. The analysis demonstrates that NW Natural's current base pay midpoints for NBU jobs are at the median of comparable companies. This well-established process confirms that NW Natural is offering an appropriate level of base pay to its employees as a component of competitive total compensation.

Q. How does the Company determine Bargaining Unit ("BU") employees' base pay?

A. BU employees' total compensation—including base pay—is determined through a negotiated process. The Company utilizes selected market survey data sources and union contracts, primarily of Northwest gas utility companies, as the points of comparison for proposing BU wage steps. The sources the Company uses for this data are agreed upon between the Company and the labor union (OPEIU) and include peer utility contracts and national databases that include gas jobs as well as local compensation studies. Pay increase trend data and union contracts are consulted when negotiating annual wage increases throughout the term of the Collective Bargaining Agreement ("CBA" or "Agreement"). See Exh. MBR-4. As with any labor negotiations, trade-offs are negotiated for other terms and conditions in the CBA.

Q. Please explain the terms of the current CBA.

A. The current CBA for BU employees was executed on May 20, 2024. The CBA covers the period June 1, 2024 through May 31, 2028. BU employees received a 6 percent wage increase on June 1, 2024. There was an additional 4 percent increase on December 1, 2024, and every December 1 thereafter through December 1, 2027. BU

employee health care costs reflect an 85 percent/15 percent sharing between the employer and employee, respectively, whereas previously the sharing was 80 percent/20 percent, respectively. Lastly, six job titles were re-graded, increasing the wages for those approximately 100 employees whose positions moved to a new pay group.

Q. How does NW Natural determine competitive compensation for Company officers?

A. As with other employees, NW Natural uses competitive compensation data to determine compensation for Company officers. In the case of officers, competitive compensation data include base pay and merit-based incentive pay comprised of both short- and long-term incentives. The data are collected and analyzed by an independent compensation consultant, Pay Governance, using peer company and survey data. Pay Governance's analysis, which is attached as Exh. MBR-5 demonstrates that the Company's compensation for officers is within the market competitive range of peer and survey data.

Q. What is the cost of utility employees' base pay for the Test Year (April 1, 2024 to March 31, 2025) and subsequent Rate Years (RY1, RY2, RY3) on a Washington-allocated basis?

A. Table 1 below provides the cost of base pay for the Test Year and the subsequent Rate Years. These amounts include only the cost for gas utility employees of NW Natural and represent the Washington-allocated base pay for FTEs.

Table 1[1]

Utility Employee Total Base Pay (Wages & Salaries) – Washington-Allocated ($000)

	Wages and Salaries Costs			
Employee Type	**Officers**	**NBU**	**BU**	**Total**
Test Year (restated)	$691	$9,352	$7,032	$17,075
Pro-Forma: 8/1/25-7/31/26	$735	$10,040	$7,593	$18,368
Rate Year 1: 8/1/26-7/31/27	$771	[redacted]	$8,046	[redacted]
Rate Year 2: 8/1/27-7/31/28	$808	[redacted]	$8,523	[redacted]
Rate Year 3: 8/1/28-7/31/29	$846	[redacted]	[redacted]	[redacted]

Q. Does the Company propose to adjust the actual Test Year base pay levels?

A. Yes. As described below, the Company has adjusted actual Test Year base pay amounts to reflect annualizations of past pay increases, as well as known and measurable increases after the end of the Test Year.

Q. How did NW Natural determine the cost of base pay in Table 1 for NBU employees and officers in the Test Year and the Rate Years?

A. For NBU employees and officers, we adjusted Test Year base pay to annualize the increase that occurred on March 1, 2025. For each subsequent rate year, we also adjusted base pay to account for the wage increase of [redacted] planned annually for March 1st (2026, 2027, 2028 and 2029). This reflects a [redacted] to reflect promotions and equity adjustments. The percentages were derived using the pay movement of competitor companies as provided in compensation trend surveys. The additional percentage for promotions and equity adjustments was determined based upon past experience and compensation trend surveys. See confidential Exh. MBR-6C.

[1] See confidential Exh. TFD-2C, tab "Restating FTE & Pay Increase" for calculations.

Q. How did NW Natural determine the cost of base pay in Table 1 for BU employees in the Test Year and the Rate Years?

A. The Company adjusted BU payroll costs to reflect the CBA's 4.00 percent wage increase effective December 1, 2025, 2026 and 2027. The current CBA runs through May 31, 2028. For this proceeding in which Rate Year 3 goes beyond this date, the Company assumed the [redacted] adjustment would apply on December 1, 2028. In addition, on top of the wage increase, the Company applied an additional 1.05 percent for each year of the CBA to account for promotions and movements from entry rate to experienced rate as described in the CBA. For Rate Year 3 that goes beyond the term of the CBA, the Company used the [redacted] adjustment to account for such promotions and movements.

IV. MERIT-BASED INCENTIVE PAY

Q. In describing competitive total compensation, you stated that merit-based incentive pay is an important component. Please define what you mean by this term.

A. Merit-based incentive pay is compensation made to employees only if certain performance goals are met within a defined timeframe. Merit-based incentive pay is not guaranteed for employees and is intended to foster high performance. It represents an essential part of competitive total compensation, as it is necessary for NW Natural to compete in the job market to attract and retain the employees that it requires to run its utility business.

Q. Is merit-based incentive pay compensation a standard practice in your industry?

A. Yes, merit-based incentive pay is widely employed by our competitors for labor, and is expected by the professional workforce. Therefore, we believe we need to provide merit-based incentive pay (at different levels depending on the employee's position) in order to compete and meet pay expectations of the workforce. Merit-based incentive pay is preferred by organizations, rather than adding this pay directly to base pay. For general industry on average, 78 percent of companies have at least one incentive plan. See confidential Exh. MBR-7C.

Q. Does NW Natural's merit-based incentive compensation result in above-market median total compensation?

A. No, it does not. As a regulated utility, NW Natural recognizes the importance of balancing fiscal responsibility with the need to attract, retain, and motivate a skilled workforce capable of delivering safe, reliable, and cost-effective utility services. Our annual incentive compensation programs are a key component of our total rewards strategy and are designed to align employee performance with corporate operational goals and objectives that ultimately benefit customers.

Our merit-based incentive compensation is a component of total compensation, which is targeted to align with market median total compensation. In other words, if NW Natural did not provide merit-based incentive pay, its total cash compensation would be below the market median. Without the opportunity to receive this pay, total cash compensation would be below the comparative market.

Q. Is merit-based incentive pay provided at the same level for all employees?

A. No. To be consistent with competitive market pay practices, targets are differentiated by employee level. Generally, the market practice is to provide higher levels of at-risk compensation to officers, directors, and managers who may have a broader influence on Company activities. See confidential Exh. MBR-8C. Table 2 below represents the pay-at-risk for our short-term incentive program for NBU employees.

Table 2
Short-Term Incentive Merit-Based Incentive Pay

Incentive Program Type	Participants	Target Percent of Pay	Amount Requested in RYs as Percent of Pay
NBU Short-Term Incentive	All NBU employees (excluding officers)	7.5 percent-20 percent depending on level	7.5 percent-20.0 percent

Q. Please briefly summarize the merit-based incentive pay that NW Natural is seeking to recover in this proceeding.

A. NW Natural is seeking to recover the costs to two merit-based pay incentive programs. The first program is designed for NBU non-officer employees, called the Goals Incentive Program. The second program is for officers, called the Executive Annual Incentive Plan.

Q. Please describe the Goals Incentive Program that is designed for NBU non-officer employees.

A. The Goals Incentive Program recognizes and rewards NBU employees who have demonstrated strong individual performance and rewards those NBU employees who achieve or exceed their annual performance objectives. These performance objectives include an operational component with the following goals: (1) customer satisfaction,

(2) Company growth, and (3) public safety and employee safety, with each described in more detail as follows:

- Customer satisfaction has two components—satisfaction with the Company as a whole, and satisfaction with employee interaction. Both are measured by customer surveys. NW Natural employees further customer satisfaction by providing efficient, courteous, and knowledgeable service in customer interactions. Customers benefit from employee behavior that increases customer satisfaction.
- Company growth measures the number of new meter sets for customers. NW Natural employees contribute to this goal by providing timely hook-ups for new customers. New customers benefit when their meters are installed in an efficient manner, while existing customers benefit from growth through sharing fixed costs with an expanding customer base.
- The public safety goal has two components—damage call response time and odor call response time. Both are measured in percent of calls responded to in less than 45 minutes. Customers benefit when the Company works quickly to resolve leaks and other potentially dangerous situations.
- The employee safety goal has two components—Days Away Restricted Time ("DART" rate) and number of Preventable Motor Vehicles Collisions ("PMVC"). The DART rate is measured by percent of time away due to on-the-job injuries and the PMVC is measured by number of preventable collisions. Customers benefit from the Company emphasizing a safe working environment that reduces injuries to its employees because it helps ensure safe and timely service.

All of these operational goals promote the Company's provision of safe, reliable, efficient, and timely natural gas service and customer service to its customers.

Q. Please describe the Executive Annual Incentive Plan that is designed for officers.

A. The Executive Annual Incentive Plan is designed to reward officers who deliver results that benefit both the Company and its customers. Specifically, the Executive Annual Incentive Plan is a merit-based incentive compensation program that is designed to incentivize efficiencies that benefit the utility's provision of safe and reliable service at reasonable costs. The Executive Annual Incentive Plan is based upon three separate components: net income (50 percent), operational goals (20 percent), and individual goals specific to the officer (30 percent). Even though a portion of the Executive Annual Incentive Plan is tied to financial goals, it is important to recognize that customers benefit from, and the Commission should encourage, utilities maintaining good financial metrics.

Operational and individual goals vary by officer based on their responsibilities. An example of such goals includes ensuring smooth and timely responses to odor and damage calls. Tying merit-based incentive pay to strong financial metrics enables the utility to efficiently raise the capital necessary to operate its business at rates that are favorable to utility customers, who ultimately pay the utility's cost of capital as part of the utility's revenue requirement. See confidential Exh. BJW-1CT.

Q. What percent of an officer's total pay is "at risk" due to the merit-based incentive programs?

A. NW Natural, like other companies around the country, believes that merit-based incentive pay is important in promoting high performance among all employees,[2] and is even more critical for the officers of the Company. The amount of total merit-based incentive pay varies by officer position and competitive market practice. The chief executive officer has between 74 and 83 percent of pay-at-risk whereas other officers average between 51 and 64 percent of pay-at-risk. In all cases, the total pay-at-risk is comprised of short- and long-term opportunities.

Q. Is NW Natural seeking to recover the entire cost of its merit-based incentive programs in this proceeding?

A. No. NW Natural recognizes that the size of its proposed rate increase, especially in the first year of the multi-year rate plan, is considerable. To limit the size of this request, NW Natural is proposing to only recover the costs of its annual merit-based incentive programs—Goals Incentive Program and Executive Annual Incentive Plan. NW Natural is not seeking recovery of the long-term portion of the Company's executive compensation program that applies to officers, high-performing managers, and key employees. Under this program, qualifying executives receive two components of long-term incentive compensation: restricted stock units ("RSUs") and performance shares. RSUs are stock units that vest over time if certain retention and financial performance threshold conditions are satisfied. Performance shares are a promise of

[2] See confidential Exh. MBR-7C.

Company stock units earned if NW Natural achieves certain performance goals during a three-year cycle. Officers receive 35 percent of their long-term incentive opportunity in the form of RSUs and 65 percent in the form of performance shares.

NW Natural believes that long-term merit-based compensation is an important part of competitive total compensation for executives, drives operational and financial goals, and is a consistent practice among its peers. Nonetheless, while NW Natural believes these costs to be reasonable and prudent, it has decided to not seek recovery of these costs in this proceeding in order to limit the size of its rate request.

Q. How else is NW Natural attempting to mitigate rate impacts related to compensation in this proceeding?

A. NW Natural is proposing to recover the same amount of merit-based incentive compensation for each year of the multi-year rate plan. By not escalating these costs, NW Natural is not seeking to incorporate inflation that will almost certainly cause merit-based incentive pay to increase over the course of the multi-year rate plan.[3]

Q. What is the total cost of short-term annual incentive compensation pay for NBU employees and officers that NW Natural has sought to recover as part of its revenue requirements in this rate case?

A. That amount of cost, by employee type and Rate Year, is shown in Table 3 below. The amounts shown below are the same amounts NW Natural will be requesting for all three Rate Years of the multi-year rate plan. Importantly, as stated above, the Company is not increasing those amounts over the course of the three Rate Years.

[3] See Exh. JEN-1T ("[I]nflation is expected to remain markedly above levels experienced prior to the COVID-19 pandemic").

Table 3[4]

Washington-Allocated Utility Employee Target Merit-Based Incentive Pay ($000)

Type of Utility Employee	All Rate Years
Non-Bargaining Unit (NBU) Employees	$1,163
Officers	$301
Total	$1,464

V. MEDICAL BENEFITS

Q. Please explain why NW Natural provides its employees with medical benefits.

A. NW Natural needs to provide competitive medical benefits to its employees in order to attract and retain a skilled, reliable workforce and because medical benefits are part of the package required to get to median total compensation levels. Additionally, quality medical benefits are necessary to ensure employees are receiving good care in a timely fashion. Good and timely care prevents the development of more serious health problems that would lead to more costly claims and higher employee absentee rates. Customers depend on receiving the safe, efficient, and reliable service that can only be delivered through a healthy and present workforce.

Q. Please describe the medical benefits NW Natural provides to its utility employees.

A. The Company provides medical and pharmacy insurance to its NBU employees and officers through Regence and Kaiser Permanente. Under the CBA, BU employees receive medical and pharmacy insurance from Regence and Kaiser Permanente through the Western States Health and Welfare Trust Fund of the OPEIU, a multi-employer union trust.

[4] See confidential Exh. TFD-2C, tab "Bonuses" for calculations.

Q. How did the Company develop the medical benefits expense proposed for recovery in this case?

A. As shown in Table 4 below, the Company has included $2.3 million (Washington allocated) of medical and dental benefits costs experienced in the historical Test Year. The Company then added an expected premium increase of 9.5 percent for 2025, 9 percent for 2026, 8.5 percent for 2027, 8 percent for 2028 and 7 percent for 2029.

Table 4[5]

Medical Expense	Total in ($1,000)
Test Year	$2,333
Pro Forma: 8/1/25-7/31/26	$2,612
RY 1: 8/1/26-7/31/27	$2,839
RY 2: 8/1/27-7/31/28	$3,072
RY 3: 8/1/28-7/31/29	$3,301

Q. Has the Company taken action to manage medical costs?

A. Yes. For the 2025 plan year, NW Natural increased the deductible on the Regence PPO plan, resulting in lower costs ($85,000 on an overall, systemwide basis). Also, NW Natural changed the cost share structure of its PPO and HMO plans over a three-year period (2021 – 2023) that gradually increased the employee contribution from 20 percent to 25 percent. This change was made to both mitigate increasing health plan costs on the Company and to encourage employees to move to more cost-effective high-deductible health plans. Finally, NW Natural conducts request-for-proposals ("RFPs") approximately every five years to determine if changing insurers would be cost effective. NW Natural's most recent RFP was issued in 2021. See confidential

[5] See confidential Exh. TFD-2C, tab "Health & Life" for calculations.

Exh. MBR-9C. At that time, changing one of the Company's medical and pharmacy insurance providers for NBU employees and officers from Cigna to Regence resulted in an annual savings of $1.0 million on an overall, system-wide basis. Given these savings, NW Natural decided to offer medical and pharmacy insurance through Regence beginning in 2022.

Q. How do NW Natural's medical expenses compare with trend factors?

A NW Natural compares renewal rate increases to trend factors for the Pacific Northwest. While for four out of the last five years NW Natural's active NBU employees' medical expenses have been increasing at a rate at or below trend factors, NW Natural medical expenses have recently exceeded the regional trend. Specifically, based on periodic survey data collected by Milliman, the regional cost for NW Natural was a 7.9 percent increase in costs for 2024, nearly the same as the regional increase of 7.4 percent. For 2025, NW Natural's renewal increase is expected to be 12.3 percent compared to the regional trend of 9.5 percent for 2025. See Exh. MBR-10.

Q. What are the key factors that influence increases in medical costs?

A. The Company's medical benefits rates are greatly influenced by the medical experience of the population being insured. Regence increases rates entirely (100 percent) on our actual insured population. On the other hand, Kaiser Permanente utilizes a combination of both manual rating and actual NW Natural experience. It places 60 percent of the formula on its book of business (manual rating) and 40 percent on the actual claims of the plan participants.

In addition to claims experience, we also know that other factors impact medical costs including age, gender and family size. Based on Kaiser Permanente's and

Regence's 2024 Clinical Utilization Reports, we know that NW Natural's average age under the pre-65 covered NBU participants in 2024 was 49 years old, compared to their overall databases that indicated an average age of 40.6 for the same time period. See Exh. MBR-11. Having a higher average age means our employee base is more expensive to insure than a younger workforce and is more likely to have more serious medical issues than would be seen on average with a younger workforce. In addition, NW Natural's Kaiser plan also has dependent enrollment of 2.5 dependents compared to the overall database, which indicated an average of 1.6 dependents, and the Regence plan has a dependent enrollment of 2.4 dependents compared to the overall database of 2.0 dependents. See Exh. MBR-11. Having a higher dependent enrollment also means that our employee base is more expensive to insure.

Finally, there are external factors that impact our renewal costs each year, and in the recent years those impacts have been especially significant. Inflation has made for even higher costs on the pharmacy side and the shortage of healthcare providers has also added costs as providers renegotiate their contracts. See Exh. MBR-12.

Q. How does the design of NW Natural's medical plans compare with those of other companies?

A. In 2024, Parker, Smith & Feek completed an analysis of the Company's medical benefits in 2024 relative to 35 utilities in the Pacific Northwest through the Milliman survey. See Exh. MBR-13. In this comparison, Parker, Smith & Feek compared our medical benefits to those of the 35 regional utilities in everything from deductibles to coinsurance (premium sharing), to co-pays for office visits and prescriptions. There

was a range of ratings depending upon the specific item being rated, although the overall rating was "Equal."

Q. Why does this testimony address medical benefits and not all components of health benefits?

A. The Company focused on medical benefits (medical and pharmacy) in my testimony because those components make up 95.5 percent of the total health care costs (medical, pharmacy, dental, vision, life, and disability) and has been the area in which significant increases have been experienced in the past 10 plus years.

Q. Are the other health benefits being offered also market competitive?

A. Yes. The same survey source noted above for medical benefits also evaluated the competitiveness of other health care and welfare benefits including dental, vision, life, and disability. All the benefits plans were found to be "Equal" to the 35 utility companies provided in the Milliman survey. While there were some variations in certain categories overall, Parker, Smith & Feek's analysis of the Milliman survey indicated that NW Natural's benefits plans were substantially at market when compared to other utilities. See Exh. MBR-13.

Q. What is the total cost of medical benefits that NW Natural has sought to recover as part of its revenue requirement for the multiyear rate plan in this rate case?

A. That amount, by employee type, is shown in Table 5 below:

Table 5
Utility Employee Medical Benefits ($1,000)

Employee Type	Medical Expense by Employee type (Washington Allocated) in ($1,000)		
	NBU[6]	**BU**	**Total**
Test Year (restated)	$1,194	$1,139	$2,333
Pro-Forma: 8/1/25-7/31/26	$1,349	$1,262	$2,612
Rate Year 1: 8/1/26-7/31/27	$1,467	$1,372	$2,839
Rate Year 2: 8/1/27-7/31/28	$1,587	$1,485	$3,072
Rate Year 3: 8/1/28-7/31/29	$1,705	$1,596	$3,301

VI. RETIREMENT BENEFITS

Q. Please provide an overview of your retirement benefits.

A. Table 6 below shows the retirement benefits programs, which provide market median retirement offerings to employees:

///

///

///

///

///

///

///

///

///

///

[6] Including officers.

Table 6
Retirement Benefits

Retirement Program	Eligible Employees	Summary Description of Benefits
Retirement K Savings Plan (401k) ("RKSP") - Employee Savings with Employer Match	All employees	Defined Contribution Savings plan with match: Match is 50 percent of first 8 percent saved by BU employee and 60 percent of first 8 percent saved by NBU employee
RKSP -Enhanced	NBU employees hired after December 31, 2006 and BU employees hired after December 31, 2009 (covers employees not eligible for pension benefits)	Contribution made by Company into "Enhanced" account-no employee contribution required Contribution is 5 percent for NBU; 4 percent for BU
NW Natural Pension Plan for BU and NBU Employees (NW Natural Retirement Plan) (closed)	Non-bargaining (NBU) and Bargaining (BU) employees	Defined benefit plan that was closed to new NBU employees hired after 12/31/06 and BU hired after 12/31/09.

Q. Are there significant changes that NW Natural has made since the Company's last rate case?

A. No. The Company is proposing no changes to retirement benefits for this case.

Q. How do NW Natural's retirement benefits compare to the benefits provided by other companies?

A. In 2024, the Company asked Parker, Smith & Feek to analyze the Company's 401(k) defined contribution retirement benefits relative to other utilities. Based on data from the Milliman survey, NW Natural's 401(k) defined contribution match benefits were found to be "Equal" for BU and NBU employees when compared to the Utility

database. The Enhanced 401(k), for those hired after the Pension Plan was closed, was found to be "Worse" when compared to the Utility database. See Exh. MBR-13.

Q. Please explain the total retirement benefits included for recovery in this rate case.

A. Table 7 below shows the amount requested for recovery for retirement benefits in the Test Year. The Company is not proposing to escalate the historical Test Year amount over the course of the multi-year rate plan. Instead, the Company is seeking to recover the same amount for each of the Rate Years.

Table 7[7]
Utility Total Retirement Benefits– Washington-Allocated ($000)

Component	Test Year
RKSP-Matching Contribution	$697
RKSP-Enhanced Contribution	$516
Western States Pension-withdrawal liability	$63
Total	**$1,276**

VII. EMPLOYEE HEAD COUNT

Q. Is the Company proposing to adjust FTE count for the Rate Years 1, 2 and 3?

A. Yes. Table 8 below shows System level FTEs the Company proposed to include in each of the Rate Years.

[7] See confidential Exh. TFD-2C, tab "401k" for calculations.

Table 8[8]

	Officers	NBU	BU	Total
Test Year (restated)	**13**	**648**	**618**	**1,280**
Pro-Forma: 8/1/25-7/31/26	**13**	**654**	**624**	**1,290**
Rate Year 1: 8/1/26-7/31/27	**13**	**660**	**629**	**1,302**
Rate Year 2: 8/1/27-7/31/28	**13**	**666**	**635**	**1,314**
Rate Year 3: 8/1/28-7/31/29	**13**	**672**	**641**	**1,326**

Q. How did NW Natural calculate the number of FTEs for the Test Year.

A. NW Natural calculated the number of FTEs that NW Natural employed during at the end of the Test Year—1,280 on a systemwide level.

Q. How did NW Natural adjust the number of FTEs over the course of the multi-year rate plan?

A. For pro forma adjustments to the number of FTEs, NW Natural examined near-term hiring expectations through July 31, 2026, to arrive at the number of FTEs it expects to have during that time. For adjustments to the number of FTEs each rate year, NW Natural estimated the number of FTEs it would have based on its experience in recent years. This experience indicates relatively small but sustained growth in the number of NBU and BU employees throughout the multi-year rate plan. We expect the number of officers to remain constant during this time, however.

[8] See confidential Exh. TFD-2C, tab "Restating FTE & Pay Increase" for calculations.

Q. Is NW Natural seeking recovery of employees' compensation and benefits based on the FTE amounts for each Rate Year?

A. Yes. NW Natural is seeking cost recovery of employees' compensation and benefits based on the gas utility FTEs that NW Natural projects to have in each Rate Year, as explained in the confidential Direct Testimony of Tobin F. Davilla (Exh. TFD-1CT). Since the Company serves customers in Washington and Oregon, it allocates a certain percentage (approximately 11.12 percent) of its employees' compensation and benefits costs to Washington. Cost allocation between Washington and Oregon is further explained in the Direct Testimony of Kyle T. Walker (Exh. KTW-1T). All employees' compensation and benefits costs referenced in this testimony reflect Washington-allocated values.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

COLLECTIVE BARGAINING AGREEMENT

THIS COLLECTIVE BARGAINING AGREEMENT, hereinafter called "Agreement," is entered into on June 1, 2024, between NORTHWEST NATURAL GAS COMPANY, a corporation, its successors or assigns, hereinafter called "the Company" or "the Employer," and OFFICE AND PROFESSIONAL EMPLOYEES INTERNATIONAL UNION, LOCAL 11, AFL-CIO, hereinafter called "the Union," collectively referred to as "the parties," to promote a balance between the needs of the employees and those of the Employer while fostering an environment of mutual respect and cooperation.

COLLABORATIVE MISSION STATEMENT

The Union and the Company will work together to:

- Achieve collaborative and transparent relationships at all levels of the organization;
- Resolve concerns at the lowest level possible;
- Foster an environment in which employees are valued and supported in their development, engagement and success; and
- Promote NW Natural's core values and continued success.

ARTICLE 1
GUARANTEES AND FLEXIBILITY

Section 1.1 Introduction

To support our ability to acquire and serve customers, and to outperform our competitors, thereby promoting employment security and enhancing job opportunities, the parties share responsibility for developing and rewarding a flexible and skilled work force. To successfully compete requires the ability to quickly adjust our products, services and processes.

Section 1.2 Flexibility

The parties agree that during the term of this Agreement, the Company has the flexibility to redesign and change its business operations, the work and the workforce. In exchange, the Company agrees that certain employees shall have Employment Security and Pay Guarantees, as defined in Section 1.4 and Section 1.5 of this Article.

Section 1.3 Involvement

It is the Company's right and responsibility to make business decisions, including such matters as redesigns, changes in business operations, the work and workforce. The Company acknowledges its obligation to bargain employee impacts with the Union.

The Company will meet quarterly with Union Representative to review the number of contractor personnel working, the type of work performed, and the current and projected workload to discuss the feasibility of increasing the bargaining unit work force or using overtime when practical and economical as an alternative.

Section 1.4 Employment Security

1.4.1 The parties agree that during the term of this Agreement there will be no layoff of any regular employee whose current period of employment was on or before May 31, 2023. Probationary and Term Employees are not eligible for employment security.

1.4.2 Employees without employment security are subject to layoff for any reason. However, the Company will not contract work to others that would cause employees with employment security to be laid off. The Company will eliminate individual, third-party contract workers, and temporary and Term employees who are performing the same bargaining unit duties in the impacted location and workgroup prior to laying off full or part-time employees. This excludes elimination of contract workers doing non-routine work that customarily uses contractors. Non-routine work performed by contractors will be reviewed by the parties to determine if regular employees can perform the work before laying off full or part-time employees.

1.4.3 The Company agrees to meet with the Union if it is considering laying off bargaining unit employees for any reason.

Section 1.5 Pay Guarantee

Pay for regular employees in jobs that are affected by work redesign, regional lack of work, or certain disability situations, will be guaranteed at no less than their current rate of pay, as provided for in Section 11.4 within this Agreement.

ARTICLE 2
GENERAL PROVISIONS

Section 2.1 Application and Coverage

2.1.1 Definition of Bargaining Unit

This Agreement applies to and covers NW Natural Gas Company individuals who are employed in the jobs shown in the Job Titles by Group list of this Agreement. The terms of this Agreement do not extend to any NW Natural affiliate.

2.1.1.1 It is not the intent to have Supervisors perform the job duties of bargaining unit employees except in circumstances such as training, testing, inspection(s)/QA, a threat to public safety or emergency (e.g., inclement weather, volcanic eruption, earthquake, hazardous material release, or other natural or man-made disaster or employee absenteeism; excluding scheduled PTO), or in occasional circumstances where needed to support the continuity of local business operations.

2.1.1.2 The Parties agree to a standard process by which all new jobs will be evaluated for inclusion in the bargaining unit.

- This process applies to newly created jobs that do not exist at the Company as of June 1, 2024. This does not apply to the creation of additional numbers of existing jobs (or positions). The Parties will consider the definitions which describe inclusion as a bargaining unit position in the National Labor Relations Act (NLRA) found on the website www.nlrb.gov.

- New jobs at these levels are excluded from possible inclusion in the Bargaining Unit: Executives, Directors, Managers, and Supervisors with direct reports as well as jobs that require advanced formal education (e.g., Financial Analysts, Attorneys, Human Resource Professionals). New jobs involving a high level of confidentiality will be excluded from consideration. Company-sensitive strategic, financial, and working with private individual employee data are examples of types of confidentiality.

- The Company will meet with the Union to review its analysis of the new jobs and to obtain the Union's input following the requirements of

2.1.1.2 of this agreement. However, it is ultimately the Company who will make the decision as to whether the new jobs should be included in the bargaining unit and will inform the Union of the final decision. If the Union disagrees with the Company's decision, they may pursue any avenue already available.

2.1.2 Employee and Other Worker Definitions

2.1.2.1 Employee

An employee is a common-law employee of the Employer whose job is within the bargaining unit as defined in 2.1.1 to this Article.

2.1.2.2 Regular Employee

A regular employee is an employee who is employed by the Employer to work on a full or part-time basis.

- A Full-Time regular employee is a regular employee who is employed by the Employer to work an average of forty (40) or more hours per work week.

- A Part-Time regular employee is a regular employee who is employed by the Employer to fill a continuing work requirement that averages less than forty (40) hours per work week.

- A Job-Share employee is a part-time regular employee who is employed by the Employer to share the responsibilities of one (1) full-time position with one (1) other job-share employee.

    - The incumbent in a job-share position will have a share of a full-time position determined by Management to be appropriate for a job-share arrangement.

    - Both job-share employees must meet the bidding and performance qualifications for the shared position.

    - Work schedules will be agreed to between the job-share employees and will be subject to approval by the workgroup Supervisor.

    - When a job-share vacancy occurs, the position will be first posted as a job-share arrangement. If the job-share vacancy cannot be filled from the posting, then the remaining incumbent will be offered a full-time position. If that is refused, a full-time position will

be posted. The remaining incumbent will then be placed into redeployment.

2.1.2.3 Probationary Employee

A Probationary Employee is a newly hired or rehired employee in their first year of employment (three hundred and sixty-five [365] calendar days) with the Company. Probationary employees who are regular employees retain all rights and benefits of regular employees under the Collective Bargaining Agreement; except as limited in 4.3.2 and Section 20.1 within this Agreement.

Probationary employees who are term employees retain only the rights and benefits provided to term employees.

If a probationary employee uses protected leave for thirty (30) calendar days or more, the Company may exercise its sole discretion to extend the employee's probationary period by the same number of calendar days.

2.1.2.4 Term Employee

A Term Employee is an employee engaged for a limited duration to complete a special project as specifically defined in their Term Employment Agreement. An Intern is a type of employee hired for a limited duration to work in a structured internship program as a BU Term Employee as specifically defined in their Term Employee Agreement. Term employees have only those benefits and rights expressly defined in their Term Employment Agreement.

- The Company will not hire Term employees for the purpose of replacing or restricting the hiring of regular employees for ongoing work. The Company will ensure that Term positions do not limit the advancement opportunities of regular employees. Unless mutually agreed by the LMC Co-Chairs, the duration of a Term position shall not exceed twelve (12) months.

- Term employees do not have regular employee bidding rights. When seeking a regular position, term employees will be considered as external applicants and will be required to complete the full external bargaining unit selection process even if they are seeking a position involving the same type of work as that done while a Term employee.

- Term employees shall be provided the benefits of regular employees only as defined in the Term Employee Agreement.

2.1.2.5 Temporary Worker

A temporary worker is an external agency worker engaged for an assignment lasting for one hundred and eighty (180) or fewer calendar days. Temporary workers are not employees of the Company and do not have Union membership rights or employee benefits. Any extension of a temporary worker on the same assignment beyond one hundred and eighty (180) calendar days requires the mutual agreement of the Parties. The Company may not rotate temporary employees into the position or assignment where there is a need to create a regular position and hire a regular employee.

Any person working in a position covered by this Agreement as a temporary worker must obtain a working permit from the Union after each thirty (30) days worked.

2.1.3 Union Security and Recognition

The Company recognizes the Union as the exclusive bargaining agent for all employees who are classified by the Company in the Job Titles (Schedule A) covered by this Agreement.

2.1.4 Union Membership Requirements

It shall be a condition of employment that all employees covered by this document shall pay dues to OPEIU Local 11, and all new employees shall, on the last calendar day of the month following the beginning of such employment, begin payment of dues and such initiation fee as is customary to the Union.

Upon receipt of a written request signed by an employee, the Company will deduct and remit to the Union dues and other fees from the pay of the employee once in each month and an accounting for such deductions. Such form will be provided by the Union.

In case any Employee shall fail to tender the initiation fee and periodic dues uniformly required as a condition of acquiring or retaining membership (which payment of fees and dues shall be a condition of continued employment), the Union will notify the executives responsible for labor relations. A Company representative will then notify the delinquent employee in writing by the end of their next workday that, unless the executives responsible for labor relations receive from the Union office notification of the employee's tender of required dues, the employee will be terminated within the next ten (10) working days.

Section 2.2 Management Rights

The Company retains all rights to manage its business and direct its work force, except as those rights are limited by the express and specific language of this Agreement. The Company's rights include, but are not limited to, the right and flexibility to redesign and change its business operations, the work and the workforce; determine the number and nature of positions needed across the Company and by work location; protect and preserve Company property; open and close work locations; contract work*; set schedules; assign and direct work; define work duties, including duties performed within any job description or job family; implement and utilize existing and new automation and technologies; and require that work be performed, including overtime.

*It is the intent and preference of the Company to use women and minority-owned contractors as well as utilize Union contractors whenever practical.

Job descriptions will be maintained for all jobs and positions in the bargaining unit. The Company has the right to change and create jobs and position descriptions. If requested by the Union, the Parties will meet to discuss and determine the impacts to the bargaining unit.

Management's right to contract work out is further described in Section 1.4 within this Agreement. While it is Management's right and responsibility to make business decisions, it is agreed that the Company will discuss the impact of the Company's decision on employees as described in Section 1.3 within this Agreement.

Section 2.3 No Strike, No Lockout

There shall be no strike, work stoppage, work slowdown, sympathy strike, lockout, or other interruption of work during the life of this Agreement. The Union shall take every reasonable means within its power to prevent such occurrences and induce employees engaged in or supporting any such prohibited conduct to cease such activity.

Any member of OPEIU Local 11 employed by the Company who recognizes a lawful primary picket line sanctioned by OPEIU Local 11 shall not be disciplined for recognizing that picket line, notwithstanding the provisions of this Article, provided that such employee shall have no greater rights under law or contract than does a striking employee.

Section 2.4 Union Member Time Off

The Union's Stewards shall be allowed time off with pay to investigate and present issues/grievances as necessary to fulfill their duty of fair representation. Whenever possible, such time shall be scheduled in advance with the Steward's Supervisor to minimize the impact on business operations.

The Parties shall meet with the Union Stewards and Management representatives after the ratification of this Agreement to provide joint training on all modifications of this Agreement.

Upon written request from the Union, members shall be given short-term leaves of absence to transact Union business and be paid by the Union. An employee covered by this Agreement who is elected, appointed or hired to an office in the Union requiring a long-term leave of absence from the Company, shall, upon two (2) weeks' written notice, be granted a voluntary leave of absence without pay not to exceed two (2) years.

Section 2.5 Union Bulletin Boards

The Company will make available space on its bulletin boards for the posting of Union notices and bulletins.

Section 2.6 Compliance with Laws Governing the Workplace

The Union shares the Company's commitment to maintaining a business in compliance with all applicable laws governing the workplace, ensuring an environment free from discrimination, harassment or retaliation and supporting business and workplace decisions promoting diversity.

The Company agrees not to discriminate or retaliate against any member of the Union for their activity on behalf of or because of membership in the Union.

The Company promptly investigates and addresses complaints regarding discrimination, retaliation, or harassment. The Union recognizes the importance of the prompt and effective investigation and resolution of such complaints and will support and cooperate with the Company in the Company's investigation and resolution of such complaints.

Section 2.7 Modifications and Agreements

2.7.1 The Parties with mutual agreement have the right to renegotiate the Agreement in the event there are external events or significant business changes which in the opinion of either party require renegotiation of the Agreement. Amendments to this Agreement are made by a Memorandum of Agreement (MOA), must be in writing, agreed to, and signed by both parties.

The language described above does not have the intention of opening the entire Collective Bargaining Agreement for negotiations.

2.7.2 Interpretations regarding this Agreement are outlined and assigned at the direction of the LMC Co-Chairs. This assignment shall be given to bargaining unit members, management, and subject matter experts; who shall review the contract language and clarify the intent within the Agreement; and which shall be submitted to the Company and Union Leadership for approval.

2.7.3 A Memorandum of Agreement is a written document signed by both the Union and the Company Executive Sponsors that states what the Union and the Company agree to when they reach agreement on something other than what is stated within the Collective Bargaining Agreement. Memorandums of Agreement can

remain in effect for the duration of the current Agreement or may be limited to a specific period of time, or incorporated into the Collective Bargaining Agreement upon opening for negotiations.

2.7.4 Except as expressly noted otherwise, this Agreement supersedes all prior CBAs, Joint Accords, Joint Accord Guidelines (JAGs), Interpretations, and Memorandums of Agreement. To the extent the terms of this Agreement were to conflict with any other agreement, the terms of this Agreement control.

Section 2.8 Labor/Management Committee

The Labor/Management Committee or LMC shall be organized for the purpose of addressing contract issues, clarifying the intent of the labor contract, monitoring for unanticipated consequences of the labor contract and anticipating change. The LMC will consist of up to ten (10) members from the Union and ten (10) members of from the Company. Members are inclusive of the LMC Leadership Team, Management employees, Stewards, and Chief Stewards. The Committee shall meet monthly at a mutually agreed location, time, and date, and with an outlined agenda set by the LMC Co-Chairs. Meetings may be cancelled by the mutual agreement of the LMC Co-Chairs. The Committee shall consider only those contract issues which are mutually agreed upon or otherwise designated in the contract.

ARTICLE 3
SENIORITY

Section 3.1 Company Seniority

Company seniority is established on the date of hire or rehire as a regular employee. When multiple regular employees are hired on the same day, Company seniority is then established based on name at date of hire in ascending alphabetical order of last name, then first name.

Any previous regular employee who was separated due to disability (industrial or non-industrial) and is subsequently awarded or placed in a position under Article 15 within this Agreement is eligible for adjusted seniority abridgement of Company seniority.

Section 3.2 Job Seniority

Job seniority is based on the days that a particular job is held. When multiple regular employees have the same number of days the job was held, the ranking will be based on Company seniority. Job seniority is only accumulated for jobs that are not in a Line of Progression.

Section 3.3 Line of Progression Seniority

Line of Progression seniority is based on the days that any job within that Line of Progression is held. When multiple regular employees have the same number of days in the Line of Progression, the ranking will be based on Company seniority. For jobs in a Line of Progression, job seniority is not accumulated.

Section 3.4 Term and Intern Employee Seniority

3.4.1 Term and Intern Employees do not accrue seniority while in Term employment status; however, if subsequently hired as a Regular Employee with no break in service, Company Seniority will be established on the date of hire as a Term or Intern Employee.

3.4.2 Job or Line of Progression seniority (as applicable) is calculated for positions involving the same type of work as that done as a Term or Intern Employee.

Section 3.5 Job and Line of Progression Seniority Accumulation

Accumulation of seniority is based on straight-time days of employment. For full-time regular employees, this is equivalent to five (5) eight-hour workdays per seven (7) calendar days. For part-time regular employees, seniority will be accumulated at seventy-five percent (75%) of the rate of full-time regular employees.

Section 3.6 Seniority Retained

Seniority accumulated by a regular employee in a job or in a Line of Progression is retained. Any employee who leaves the bargaining unit or ends employment will not retain any job, Line of Progression, or Company seniority. Any previous regular employee who was separated due to disability (industrial or non-industrial) and is subsequently awarded or placed in a position under Article 15 within this Agreement is eligible for adjusted seniority abridgement of Company seniority.

Section 3.7 Application of Seniority

For the application of seniority, refer to the appropriate articles within this Agreement.

Section 3.8 Line of Progression and Job Seniority Calculations

The process of seniority calculations related to the definitions under this Agreement shall be as follows:

3.8.1 Name changes after the date of hire will not impact a regular employee's seniority ranking or subsequent seniority calculations.

3.8.2 Regular employees who receive a fourteen (14) calendar day award will earn seniority in both the new job and the old job until they start in the new job.

3.8.3 Regular employees who hold a Combo Position earn seniority in each distinct job that makes up their Combo Position.

3.8.4 Regular employees who fail to qualify for a job for reasons within their control (e.g., bidding to another job or failing to qualify) will not earn any seniority for that job.

3.8.5 Regular employees on a Long-Term Special Assignment (LTSA) earn seniority in the temporary job and continue to earn seniority in their regular job.

3.8.6 Regular employees on a Short-Term Assignment only earn seniority in their regular job.

3.8.7 Regular employees on a Temporary Development Opportunity (TDO) do not earn seniority in their regular job.

3.8.8 During a leave of absence, a regular employee will continue to earn seniority.

3.8.9 A temporary, unplanned reduction in work resulting in an interruption of paid status will not interrupt a regular employee's seniority calculation.

3.8.10 Regular employees in redeployment due to a work redesign or a bump will continue to earn seniority in the job from which they were redeployed until they secure a new regular job.

3.8.11 Positions that become obsolete or honored will be mapped to a current job or Line of Progression and applicable seniority credited to regular employees who hold those positions accordingly.

3.8.12 Regular employees who exercise a right to return will not earn seniority in either the new job or the old job to which they return for the duration of the transfer to the new job in accordance with Article 4 within this Agreement.

ARTICLE 4
SELECTION AND ASSIGNMENT

Section 4.1 General

This Article describes the selection and assignment provisions and processes for regular employees. Term employees are not eligible for these provisions or processes, as explained in the Term Employee Agreement.

Section 4.2 Definitions

All bargaining unit job descriptions, including general task bars, will be maintained by the Company. The Company has the right to change and create job descriptions. Upon completion, the Company will notify the Union of substantive changes to existing job descriptions and newly created job descriptions. Substantive changes will follow the review process outlined in Section 11.3. All job descriptions and General Task Bars are made available on the Company intranet site.

- Job: A paid role of employment.

- Job Title: Describes the occupation, function, and, if applicable, the level of a job if part of a larger job family.

- Job Description: Written documentation of a job title that may include general purpose, job requirements, position specific essential functions, and requirements for a particular job.

- Job Family: A group of jobs that are related because of similar job content, skill requirements, and/or career paths.

- General Task Bar: A list of tasks that everyone in a Job Family can be expected to perform, with training, as needed.

- Position: Role within the organization that is assigned a job title and used for headcount management. All employees are assigned to a position and job title.

Section 4.3 Postings and Consideration of Bids

4.3.1 When a position has been approved, the position will be posted Company-wide for seven (7) calendar days. Open and available positions are posted on the Company's intranet. It is every employee's responsibility to check the intranet on a regular basis for postings upon which they may want to bid. The intranet shall be available to access at all resource centers or remotely on the Company device/application.

4.3.2 All applications received from regular employees* prior to the expiration of a posting shall be considered in accordance with the Position Posting and Bidding Company policies, processes and procedures. Probationary employees will only be allowed to apply as external candidates.

*Regular employees already in the Construction line of progression at the resource center where a posted position in Construction is located are considered auto-bidders and automatically included in the bidding process. If an auto-bidder declines an award, must sign a Progression Waiver (existing rate retention will be forfeited). When bidding between Distribution and Transmission Construction, auto bidding does not apply.

4.3.3 The internal bidding and selection process applies for bidding and/or selection of non-probationary regular employees to fill regular, term and Long-Term Special Assignment (LTSA) bargaining unit positions that have been approved by the Company. This process applies to the bidding and selection process for non-probationary regular employees bidding on internal bargaining unit positions. This process is also used to determine if displaced employees meet bidding qualifications when being assigned/placed into a bargaining unit position through redeployment and/or when an employee is bumping into a position.

4.3.4 The Parties agree to use and continue to refine the currently agreed to internal bidding and selection processes as outlined in the Internal Bidding and Selection Process Company policies, processes and procedures.

4.3.5 Employees who are off on Paid Time Off (PTO), Short-Term Disability, Long-Term Disability, Workers' Compensation, unpaid active status, or protected leave as defined under Federal, State or local law; or by Company policy for an entire posting period shall be eligible to submit a bid on any posted position within the seven (7) calendar days following the expiration of the posting period in accordance with the Position Bidding and Award Eligibility for Regular Employees Company policies, processes and procedures.

Section 4.4 Position Awards

Seniority and qualifications will be considerations in awarding a posted position. With agreement between the Parties, certain positions will be awarded based on qualifications first and then seniority. Bidders will be considered for posted positions regardless of their currently assigned Company-based location except as provided for in Section 4.9 of this Article.

Position awards will be published within fourteen (14) calendar days of acceptance by the employee. Employees will be moved to the new position as soon as possible, usually within twenty-one (21) calendar days of accepting the award.

- Extensions to the above timelines from twenty-two (22) calendar days up to a maximum of one hundred and twenty (120) calendar days may be made after discussion with the employee and upon mutual agreement between the releasing and receiving Supervisors.

- Employees not in the new position after fourteen (14) calendar days from the position award will receive any applicable pay increases and begin accumulating either Job seniority or Line of Progression seniority as of the fourteenth (14th) calendar day from the employee’s acceptance of the award.

The following are the principles that apply when awarding positions for: Open Jobs, Line of Progression Jobs, and Jobs involving Progression without Bidding (unless otherwise agreed that the position is selected on qualifications first and then seniority).

4.4.1 Open Positions

An open position is one that, if posted, all regular employees are eligible to bid. These positions do not include those within a Line of Progression or Progression without Bidding except at the entry level. Qualified bidders will be awarded positions based on seniority in the following order:

- Job seniority for the position posted for bid, then
- Company seniority.

4.4.2 Line of Progression (LoP) Jobs

A LoP is a sequence of specifically related jobs that require successively higher skills to advance sequentially to the next higher position. The following are the currently recognized LoPs:

- Construction (2, 3, 4)
- Customer Field Service (2, 3, 4)

LoP jobs may be added to, or removed from, or changed with mutual agreement of management and the Union during the life of the contract.

Qualified bidders will be awarded positions based on seniority in the following order:

- Line of Progression seniority in the line of the position posted for bid, then
- Company seniority.

Advancing in a LoP requires that a regular employee meet all the qualifications, certifications, and training for the current level prior to being eligible to move into a vacant and available position at the next level. Regular employees in a LoP earn days toward rate retention when they work up.

4.4.3 Qualification Based Progression

Certain jobs are posted based on business need and awarded based on qualifications regardless of Company, Job, or Line of Progression seniority. Additional jobs may be added to the qualifications based process by mutual agreement between management and the Union. The parties agree that when filling vacancies or promotional opportunities, the goal is to encourage growth and opportunity for advancement from within and to hire the most qualified candidate for the position. When, in the judgment of the hiring manager and Human Resources Department, sufficient candidates who apply from within the Company are qualified, available and interested, the recruitment may be restricted to internal candidates.

The current jobs are:

- Accounting 4
- Customer Service 4
- Construction 4
- Customer Field Service 4
- Gas Storage 1
- General Services 4
- Transportation 3
- Transportation 4
- Welding & Fabrication 4

4.4.4 Jobs Involving Progression without Bidding

Employees will progress based on meeting the qualifications and performance standards for the higher-level job. Jobs may be added to, removed, or changed by mutual agreement between management and the Union. Progression may be limited by position availability. In this case, the most senior qualified person will progress, based on seniority in the following order:

- Job seniority in the lower position, then
- Company seniority.

The jobs involving Progression without Bidding are:

- Accounting = Accounting 2 to 3
- Account Services = Accounting 2 to 3
- Customer Field Service 2 to 3 in Astoria / Warrenton, Coos Bay, The Dalles, Lincoln City
- Customer Service 2 to 3
- Distribution Arc Welder 1 to 2
- Electronic Technician 1 to 2
- Gas Storage 1 to 2
- GIS Tech 1 to 2; 2 to 3
- Specialty Construction 1 to 2
- System Operations 1 to 2
- Technical Coordinator 2 to 3
- Transmission Maintenance 1 to 2
- Transportation 1 to 2

Some of the above workgroups have specific rules for progression without bidding. In the absence of such rules, the default criteria for progression will be the accumulation of working two hundred and sixty (260) days at the higher-level position with satisfactory performance.

4.4.5 Qualifying Standards

An employee awarded a new position must satisfy the Performance Qualifying Standards during the established qualifying period per Article 5 within this Agreement.

Section 4.5 Right to Return to Former Position

Employees have sixty (60) calendar days after reporting to a new and different position to voluntarily return to their former position. This right provides a one-time ability to return for any reason. An employee wanting to return to a former position must have previously qualified in order to return to that position. Any subsequent request to return to their former position within a rolling five (5) year period from the date of award must be mutually agreed upon by the

Parties. Employees who exercise their right to return within five (5) workdays will not be subject to the five (5) year restriction. An employee may relinquish their right to return at any time. Written notification will be sent to Human Resources (Talent Acquisition).

An employee still retains the right to bid on any position posting at any time. The employee will not continue to accumulate Job or Line of Progression seniority while they are away from the former position.

Right to return to former position does not apply to situations where movement is to the same position at any location.

Section 4.6 Waivers

A waiver is a mechanism for an employee to voluntarily return to a former position or to forego advancement. In all cases of waiver, the employee will be paid the applicable rate for the position waiving into, and is waiving rate retention and all days currently earned towards rate retention.

In a Lack of Work situation, restrictions on returning to a waived position are removed. There are two (2) types of waivers: Progression (Advancement) Waivers and Position Waivers. The waiver definitions and processes are as described herein.

4.6.1 Progression (Advancement) Waiver

An employee elects to forego advancement (move up and/or work up). An employee who waives advancement is also waiving working up. When exercised, the employee waives the right to advance to a specific opening, but does not waive the right to advance should a subsequent posting/work-up opportunity occur. For convenience, this waiver is considered in effect until “pulled” by the employee (by notifying their Department and Human Resources in writing). For Progression Waivers related to a declined auto-bid award, there is a minimum of one (1) year term before the waiver can be pulled. There is no duration requirement for other Progression Waivers.

4.6.2 Position Waiver

An employee elects to vacate a position to return to a lower rated position at the same resource center for which they previously qualified. A Position Waiver has a minimum one (1) year term. After one (1) year, the waiver remains in effect until “pulled” by the employee (by notifying their Department and Human Resources in writing). Employees who wish to return to the waived position may bid (or progress in the case of Progression Without Bidding or Qualification Based Progression) to an opening of that position.

The Chief Steward and Manager for the requesting employee approve this waiver and shall meet to discuss.

Section 4.7 Workplace Location Exchange

Employees may request a workplace location exchange by completing a "Workplace Location Exchange Request" form. Human Resources will notify the Chief Stewards and the Union office of the finalized exchange including the nature of the exchange (lateral or non-lateral), qualifying periods, pay rates, and effective dates.

Section 4.8 Retention of Higher Rate

4.8.1 Jobs awarded based on qualifications are not eligible for rate retention.

4.8.2 When an employee in a Line of Progression position is working up a grade, the employee will be paid at the entry level rate for the first two hundred and sixty (260) working days. Once an employee in a Line of Progression position has worked up a grade for two hundred and sixty (260) working days, the employee will continue to receive the higher rate of pay at the experienced level, until such employee leaves their position or signs a Progression Waiver.

4.8.3 When an employee with less seniority in a Line of Progression works up a grade ahead of a senior employee in the same Line of Progression at the same Company-based location, the most senior employee will also be paid entry level at the higher rate for the day, except when the less senior employee is working up into a qualifications-based job (e.g., Construction 4).

4.8.4 If a less senior employee at the same Company-based location reaches rate retention prior to a senior employee at the same Company-based location in the same Line of Progression because the senior employee was on a Short-Term Assignment, the senior employee will be designated as rate retained.

4.8.5 When working up into qualification-based jobs, only the employee working up is paid the higher rate for the day.

Section 4.9 Temporary Positions / Internal Assignment of Employees

4.9.1 **Short-Term Assignment of Employees**

Employees may be temporarily assigned for one hundred and eighty (180) calendar days or less per calendar year to a position for which they qualify or may be trained based on Company needs. Any individual employee assignment longer than one hundred and eighty (180) calendar days shall be by mutual agreement of the Parties. The Chief Stewards and Union will be notified by management no later than the start of any Short-Term Assignment expected to last longer than seven (7) calendar days.

An employee who is assigned to perform a higher-grade position will be compensated at the higher of the employee's current or assigned rate for the hours worked at that rate up to four (4) hours of the day. An employee who works four (4) hours or more is paid for the full day at the higher rate.

Employees will continue to accumulate Job or Line of Progression seniority in their regular position during such assignments.

An employee returning from an authorized leave of absence may be temporarily assigned to other work regardless of seniority.

4.9.2 Long-Term Special Assignment

A Long-Term Special Assignment (LTSA) is a posted special, voluntary work opportunity that is up to twelve (12) months in length. Requests for extensions beyond the initial term will be mutually reviewed and agreed upon by the Parties. All LTSAs are subject to the following:

- An LTSA is not a replacement for a vacant regular position. Recurring LTSAs shall be reviewed by the Parties to determine whether there is a need for a regular position; the Union may include a Chief Steward for the review. The term “voluntary,” as used here, means that either the employee or the Company may end the LTSA at any time for any reason.

- Because an LTSA goes through the post, bid and award process, the pay rate for the LTSA will apply in all situations. If the LTSA is a lateral move, the employee will retain their current pay rate. An employee bidding from a higher paying position will not retain that higher pay rate while in the LTSA position; they will receive the experienced level of the lower position.

- At the conclusion of the LTSA, the employee will return to their original position. While in the LTSA, the employee will be included in any work redesign, as it may occur, that might affect their regular position.

- If there are no qualified bidders, the position will be temporarily assigned based on this Article.

4.9.3 Assignment to Non-Bargaining Position - Temporary Development Opportunity (TDO)

The Company’s TDO procedure applies with respect to the assignment. The employee will continue to retain Union membership status (including benefits) and pay Union dues. Per 3.8.7, Regular Employees on a TDO do not earn seniority in their regular job. The Company will notify the Chief Stewards and the Union no later than the start of the non-bargaining assignment.

ARTICLE 5
PERFORMANCE QUALIFYING STANDARDS

Section 5.1 General

Employees must acquire and maintain Performance Qualifying Standards per these four (4) following processes:

- Failure to Qualify During Qualifying Period
- Failure to Maintain Performance Qualifying Standards
- Field Operations Testing Failure to Qualify
- Welding Procedure to Recertify

Section 5.2 Failure to Qualify During Qualifying Period

5.2.1 **Application**

The process outlined below applies when a regular employee is failing to meet performance-qualifying standards during the qualifying period for that position.

5.2.2 **Process**

5.2.2.1 Employees may exercise their right to return per Section 4.5 within this Agreement.

5.2.2.2 Employees ineligible for a right to return may:

- Return to original position if previously qualified and position is still vacant.
- Return to previous status when outside of a regular position (e.g., redeployment, leave of absence due to Failure to Maintain Performance Qualifying Standards). If original status was a leave of absence resulting from Failure to Maintain Performance Qualifying Standards or a third Testing Failure, employee's leave of absence will be restarted from the point at which it had been paused at the time of the employee's successful bid (See Failure to Maintain Performance Qualifying Standards and Field Operations Testing Failure to Qualify process within this Article).
- Return to the department if the position is not vacant and the department can absorb the employee, as determined by Management.

5.2.2.3 If no job is available, the employee will be placed in the redeployment process at the pay group and pay rate of the job in which the employee last qualified, or Pay Group O Experienced Pay Rate if never previously qualified, or Pay Group M Experienced Pay Rate if prior status was a third testing failure on a new task or content area and Paid Time Off (PTO) is exhausted (See Redeployment Process in Section 7.3 within this Agreement).

Section 5.3 Failure to Maintain Performance Qualifying Standards

5.3.1 Application

This process applies to regular employees who have successfully completed the qualifying period and who are subsequently unable to maintain performance qualifying standards for a position.

For failure to qualify situations involving Operator Qualifications or welding, refer to the Field Operations Testing Failure to Qualify process within this Article or Welding Procedure to Recertify within this Article, as appropriate.

5.3.2 Process

After the employee has received coaching and direct performance feedback, which may include a Performance Development Plan (PDP), and still does not maintain performance qualifying standards, the following occurs:

5.3.2.1 A Failure to Maintain Performance Qualifying Standards Disciplinary Action Plan (DAP) will be utilized and will specify:

- The changes that must occur for the employee to meet standards;
- The timeline for the employee to accomplish those changes. (The DAP should generally be no longer than the qualifying period for the employee's position. If the DAP is longer than the qualifying period for the employee's position, it must be approved by the LMC Co- Chairs and must be signed by the Manager and Union Representative.); and
- Consequences if the employee does not meet the requirements of the DAP.

5.3.2.2 The employee may:

- Bid on any open positions (if any are available) for which they meet bidding qualifications; and/or
- Apply for a position waiver in accordance with Section 4.6 within this Agreement.

5.3.3 If the employee does not successfully complete the DAP:

- The employee will be placed on leave for a period equivalent to one (1) month per year of service during which time they may bid to an open posted position (other than the position from which they were disqualified) for which they meet bidding qualifications; and
- The employee will use Paid Time Off (PTO) until PTO is exhausted; then the employee will be placed on leave without pay; and
- If the employee's leave of absence extends beyond the period equivalent to one (1) month per year of service with the Company, the employee shall be terminated.

Section 5.4 Field Operations Testing Failure to Qualify

5.4.1 **Application**

This Section outlines the process to be followed when a field operations employee fails to pass required testing for their current job, including but not limited to testing related to Operator Qualifications (OQ).

5.4.1.1 This process covers:

- The consequences after each failure of a required test;
- The criteria that must be met before an employee can attempt to retest;
- The time intervals between testing opportunities; and
- The resources available to the employee.

5.4.1.2 This process does not apply to:

- Testing that is part of initial position training (Refer to the Failure to Qualify During Qualifying Period process within this Article or department guidelines);or
- Performance issues identified on the job (Refer to the Failure to Maintain Performance Qualifying Standards process within this Article or Failure to Qualify During Qualifying Period process within this Article, as appropriate); or
- Weld testing (Refer to the Welding Procedure to Recertify within this Article, as appropriate).

5.4.1.3 Certification testing provided by outside agencies may be covered by this Article as determined appropriate.

5.4.2 **Process**

At any point during this process, the regular employee has the option to do any of the following, if applicable:

- Bid to an open position, if available, for which they meet bidding Qualifications;
- Apply for a Waiver per Section 4.6 within this Agreement, as available, or
- Exercise their right to return to a former position per Section 4.5 within this Agreement.

5.4.3 **First Failure**

5.4.3.1 Employee is immediately restricted from performing the task or associated task(s) (e.g., tasks connected to a failed Abnormal Operating Condition [AOC]), unless directed by a qualified worker, as permitted and approved by management. If the employee will not be directed by a qualified worker, the employee will be assigned work that does not involve performing the associated task(s) for which they are now unqualified, if such work is available.

5.4.3.2 The employee will be provided focused training on the tasks or AOCs, which may include individual review, training, and/or time to practice or study as deemed appropriate by a training representative, with consideration of input from the employee. Training will be documented on the FTQ Training Documentation form.

5.4.3.3 On the day of first failure:

- Employee may be afforded additional time to prepare (e.g., receive training or study) for retesting, as necessary.
- Employee may choose to utilize PTO or leave without pay, as appropriate, for rest of shift. Such PTO will be approved without penalty.

5.4.3.4 The employee must be scheduled to retest at a minimum next shift and maximum of fourteen (14) calendar days, excluding scheduled PTO or approved leave. Within this timeframe and with regard to input from the employee, a training representative will schedule retesting. Any exceptions to minimum or maximum time to retest must be approved by the Training Manager or designee.

5.4.4 **Second Failure**

5.4.4.1 Employee restriction from performing the associated task(s) continues, unless directed by a qualified worker, as permitted and approved by management. If the employee will not be directed by a qualified worker, the employee will continue to be assigned work that does not involve performing the task(s) for which they are now unqualified, if such work is available.

5.4.4.2 Prior to retraining, the employee will have a meeting with their Supervisor, a Union Steward if one is requested, and a representative from Human Resources (HR) to review this Article and discuss concerns and options.

5.4.4.3 The employee will be provided focused training on the tasks or AOCs, which may include individual review, training, and/or time to practice or study as deemed appropriate by a training representative, with consideration of input from the employee. The employee may request to waive the focused training session. Training will be documented on the FTQ Training Documentation form.

5.4.4.4 The employee must be scheduled to retest at a minimum seven (7) calendar days and maximum of thirty (30) calendar days, excluding scheduled PTO or approved leave. Within this timeframe and with regard to input from the employee, a training representative will schedule retesting. Any exceptions to minimum or maximum time to retest must be approved by the Training Manager or designee.

5.4.5 **Third Failure**

5.4.5.1 If the employee is in their qualifying period, see Failure to Qualify During Qualifying Period process within this Article. If the previous position held by the employee requires the same task, then the employee moves into redeployment.

5.4.5.2 If the employee is not in their qualifying period:

- Following third failure of a required test for requalification (i.e., employee has previously passed testing and was “qualified”).
- Employee will be placed on leave for a period equivalent to one (1) month per full year completed from date of hire, during which time they may bid to an open position (other than the position for which they were disqualified) for which they meet bidding qualifications.
- Employee will use all accrued and banked PTO until PTO is exhausted; then employee will continue on leave without pay.

- If the employee's leave of absence extends beyond the period equivalent to one (1) month per year of service with the Company, the employee shall be terminated.

Following third failure of a required test on a new task or content area introduced to an incumbent's position:

- Employee will be placed on leave for a period equivalent to one (1) month per full year completed from date of hire, during which time they may bid to an open position (other than the position for which they were disqualified) for which they meet bidding qualifications.

- While on leave, the employee may be assigned to temporary work, as available. Assignments of temporary work will not exceed one (1) month per year of service up to a maximum of twelve (12) months from the date of the third (3rd) failure. Days assigned to temporary work do not extend the length of the leave of absence.

- Employee will use all accrued and banked PTO until PTO is exhausted; then the employee will continue on leave without pay.

- Once PTO is exhausted, the employee is removed from their current position and will be reclassified to Pay Group M, Experienced Pay Rate. Employee continues to accumulate only Company seniority.

- While performing temporary work, additional PTO will be accrued at Pay Group M. When temporary work is not available, the employee will use additional accrued PTO until PTO is exhausted; then the employee will be returned to leave without pay.

- Employee will not be eligible for preferential bidding, redeployment, or bumping as a result of this process.

- If the employee's leave of absence extends beyond the period equivalent to one (1) month per year of service with the Company, the employee shall be terminated.

5.4.6 An employee who has successfully bid to another job or exercised the waiver option at any point during this process may reapply for the position (if available) after a period of one (1) year if the employee can demonstrate that a substantial change has occurred making it possible for the employee to qualify, based upon management's approval.

Section 5.5 Welding Procedure to Recertify

5.5.1 Application

This procedure applies to all regular employees who are required to maintain Welding qualifications. This procedure covers failure on any of the following Welding tests:

- Requalification Testing
- Probable Cause Testing
- Random Testing

It is the employee's responsibility to actively participate in this process.

5.5.2 First Failure

- Employee is immediately restricted from performing the task.
- Employee is issued Welding Documented Verbal Warning.
- Employee does not earn days toward Experienced rate, if at Entry rate.
- Employee is provided a minimum of eight (8) hours of formal, paid, documented training.
- The minimum time to retest is the second (2nd) business day after failure. Maximum time to retest is fourteen (14) calendar days after failure. Any exceptions to minimum or maximum time to retest must be approved by Management.

5.5.3 Second Failure

- Employee restriction from performing the task continues.
- Refer to "Failure to Maintain Performance Qualifying Standards" or "Failure to Qualify During Qualifying Period" process. Employee issued Welding DAP.
- Employees at the Experienced rate return to Entry rate of their current grade.
- Employee is provided a minimum of eight (8) hours of formal, paid, documented training.
- The minimum time to retest is fourteen (14) calendar days after failure. Maximum time to retest is thirty (30) calendar days after failure. Any exceptions to minimum or maximum time to retest must be approved by Management.

5.5.4 **Third Failure**

- Refer to “Failure to Maintain Performance Qualifying Standards” or “Failure to Qualify During Qualifying Period” processes within this Article.
- Loss of position.
- One (1) year minimum from loss of position to bid on open Welding position.

ARTICLE 6
WORKING CONDITIONS

Section 6.1 Schedules and Overtime

This Article recognizes the fact that the Company must provide uninterrupted continuous service to our customers, twenty-four (24) hours per day, seven (7) days per week, as a matter of public safety and health. In accordance with Article 2 within this Agreement, the Company retains the right to manage the business and direct the work and workforce, including the right to determine schedules and require overtime, subject to the rules listed below.

6.1.1 **General Definitions and Rules**

6.1.1.1 Workweek: For the purposes of calculating overtime and establishing schedules, the seven (7) day workweek for all employees begins at 12:01 a.m. on Monday.

6.1.1.2 Work Schedule: For most employees, a regular full-time schedule will be five (5) workdays of eight (8) hours duration; including two (2) consecutive days off. Some work groups have alternate schedules which may be required by Management based on business needs. Work schedules define the workdays and shifts and shall be documented by each department and/or workgroup as appropriate and will be made available to all employees on the Company intranet.

Employee selection process guidelines for work outside a typical schedule, such as 6th and 7th day, night work, or out of town work, will include recognition and application of Job Seniority, and will be made available to all employees on the Company intranet.

6.1.1.3 Workday: Each employee’s workday begins at the start of their shift and continues for twenty-four (24) hours or until the beginning of their next shift, whichever is sooner. For payroll purposes, all hours worked on a workday will be paid based on the start of the shift.

6.1.1.4 Shift: An employee's shift is defined as scheduled working hours within a workday.

6.1.1.5 Shift types are defined based on the scheduled start time as follows:

Shift Type	Start Time
Day Shift	06:00 a.m. – 9:59 a.m.
Swing Shift	10:00 a.m. – 5:59 p.m.
Graveyard	06:00 p.m. – 5:59 a.m.

6.1.1.6 For work groups that operate a 24/7 schedule, starting times will be rotated as equitably as practicable between members of the same position.

6.1.1.7 Work groups that offer shift bid opportunities will do so at least annually to eligible workers in Job Seniority order. Processes will be developed and documented by department and/or work group as appropriate and will be made available to all employees on the Company intranet.

6.1.1.8 The Parties agree that there shall be a minimum of an eight (8) hour period between scheduled shifts.

6.1.1.9 An employee who reports for work on a regularly scheduled workday and is then sent home for lack of work shall be paid for their entire scheduled shift at the rate such employee would have received if they worked.

6.1.1.10 Unless otherwise stated within the Agreement, overtime is calculated on actual hours worked, not hours paid. The calculation of time worked for overtime purposes shall include paid leave, paid rest period, holidays, floating holidays, and PTO used.

6.1.1.11 If pay is due to an employee under two (2) or more provisions under this Article, only the highest payment required under any provision of this Article shall be paid. This should only be used when a situation is ambiguous and all Articles within the Agreement have been reviewed.

6.1.1.12 Employees will not be required or expected to perform any work before their designated start time or after the end of their shift without compensation.

6.1.2 Flexible Schedules/Work Arrangements

6.1.2.1 An employee may work a flexible work schedule (e.g., four [4] ten-hour days), flex start and end times of their shift, and/or make up lost time in their work schedule within the same workweek if mutually agreed upon by the employee and Management. Not every Flexible Schedule/Work Arrangement option will be available for every work group, position, or employee and approval of a flexible schedule/work arrangement will be at the Manager's

discretion. Company policies and department guidelines will define specific and/or additional requirements for a flexible schedule/work arrangement.

6.1.2.2 If an employee requests a temporary flexible work schedule, this temporary schedule is not considered a regularly scheduled workweek and Saturday/Sunday and Shift Work premiums will not apply for the shift(s) impacted by the temporary schedule change.

6.1.2.3 Remote Work. An employee may request to work remotely, which allows a reporting location off Company property. An employee who is working remotely must log in to the appropriate Company software systems at the employee's scheduled start time. The remote work location is not considered a fixed official work location/station. Remote work will not be available for every work group, position, or employee. Hybrid work schedules will be approved on a case-by-case basis. Flexible Work Company policy and department guidelines will define specific and/or additional requirements for working remotely and will be made available to all employees on the Company intranet.

6.1.3 Unplanned Schedule and Shift Changes

6.1.3.1 Unplanned Schedule Changes

Changes in an employee's scheduled workdays affecting the employee's scheduled days off made with less than forty-eight (48) hours advance notice are considered Unplanned Schedule Changes and hours worked shall be paid at the applicable overtime rate.

6.1.3.2 Unplanned Shift Changes

Changes in an employee's scheduled working hours (i.e., shift) made with less than twelve (12) hours notification prior to the start of the new shift are considered Unplanned Shift Changes and include:

- When an employee meets the conditions for a rest period under 6.1.6 within this Article and is required to return to work before the end of the employee's eight (8) hour rest period, all hours worked are considered an Unplanned Shift Change and paid per 11.5.1.

- After the start of an employee's shift, if an employee is released and rescheduled for a later start time, all hours worked are considered an Unplanned Shift Change and paid per 11.5.1.

6.1.3.3 Unplanned Shift Changes are not eligible for schedule-based premium pay rates.

6.1.3.4 It is not an Unplanned Shift Change when a Call-In extends into the regularly scheduled shift.

6.1.4 On-Call Assignment

6.1.4.1 On-Call Assignments shall be filled between the qualified resource center, department and/or workgroup employees as equitably as practicable; qualified employees are those identified by Management as having the necessary skills to handle emergency response work.

6.1.4.2 If employees are assigned a Company vehicle for the purposes of emergency response when On-Call, travel to and from work is not considered commuting for the purposes of 6.1.3.2 nor is it considered paid time. Employees working On-Call Assignment are required to accept any Call-Ins.

6.1.4.3 Employees are responsible for the accuracy of their contact information. On-Call guidelines shall be documented by each department and/or workgroup as applicable and will be made available to all employees on the Company intranet.

6.1.4.4 An On-Call Assignment on an employee's regularly scheduled workday begins at the end of the employee's regular work shift including overtime worked beyond the end of the employee's regular shift and ends at the start of the employee's next shift the following day. An On-Call Assignment on an employee's scheduled days off begins at their normal shift start time and ends after twenty-four (24) hours or the start of the employee's next regular shift.

6.1.4.5 If an employee has an On-Call Assignment for which the Company provides lodging, the Company will provide a minimum of eight (8) hours work for the employee on the assigned day. Current guidelines for establishing On-Call Assignments will be utilized.

6.1.4.6 Pay for On-Call Assignment will be in accordance with 11.5.3 within this Agreement.

6.1.5 Call-In

6.1.5.1 When an Employee is notified to report for emergency, immediate or unplanned work either before or after completion of the employee's shift, or on a scheduled day off, the time worked shall be considered a Call-In.

6.1.5.2 For Call-Ins that extend into a regularly scheduled shift, the Call-In rate will be paid until the start of the regular scheduled shift or for a minimum of 2

hours, whichever is greater. The regular scheduled shift will be worked and paid at the regular rate of pay.

6.1.5.3 Employees may be required to work through to the end of their original shift and may be required to work additional overtime.

6.1.5.4 Call-Ins are not eligible for schedule based premium pay rates.

6.1.5.5 It is not a Call-In when:

- An employee is requested to extend hours in conjunction with a regular shift.
- An employee is requested at least twelve (12) hours in advance to work additional hours on a scheduled day off. A minimum of two (2) hours at the appropriate overtime rate will apply and the work time shall start at the reporting location.

6.1.5.6 **Call-In Procedure.** Call-In procedures shall be developed and documented by each department and/or workgroup as appropriate and will be made available to all employees on the Company intranet.

6.1.5.7 For immediate response (unplanned), paid time for the Call-In begins when the employee is notified when On-Call or accepts the work for a Call-In.

6.1.5.8 For non-immediate response (planned), paid time for the Call-in begins at the agreed upon start time.

6.1.5.9 Call-Ins that do not extend into a regularly scheduled shift end upon completion of work and return to the reporting location unless an employee is assigned a Company vehicle during this time period, in which case time ends when the employee returns to their originating location.

6.1.5.10 Employees called in will be paid a minimum of two (2) hours at two (2) times their rate of pay. All subsequent Call-Ins that begin on the same scheduled day off or workday will be paid at two (2) times the employee's rate of pay for actual hours worked. Employees called in are obligated to remain in contact and be available to work for the full two (2) hours that they are being compensated.

6.1.6 Excused Rest Period

When an employee is called into work and the last Call-In ends less than eight (8) hours before start of the employees' next scheduled shift, the employee will be given eight (8) hours of rest if:

- The Call-In totals six (6) or more hours duration (consecutive or aggregate); or

- The employee has three (3) or more Call-Ins within the twelve (12) hour period before the start of their next scheduled shift.

6.1.6.1 Additionally, for safety reasons, following unscheduled work and/or Call-Ins prior to a regularly scheduled shift, Management reserves the right to excuse an Employee for some or all of the employee's regularly scheduled shift in accordance with the established Company policy and procedure and the shift will be paid per 6.1.6.3.

6.1.6.2 An employee that does not qualify for a rest period or after a rest period feels they cannot safely perform their assigned duties may request to be excused for the beginning or remainder of their shift not to exceed more than one half of the regular scheduled shift. Available PTO must be used prior to leave without pay.

6.1.6.3 Hours excused from original shift shall be paid at the straight-time rate and shall be counted as time worked for the purpose of calculating overtime.

6.1.7 **Paid Transition Time**

At Management's discretion, when transitioning from scheduled nights to days, or scheduled days to nights, the employee may receive pay per 6.1.6.3 in lieu of working a shift to ensure appropriate rest.

Section 6.2 Work Reporting Methods

6.2.1 **General**

Work reporting methods, including facility-based reporting, jobsite reporting and telecommuting, are defined below. All employees have a work reporting method, in addition to a Company-based location, both of which are determined and assigned by the Company. The Company may change employees' Company-based location and work reporting method based on business needs.

6.2.1.1 Work reporting methods contained in Section 6.2 do not address mileage reimbursement or compensation for time spent traveling in accordance with provisions outlined in this Article.

6.2.1.2 When a work reporting method other than facility-based reporting is utilized, department/workgroup guidelines addressing the application of the method will be established and utilized.

6.2.2 Facility-Based Reporting Method

The facility-based reporting method establishes a location to which the employee reports (e.g., resource center, corporate office or storage facility). Under this method, the Company-based location is the reporting location. The employee must be at that reporting location and ready to work at the employee's scheduled start time.

6.2.3 Travel When Facility-Based Reporting

Employees beginning and ending their shift at a temporary location within thirty (30) miles of their Company-based location will travel to and from the temporary location on their own time.

- Employees beginning and ending their shift at a temporary location greater than thirty (30) miles from their Company-based location will be compensated for travel time.

- Employees beginning and ending their shift at a temporary location will be paid mileage based on the distance between their Company-based location and the temporary location, unless a Company vehicle or other transportation is provided.

6.2.4 Jobsite Reporting Method

The jobsite reporting method establishes varying reporting locations (e.g., job sites, facilities or geographic work areas) to which the employee reports. The employee must be at the employee's reporting location and ready to work at their scheduled start time. Additionally, the employee must be at the employee's reporting location at the end of their shift, unless otherwise directed. Under this method, the Company-based location is not considered the fixed official work location/station.

6.2.5 Travel When Jobsite Reporting

For jobsite reporting, the region is defined as the geographic area within a forty-five (45) mile radius of the Company-based location.

For travel within the region:

- Time spent traveling to and from the reporting location is considered personal commuting time and is not time worked.

- If an employee uses a personal vehicle to commute to and from the reporting location, there will be no mileage reimbursement for that commute.

For travel outside the region:

- Time spent traveling to and from the reporting location will be compensated as time worked based on the calculated travel time from the employee's Company-based location to the reporting location.

- If an employee uses a personal vehicle to commute to and from the reporting location, mileage reimbursement will be provided for that commute based on the calculated mileage between the employee's Company-based location and the reporting location.

Section 6.3 Health and Safety

6.3.1 It is the Company's responsibility to provide a safe work environment and to operate its system safely. The parties mutually agree to promote safe work and stop work practices, which include providing appropriate personnel and equipment to meet health and safety obligations. Personal Protective Equipment (PPE) allowances provided by the Company shall be in accordance with Section 17.8 within this Agreement; unless otherwise required by applicable law.

6.3.2 All employees are subject to the Company's Drug and Alcohol policies.

Section 6.4 Emergency Operations

If adverse or emergency conditions exist, employees may be given alternative work assignments, schedules, shifts, and/or work locations. The Parties agree that the Company will maintain safe operation in their service territory.

Mutual Aid/Assistance. In the event of mutual aid requested by another utility, the employee selection process will include recognition and application of Job Seniority and will be made available to all employees on the Company intranet.

Section 6.5 Dash Camera

The vehicle dash cameras are to be used for triggering events such as collisions, litigation around collisions, and public complaints or other triggering events such as hard braking. Video footage from a triggering event will first be reviewed by a third party. The Company and the Union recognize the intent of the dash cameras is to improve driving habits and the overall safety of our employees, customers, and the communities in which they drive.

The camera will only upload video footage for viewing when there has been a triggering event or as requested by the Company. The cameras will not be used for real-time video or audio surveillance of employees, or to track employee work performance.

At no time will the device be used for audio voice recording of employees.

The use of cab facing cameras are not considered discipline. The cab facing cameras will only be activated in conjunction with discipline related to violations of Company Driving Policies. Activation of cab facing cameras longer than one hundred and eighty (180) calendar days must be signed by the Manager and the Union Representative. Forward facing cameras will continue to be used.

ARTICLE 7
EMPLOYEE DISPLACEMENT

Section 7.1 General

Employee displacement includes work redesign, redeployment, lack of work, bumping process, and layoff.

Section 7.2 Work Redesign

Work redesign may occur within a department, a workgroup, a resource center, or company-wide resulting in employee position status change or displacement from position. Before a work redesign, the Company will bargain the impact of the redesign and identify issues that are covered under this Agreement or are considered mandatory subjects of bargaining and must be resolved before the application of the Company's Work Redesign Job Allocation Process. When a redesign has projected reductions in occupied positions or changes in Company-based location, the Company agrees to inform the Union in accordance with Section 7.3 to this Article and Company processes.

7.2.1 **Acceptance or Declination Timelines**

Regarding position selection, the employee shall be given a minimum of forty-eight (48) hours (two [2] complete workdays) from point of notification to make their decision.

Failure or refusal by a regular employee to complete the documents within the agreed timeframe will be considered a declination.

7.2.2 **Position Reinstatement**

An eliminated position in the impacted group that is reinstated within one (1) year of a regular employee's displacement date will be offered in Company seniority order to those regular employees displaced by this redesign provided that the reinstated position is not in a location declined by that employee. This reinstatement applies to regular employees displaced due to the initial redesign only and not regular employees displaced due to any subsequent assignments or bumps.

Section 7.3 Redeployment

7.3.1 Redeployment is a process utilized to retain a regular employee whose job has been eliminated due to work redesign, or may be used in a regional lack of work if mutually agreed upon by the Union and the Company. This process may also be used as a result of Failure to Qualify During Qualifying Period as defined in Section 5.2 within this Agreement.

7.3.2 This process shall include preferential consideration for the displaced regular employee in the bidding and selection process for equivalent or lower grade positions for which the employee meets bidding qualifications. As an alternative to bumping, the Company may assign such employee to a position for which the employee meets bidding qualifications. Refer to the Redeployment Process and Failure to Qualify During Qualifying Period in accordance with Article 5 within this Agreement.

Section 7.4 Lack of Work

7.4.1 If the Company declares a regional lack of work in a location or workgroup, regular employees may be permanently assigned from one work location to another. Regular employees involved in regional lack of work will have their pay guaranteed per Section 1.5 within this Agreement. Once the Company has declared a regional lack of work, the impact and application of that determination shall be mutually agreed upon by the Union and the Company.

7.4.2 If the Company declares a Company-wide lack of work, the bumping process shall be applied per Section 7.5 to this Article.

7.4.3 The Parties agree that in the case of unforeseen events that could cause the need for a temporary reduction in the amount of work available either Company-wide, in a location, or workgroup, the Parties will meet to determine the method by which they may meet the challenges of the unforeseen event(s). Before any forced reduction in available work hours is initiated, the Parties will exhaust as many voluntary options as appropriate that meet the joint interests of the parties. Situations covered under this Section are not considered a permanent event and will not be subject to other provisions of this agreement such as layoff or bumping rights.

Section 7.5 Bumping

Bumping, as described in 7.5.1 to this Article, General Bumping Principles, and in the Company process, may be available for use in the following circumstances:

- Redeployment resulting from work redesign (refer to the Redeployment Process in accordance with Section 7.3 within this Agreement)

- Company-declared lack of work.

7.5.1 General Bumping Principles

An employee:

- Cannot bump an employee who has more Company seniority.
- Cannot bump into a higher graded job.
- Cannot bump into a job for which bidding qualifications are not met as defined in Article 4 within this Agreement.
- Cannot bump into a previously declined job at any location due to Work Redesign.
- Cannot bump into a previously declined job at that specific location due to assignment in redeployment.
- Can decline to bump into positions that change their employment status (FT, PT>20, PT<20). In such cases, the Parties will convene a Committee to provide oversight on significant redeployment and bumping activities. The process will be based on seniority, and the Committee will also consider employee preference for work location, current job held, previous jobs worked and maintaining group.
- Can bump into a different employment status (FT, PT>20, PT<20), but must elect to change employment status accordingly.

Section 7.6 Layoff

The parties agree that a layoff will only occur when the Company determines a need to reduce its workforce. The Company may layoff any employee who has not earned employment security as defined in Section 1.4 within this Agreement.

Regular employees shall be given ten (10) working days' advance notice before a layoff expected to last longer than ten (10) working days.

ARTICLE 8
PERFORMANCE DEVELOPMENT AND MANAGEMENT

Section 8.1 Performance Appraisal

Management will maintain an appraisal system to determine if performance requirements have been or continue to be satisfied for the Probationary period and the Qualifying period.

Line of Progression

Advancing within Line of Progression jobs requires a regular employee currently meet all the standards for the previous job prior to being eligible to move into the next job.

Section 8.2 Performance Development Plan

A Performance Development Plan (PDP) shall be used for incumbent regular employees who have been assessed as "not meeting" performance qualifying standards. However, Performance Development Plans are not to be used for term employees, probationary regular employees, and regular employees in their qualifying period, or situations warranting immediate use of the progressive discipline process. The Performance Development Plan will be kept in Human Resources (HR) in the employee's personnel file.

Successful completion of the Performance Development Plan does not change anniversary dates for pay progression timelines.

8.2.1 Responsibility of the Supervisor

Using a Performance Development Plan, Supervisors shall provide monitoring of regular employees so that the employees are aware of any standards they are not meeting, and what they need to do to meet the standard.

8.2.2 Responsibility of the Employee

Regular employees on a Performance Development Plan have the responsibility to follow through on the agreed plan, including any training or use of tools/resources provided by the Supervisor, and to inform the Supervisor if there are any barriers to completing the plan. Regular employees who know they are not meeting an essential function may ask Supervisors for a Performance Development Plan to help ensure that they can meet the standards.

Section 8.3 Statement of Expectations

A Statement of Expectations is a non-disciplinary coaching tool a Supervisor may use to outline and help an employee understand the Supervisor's expectations of the employee.

At times a Supervisor may choose to provide an Employee with a Statement of Expectations to further communicate or document expectations. A Statement of Expectations may be retained in the employee's personnel file.

Section 8.4 Relationship to the Disciplinary Process

A Performance Development Plan or Statement of Expectations **cannot** be construed as the first step of the disciplinary process and cannot be used or referenced in any future disciplinary documents. All disciplinary action must be conducted as described in Article 20 within this Agreement.

ARTICLE 9
ATTENDANCE

Section 9.1 General

The Union and the Company agree that employees' regular and reliable attendance is critical to the success of the Company. The Parties further agree that late arrivals to work, early departures from work, and other unscheduled and unapproved absences are disruptive and should be avoided. Employees are expected to be at work each scheduled workday, on time and ready and able to work and all employees are expected to have regular, reliable and punctual attendance. Appropriate use of Paid Time Off (PTO), disability benefits (Short-Term Disability, Long-Term Disability and Workers' Compensation), and protected forms of leave as defined by Company policy are essential to employee well-being, a healthy work environment, and a committed workforce, which are integral factors in Company performance.

Section 9.2 Relationship to Paid Time Off

Employees may use Paid Time Off (PTO) per Article 12 within this Agreement for vacation, illness, accident, family illness, medical appointments or personal business.

Section 9.3 Attendance Guidelines

9.3.1 **Definitions**

9.3.1.1 Time away from scheduled work is:

- **Absence**: one (1) hour or more of time away is considered one (1) absence. This includes late arrivals and early departures as well as full day absences.
- **Tardy**: Late arrivals or returns and early departures of less than one (1) hour. This includes late arrivals or returns from breaks or meal periods.
- **Days Off**: Negotiated days off such as PTO, holidays, floating days, bereavement leave, etc.

9.3.1.2 **Approved**: Time away will be considered approved when the time away is:

- Protected leave, defined under applicable local, state or federal laws (i.e., FMLA, OFLA, WFLA, *Oregon and Washington Paid Sick Leave), or relevant leave laws. Protected leave is applied before absences are determined to be unapproved. Employees need to work with Matrix or current leave administrator and the Human Resources team to determine whether any particular absence is covered by protected leave.

* As of June 1, 2024, Oregon Paid Sick Leave is 40 hours of protected leave and Washington State Sick Leave is 50 hours of protected leave. Subject to change, refer to Company Policy.

- Discipline or retaliation based on an employee's use of protected leave is not permitted by law. Employees are responsible for providing appropriate notice and documentation of protected leave as described in the Company's Family Medical Leave policy.

- Approved bereavement leave (per Article 13 within this Agreement), approved military leave, protected leave (as defined in Company policy), jury duty, witness duty on behalf of NW Natural, and approved absences due to industrially related injuries or illnesses.

- Granted approval with at least forty-eight (48) hours' notice, e.g., floating days, PTO, appointments. *

  *Requests for time away from work with less than forty-eight (48) hours' notice may be considered approved. This is an exception and the decision is at the sole discretion of the Supervisor/Manager/designated approving authority.

9.3.1.3 **Unapproved:** An absence will be considered unapproved when the time away from work does not meet the criteria for approved absence within this Article or if the employee failed to notify their department's designated approving authority or failed to follow the applicable department reporting procedures for the absence, tardy, or early departure before the start of the scheduled shift or as soon as practicable upon the employee's knowledge that they would be late or absent.

9.3.1.4 **Use of PTO for Unapproved Absence:** Employees may use their accrued Paid Time Off (PTO) for unanticipated absences with less than forty-eight (48) hours' advance notice, but the time away is not considered approved just because the employee has PTO available to cover the time they were away from work.

9.3.1.5 **Unacceptable Amounts/Patterns of Unapproved Absences:** An unacceptable pattern of unapproved absence is demonstrated generally by the following:

- Except as provided in 9.3.1.2 to this Article, after five (5) unapproved absences within a rolling twelve (12) month period measured backward from the date of the most recent unapproved absence.

- Unacceptable amounts/patterns of unapproved absence may be subject to discipline per Article 20 within this Agreement. The Company has

discretion to assess an employee's overall attendance record as it relates to unapproved absences to determine if there is an unacceptable pattern and, if so, the appropriate level of discipline.

9.3.1.6 **No Call/No Show:** An employee is considered a No Call/No Show when the employee fails to report for work without contacting their Supervisor (or the Supervisor's documented designee, or if no documented designee, the next level of Supervision) or without following any applicable department-level procedures for absence notification. After three (3) or more consecutive workdays in which a No Call/No Show has occurred, an employee is considered to have voluntarily abandoned employment with the Company.

ARTICLE 10
ISSUE RESOLUTION

Section 10.1 Introduction

The Issue Resolution Process is the agreed to method to address questions, conflicts and disputes, regarding any provisions of this Agreement, at the lowest level possible prior to going through the Grievance Process. The Issue Resolution Process is not intended to be a substitute for direct dialogue between employee and Supervisor. The objective of the Issue Resolution Process is to promote open and continuous communication to determine what's right, not who's right, regarding concerns in the workplace. This process is established on the premise of trust, respect and the mutual goal of resolving issues at the earliest opportunity and appropriate level.

Section 10.2 Issue Resolution Process

Step One

Prior to filing a formal issue (OPEIU Local 11 form), the employee and the Supervisor should first meet informally to discuss and attempt to resolve the issue(s).

Step Two

In the event there is no resolution, the Steward, the employee and the Supervisor should meet and discuss the issue(s) and attempt to resolve the issue(s) informally.

Section 10.3 The Issue Resolution Committee

Step Three

Should the issue not get resolved between the employee, the Steward and the Supervisor, it shall be presented to an Issue Resolution Committee, hereinafter referred to as the "Committee," for consideration.

10.3.1 An Issue Resolution Committee is organized on an as needed basis for the purpose of dealing with possible conflict(s) with the Agreement and in accordance with Section 10.1 to this Article. The Committee shall not have the authority to change, delete, or modify any terms and conditions of the Agreement.

10.3.2 The Committee shall be comprised of two (2) bargaining unit members from the current list of Stewards and Chief Stewards appointed by the Union and two (2) management employees appointed by the Company. These Committee members will be mutually agreed upon by the LMC Co-Chairs. The appointed Committee members with mutual agreement may at their discretion bring in a subject matter expert (SME).

10.3.3 For any single topic the Committee may meet for up to three (3) hours total.

The Committee shall consider only those contract issues which are mutually agreed upon or otherwise designated in the Agreement or bylaws of the Committee.

The Committee resolution decisions will be made by consensus and the Committee shall submit their findings and decision to the employee, Supervisor, and the LMC Co-Chairs. Resolutions that are changes to work rules/conditions or other items that may impact other workgroups or employees shall be submitted to the LMC Co-Chairs for review, approval, and communication to members and/or workgroups impacted.

Should these four (4) Committee members not reach consensus within fourteen (14) calendar days, they shall immediately communicate this to the LMC Co-Chairs for resolution or movement to the grievance process.

All timelines above may be extended by mutual agreement of the Parties. If extended, notification will generally be provided to all parties along with status and anticipated action within three (3) working days of the decision to extend or as soon as possible thereafter.

Nothing in this language precludes a party from withdrawing an issue at any time with notification to the Union office and Human Resources.

ARTICLE 11
WAGES

Section 11.1 Compensation

The parties agree to ensure that there will be a compensation system that supports business operations while maintaining internal and external equity.

11.1.1 **Pay Rates.** Each job will be placed in a pay group. Each pay group will have at least two (2) pay steps.

11.1.2 **Entry Rate.** This rate of pay is one step below the Experienced Rate.

11.1.2.1 An employee entering a position which has only two (2) pay steps shall receive the Entry Rate when:

- Entering a new position in a higher pay grade,
- Entering a new position in the same grade when an employee is currently receiving the entry pay rate,
- Entering the same or lower position and an employee has never received the Experienced Rate for either position.

11.1.3 **Experienced Rate.** This is the top rate of pay an employee will receive for that grade.

11.1.3.1 In order to receive the Experienced Rate an employee must first successfully complete all of the following:

- Any applicable in training programs or required certifications.
- Receive the Entry Rate for the new position for a period not less than two hundred and sixty (260) working days (credit towards the two hundred and sixty [260] working days will be given for any previous days worked in the same or higher grade at the entry rate). The parties agree for absences of twenty (20) workdays or more, the Company may, at its sole discretion, extend the two hundred and sixty (260) day timeframe by the same number of workdays missed.
- The qualifying period for the position.

11.1.3.2 Employees who have previously held the same or higher grade and who have received the experience rate for the same or higher grade shall also be paid the experienced rate.

11.1.4 **Additional Pay Steps**

11.1.4.1 Under certain circumstances, positions may have additional pay steps. These positions must be mutually agreed to and have formal In-Training programs and as defined below.

11.1.4.2 An employee entering a position with these additional pay steps will receive the appropriate rate of pay in accordance with the provisions within this

Article. The starting rate shall not be less than eighty percent (80%) of the Experienced Rate.

11.1.4.3 A formal In-Training program is required for a position to have additional pay steps. Not all positions with a formal training program will have additional pay steps. The starting step for any such position shall not be less than eighty percent (80%) of the experienced rate as deemed appropriate by the Company.

11.1.4.4 **Positions with Approved Additional Pay Steps**

Currently, the following positions have additional pay steps. The pay steps are tied to timeframes and not to completion of training phases or qualifying periods. During the life of this Agreement, positions with additional pay steps may be added to, removed from or changed by mutual agreement between Management and the Union.

- Corrosion Technician
- Construction 2
- Service Technician (CFS 2)
- Mechanic Welder (Welding & Fabrication 4)

11.1.4.5 Time starts on the date of hire for external hires and rehires or first day of training for internal hires. Employees shall progress through Steps 1 through 4 in accordance with the schedule below.

Employees may progress from Step 4 to Step 5 (Experienced Rate), after successfully meeting all the conditions as described in 11.1.3.1 to this Article and receiving satisfactory performance evaluations. Steps as a percentage of Experienced Pay Rate are listed below:

Step	Time in Program	% of Experienced Pay Rate
1	0 months	80%
2	6 months	85%
3	12 months	90%
4	24 months	96% (Entry)
5	36 months	100%

Pay rates for internal employees entering an In-Training program will be determined as follows:

- When promoting into a job with a higher pay grade the employee shall be placed at the Step closest to their current rate of pay that results in a pay increase.

- When bidding into a job in the same pay grade, they shall be placed at the same Step the employee currently holds, except in the case of an employee who currently holds the Experienced Rate where it will be the Step below the Experienced Rate.

- When bidding into a job with a lower pay grade they shall be placed at the Step below the Experienced Rate which results in the least reduction in pay.

11.1.4.6 Internal employees entering an In-Training program at a step higher than Step 1 will advance to the next Step within the timeframes as defined in the above chart. For example, an employee who enters at Step 3 will move to the Step 4 pay rate after twelve (12) months.

11.1.4.7 **Benchmark-based Progression**

At Management's discretion, with mutual agreement from the employee, benchmark-based progression may be used for the following workgroups:

- Weld & Fab 4
- Corrosion Technician

Benchmark-based progression would allow an employee to advance to the next step/pay scale as described in 11.1.4.5, not to exceed Step 4, by completing the required testing ahead of the time-based progression. In the absence of benchmark-based progression, the employee will follow the additional step/pay scale schedule.

Section 11.2 Scheduled Annual Increases and Wage Adjustments

Increases to wages are incorporated into "Schedule B – Wage Scale" within this Agreement. These negotiated rates were achieved utilizing the guiding principle of alignment with market practices and internal equity considerations. This principle was applied to comparable companies, surveys and job matches. Internal equity ranking shall be applied by mutual agreement in comparison to peer utilities. Market matches and internal equity shall both be considered when achieving alignment.

11.2.1 An employee's rate of pay shall be adjusted depending upon the employee's current rate of pay as follows:

- Effective June 1, 2024, all bargaining unit employees shall be moved to the appropriate rate for their job group in accordance with "Schedule A – Job Titles by Pay Group" to this Agreement.

- Employees in positions covered by pay guarantees in Section 1.5 within this Agreement are covered in Section 11.4 to this Article below.

11.2.2 For Employees whose current rate of pay is equal to that contained in "Schedule B – Wage Scale," the minimum Scheduled Annual Increase is specified in the table below.

Scheduled Annual Increases	
Effective Date	**Percentage Increase**
June 1, 2024	6.0 %
December 1, 2024	4.0 %
December 1, 2025	4.0 %
December 1, 2026	4.0 %
December 1, 2027	4.0 %

Section 11.3 Job Compensation and Approval Process

11.3.1 Human Resources Professional Review

When a new bargaining unit job is established or if there is a substantive change, initiated by the Human Resource Compensation Professional or submission of the Job Compensation Evaluation Form, to the job that requires changing the job match used in the market evaluation as determined by the Human Resources Compensation Professional, the Company shall conduct a market evaluation of wages using the same comparable companies, surveys, job matches, and methodology used in the negotiations for this Agreement. For purposes of determining whether there is a substantive change to a job, the Company's Human Resources Compensation professional will make the ultimate determination which will focus on whether there is a material change in job duties that significantly affect the nature and level of the work being performed and using the process described below.

11.3.2 Labor Management Committee Review

The Labor Management Committee Leadership Team (LMC LT) will review and approve recommended changes to Job Matches, Pay Groups, Wage Rates and Adjustments as described in this Article and presented by the Company Compensation Professional following the Job Compensation Evaluation Form,

which will be made available to all employees on the Company intranet. The LMC LT reserves the right to bring in subject matter experts to inform their decisions.

11.3.3 Changes and additions of a significant nature to "Position Specific Essential Functions" will follow these steps:

(1) Employee(s) shall submit the Job Compensation Evaluation to their department Manager for consideration. The manager will consult with the HR Compensation Professional prior to approving a request for job description changes or evaluation. If after review with the HR Compensation Professional it is determined there are changes of a substantive nature to the job description that would warrant a review (material change of job duties that significantly affect the nature and level of the work), the manager will approve the job evaluation form and compensation will notify the employee that a review is pending and will be presented to the LMC-LT.

(2) If the HR Compensation Professional determines there is not a substantive change to the job to warrant a review, the HR Compensation Professional will inform the manager and requesting employee that a market review will not be completed. The HR Compensation Professional will inform the LMC Co-Chairs of the request, and non-substantive changes to the job description. The LMC Co-Chairs have the option to request a deeper review if other material information is presented to the HR Compensation Professional that was not included in the initial request.

(3) The HR Compensation Professional is responsible for communicating decisions on review requests to the LMC-LT, the requesting manager, and employee(s).

(4) The effective date of any change will be the date of the decision by the LMC-LT. If the compensation review has taken an extended period of time (i.e., more than three (3) months), the LMC-LT will agree on an appropriate effective date.

Section 11.4 Honored Pay Rate Employees

11.4.1 Effective June 1, 2024, and for the term of this Agreement, Honored Pay Rate employees shall receive a lump sum equal to the scheduled annual increase. This lump sum payment shall continue until the difference between their current rates of pay prior to the scheduled annual increase is less than three percent (3%) more than the rate of the "Schedule B – Wage Scale." At that time, they will receive that percentage amount necessary for their current wage to equal that in the "Schedule B – Wage Scale" with the difference between that amount and the scheduled annual increase in a lump sum*.

* Lump sums owed under these provisions shall be calculated based on the employee's regular and overtime earnings for pay periods ending in the preceding

twelve (12) months period prior to the increase, and shall be paid on the employee's second pay check in the month the increase was issued.

11.4.2 In the event an Honored Pay Rate employee bids into a position with a Wage Scale rate lower than the pay rate for the position the employee was placed or preferentially bid into that resulted in the pay guarantee, the employee's pay shall be decreased to the rate contained in the Wage Scale for the position into which the employee bid.

Section 11.5 Premium Pay Rates

11.5.1 Overtime Pay

11.5.1.1 An employee shall be paid at one and one-half (1.5) times the regular rate, including applicable premiums for:

- The first twelve (12) hours worked on the first scheduled day off for any time worked.
    - The first twelve (12) hours worked on an Unplanned Schedule Change or an Unplanned Shift Change except as provided for in 11.5.1.2 to this Article.
- Hours worked in excess of an employee's shift (minimum eight [8] hours) when working a regular full-time schedule.
- Hours worked in excess of forty (40) regular hours in a workweek, when working a regular full-time, flexible or part-time schedule.

11.5.1.2 An employee shall be paid at two (2) times the employee's regular rate, including applicable premiums for:

- More than four (4) hours worked in excess of an employee's shift (minimum eight [8] hours), or hours worked in excess of forty (40) regular hours plus twenty (20) time-and-one-half hours in a workweek.
- All hours worked on the second scheduled day off in a workweek when no schedule change is involved. This applies only if an employee works at least eight (8) hours on the first scheduled day off.
- All hours worked on a Sunday that is a scheduled day off.
- Call-Ins as provided for in 6.1.5 within this Agreement.
- All hours worked on holidays as provided for in Section 14.5 within this Agreement.

11.5.2 **Pay for On-Call Assignment**

- Sixty-nine dollars and fifty-three cents ($69.53) for each On-Call Assignment on an employee's regularly scheduled workday,

- One hundred four dollars and twenty-nine cents ($104.29) for each On-Call Assignment on an employee's scheduled days off, and

- One hundred thirty-five dollars and forty-six cents ($135.46) for each On-Call Assignment that begins on an actual (not an Observed) holiday as defined in Section 14.1 within this Agreement.

Effective June 1, 2024, the amounts listed in this Section above will be increased annually at the same time and percentage as the scheduled annual increase in accordance with 11.2.2 to this Article.

11.5.3 **Recognition for On-Call Assignments**

11.5.3.1 Employees who have eighty (80) to one hundred four (104) On-Call Assignments in a calendar year will receive a payment of one and a half percent (1.5%) of that Employee's regular and overtime earnings for that same calendar year payable in a lump sum on the second regularly scheduled paycheck in January of the next year. An employee who retires or separates employment prior to the end of the calendar year and has earned the On-Call Assignment Recognition Incentive shall be paid the on-Call Assignment Incentive with their final paycheck.

11.5.3.2 Employees who have one hundred five (105) or more On-Call Assignments in a calendar year will receive a payment of two and a half percent (2.5%) of that Employee's regular and overtime earnings for that same calendar year payable in a lump sum on the second regularly scheduled paycheck in January of the next year. An employee who retires or separates employment prior to the end of the calendar year and has earned the On-Call Assignment Recognition Incentive shall be paid the on-Call Assignment Incentive with their final paycheck.

11.5.3.3 Call-In pay is in addition to On-Call Assignment pay as provided in 6.1.5 within this Agreement. On-Call Assignment periods are not to be counted as time worked for the purpose of calculating overtime.

11.5.4 **Schedule Based Premium Pay**

11.5.4.1 **Saturday/Sunday Pay.** Hours worked on Saturday and/or Sunday as part of the employee's regularly scheduled workweek; as defined in Article 6 within this Agreement; shall be compensated an additional four dollars ($4.00) per hour.

11.5.4.2 **Shift Work Pay.** Hours worked on Swing and/or Graveyard shift as part of the employee's regularly scheduled workweek shall be compensated an additional two dollars ($2.00) per hour for Swing shift and three dollars ($3.00) per hour for Graveyard shift.

11.5.5 **Skill Based Premium Pay**

11.5.5.1 **HAZWOPER Work Pay.** Employees trained to perform duties identified by the Company as HAZWOPER (Hazardous Waste Operations and Emergency Response) will receive an additional three dollars and fifty cents ($3.50) per hour for the entire shift when performing such duties.

11.5.5.2 **Bilingual Pay.** All hours worked by an employee who is qualified for and participating in an approved Bilingual Program shall be compensated an additional two dollars ($2.00) per hour.

11.5.5.3 **High Angle Work Pay.** Employees identified, trained and certified in high angle work and rescue skills shall be paid an additional three dollars and fifty cents ($3.50) per hour when performing such duties.

When an employee is eligible and earning premium pay under any of the categories listed in this Section, that premium pay will be included when calculating the employee's overtime rate.

Section 11.6 Accurate Timekeeping

It is the Company's intention to perform accurate timekeeping and payroll entry. In the event of a discrepancy with an employee's submitted time, the employee will be contacted as soon as possible to identify and correct the discrepancy.

ARTICLE 12
PAID TIME OFF (PTO)

Section 12.1 General

Paid Time Off (PTO) benefits are available to employees and may be used for vacation, illness, accident, family illness, medical appointments, or other personal business. PTO shall accrue according to Length of Service with the Company as defined in Section 12.3 to this Article.

12.1.1 **Guidelines for PTO Scheduling**

Established PTO selection groups based on a department, work group or resource center with more than one (1) bargaining unit employee may create their own guidelines for PTO scheduling.

These guidelines shall be made available to all employees on the Company intranet and:

- Include signatures of the department Manager and the Union Representative.
- Include date the guidelines were completed or reviewed.
- Be reviewed no more than once each calendar year, and changes must be finalized sixty (60) days prior to the start of the department's PTO selection process.

12.1.2 Unless otherwise defined in an employee's department, work group or resource center guidelines, scheduling of available PTO will be as follows:

- During the first round of scheduling, full work weeks, including weeks with holidays, and consecutive weeks may be scheduled.
- During the second round, partial weeks and single days can be scheduled.
- Carry over PTO hours accrued in previous years may be scheduled once all employees have been afforded the opportunity to schedule their current year accrual.
- Groups without guidelines will review the need for guidelines not more than annually and if mutually agreed to, then, the group can continue to operate without guidelines.

12.1.3 Employees will be required to take a minimum number of PTO hours annually (Annual Minimum Usage) as described in 12.2.2 to this Article, but will otherwise be able to carry over accrued but unused PTO up to a total of four hundred and eighty (480) PTO hours.

All other PTO provisions of the Agreement apply (i.e., requests must be made forty-eight [48] hours in advance, etc.).

12.1.4 **Previously Approved PTO Scheduling When Awarded a Position**

Once a position has been awarded, the awarding group will accommodate the PTO requests that were previously approved, subject to availability and approval. If an employee exercises the right of return, the group that the employee is returning to will attempt to accommodate the PTO request that was previously approved, subject to availability and returning Supervisor approval.

12.1.5 The LMC Co-Chairs may approve payout of annual minimum usage time not taken that otherwise would be forfeited due to the inability to schedule the

minimum because of a disability or protected leave. In all other cases, for employees who do not take the full annual minimum usage of PTO, the PTO will be forfeited.

12.1.6 **Annual Minimum PTO Usage Exceptions**

12.1.6.1 Employees are responsible to schedule and take annual minimum PTO within department guidelines.

12.1.6.2 For employees whose medical disability time off or protected leave does not allow them to schedule their entire annual minimum PTO usage hours, unused minimum hours may be paid out rather than rolled over. In these cases, employees need to make their request via email to the LMC Co-Chairs prior to December 31st. Requests are reviewed on a case-by-case basis; approval is not automatic. Employees will be advised via email of the final decision.

12.1.6.3 On a voluntary basis, employees may donate up to 40 PTO hours annually to other employees. Donated time does not count towards minimum usage for either the giver or the recipient and must be scheduled in accordance with 12.1.1 and 12.1.2. The recipient must have satisfied their probationary period.

Section 12.2 Accrual

12.2.1 Regular employees begin to accrue PTO benefits from the first day of regular employment. PTO benefits are credited to the employee's account at the end of each pay period.

12.2.2 The rate of PTO accrual is based on a regular employee's Length of Service as follows:

Length of Service	Annual PTO Accrual	Annual Accrual In Hours	Annual Minimum PTO Usage
0 to less than 1 year	16 days	128 Hours	0 Hours
1 to less than 5 years	16 days	128 Hours	40 Hours
5 to less than 13 years	21 days	168 Hours	80 Hours
13 to less than 22 years	26 days	208 Hours	120 Hours
22 years and more	31 days	248 Hours	160 Hours

12.2.3 During the year in which an increase in annual PTO accrual occurs, the change will take place during the pay period of the regular employee's anniversary date and will be prorated for the calendar year.

12.2.4 Term and Intern Employees accrue PTO only as provided for in their Term Employment Agreement.

12.2.5 Employees who qualify for Short-Term Disability (STD), Workers' Compensation (WC), or protected leave as defined in Company policy will continue to accrue PTO during their first six (6) months of absence.

12.2.6 Employees do not accrue PTO while on Long-Term Disability (LTD) or after six (6) months on WC or protected leave as defined in Company policy, unless otherwise required by applicable law.

12.2.7 PTO will not accrue during a voluntary unpaid leave of absence of any duration (See Section 12.7 to this Article).

12.2.8 Employees may borrow PTO in advance up to their current year annual accrual. An employee who terminates employment with a negative PTO balance will be required to reimburse the Company for the PTO advanced to the employee. Employees agree and understand that this reimbursement will be deducted from the employee's final paycheck and that such deduction is specifically authorized as a term of this Agreement.

12.2.9 PTO accrual for part-time regular employees will be prorated based on the actual hours worked as compared to a full-time year of two thousand eighty (2,080) hours.

Section 12.3 Length of Service

12.3.1 Length of Service for purposes of determining PTO accrual shall be defined to include:

- The time during which the regular employee was an employee and received income (pay) or income replacement (e.g., STD, LTD, WC), regardless of whether that previous service was as a regular, Term, or Intern employee; and

- An approved period of absence without pay that is less than sixty (60) consecutive calendar days. In such a circumstance, the regular employee will retain their original hire date for the calculation of the Length of Service.

12.3.2 Length of Service does not include periods of absence without pay of sixty (60) or more consecutive calendar days, unless otherwise required by applicable law.

12.3.3 Regular employees who have a break in service may be eligible for an adjusted PTO abridgement date for PTO accrual if their prior eligible Length of Service is greater than the time they were not an employee of the Company. If so eligible for abridgement date, the duration of the break in service will not be credited toward

Length of Service. The determination of this adjustment will be done at the time of rehire.

12.3.4 Section 12.3 to this Article addresses Length of Service for purposes of determining PTO accrual. Length of Service may be defined differently in other benefits plans including, for example, the Retirement Plan for bargaining unit employees. In such cases, the terms of the individual plan(s) control.

Section 12.4 Buy Back Provision

Employees may request a buy back of their annual PTO accrual which exceeds the minimum usage requirement. Requests for buy back will be permitted so long as the PTO balance is not reduced below thirty-two (32) hours. The thirty-two (32) hour buy back restriction does not apply to the scheduling of PTO (i.e., PTO can be scheduled to a zero [0] balance, but not sold below the thirty-two [32] hour balance).

In all buy back instances, the calculation of pay for buy back requests refers to the current rate of pay at the time of the buy back, which means the rate of pay contained in the Wage Scale for the current awarded position. If rate retained, the higher rate applies. This applies only to situations of PTO buy back and has no impact on the language contained in Section 12.5 to this Article.

All PTO buy back shall be in accordance with IRS rules and Company guidelines and will be made available to all employees on the Company intranet.

Section 12.5 Rate of Pay

The rate of pay for PTO shall be computed at the employee's wage rate for the employee's current awarded position. If rate retained, this higher rate applies. In addition, the rate of pay shall include the appropriate shift work pay and other premium pay if the employee works (is scheduled to work) shift work and/or receives premium pay every working day.

Section 12.6 Scheduling of PTO

12.6.1 Except for emergencies, bereavement and PTO for unanticipated illness as described in Section 15.1 within this Agreement, requests for PTO for full or partial day absences must be made forty-eight (48) hours in advance and require prior Supervisor approval. The minimum increment of time that may be used for PTO is fifteen (15) minutes.

12.6.2 Employees will schedule PTO on a Company seniority basis according to workgroup, department or resource center guidelines and in accordance with this Article. Guidelines will be made available to all employees on the Company intranet.

Section 12.7 Voluntary Leave of Absence without Pay

A voluntary unpaid leave of absence is a leave of absence without pay that does not fall within any category of protected leave as defined in Company policy. Employees are eligible for a voluntary unpaid leave of absence only as provided for in Company policy. Annual PTO accrual must be exhausted before an employee may take a voluntary unpaid leave of absence and PTO will not accrue during a voluntary unpaid leave of absence of any duration. Under certain business conditions the Executive Officer responsible for Human Resources may waive the requirement to use the annual PTO accrual prior to allowing voluntary leave without pay.

Section 12.8 PTO Counts as Time Worked

Any PTO used by an employee shall be treated as if it were time worked for the purpose of computing overtime.

Section 12.9 PTO at Separation

At the time an employee retires or separates employment, all accrued and unused PTO will be paid to the employee with their final paycheck. Accrued PTO is not intended to be used to extend employment prior to retirement or separation, therefore, employees shall not schedule more than a maximum of one (1) month of PTO just prior to their retirement or separation date.

ARTICLE 13
PAID BEREAVEMENT LEAVE

Section 13.1 General

13.1.1 Employees are eligible for Paid Bereavement Leave in the event of the death of a covered family member. Eligible employees may take up to a maximum of three (3) workdays of Paid Bereavement Leave for each death of a covered family member to grieve and attend to matters related to the loss. A covered family member is defined in the Company's Bereavement Leave policy.

13.1.2 Employees must notify the Company as soon as practical when taking Paid Bereavement Leave or any extension of bereavement leave covered by PTO in accordance with departmental absence reporting practices. Employees may be required to provide documentation.

Section 13.2 Rate of Pay

The rate of pay for Paid Bereavement Leave shall be computed in the same manner as PTO as described in Section 12.5 within this Agreement.

ARTICLE 14
HOLIDAYS

Section 14.1 Holidays Defined

14.1.1 **Paid Holidays**

New Year's Day
Martin Luther King Jr. Day
Memorial Day
Independence Day
Labor Day
Veterans Day
Thanksgiving Day
Day after Thanksgiving
Christmas Day
Three (3) Floating Days per calendar year
One (1) Additional Designated Holiday

14.1.2 **Paid Holidays Falling on a Saturday and/or Sunday**

Any Holiday which falls on a Sunday shall be observed on the following Monday; any Holiday which falls on a Saturday shall be observed on the Friday before. However, for employees with regular schedules that include scheduled workdays of Saturday and/or Sunday, the holiday shall be recognized on the actual date of the Holiday and not on the Observed Holiday.

Section 14.2 Holiday Pay

14.2.1 Full-Time regular employees shall receive holiday pay based upon an eight (8) hour day regardless of assigned shift (e.g., ten [10] or twelve [12] hours) and will be paid at the employee's regular straight time pay. For remaining hours beyond eight (8) hours, employee may use PTO or Leave without Pay.

14.2.2 Part-Time regular employees receive holiday pay based on the actual hours compensated in the two (2) full pay periods prior to the pay period in which the Holiday occurs as compared to a normal two (2) full pay periods of one hundred sixty (160) hours.

Section 14.3 Floating Days

14.3.1 Floating days are additional paid days off which are not defined holidays and during which the Company will remain open. Employees are eligible for three (3) floating days per calendar year. Floating days must be used within the calendar year or they are forfeited. Floating days will be made available by Management to the limit required by the department to assure appropriate business staffing. Employees must schedule their floating days within these limits with the mutual agreement of their Supervisor.

14.3.2 Employees in their first year of employment will be eligible for floating days during that calendar year as follows:

Hire Date	Floating Days Qualified For
January 1 through April 30	Three (3) 8-hour days
May 1 through September 30	Two (2) 8-hour days
October 1 through November 30	One (1) 8-hour day
December 1 through December 31	0 days

14.3.3 Scheduled floating days qualify as a holiday for pay. Part-Time regular employees receive pay for floating days per 14.2.2 within this Article.

Section 14.4 Additional Designated Holiday

Employees will be given one (1) additional designated holiday to be used on the workday before or after Christmas or New Year's Day. The day or days available for scheduling the additional designated holiday will be based upon staffing requirements as determined by the department Manager, which may vary by employee if the department is not closed. Date(s) to be determined and communicated before annual PTO scheduling.

Scheduled additional designated holidays qualify as a holiday for pay.

Section 14.5 Holiday Allowance for Work on a Holiday

Employees who are scheduled to work during a holiday (actual and/or observed), additional designated holiday, or on a previously scheduled floating day shall be paid at two (2) times the employee's regular rate and the rate of pay shall include the shift differential and other applicable premium pay if the employee works or is scheduled to work an alternate shift and/or receives premium pay every working day. In addition, the employee will receive eight (8) hours of holiday pay.

Section 14.6 Holiday Pay if Absent

14.6.1 Employees who are absent are eligible for holiday pay when on:

- Approved PTO or absences, including State(s) Paid Sick Leave, the scheduled workday before or scheduled workday after a holiday;
- Paid status for a continuous absence for a period of not more than six (6) months and when the pay is in some form directly from the Company;
- Unpaid status in conjunction with a protected leave; or
- Short-Term Disability (STD). The employee receives holiday pay to supplement the portion of the employee's earnings not paid through STD,

calculated at the employee's regular straight-time rate not to exceed a total of one hundred percent (100%) of the employee's regular pay.

14.6.2 Employees are not eligible for paid holiday(s) when the employee is:

- Absent the scheduled workday before or the scheduled workday after the scheduled holiday(s) and the absence is unapproved, and in accordance with 9.3.1.4 within this Agreement*;
- On Workers' Compensation (Industrial Disability) paid leave. The Employee will continue to receive time loss payments from the Workers' Compensation carrier;
- Absent for six (6) months or more;
- On a voluntary unpaid leave of absence of any duration;
- On a period of absence for which the employee is already receiving full pay from the Company; or,
- On Long-Term Disability (LTD). The employee receives LTD pay through the LTD provider and is not eligible for holiday pay.

*When an employee has an unapproved absence due to treatment at a healthcare provider (doctor's office), urgent care facility, emergency room, or admission to a hospital and the employee provides documentation of such treatment, the employee shall be eligible for holiday pay.

Section 14.7 Holiday Counts as Time Worked

Paid holidays shall be counted as time worked for the purposes of computing overtime if the holiday falls on an employee's scheduled workday. If the holiday falls on an employee's scheduled day off, it shall be treated the same as a Saturday and be paid at the employee's regular straight time pay.

ARTICLE 15
DISABILITY

Section 15.1 Non-Industrial Disability

15.1.1 **Short-Term Disability (Non-Industrial)**

Short-Term Disability (STD) benefits are available to eligible regular employees.

Qualified absences for eligible full-time regular employees that exceed four (4) consecutive or non-consecutive workdays in a consecutive fourteen (14) calendar

day period for the same non-industrial illness or injury are covered under STD subject to the provisions and eligibility requirements of the NW Natural Short-Term Disability Income Protection Plan (STD Plan). For part-time regular employees the elimination period will be prorated based on the actual hours compensated in the two (2) full pay periods prior to the pay period in which the initial absence occurs as compared to a normal two (2) full pay periods of one hundred sixty (160) hours.

STD income replacement is based on a regular employee's Length of Service, as defined in Section 12.3 within this Agreement, and as follows:

Length of Service	Percentage of Income Replacement
0 to less than 10 years	70%
10 to less than 15 years	80%
15 years and more	85%
Date of hire 1994 and earlier (honored)	100%

STD benefits are provided to eligible regular employees for as long as the employee(s) have an accepted disability claim supported by the employee's health care provider, and determined by the disability carrier. However, the maximum period for a STD claim is one hundred eighty (180) consecutive calendar days. All STD requests require documentation from a qualified healthcare provider supporting the illness/injury. A period of short-term disability may require the employee's qualified healthcare provider's release to return to work when directed by the third-party STD Plan Administrator.

While an employee is on company paid STD Plan, the Company will continue to contribute to the employee's retirement plan(s), transfer Union dues, and contribute Company portion of the Health & Welfare premium share.

While an employee is receiving benefits from a State Paid Leave Program the Company will continue to pay the employer share of the Health and Welfare premium.

Regular employees may elect to supplement their STD income replacement up to one hundred percent (100%) of their regular rate of pay by drawing on their PTO account.

For more details regarding STD, including eligibility requirements and coordination with State Paid Leave Laws, refer to the STD Plan summary plan description or contact Human Resources. All plan descriptions will be made available to all employees on the Company intranet.

15.1.2 **Long-Term Disability (Non-Industrial)**

Long-Term Disability (LTD) benefits are available to eligible regular employees. A qualified disability for eligible regular employees that extends beyond one hundred eighty (180) calendar days will be covered under LTD subject to the provisions and eligibility requirements of the bargaining unit Group Long Term Disability Insurance Program (LTD Plan). The LTD Plan provides income continuation at sixty percent (60%) of the regular employee's pay for as long as disabled, until the regular employee reaches the Maximum Duration of Benefits as outlined in the LTD Plan. Each period of Long-Term Disability requires a qualified healthcare provider's release to return to work as coordinated through the third-party LTD Plan Administrator. For more details regarding LTD, including eligibility requirements, refer to the LTD Plan or contact Human Resources.

A regular employee's employment will end on the anniversary date of the first day of absence, as defined in Consecutive Disability Period (per Section 15.5 to this Article). LTD benefits may continue as described above and per the terms of the LTD Plan. Nothing in Article 15 is intended to indicate a guarantee of employment; employment may be ended for other reasons during the year, subject to other provisions of this Agreement.

A regular employee whose employment has ended as described in this Article will retain the right to apply for an open and available position as an internal bidder for a time period equal to two (2) years or one (1) month per full year completed from date of hire, whichever is greater, from the date of first absence related to the disability. The employee's Company, Job and/or Line of Progression seniority accumulated as of the last day of employment will be used for bids and awards per Article 4 within this Agreement.

Section 15.2 Workers' Compensation (Industrial Disability)

If an employee is injured on the job, the employee may be eligible for Workers' Compensation benefits, including industrial disability pay. If injured on the job, the employee will contact their Supervisor immediately to report the injury and complete any required form(s) in a timely manner. In no case shall an employee receive non-industrial disability pay and industrial disability pay for the same period(s) of time. If for any reason an employee's Workers' Compensation claim is denied, the employee may apply for coverage of the disability using the non-industrial disability programs outlined in 15.1.1 and 15.1.2 to this Article.

Section 15.3 Workers' Compensation (Industrial Disability) Supplemental Pay Allowance

Industrial disability pay or "time loss" in connection with a Workers' Compensation claim generally begins following a waiting period (currently three [3] days). The Company will compensate the employee during the waiting period with a supplemental allowance equal to the employee's statutory rate of sixty-six and sixty-seven hundredths' percent (66.67%) of an employee's regular straight time pay on a tax-free basis.

Section 15.4 Reemployment and Reinstatement Arising from Industrial Disability

15.4.1 If it is determined that a regular employee has ongoing restrictions which prevent them from returning to their current regular job, the Parties will consider applicable ADA (Americans with Disabilities Act) reasonable accommodations and/or state workers' compensation reemployment or reinstatement provisions to explore options for that employee.

15.4.1.1 Employees on permanent restrictions due to Industrial Disability are encouraged to seek open positions that fit with their restrictions and must follow the bidding process per Article 4 within this Agreement.

15.4.1.2 With joint Union and Management agreement, these employees may be placed into an open position without posting the open position.

15.4.2 If a regular Employee exceeds one (1) year of Consecutive Disability Period (as defined in Section 15.5 to this Article) related to the covered industrial disability, the employee's employment will end. Workers' Compensation benefits may continue, subject to eligibility in accordance with applicable Workers' Compensation laws. The regular employee also retains the right to apply for any open and available position for which they meet bidding qualifications as an internal bidder for a time period equal to two (2) years from date of separation of employment. The employee's Company, Job and/or Line of Progression seniority accumulated as of the last day of employment will be used for bids and awards per Article 4 within this Agreement.

15.4.3 A regular employee who is placed, awarded, or reemployed in a lower classification per Section 15.4 to this Article shall have their pay administered as an Honored Pay Rate Employee subject to provisions in Section 11.4 within this Agreement.

15.4.4 A regular employee whose employment is ended per 15.4.2 to this Article will be eligible for a COBRA (Consolidated Omnibus Budget Reconciliation Act) subsidy equivalent to the amount and duration provided through the LTD Plan. This subsidy will be adjusted to match the LTD benefit as needed.

Section 15.5 Consecutive Disability Period (Industrial and Non-Industrial)

The Consecutive Disability Period starts with the first day of absence for the covered disability and includes time off on STD and/or LTD and/or Workers' Compensation. Any return to work for twenty-nine (29) calendar days or less, excluding PTO, does not restart or extend this Consecutive Disability Period.

The Consecutive Disability Period ends when an employee returns to work, without restriction (with or without accommodation), for a period of thirty (30) or more consecutive calendar days, excluding PTO, in either the employee's original position or a new regular position. Any

subsequent absence related to the same initial disability would start a new Consecutive Disability Period.

Section 15.6 Family and Medical Leave Act and Americans with Disabilities Act (ADA)

As detailed in Section 2.6 within this Agreement, the parties strive to comply with all applicable laws, rules and regulations governing the workplace, including but not limited to the Family and Medical Leave Act (and applicable state law) and the Americans with Disabilities Act (and applicable state law). To the extent applicable laws include exceptions for parties in a collectively bargained relationship, this Section does not address or waive the application of such exceptions.

15.6.1 **Family and Medical Leave Act (and Related State Laws)**

Federal and State laws permit eligible employees to take unpaid leave in certain circumstances. These laws include, for example, the federal Family and Medical Leave Act (FMLA), the Oregon Family Leave Act (OFLA), the Washington State Family Leave Act (WFLA), the Washington State Family Care Act (WFCA), and the Washington State Military Family Leave Act (WMFLA).

15.6.2 **Americans with Disabilities Act (and Related State Laws)**

Employees must be able to perform essential job functions with or without reasonable accommodation.

ARTICLE 16
HEALTHCARE

Section 16.1 Employees

The Company shall pay into the Western States Health & Welfare Trust Funds of the OPEIU, hereinafter the Welfare Trust Fund, the costs necessary to establish and maintain coverage for medical, dental, vision, and life insurance benefits for eligible employees through the Welfare Trust Fund, including that percentage specified in 16.1.1.3 to this Article as the responsibility of the employee. The terms and conditions of coverage are set forth in the Welfare Trust Fund's plan documents and are not the subject of negotiation between the Parties.

16.1.1 **General**

16.1.1.1 These Company payments will be made only for eligible employees who are regularly scheduled to work twenty (20) or more hours per week. Term employees are eligible only for the benefits identified in their Term Employee Agreement.

16.1.1.2 For the term of this Agreement the Company will share in the cost of benefits with employees as necessary to provide benefits under the Welfare Trust Fund, on the effective dates and in the amounts described below.

16.1.1.3 Effective with the benefit year beginning January 1, 2025, and for the term of the Agreement, eligible employees shall be responsible for fifteen percent (15%) of the cost of the premium. The premium share payments for the Company and employees described above are based on composite rates provided by the Welfare Trust Fund and will apply regardless of the number of dependents that the employee enrolls. If the Trustees of the Welfare Trust Fund make alternate rates available during the term of this Agreement, the Parties agree to negotiate the impact of any alternate rates.

The Company is authorized to deduct from each eligible employee's wages the percentage amount described above as the employee's cost of premium in such amount that is necessary to maintain coverage under the Welfare Trust Fund.

16.1.2 **Spouses or Partners Both Working for NW Natural**

An employee who is married to, or in a domestic partnership with, a current or former Company employee who is eligible for Company payments to the Welfare Trust Fund will not be required to opt out of coverage, but may elect to opt out. In which case, the employee will be covered under the voluntary provisions of 16.1.3 to this Article.

16.1.3 **Opt Out Due to Other Coverage**

Employees eligible for Company payments to the Welfare Trust Fund may voluntarily opt out of Welfare Trust Fund medical, dental, and vision coverage, provided that they produce evidence of other such coverage. Employees who opt out of coverage will receive a cash payment of three hundred dollars ($300.00) per month in lieu of Company payments to the Welfare Trust Fund. This monthly cash payment can be applied to other benefits offered by the Company (such as additional life insurance or additional life insurance or additional LTD, subject to the terms of those benefits), deferred into the RKSP 401(k) Plan, taken as cash, and/or directed into the Flexible Spending Account.

16.1.4 **Timing of Elections**

In any case where an employee can elect a cash payment in lieu of Company payments to the Welfare Trust Fund, the employee's election must be made under, and in compliance with, a cafeteria plan under Section 125 of the Internal Revenue Code, as amended (Code). The provisions of Section 16.1 to this Article shall be interpreted and applied in a manner that complies with Section 125 of the Code.

Section 16.2 Retirees

16.2.1 **General.** A covered retiree is a former employee who (i) is eligible for and elects to retire at or after age sixty (60) with a total of fifteen (15) years of service, or at or after age fifty-eight (58) with a total of twenty (20) years of service, under the Retirement Plan and (ii) enrolls in retiree coverage through the Welfare Trust Fund. A covered retiree may enroll their eligible dependents (as defined by the Welfare Trust Fund). Retiree medical coverage through the Welfare Trust Fund ends when the covered retiree becomes Medicare eligible, currently age sixty-five (65). The Company's obligations under this Agreement are to make payments to the Welfare Trust Fund for retiree medical coverage through the term of this Agreement.

16.2.2 Effective through the term of this Agreement, the premium necessary to maintain benefits for each covered retiree under the Welfare Trust Fund shall be paid by the Company and covered retiree, as of the effective date of this Agreement (seventy-five percent [75%] Company/twenty- five percent [25%] Covered Retiree).

16.2.3 The premium share payments for the Company and covered retirees are based on composite rates and will apply regardless of the number of dependents (if any) that the covered retiree enrolls. If the Trustees of the Welfare Trust Fund make alternate rates available during the term of this Agreement, the parties agree to negotiate the impact of any alternate rates.

16.2.4 **Exclusion of Certain Employees**

Employees hired on or after January 1, 2010, are not eligible for retiree medical coverage under the Welfare Trust Fund or for Company payments to the Welfare Trust Fund. Employees who terminate employment with the Company and who are rehired on or after January 1, 2010, are not eligible for retiree medical coverage under the Welfare Trust Fund or for Company payments to the Welfare Trust Fund. This exclusion applies regardless of the length of the rehired employee's break in Company employment and regardless of whether the rehired employee previously would have been eligible for retiree medical benefits.

Section 16.3 Retirees with Spouses or Partners Eligible for Company Paid Benefits

A Company retiree who is eligible for coverage under the Welfare and Trust Fund will not be required to opt out of coverage but may elect to opt out. In which case, the company retiree will be covered under the voluntary provisions of 16.1.3 to this Article.

ARTICLE 17
OTHER BENEFITS

Section 17.1 Meal Stipend

17.1.1 **Meal Stipend.** Employees, except for those on per diem, shall be provided a meal stipend for any of the listed situations:

a. Working three (3) or more hours in addition to the assigned shift duration (minimum eight [8] hour shift);

b. Each four (4) hours of continuous overtime beyond the original three (3) hours;

c. Unplanned Shift Change or Call-In without at least three (3) hours advance notice to provide for a meal; or,

d. After four (4) consecutive hours of work on a Call-In.

17.1.2 **Time Stipend.** Employees who meet the criteria of 17.1.1 (a), including those on per diem, shall be paid the amount equivalent of thirty (30) minutes of time at one and one-half (1.5) times the regular rate. The thirty (30) minutes will be paid one (1) time per continuous work period and shall not be counted as time worked for the purpose of calculating overtime.

17.1.3 Effective November 1, 2023, the meal stipend is twenty-three dollars and sixty cents ($23.60). The meal stipend will be adjusted annually by the same percentage adjustment made to the per diem rate, if any. The dollar amount of meals will be recalculated annually by indexing it to the Government Services Administration's per diem rate for the State of Oregon as described in 17.2.2 of this Article.

Section 17.2 Per Diem

17.2.1 An employee shall be provided per diem for each day the employee is temporarily assigned job duties away from the regular work area which requires an overnight stay, including the first and last scheduled workdays. Such allowance shall include all personal expenses other than lodging and travel, and is provided to cover such items as meals, tips, personal phone calls, and local transportation. Meal stipends are not provided when the employee receives per diem.

17.2.2 Effective December 1, 2023, the per diem rate is sixty-six dollars ($66.00). The per diem rate will be adjusted annually by averaging the Government Services Administration's State of Oregon rates as published on the website (www.gsa.gov). This per diem rate will be adjusted not less than thirty (30) days after publication by averaging the Meals and Incidental rate column for the close

of the government fiscal year, published approximately October of each year for the following twelve (12) month period.

Section 17.3 Compensation for Travel

Employees will be compensated for travel and mileage. Federal applicable state wage and hour regulations apply as a minimum in these situations, absent an agreement between the Parties.

17.3.1 Paid Travel Guidelines

Paid travel is to be completed during regular scheduled working hours if possible. With the appropriate advance notice, an employee's schedule can be changed to accommodate travel time. (To determine if an Unplanned Shift/Schedule change, see 6.1.3 within this Agreement).

- Paid travel at a time other than the employee's regular scheduled working hours must be pre-approved by Management.
- Paid travel time shall be counted as time worked for the calculation of overtime. To determine appropriate pay, refer to 11.5.1 within this Agreement for overtime calculation with the exception that travel on Sundays or holidays is not automatically paid at two (2) times the regular rate.
- Paid travel time is eligible for applicable premium pay.
- For standard travel times and mileage between Company-based locations, refer to the Hub. Travel times and mileage between locations other than Company-based locations will be calculated by management utilizing the method used by the Labor/Management Committee (LMC) [e.g., currently GoogleMaps]. Time exceeding those calculated will be reported to Management for compensation.
- When applicable, mileage reimbursement will be paid in accordance with the Company's Mileage Reimbursement Policy and will be made available to all employees on the company intranet.
- A Company vehicle may be temporarily or permanently assigned to employees for "drive home" use based on business needs.

17.3.2 Travel within Company Territory Requiring Overnight Stay

The Company will provide lodging when an overnight stay is required. The Company is responsible for all associated costs of lodging prior to travel. Employees will not be responsible for any out-of-pocket expenses for lodging,

excluding incidentals. Employees may be required to provide personal credit card to cover incidentals.

- If the employee requests and Management agrees, the employee may travel on a normal day off ahead of the desired reporting day to the temporary reporting location. Under these circumstances, the Company will provide lodging for that day and time spent traveling to the temporary location will be compensated as time worked based on the calculated travel time from the employee's Company-based location to the temporary reporting location. Per diem will not be provided for that day.

- Employees returning home on the last day of a work assignment will be paid for time worked that day including the standard time to drive from the temporary reporting location to the employee's Company-based location. They will also receive per diem for that day.

- If an employee uses a personal vehicle to commute to and from the temporary reporting location, mileage reimbursement will be provided for that commute based on the standard mileage between the employee's Company-based location and the temporary reporting location.

17.3.3 Travel Outside Company Territory

The Company may ask employees to travel to training or other events outside of the territory. Such travel can normally be completed within an eight (8) hour timeframe, but due to unforeseen circumstances (e.g., weather or mechanical delays) may exceed this time.

- All travel arrangements, including scheduled travel day, and itinerary, are to be mutually agreed to by the employee and Management prior to travel. The Company is responsible for all associated costs of lodging prior to travel. Employees will not be responsible for any out-of-pocket expenses for lodging, excluding incidentals. Employees may be required to provide personal credit card to cover incidentals.

- Paid travel time for travel outside of scheduled working hours shall be up to a maximum of eight (8) hours per day in addition to any time already worked that day, unless otherwise required by applicable law. Employees will also receive per diem for that day.

- Travel time is only those hours spent in transit to or from the travel destination.

- Company Policy "Business Travel Procurement and Expense Reimbursement" also applies for travel arrangements outside NWN territory.

17.3.4 **Voluntary Travel Alternatives**

Travel alternatives at the employee's discretion (mode of travel, early arrival or late departure for personal reasons) must be mutually agreed upon by the employee and Management. Such travel should be cost neutral to the Company.

When voluntary travel arrangements result in missed workdays, those days will be charged to Paid Time Off (PTO).

Section 17.4 Transportation

17.4.1 **Basis of Allowance**

Employees who use their personal vehicles for Company business shall be compensated at the rate authorized by the Company, taking into consideration the rate established by the Internal Revenue Service (IRS). The current rate will be made available to all employees on the Company intranet.

17.4.2 **Parking**

The Company has no obligation to provide employee parking, but will make parking available to the extent possible. A parking Flexible Spending Account (FSA) will be available to employees to allow for pre-tax benefit account that can be used to pay or get reimbursed for qualified parking expenses.

17.4.3 **Transit Passes**

Transit passes will be made available to Headquarters-based bargaining unit employees at no cost to the employee. Oregon residents will be provided a TriMet pass. Washington residents who are reporting at 250 Taylor two (2) or more times per week will be provided a C-Tran pass upon request.

In the event of a personal emergency, the Company may provide accommodations to transport the employee to their destination.

Section 17.5 Jury Duty

17.5.1 Employees will receive their regular straight-time rate of pay while serving on jury duty, provided the employee has:

- Promptly notified a designated Company representative and presented a legally enforceable subpoena,
- Requested a transfer to a Monday through Friday Day Shift schedule, if applicable, and

- Called a designated Company representative on weekdays when excused from jury duty to determine whether to report to work.

17.5.2 Employees shall retain any compensation paid by the court while performing this civic function.

Section 17.6 Recognition Programs

In recognition of employee flexibility and support of continuous operations, departments or workgroups may develop recognition programs. Any new recognition programs are subject to approval of the LMC Leadership Team.

Section 17.7 Paid Parental Leave

Regular employees who are regularly scheduled to work twenty (20) or more hours per week are eligible for Paid Parental Leave following the birth, adoption of a child, or foster care placement. Eligible full-time employees qualify for one hundred and twenty (120) hours of pay at their regular rate of pay.

Eligible employees who are typically scheduled to work between twenty (20) to thirty-nine (39) hours per week will receive a pro-rated benefit, based on their weekly schedule. Additional details are provided in the Company's Paid Parental Leave policy.

17.7.1 If and when any new state or federal laws are passed that include a requirement for employers to provide additional paid or unpaid leave, the parties agree to meet and discuss total paid leave allocation. Paid Parental Leave will run concurrently with leave taken under the Oregon Family Leave Act, the federal Family and Medical Leave Act, and/or paid leave provided under any state law when applicable.

17.7.2 Eligible employees should provide thirty (30) days' advance notice or as much advance notice as practicable under the circumstances when requesting paid parental leave. Any paid parental leave provided will run concurrently with leave taken under applicable state or federal leave laws.

17.7.3 **Rate of Pay**

The rate of pay for Paid Parental Leave shall be computed in the same manner as PTO as described in Section 12.5 within this Agreement.

Section 17.8 Personal Protective Equipment (PPE) Allowances

PPE allowances will be reviewed annually and adjusted as necessary based on Tyndale's average price increase.

17.8.1 **FR (Fire Resistant) Clothing Allowance**

- Newly hired or rehired field employees who are required to wear FR clothing shall receive two thousand one hundred seventy-five dollars ($2,175.00) for the purchase of approved FR clothing by the end of the calendar year.

- All field employees who are required to wear FR clothing shall receive an annual allowance of nine hundred dollars ($900.00) for the purchase of approved FR clothing, effective January 1st, 2025.

- Employees have the obligation to take reasonable care of FR clothing. Employees are responsible for laundering. Employees may receive replacement of damaged FR clothing due to unanticipated work-related situations with Supervisor approval.

17.8.2 **Footwear Protection Allowance**

Employees required to wear safety footwear shall be provided up to three hundred dollars ($300.00) per calendar year for either purchase or refurbishment of boots (e.g., boot rebuilds or toe guards).

17.8.3 **Prescription Safety Glasses**

Employees requiring prescription safety glasses receive up to four hundred fifty dollars ($450.00) for two (2) pairs of prescription safety glasses during their initial year in the program, and thereafter an annual allowance of up to two hundred twenty-five dollars ($225.00) for replacement prescription safety glasses.

ARTICLE 18
RETIREMENT PLANS

Section 18.1 Bargaining Unit Employees' Retirement Plan

The Company shall continue to maintain the NW Natural Gas Company Retirement Plan. The Company will make contributions to the Retirement Plan in amounts determined by the Company in consultation with an enrolled actuary, that are sufficient on a sound actuarial basis to provide for the payment of benefits.

18.1.1 Regular employees employed on or before December 31, 2009, are eligible to participate in the Retirement Plan to the extent provided for in the written terms and conditions of the Retirement Plan. Term employees are eligible only for the benefits described in the Term Employee Agreement. Term employees are not eligible to participate in the Retirement Plan.

18.1.2 Regular employees hired on or after January 1, 2010, are not eligible to participate in the Retirement Plan. Regular employees who terminate employment

with the Company and who are rehired on or after January 1, 2010, are not eligible to participate in, or to accrue any additional benefits under, the Retirement Plan. This exclusion applies regardless of the length of the rehired employee's break in Company employment and regardless of whether the rehired employee previously participated in the Retirement Plan.

18.1.3 Western States Pension Plan (Western States Plan B)

Upon establishment of the plan, the Company will perform its due diligence for acceptance. Company and Trust Representatives will present the Western States Pension Plan B to the NW Natural RKSP Committee and to the NW Natural Board of Directors for approval. If approval is given the Company will make contributions to the Western States Office and Professional Employees Pension Fund on behalf of each eligible Regular Employee beginning the first of the calendar year following approval.

For employees hired or rehired on or after January 1, 2010, the Company will contribute four percent (4%) of the employee's compensation including overtime. Benefits are determined by the Board of Trustees of the Western States Plan and are not subject to negotiation between the Company and the Union.

If the plan is not approved in order to commence contribution on January 1, 2025, 18.1.3 will be opened to renegotiate.

Section 18.2 Retirement K Savings Plans (401(k) Plan)

18.2.1 **Retirement K Savings Plan (RKSP 401(k) Plan)**

Except as provided in this Agreement, all bargaining unit employees shall be eligible to participate in the RKSP 401(k) Plan under the terms and conditions set forth in the RKSP 401(k) Plan document. For purposes of Section 18.2 to this Article, employees participating in the RKSP 401(k) Plan shall be referred to as "RKSP Participants." During the term of this Agreement, the Company will make a cash matching contribution each pay period on behalf of each RKSP Participant who has made elective deferrals to the RKSP 401(k) Plan during that pay period.

- During the term of this Agreement, the matching contribution shall be equal to fifty percent (50%) of the RSKP participant's elective deferrals (excluding catch-up contributions under Code Section 414(v)) for the pay period, but disregarding elective deferrals exceeding eight percent (8%) of the RKSP Participant's compensation, as defined in the RKSP 401(k) Plan, for the pay period.

- Term employees are eligible only for the benefits identified in their Term Agreements.

18.2.2 **Enhanced RKSP 401(k) Plan Contributions for Employees Hired or Rehired On or after January 1, 2010**

For employees hired or rehired on or after January 1, 2010, who are eligible to participate in the RKSP 401(k) Plan, the Company will separately contribute four percent (4%) of the employee's compensation for each plan year to the RKSP 401(k) Plan account (Enhanced RKSP 401(k) Plan Benefit). This Enhanced RKSP 401(k) Plan Benefit is available only to employees hired or rehired on or after January 1, 2010, as they are not eligible to participate in the NW Natural Gas Company Retirement Plan.

Pursuant to 18.1.3, the Enhanced RKSP 401(k) plan contribution will be redirected to Western State Pension Plan B in the same manner as the Enhanced Contributions are structured. Employees that are not eligible to enroll in the Western State Pension Plan will continue to participate in the Enhanced RKSP 401(k) plan.

ARTICLE 19
EMPLOYEE STOCK PURCHASE PLAN

Employees are eligible to participate in the Company's Employee Stock Purchase Plan ("ESPP") according to the terms and conditions set forth in the written ESPP document. The Company shall continue to have sole discretion to determine the terms and conditions of the ESPP applicable to employees, including contributions, benefits, and administrative provisions. The Company retains the right to terminate the ESPP at any time and will notify the Union of such decision prior to its implementation. Term employees are eligible only for the benefits identified in their Term Agreements.

ARTICLE 20
PROGRESSIVE DISCIPLINE

Section 20.1 General

The Company may discipline or terminate any employee for Just Cause and will determine the appropriate level of discipline based on the facts and circumstances presented. The Company shall conduct investigations and issue all discipline in an expedient manner. Notwithstanding the inclusion of Just Cause, the Union and the Company agree to a reasonable person standard to determine what's right, not who's right, in matters of discipline. To ensure the reasonable person standard is adhered to, discipline defense based purely on Just Cause must be approved by the Executive Secretary-Treasurer of OPEIU Local 11 or their designee.

20.1.1 **New Hire Probationary Periods**

Any probationary new employee can be terminated for any reason without intervention by the Union and without right of appeal to the Grievance and Mediation/Arbitration Process in Article 21 within the Agreement.

20.1.2 **Progressive Discipline**

Regular employees may be disciplined in the form of a Documented Verbal Warning, Disciplinary Action Plan, suspension, or termination for Just Cause. Discipline should be progressive to allow the employee the opportunity for improvement prior to moving to a higher level of discipline.

Section 20.2 Definitions

20.2.1 **Documented Verbal Warning (DVW)**

A disciplinary document a Manager or Supervisor may use that identifies in writing an employee's performance problems or other conduct that requires correction.

20.2.2 **Disciplinary Action Plan (DAP)**

A written disciplinary document a Manager or Supervisor may use that states specific performance problems or conduct requiring correction and requires that the employee fully correct the problem within a specified period of time.

20.2.3 **Suspension**

A disciplinary suspension is unpaid and may be used by a Manager or Supervisor in conjunction with a DVW or DAP.

20.2.4 **Last Chance Agreement (LCA)**

A written disciplinary document a Manager or Supervisor may use that states that employee misconduct could have led to termination, but the employee is being offered one final opportunity. An LCA is not subject to the grievance process.

Section 20.3 Disciplinary and Investigatory Meetings

During a disciplinary or investigatory meeting, an employee shall be afforded Union representation as associated with Weingarten Rights, upon the employee's request. The Company shall notify the appropriate representative of the Union (e.g., Steward, Chief Steward, Union Representative) and provide a reasonable period of time to be available for the meeting.

Employees shall be advised of their right to Union representation during any investigatory interview or meeting which could reasonably be expected to lead to disciplinary action.

Section 20.4 Process

Progressive discipline shall normally include the following steps:

20.4.1 **Documented Verbal Warning (DVW):** Supervisor is to keep the original in the supervisory file. A copy will be provided in accordance with Section 20.5 to this Article. Documented Verbal Warnings shall remain in effect for no more than two (2) years, at which time they shall be considered removed from the employee's supervisory file.

20.4.2 **Disciplinary Action Plan (DAP):** Copies of the DAP will be sent to Human Resources to be placed in the employee's personnel file and copies provided in accordance with Section 20.5 to this Article. Typically, a DAP will be in effect for up to one hundred and eighty (180) calendar days. Duration of DAPs longer than one hundred and eighty (180) calendar days must be signed by the Manager and the Union Representative.

Three (3) years after the satisfactory completion of a DAP, it will be considered moved from the employee's personnel file to the employee's "employee history file," provided no additional DAPs have been issued to the employee. This "employee history file" will be retained in Human Resources and will be considered a part of the employee's personnel record.

20.4.3 **Suspension:** In case of a suspension, the Company agrees that the employee and the Union shall be provided written documentation setting forth the reason(s) for such action, and in accordance with Section 20.5 of this Article. Employees are entitled to Union representation at such meetings.

To avoid undue burden on the workgroup the date(s) that the employee will be away from work for disciplinary suspension will be determined by applicable PTO guidelines. For work group(s) that do not have documented PTO scheduling guidelines the accepted departmental process will apply; if the suspension dates are not selected and agreed to within five (5) working days management will assign the dates.

For suspensions that are three (3) days or fewer, the date(s) will not be adjacent to employee's regular scheduled day(s) off. No suspension days will be taken adjacent to an observed Holiday. Unpaid dates will occur within sixty (60) days from the date of discipline.

20.4.4 **Last Chance Agreement (LCA):** Copies of the LCA will be sent to Human Resources to be placed in the employee's personnel file permanently and copies will be provided in accordance with Section 20.5 of this Article.

20.4.5 Employees will be required to acknowledge receipt in writing of any disciplinary action; which the employee's signature shall not be construed as agreement or

concurrence with the discipline; and in accordance with Section 20.5 of this Article.

Section 20.5 Distribution of Documents

The Company will provide copies of DVWs, DAPs, LCAs, and Terminations to the employee, Human Resources, Union Office, and Steward or Chief Steward. Sensitive information (e.g., LCAs) may be only shared with the Union Office to ensure privacy for the employee.

Section 20.6 Repetition of Infraction

Repetition of the infraction or failure to complete an action plan within the time specified may lead to further discipline up to and including termination.

Section 20.7 Discipline

As stated in Section 20.1 of this Article, any infraction may also warrant an immediate DAP, suspension, or termination.

Section 20.8 Bidding

Bidding on positions, advancing in a Line of Progression, or Progression without Bidding may be affected as a condition of progressive discipline.

Section 20.9 Grievance

The employee may file a written grievance appealing disciplinary action per Article 21 within this Agreement.

ARTICLE 21
GRIEVANCE AND MEDIATION / ARBITRATION PROCESS

Section 21.1 Introduction

The Grievance Process is limited to matters of discipline and unresolved Issue Resolution items, and in accordance with Section 21.3 to this Article. This Grievance Process is established on the premise of trust, respect and the mutual goal of resolving differences at the earliest opportunity and appropriate level. It is not intended to be a substitute for direct dialogue between employee and Supervisor or to be used for events covered by the Issue Resolution Process as per Article 10 to this Agreement.

Section 21.2 Timelines

When computing timelines under this Article, the day which triggers the grievance (contract violation, receipt of grievance, etc.) shall not be included. “Working days” means Monday through Friday, excluding holidays. Filing and response time limits shall be met by mailing, e-mail, hand delivery or facsimile transmission. Receipt shall be considered to be the date of actual receipt.

The time limits prescribed herein may be waived or extended by mutual agreement, in writing by the Steward, Chief Steward, or the Union, and the appropriate Company representative at each step.

A grievance not brought within the time limit prescribed for every step shall be considered settled on the basis of the Company's last decision received by the Steward, Chief Steward, or the Union. A grievance or complaint not responded to by the Company representative may be moved to the next step in the procedure.

Section 21.3 Written Grievances

A written grievance shall be documented on the official OPEIU Local 11 Grievance form and must be signed and dated and indicate the step at which it is being filed. Grievances not meeting the requirements of this Section shall not be considered officially filed or may not be moved to the next step until missing information is provided. Grievances or responses to grievances missing information may be referred to the LMC Co-Chairs or timelines can be extended in accordance with Section 21.2 to this Article. Written grievances and responses at all levels shall address, at a minimum, the following points:

- The statement of the grievance/response and the facts upon which it is based;
- Signed by the grievant and the represented parties involved;
- A statement of the specific provision(s) of the Agreement that is (are) the basis of the grievance/response;
- The manner in which the provision is purported to have been violated, misapplied, or misinterpreted (or in which the provision supports the response);
- The date or dates on which the alleged violation, misinterpretation, or misapplication occurred; and
- The specific remedy sought or offered.

Section 21.4 Grievance Process

A grievance can be initiated in the following ways:

- If the concern is about discipline, it should start at Level 1 in the grievance process.
- If the grievance is related to an employee's involuntary termination, Level 1 and Level 2 of the grievance process will be bypassed and the grievance process will start at Level 3 in accordance with this Article.
- The concern may be referred from the issue resolution process at the discretion of the LMC Co-Chairs. In these instances, the LMC Co-Chairs may elect to bypass Levels 1 and 2 of the grievance processes.

Grievances may necessitate meeting more than once at any particular level or obtaining information from additional sources; however, each level will be addressed in an expedient manner.

For grievances that start in the Grievance Resolution Process, the Steward and the Supervisor should first meet informally to understand and potentially resolve the unfiled grievance.

For grievances referred through the Issue Resolution Process, it is required that the Issue Resolution Committee write up what was agreed to, what the parties were unable to agree to, and narrowly describe the open question that has not been resolved.

21.4.1 **Level 1 – Process**

Participants: Employee, Steward(s) or the Union Representative, and the first line Supervisor or their designee.

Procedure: The Union Steward has twenty (20) working days to file a formally documented grievance for the employee(s) or on behalf of the employee(s) from the event or knowledge of the event and should be submitted to the Supervisor of the employee(s).

The Supervisor will schedule a meeting with the Steward to occur within ten (10) working days of receiving the documented grievance to potentially resolve the grievance or to provide additional background information. Resolved and unresolved outcomes of the grievance resolution meeting will be documented.

It is the intent of the Parties to strive to resolve grievances at this level.

Copies will be sent to the Union office and the Chief Steward by the Steward, and to Human Resources and the Manager by the Supervisor within ten (10) working days from the Level 1 meeting. Unresolved Grievances will enter the Level 2 process.

21.4.2 **Level 2 – Process**

Participants: Individuals involved in Level 1 plus Chief Steward and Manager(s) responsible for department (or representative) and any Subject Matter Expert (SME) needed to reach resolution.

Procedure: Within ten (10) working days of receipt of the unresolved Level 1 grievance filing, the Manager (or designee) will schedule a meeting with the Chief Steward; this meeting is to occur at a mutually agreeable time.

Resolved outcomes of the grievance resolution meeting between the Chief Steward and the Manager will be documented. Copies will be sent to the Union

office by the Chief Steward and to Human Resources by the Manager within ten (10) working days from the Level 2 meeting.

Unresolved grievances, within ten (10) working days from the Level 2 meeting, will be documented with recommendations and forwarded by the Manager and Chief Steward to the LMC Co-Chairs (or designee) for review and recommended action prior to entering the Level 3 process.

21.4.3 **Level 3 – Process**

Participants: LMC Co-Chairs; and as needed, the Chief Steward and the Department Manager.

Procedure: LMC Co-Chairs shall review the grievance, and meet to discuss said grievance within ten (10) working days of receipt of the grievance, and determine a resolution within fifteen (15) working days of receiving the Level 2 grievance meeting documentation. If the grievance is not resolved by the LMC Co-Chairs, it shall be submitted in writing to the LMC Executive Sponsors within five (5) business days from the Level 3 grievance meeting for continued discussion or consideration of next steps. All Level 3 documented resolutions must be approved by the Company's Executives responsible for labor relations and the Executive Secretary-Treasurer of OPEIU Local 11, or their designees. Resolutions reached at this level will be final and binding on both parties and documentation will be forwarded to the filing parties within ten (10) working days of the decision.

All timelines above may be extended by mutual agreement of the Parties. If extended, notification will generally be provided to all parties along with status and anticipated action within three (3) working days of the decision to extend, or as soon as possible thereafter.

Section 21.5 Mediation and Arbitration

If the grievance cannot be resolved at Level 3, the Parties may, by mutual agreement, seek the assistance of the Federal Mediation and Conciliation Service in a non-binding attempt to resolve the dispute. Mediation communications are not admissible in arbitration.

In the event the grievance has not been settled, the Union or the Company may seek arbitration. The Arbitrator shall be selected by Union and Company representatives from a panel obtained from the Federal Mediation and Conciliation Service or as otherwise mutually agreed by the parties. The authority of the Arbitrator is limited to interpreting the express provisions of this Agreement or related terms and conditions of employment of covered employees. The decision of such arbitrator shall be final and binding upon both parties. The parties shall each pay their own fees and costs, and each shall pay one-half (½) of the Arbitrator's fees and any other joint costs of the arbitration.

Nothing in this Article precludes a party from withdrawing a grievance at any time with written notification to the Union office and to Human Resources.

ARTICLE 22
SEPARABILITY OF PROVISIONS

If any provision of this Agreement shall be found to be invalid by any court having jurisdiction in respect thereof, such finding as to such provision shall not affect the remainder of this Agreement, and all other terms and provisions hereof shall continue in full force and effect as set forth herein. If the provision is found to be invalid by the court having final jurisdiction in respect thereof, the parties shall promptly negotiate and endeavor to reach agreement upon a suitable substitute for said provision.

Nothing in this Collective Bargaining Agreement shall be interpreted or enforced to cause a violation of any applicable Federal, State, or local law or regulation.

ARTICLE 23
TERM OF THE AGREEMENT AND METHOD OF REOPENING

The Collective Bargaining Agreement and all terms and provisions hereof shall be and continue in effect from and after the date first written hereof until midnight on May 31, 2028, and until May 31st from year to year thereafter until and unless either party shall have served written notice to the other party at least sixty (60) calendar days prior to said May 31, 2028, or prior to any May 31st thereafter stating that it desires to negotiate modifications or to terminate this Agreement.

IN WITNESS WHEREOF, the parties have caused this Collective Bargaining Agreement to be executed in duplicate by their respective officers, thereunto duly authorized.

Total Remuneration Review

Organization and Executive Compensation Committee Meeting – February 2024

©2024 Pay Governance LLC. All rights reserved. Proprietary and Confidential. For Pay Governance LLC client use only.

Key Findings

1. NW Natural's compensation program (target total remuneration) is competitive with the Proxy Peer Group, broader energy industry and general industry
   - Long-term incentive awards are generally higher than the survey data.
2. Officers positioned below competitive TDC and total remuneration levels (-10% or more) should be reviewed for continued movement toward competitive compensation.
   - Currently, total remuneration levels for the Officers are generally meeting the Company's compensation philosophy target (50th percentile) except for the VP, Chief HR & Diversity Officer, and the VP, Engineering & Utility Operations which are below the philosophy target.
3. All elements of compensation are generally aligned with the NW Natural philosophy of targeting median.
4. NW Natural internal equity generally aligns with the pay ranking of CEO and highest paid executives at energy industry companies (see p. 15).

DFR rate recommendations 23

INTRODUCTION

Each year, the Division of Financial Regulation (DFR) conducts a transparent health insurance rate review process for health plans that comply with the Affordable Care Act for small businesses and people who buy their own coverage rather than getting it through an employer. Conducting a yearly rate review ensures that premium rates charged to Oregonians adequately cover health care costs without being too high or too low.

This guide provides an overview of the rate change insurers requested, an explanation of the factors and trends affecting rates, and a summary of DFR's recommended rates formally communicated in DFR's preliminary decision documents, published on www.OregonHealthRates.org. The purpose of this guide is to aid in understanding DFR's preliminary decision document for rates set to become effective Jan. 1, 2025.

The 2025 health rate review process began in the fall of 2023 with insurance companies submitting filings that included information about their financial experience and assumptions. Pursuant to the authority granted by ORS 743.018(5), DFR actuaries review that data to ensure the requested rates are "reasonable and not excessive, inadequate or unfairly discriminatory."

The review process takes into account a three-year window:

- The year the plan takes effect (2025)
- The year the rates are prepared, filed, and reviewed (2024)
- The most recent full year of data that can be referenced (2023)

That three-year window means that rates are set using data from prior years that is then projected forward to produce current rates. Trained and certified actuaries, experts in mathematics and statistical methods, make those projections. DFR also employs actuaries to review the information provided by insurers and to provide an independent assessment of the insurer's calculations.

The rate review process is designed to foster a healthy insurance marketplace that maximizes consumer choice, minimizes consumer cost, and maintains the solvency of insurers to prevent consumer harm. Because of rising costs throughout the market, annual cost increases are to be expected most years – over time, inflation drives all costs up in healthy economies. The rate review process allows DFR actuaries to "check the math" of insurance companies, ensuring that their requested cost increases are justified by actuarial standards and market forces, and are necessary to maintain the solvency of the insurance company.

RATE CHANGE REQUESTS

The table below shows the rate change requested by each insurer this year. It shows the rate increase requested, a representative "base rate," and the total number of members affected.

The base rate represents what a 40-year-old on a "silver" plan in the Portland area would pay (without any subsidies or financial assistance) for health insurance. Rates vary based on geographic location and age.

Plans are rated on a "metals" system: bronze, silver, and gold. Those metal levels correlate to upfront premium costs (low for bronze, high for gold) and out-of-pocket cost sharing (high for bronze, low for gold). Consequently a Silver is the middle cost plan.

	Individual			Small Group		
Company	**% Increase**	**Rate**	**Members**	**% Increase**	**Rate**	**Members**
BridgeSpan	10.2%	$582	264			
Kaiser	5.0%	$486	34,574	6.4%	$426	27,959

Health Net				7.8%	$435	3,140
UHC IC**				13.2%	$518	9,523
UHC of OR***				13.8%	$518	3

* BlueCross BlueShield

** UnitedHealthcare Insurance Company

*** United Healthcare of Oregon

Each insurers rate change request, and supporting documentation, underwent a comprehensive review.

RATE CHANGE CONTRIBUTING FACTORS

The table below shows the amount each rate component contributes to the requested rate change per company. The percent change is shown as a portion of the requested rate change, so the columns add up to the total rate change request.

Experience and trend are the primary factors driving cost increases. In short, trend accounts for both changes in the cost of services as well as changes in the utilization of services. Trend is explained in greater detail further in this document.

Individual market rate change contribution

Contribution factor	Kaiser	PacificSource	Moda	Providence	BridgeSpan	Regence
Experience and trend	9.8%	8.9%	12.3%	6.0%	8.7%	8.5%

Experience and trend includes risk adjustment. More information on risk adjustment available here.

WHAT IS TREND?

Trend simply refers to the change in cost of providing services. Trend includes many factors, but it generally ends up illustrating how certain key costs are changing, influencing the premiums an insurer must charge to stay solvent.

Trend can be broken down into two key categories – medical and pharmacy – each with a handful of items contained within.

Trend Components

Medical

- Unit cost – when considering the same service is being provided, the cost of providing that service has gone up. This includes forces such as:
  - Medical inflation
  - Provider contract changes
  - Changes in intensity of medical care
- Utilization – In a given period, more services are being provided than before, causing an increase in costs. This includes forces such as:
  - Changes in medical care practices
  - Supply of services
  - Changes in health or behavior of the covered population

Pharmacy

- Typically, most insurers use a pharmacy benefit manager (PBM) model. In short, a third party is contracted to negotiate drug prices and coordinate with pharmacies. Includes forces such as:
  - Introduction of new drugs
  - Expiration of patents
  - Issuer-specific utilization by drug class

Trend has marketwide forces, but will also vary by specific insurer. Each insurers' trend calculation is reviewed by DFR actuaries.

Historical overall trend

Trend varies over time based on changes in the market. The table below illustrates the changes to trend over the last two years and compares it to the projected 2025 trend. Overall, trend is projected to be higher in 2025 than it was in 2024.

		Medical			RX			Overall		
	Year	Avg.	Min.	Max.	Avg.	Min.	Max.	Avg.	Min.	Max.
Individual	2023	4.6%	2.0%	6.1%	7.4%	2.0%	11.3%	5.2%	2.0%	6.6%
	2024	6.1%	5.0%	8.0%	8.3%	5.0%	10.2%	6.6%	5.0%	8.2%
	2025 (proj.)	7.9%	4.5%	9.4%	8.7%	4.5%	11.7%	8.0%	4.5%	9.6%

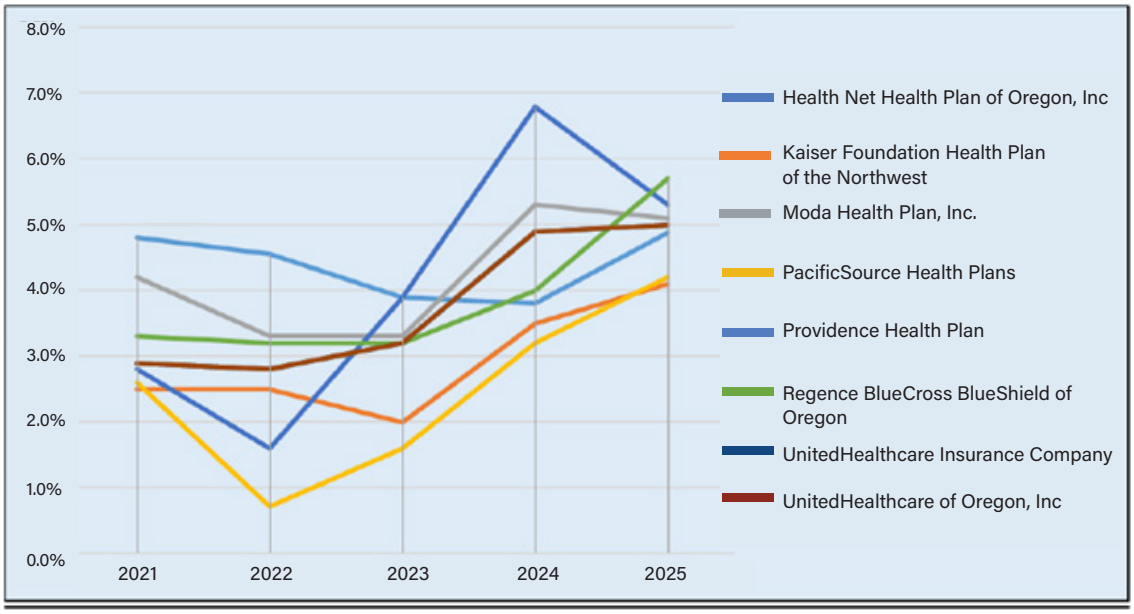
Projected medical cost trend by year – small group market



COST GROWTH TARGET ANALYSIS

While much of trend is the result of market forces, some costs can be influenced by insurer choices, such as contract negotiations. Oregon's Sustainable Health Care Cost Growth Target Program sets a statewide target for the annual per person growth rate of total health care spending in the state. The "cost growth target" (CGT) that it sets is meant to help ensure that health care costs are not growing faster than wages, inflation, and other economic indicators so that people continue to have access to high quality, affordable care.

The CGT is currently set at 3.4 percent. It is calculated at a high level, using a total cost of care approach. This view of health care spending includes all costs related to an individual's care, rather than focusing on a single factor such as prices. The CGT is not a spending cap and does not limit health care spending. Instead, the target aims to achieve a sustainable rate of growth.

The CGT is measured at four levels: statewide, by market (commercial, Medicaid, Medicare), for payers, and for provider organizations. The Cost Growth Target Program at the Oregon Health Authority annually measures and publicly reports on how the state is measuring against the CGT. More information is available here: OHA CGT.

The Cost Growth Target Program has developed a series of accountability focused rules that begin with transparency. Payers and provider organizations who exceed the CGT with statistical confidence **and** without an acceptable reason may be subject to a performance improvement plans. Payers and provider organizations who continue to exceed the target without an acceptable reason may be subject to financial penalties. More information on that available here: OHA CGT Accountability

Cost growth under the program is measured in two ways: total health care expenditures and total medical expenses, each of which are specifically defined. More information available here: Data Specification Manual. While not an exact comparison, the CGT is substantially similar to the medical unit cost trend reported by insurers. The table below shows how much lower premiums could be in 2025 if each insurer met the CGT target of 3.4% for its medical and pharmacy unit cost trend.

Company	Individual	Small Group
BridgeSpan	-2.0%	
Kaiser	-1.1%	-0.7%
Moda	-2.1%	-2.1%
PacificSource	-0.9%	-0.8%
Providence	-2.7%	-3.2%
Regence BCBS	-2.0%	-1.9%
Health Net		-1.3%
UHC IC		-1.4%
UHC of OR		-1.4%

PROJECTED MEDICAL LOSS RATIO

The Affordable Care Act (ACA) requires that 80 percent of premiums must be used to pay claims. The table below shows what percentage of premium costs each insurer paid in claims.

There is more than one way to calculate this figure. In the "federal medical loss ratio" (MLR) column below, "quality improvement" expenses are included in the claim amount, and taxes and fees are excluded from the premium in the calculation. This results in a higher projected medical loss ratio. In either case, all Oregon health insurers have exceeded this requirement.

Should an insurer go below 80 percent MLR, the ACA requires that insurers return the excess premiums collected to plan holders in the form of rebates.

	Individual		Small Group	
Company	**Pricing**	**Federal**	**Pricing**	**Federal**
BridgeSpan	83.7%	88.1%		
Kaiser	83.9%	84.9%	83.3%	87.3%
Moda	88.7%	90.5%	89.0%	90.9%
PacificSource	86.6%	90.9%	85.0%	87.7%
Providence	83.8%	88.7%	85.7%	88.6%
Regence BCBS	84.7%	89.0%	84.2%	87.6%
Health Net			83.9%	86.2%
UHC IC			83.8%	86.8%
UHC of OR			83.8%	86.8%

Pricing MLR – This calculation is strictly claims divided by premiums

Federal MLR – In this calculation, the quality improvement expense is included in the claim amount, and taxes and fees are excluded from the premium in the calculation.

RETENTION

This table shows what is done with the money left over after claims – the other side of the MLR shown above. This amount includes all salaries paid to insurer staff and any premium expected to be retained as profits or margin for the individual market.

OHP BRIDGE - BASIC HEALTH PROGRAM, COST-SHARING REDUCTION PLANS, AND SILVER-LOADING

There is a complex interaction between two different federal subsidy programs and Oregon's newly created Basic Health Program, officially called OHP Bridge – Basic Health Program. In short, Marketplace silver-tier plans will have reduced premiums following implementation, but federal premium tax credits may simultaneously be reduced for enrollees in other plan tiers. For some individuals on bronze and gold Marketplace plans, this will result in a higher net monthly premium payment than before.

To explain how this interaction unfolds, we need to describe the different elements at play.

OHP Bridge - Basic Health Program

OHP Bridge - Basic Health Program (OHP Bridge - BHP) is a program required by the legislature through House Bill 4035 (2022) and run by the Oregon Health Authority. It provides free health coverage for adults between 138 percent to 200 percent of the federal poverty level. More information available here: OHP Bridge

Cost-Sharing Reduction Plans

Cost-sharing reduction plans (CSR plans) are a type of silver plan required by the Affordable Care Act and are available for consumers with incomes under 250% of the federal poverty level (FPL). These plans have lower deductibles, co-pays, and other out-of-pocket expenses for low-income enrollees. Insurance companies are obligated to pay providers the difference in the reduced cost-sharing for eligible consumers who enroll in these plans. Prior to 2017, carriers would submit those expenses to the federal government for reimbursement. In 2017, however, the federal government stopped paying carriers to cover the costs of these subsidies.

Silver-loading

When the federal government stopped reimbursing cost-sharing reductions directly to carriers, states came up with a plan known as "Silver Loading". To cover the costs of the missing CSR payments, additional costs are "loaded" onto silver plan premiums, which makes silver plans more expensive.

However, because silver plans are the basis for calculating Premium Tax Credits (PTC), the increased cost of the silver-loaded plans caused the overall tax credits provided by the federal government to increase as well. In summary, the silver loading strategy results in higher premium tax credits giving consumers higher purchasing power towards bronze and gold plans.

The effect of the BHP on Marketplace Tax Credits

Based on the eligibility criteria for the BHP, enrollment in CSR-eligible plans is anticipated to decrease until 2027. As that happens, the amount carriers need to pay to cover CSR plans goes down, so premiums for silver plans go down as well. As stated above, premium tax credits for Marketplace plans are tied to the cost of premiums for the silver plans. As the premium goes down, the available premium tax credits also go down. For some individuals on bronze and gold plans, the decrease in premium tax credits will result in a monthly premium payment that is higher than it was before.

Reinsurance and risk adjustment – individual

The Oregon Reinsurance Program and the federal Risk Adjustment Program both work to offset risk (costs) experienced by insurers, ultimately lowering premiums.

Reinsurance is based on claim costs – when claims exceed a certain value, an insurer can receive payments from the reinsurance program to offset that risk, ultimately keeping costs lower for consumers.

The federal Risk Adjustment Program is designed to distribute the impact of high-risk, low-probability events across the market. These numbers represent payments made to the insurer or contributions to the pool.

	Reinsurance		Risk Adjustment

DFR RATE RECOMMENDATIONS

After a thorough review of the filed rates, DFR has recommended some adjustments to the rate increases requested. The changes are driven by two key factors: administrative cost adjustments and silver-load adjustments. The table below details those recommended changes per insurer.

These recommended changes are formally communicated in DFR's preliminary decision documents, published on www.OregonHealthRates.org.

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position with Northwest Natural Gas Company ("NW Natural" or "the Company").

A. My name is Tobin Davilla. I am the Director of Financial Planning and Analysis at NW Natural. I am responsible for producing the annual operations and maintenance ("O&M") expense budget, the capital expenditures budget, the income statement budget, developing the short-term and long-term financial forecasts for senior management, and generally supporting the organization with financial modeling and analysis.

Q. Please summarize your educational background and experience.

A. I hold both a Bachelor of Science degree and a Master of Business Administration degree from Oregon State University. Prior to joining NW Natural, I held a position in Finance at PacifiCorp. I joined NW Natural in 2007 as a financial analyst and have held numerous positions within the Finance department and have been in my current position since 2018.

Q. Please provide a summary of your testimony.

A. My testimony explains how NW Natural calculated the O&M expense included in its revenue requirement in this proceeding. Specifically, I provide an overview of how the Company adjusted Test Year O&M (April 2024 – March 2025) and the adjustments to O&M for the provisional years to arrive at its rate case request.

II. OPERATIONS AND MAINTENANCE EXPENSE

Q. What is the Washington-allocated O&M expense included in the Company's revenue requirement in this case?

A. The Washington-allocated expense included in the revenue requirement in the first year that rates are in effect (August 1, 2026, to July 31, 2027) ("RY1") is $29.6 million. This amount increases to $31.5 million beginning for the second year of the rate period (August 1, 2027, to July 31, 2028) ("RY2"), and increases to $32.5 million for the third year of the rate period (August 1, 2028, to July 31, 2029) ("RY3").

Q. How did the Company calculate its Washington-allocated O&M expense?

A. The Company calculated its Washington-allocated O&M expense[1] by:

1. Determining the Washington-allocated O&M expense that it incurred during the historical Test Year—April 1, 2024, through March 31, 2025.
2. Making certain restating, pro forma, and provisional adjustments to better reflect the expense the Company expects to incur during the rate effective periods.

Each of these steps is discussed in further detail below.

A. Washington-Allocated O&M Expense Incurred During Test Year

Q. What was the total O&M expense that the Company incurred during the Test Year?

A. The Company incurred $250.4 million in total O&M expense during the Test Year. Since the Company serves customers in Washington and Oregon, it must allocate a

[1] Confidential Exh. TFD-2C, O&M development excel model.

certain amount of O&M expense to its Washington customers.

Q. How did the Company allocate O&M expense to its Washington customers?

A. The total O&M expense incurred during the Test Year—$250.4 million—was allocated to O&M Federal Energy Regulatory Commission ("FERC") accounts. The Company then applied Washington allocation factors to each FERC account to calculate Washington-allocated O&M.[2] This resulted in $26.0 million of Washington-allocated O&M incurred during the Test Year, which is then further adjusted as explained in sections B below.

B. Restating, Pro Forma and Provisional Adjustments to O&M Expense

Q. Please summarize the restating, proforma and provisional adjustments to O&M expense.

A. The Company made restating, proforma and provisional adjustments to better reflect the expense the Company will incur during the rate effective periods or to remove expenses for which the Company is not seeking recovery. Restating adjustments were made to annualize ongoing costs, normalize the balances in accordance with historical ratemaking practices, or remove costs that were incurred during the Test Year for which the Company is not seeking recovery. Proforma adjustment were made to reflect costs for the twelve-month period from August 1, 2025, through July 31, 2026, the immediately preceding twelve-month period prior to the initial Rate Year 1 effective date. Finally, the Company included provisional O&M adjustments for the following periods: August 1, 2026, through July 31, 2027 (RY1); August 1, 2027, through July

[2] *See* the Direct Testimony of Kyle T. Walker (Exh. KTW-1T) for further detail on how costs were allocated between Washington and Oregon.

31, 2028 (RY2); and August 1, 2028, through July 31, 2029 (RY3). These adjustments incorporate the Company's projected expense and other known and measurable changes, as further discussed below. Each of these restating, proforma and provisional adjustments are reflected in Table 1 below (found in confidential Exh. TFD-2C) and in subsequent subsections of my testimony.

Total O&M Expense	[redacted]				

1. O&M Costs for which the Company is Not Seeking Cost-Recovery

Q. Please describe the Test Year O&M costs for which the Company is not seeking cost recovery in this case.

A. The Company removed four expenses (lines labeled A-D in Table 1 above) from the Test Year as part of their restating adjustments. The Company removed all FERC 913

(Promotional Advertising Expense), the Supplemental Executive Retirement Plan ("SERP") and Executive Supplemental Retirement Income Plan ("ESRIP"), expenses related to the Long-Term Incentive Plan ("LTIP"), and all expenses related to Stock Expense (which include Restricted Stock Units, or "RSUs"). The cumulative effect of not seeking cost recovery of these O&M costs is a $690 thousand reduction in Washington-allocated O&M (Table 2 below).

Table 2

	Test Year 4/1/24-3/31/25
Test Year Removals	
A. FERC 913 removal	$ (101,050)
B. SERP and ESRIP removal	$ (227,492)
C. LTIP removal	$ (112,840)
D. Stock Expense removal	$ (249,103)
Total	**$ (690,485)**

2. Claims Adjustment (line E in Table 1)

Q. Please describe the Claims restating adjustment.

A. The Company includes a restating adjustment to include actual ordinary claims for the Test Year, replacing the expense accrual activity that is used for claims reserve accounting. The Direct Testimony of Kyle T. Walker (Exh. KTW-1T) provides more information on the claims adjustment included in the case.

Q. What is the impact to O&M of the Claims restating adjustment?

A. The restated O&M Test Year adjustment for claims is a decrease of $12 thousand to align the Test Year amount to the actuals ordinary claim amount instead of the expense accrual activity in the Test Year results.

3. Annual Incentive Adjustment (line F in Table 1)

Q. Please describe the Annual Incentive restating adjustment, and quantify the impact to O&M of that adjustment.

A. The Company used the historical average of annual incentive compensation paid to make a restating adjustment to the Test Year amount. Specifically, a three-year historical average was applied to restate the annual incentive compensation for Non-Bargaining Unit ("NBU") employees, while a six-year historical average was used for Officers. Bargaining Unit ("BU") employees were not included in this restatement because they are not eligible for incentive compensation under the Collective Bargaining Agreement ("Agreement"). The confidential Direct Testimony of Melinda B. Rogers (Exh. MBR-1CT) provides more information on the incentive compensation expense included in the case. The total impact of the restating adjustments above is a reduction of $166 thousand.

4. Rate Case Expense Adjustment (line G in Table 1)

Q. Please describe the Rate Case restating adjustment, and quantify the impact to O&M of that adjustment.

A. During the Test Year period, the Company incurred expenses of $1.24 million for rate –case related expenses occurring in jurisdictions unrelated to this case. Therefore, a restating adjustment was made to remove all costs related to those expenses allocated to Washington. The Washington-allocated amount in the Test Year was $149 thousand. This was removed as a Test Year restarting adjustment.

Q. Is the Company included any rate case related costs in this case?

A. Yes, the Company is forecasting to spend $1.5 million in rate case related expenses in this case. To minimize the immediate impact to customers in Rate Year 1, instead of spreading the costs over the three provisional periods, the Company layered additional expense beginning in Rate Year 2 of $750 thousand for both Rate Year 2 and Rate Year 3 to recover those expenses.

5. Resource Scheduling Optimization Savings Adjustment (line H in Table 1)

Q. Please describe the Resource Scheduling Optimization Savings adjustment.

A. As further described more fully in the confidential Direct Testimony of Brian E. Fellon (Exh. BEF-1CT), the Resource Scheduling Optimization Project will improve the software used by NW Natural's Resource Management Center ("RMC") to manage field worker schedules and timesheets, thus allowing the Company to better track and assign work. The Resource Scheduling Optimization Project will resolve issues with the Workforce software that currently require several manual workarounds and will implement functionality improvements. Accordingly, the Company includes a proforma expense adjustment to reducing O&M in this case to reflect a reduction of two contracted workers because of the expected reduced manual workarounds. The total savings are $322 thousand on a system level. The Washington-allocated adjustment is a reduction of $11 thousand to O&M, and a reduction of $28 thousand to rate base.

6. FTE Adjustment (line I in Table 1)

Q. Please describe the full-time equivalent ("FTE") restating adjustment.

A. The Company makes an O&M Test Year restating adjustment to annualize the expense of the actual FTE count at the conclusion of the Test Year. The adjustment increases O&M by $256 thousand.

Q. Is the Company requesting additional FTEs in the Rate Years?

A. Yes, the Company projects continued annual FTE growth of 12 on a system basis going forward.

Q. What is the impact to O&M of the additional forecasted FTEs?

A. The additional FTE expense in the proforma period is an increase as compared to the Test Year by $80 thousand. Rate Year 1 is an increase in expense of $92 thousand as compared to the proforma period. Rate Year 2 is an increase of $92 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $92 thousand as compared to Rate Year 2. The confidential Direct Testimony of Melinda B. Rogers (Exh. MBR-1CT) provides more information on the FTE increases included in the case.

7. Wage and Salary Increase Adjustment (line J in Table 1)

Q. Please explain the adjustment to wages and salary costs.

A. The Company made proforma and provisional adjustments for wage and salary increases as shown in Table 3 below, and the confidential Direct Testimony of Melinda B. Rogers (Exh. MBR-1CT) provides more information on the wages and salary expense included in the case. BU employee payroll costs were escalated by taking the Test Year restated Washington-allocated BU employee wages, adjusting to account for expected annual FTE growth, and then applying the scheduled wage increases under

the Collective Bargaining Agreement with the Union. The Company adjusted BU payroll costs to reflect the Agreement's 4.00 percent wage increase effective December 1, 2025, December 1, 2026 and December 1, 2027. The current Collective Bargaining Agreement[3] with the Union runs through May 31, 2028. For this case in which Rate Year 3 goes beyond this date, the Company assumed the [redacted] adjustment would apply on December 1, 2028. In addition, on top of the wage increase, the Company applied an additional 1.05 percent each year for promotions and movements from entry rate to experienced rate as described in the Agreement. For Rate Year 3 that goes beyond the term of the CBA, the Company used the [redacted] adjustment to account for such promotions and movements.

Table 3

	ProForma 8/1/25-7/31/26	Rate Yr1 8/1/26-7/31/27	Rate Yr2 8/1/27-7/31/28	Rate Yr3 8/1/28-7/31/29
J. Wage and Salary Increase				
BU	$ 289,937	$ 223,279	$ 236,497	[redacted]
NBU	$ 367,080	[redacted]		
Officers	$ 23,229	$ 18,348	$ 19,228	$ 20,151
Total	**$ 680,245**	[redacted]		

The total O&M adjustment to BU payroll increased O&M expense by $290 thousand in the proforma period as compared to the Test Year. Rate Year 1 is an increase of $223 thousand as compared to the proforma period. Rate Year 2 is an increase of $236 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of [redacted] as compared to Rate Year 2.

[3] Exh. MBR-4.

Like BU payroll costs above, NBU and Officer payroll costs were escalated by taking the Test Year restated NBU and Officer salaries, adjusting to account for expected annual NBU employee growth, and then applying forecasted wage and salary increases.

The Company included a [redacted] annual increase each March beginning in 2026. The [redacted] is made up of [redacted] projected salary increases [redacted] for promotions that have historically occurred each year.

The total O&M adjustment to NBU payroll increased O&M expense by $367 thousand in the proforma period as compared to the Test Year. Rate Year 1 is an increase of [redacted] as compared to the proforma period. Rate Year 2 is an increase of [redacted] as compared to Rate Year 1, and Rate Year 3 is an additional increase of [redacted] as compared to Rate year 2.

The total O&M adjustment to Officer payroll increased O&M expense by $23 thousand in the proforma period as compared to the Test Year. Rate Year 1 is an increase of $18 thousand as compared to the proforma period. Rate Year 2 is an increase of $19 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $20 thousand as compared to Rate Year 2.

Q. Does the O&M payroll expense include any non-regulated full-time equivalents (FTEs)?

A. No. The O&M payroll expense excludes all payroll related to non-regulated activity. This non-regulated activity includes any time spent by employees on affiliate activities.

8. Health and Life Adjustment (line K in Table 1)

Q. Please describe the Health and Life adjustment.

A. The Company made proforma and provisional adjustments for both medical and life benefits. For medical benefits, the Company used projected annual medical benefit increases to determine the adjustment amounts. The annual projected increase for medical benefits is 9.50 percent in 2025, 9.00 percent in 2026, 8.50 percent in 2027, 8.00 percent in 2028, and 7.00 percent in 2029. The confidential Direct Testimony of Melinda B. Rogers (Exh. MBR-1CT) includes additional information regarding the medical benefit increases. For life insurance, the Company used projected annual life insurance increases to determine the adjustment amounts. The annual projected increase for 2025 and 2026 was kept flat to Test Year amounts. Life insurance increase was applied at 3.00 percent in 2027, 3.00 percent in 2028, and 3.00 percent increase in 2029. The confidential Direct Testimony of Melinda B. Rogers (Exh. MBR-1CT) includes additional information regarding life insurance increases. The total O&M adjustment for Health and Life increased O&M expense by $164 thousand in the proforma period as compared to the Test Year. Rate Year 1 is an increase of $134 thousand as compared to the proforma period. Rate Year 2 is an increase of $138 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $135 thousand as compared to Rate Year 2.

9. Pension Expense Adjustment (line L in Table 1)

Q. Please describe the Pension Expense adjustment.

A. The Company has adjusted the pension expense in the proforma and provisional periods to reflect the projected expense forecasted by the Company's actuary, Fidelity

Investments, as shown in Table 4 below. The Company used the latest forecast provided by Fidelity Investments prior to filing this rate case, which reflects what the Company will incur during the period when rates are in effect. The proforma expense is projected to increase as compared to the Test Year by $349 thousand. Rate Year 1 is an increase in expense of $59 thousand as compared to the proforma period. Rate Year 2 is a decrease of $95 thousand as compared to Rate Year 1 expense, and Rate Year 3 is an additional decrease of $192 thousand as compared to Rate Year 2 expense.

Table 4

	Test Year 4/1/24-3/31/25	ProForma 8/1/25-7/31/26	Rate Yr1 8/1/26-7/31/27	Rate Yr2 8/1/27-7/31/28	Rate Yr3 8/1/28-7/31/29
L. Pension					
Beg. Balance	$ 687,345	$ 687,345	$ 1,036,720	$ 1,095,405	$ 1,000,315
Adjustment		$ 349,375	$ 58,686	$ (95,091)	$ (192,241)
Ending Balance	**$ 687,345**	**$ 1,036,720**	**$ 1,095,405**	**$ 1,000,315**	**$ 808,074**

10. General Non-Payroll (with CPI) Adjustment (line M in Table 1)

Q. Please describe the General Non-Payroll (with CPI) adjustment.

A. The Company escalated general non-payroll costs using year-over-year rates of change in the forecast of the U.S. Urban CPI, as reported in the May 2025 Oregon Economic and Revenue Forecast.[4] These escalation factors were applied on January 1st of each year in this case. The published rates are as follows: 3.40 percent in 2025, 2.90 percent in 2026, 2.20 percent in 2027, 2.00 percent in 2028 and 1.90 percent in 2029.

[4] Exh. TFD-3.

Q. What is the impact to O&M of using these escalation rates for Non-Payroll?

A. The proforma expense is projected to increase as compared to the Test Year by $481 thousand. Rate Year 1 is an increase in expense of $292 thousand as compared to the proforma period. Rate Year 2 is an increase of $251 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $239 thousand as compared to Rate Year 2.

Q. Does the Company include any other adjustments for specific non-payroll program costs in this case?

A. Yes, the Company identified several items where its forecasted growth projection was greater or lesser than CPI's projections and adjusted these items accordingly. This ensures that these adjustments accurately reflect changes that are known to the Company—for example, changes due to fluctuation of contractual agreements, which are both known and measurable, or expense changes that the Company knows will increase or decrease at a rate that differs from CPI's escalation rate. As shown in Table 5, below, the following areas have been adjusted for accordingly: Information Technology and Services ("IT&S"); Contracted Locating & Survey Services; Insurance; Pipeline Inspection Integrity Program; Well Casing Integrity Inspection Program; the Company's Contracted Customer Payment Processing Fees; and Thermal Energy Network ("TEN") project.

Table 5

	ProForma 8/1/25-7/31/26	Rate Yr1 8/1/26-7/31/27	Rate Yr2 8/1/27-7/31/28	Rate Yr3 8/1/28-7/31/29
Adjustments for Specific Non-Payroll				
N. Information Technology and Services (IT&S)	$ 553,949	$ 204,631	$ 23,758	$ 8,267
O. Contracted Locating and Survey Services	$ 44,727	$ 74,091	$ 72,307	$ 71,816
P. Insurance	$ 203,941	$ 76,969	$ 36,235	$ 39,604
Q. Pipeline Inspection Integrity Program	$ 34,701	$ 5,178	$ (479)	$ 2,730
R. Well Casing Integrity Inspection Program	$ 219,418	$ 99,527	$ (71,741)	$ (110,537)
S. Contracted Cust. Payment Processing Fee	$ 51,807	$ 48,483	$ 56,797	$ 64,302
T. Thermal Energy Network "TEN" project			$ 9,529	$ 47,707
Total Adjustments for Specific Non-Payroll	**$ 1,108,543**	**$ 508,880**	**$ 126,406**	**$ 123,889**

11. Information Technology and Services (IT&S) Adjustment (line N in Table 1)

Q. Please describe the IT&S adjustment.

A. The confidential Direct Testimony of Brian E. Fellon (Exh. BEF-1CT) discusses in more detail the largest components of the IT&S O&M expense increase. The forecast includes projected hardware & software maintenance as well as service expenses.

Q. What is the impact to O&M of the specific IT&S non-payroll expenses?

A. The IT&S proforma expense is projected to increase as compared to the Test Year by $554 thousand. Rate Year 1 is an increase in expense of $205 thousand as compared to the proforma period. Rate Year 2 is an increase of $24 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $8 thousand as compared to Rate Year 2.

12. Contracted Locating & Survey Services Adjustment (line O in Table 1)

Q. Please describe the Company's Damage Prevention Program and the locating and survey services provided under that program.

A. The Company's Damage Prevention Program and the locating and survey services provided under that program are addressed in the Direct Testimony of Daniel B. Kizer and Scott S. Johnson (Exh. DBK-SSJ-1T).

Q. What is the impact to O&M of the specific Contracted Locating & Survey Services non-payroll expenses under the Damage Prevention Program?

A. The Contracted Locating & Survey Services proforma expense is projected to decrease as compared to the Test Year by $45 thousand. Rate Year 1 is an increase in expense of $74 thousand as compared to the proforma period. Rate Year 2 is an increase of $72 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $72 thousand as compared to Rate Year 2.

13. Insurance Expense Adjustment (line P in Table 1)

Q. Please describe the Insurance adjustment.

A. The Company has incurred insurance premiums for the fiscal period 2024-2025, and expects that the Company's excess liability insurance costs will increase beginning November 2025. The increase is driven by two main factors: (1) pricing for excess liability insurance has increased dramatically across insurance markets, particularly for gas and electric utilities; and (2) the Company is behind its peers with respect to the levels of excess liability insurance limits purchased. Both factors are driven by unprecedented losses experienced in the United States in a number of industries. The size and frequency of catastrophic jury awards, often referred to as "nuclear verdicts,"

have been increasing at a pace that far exceeds inflation for the past several years. The effect of these verdicts is exacerbated for gas and electric utilities due to the rapid increase in size and frequency of catastrophic wildfire claims. Combined, these circumstances have resulted in significantly higher premiums and reduced market capacity for excess liability. For the 2024-2025 insurance year, the Company saw a 22 percent increase in insurance premiums for policies that provide the same level of excess liability limits purchased in the prior year and a wildfire coverage limit that was 29 percent lower than the prior year. In other words, the Company paid more in the base year for less coverage than it had the year before, and the Company expects this trend to continue.

Q. Please explain why the Company decided that increased liability coverage is necessary.

A. NW Natural's liability coverage limits are consistently below its peers. Specifically, NW Natural's limit of $120,000 falls below the average coverage limit of approximately $270,000, and its limit per connection of $150 falls below the average of $229. NW Natural will increase its current $120 million total coverage when it renews the policy on October 15, 2025, to reach $200 million in total coverage. Even after the Company increases its coverage to this range, NW Natural will still have less coverage than most of the other utilities in the benchmark group, but it will be much closer to industry standard.

Q. Please explain the insurance expense increase the Company is seeking in this case.

A. For the forecasted premium beginning October 2026, the Company is expecting an increase of 30 percent in expense that considers increases for both higher pricing as

well as the impact of the higher liability limits. Beyond the premium year ending October 2027, the Company is projecting its overall insurance expenses to increase 5.00 percent annually.

Q. What is the impact to O&M of the Insurance adjustment?

A. The Insurance proforma expense is projected to increase O&M as compared to the Test Year by $204 thousand. Rate Year 1 is an increase in expense of $77 thousand as compared to the proforma period. Rate Year 2 is an increase of $36 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $40 thousand as compared to Rate Year 2.

14. Pipeline Inspection Integrity Program Adjustment (line Q in Table 1)

Q. Please describe the Company's Pipeline Inspection Integrity Program.

A. The Company's Pipeline Inspection Integrity Program is described in the Direct Testimony of Daniel B. Kizer and Scott S. Johnson (Exh. DBK-SSJ-1T).

Q. What is the impact to O&M for the Pipeline Inspection Integrity Program?

A. The Pipeline Inspection Integrity Program proforma expense is projected to increase as compared to the Test Year by $35 thousand. Rate Year 1 is an increase in expense of $5 thousand as compared to the proforma period. Rate Year 2 is a decrease of $479 as compared to Rate Year 1, and Rate Year 3 is an increase of $3 thousand as compared to Rate Year 2.

15. Well Casing Inspection Program Adjustment (line R in Table 1)

Q. Please describe the Company's Well Casing Inspection Program.

A. The Company's Well Casing Inspection Program is described in the Direct Testimony of Daniel B. Kizer and Scott S. Johnson (Exh. DBK-SSJ-1T).

Q. What is the impact to O&M for the Well Casing Inspection Program?

A. The Well Casing Inspection Program proforma expense is projected to increase as compared to the Test Year by $219 thousand. Rate Year 1 is an increase in expense of $100 thousand as compared to the proforma period. Rate Year 2 is a decrease of $72 thousand as compared to Rate Year 1, and Rate Year 3 is an additional decrease of $111 thousand as compared to Rate Year 2.

16. Contracted Customer Payment Processing Fees Adjustment (line S in Table 1)

Q. What are Customer Payment Processing Fees, and why are they increasing?

A. The Company entered into an agreement with Paymentus[5] to provide electronic bill payment services to the Company's customers and has been doing so since October 2020. The parties recently amended the contract in December 2023 for services through May 2027.[6] The Company has experienced a strong customer preference to pay by bankcard. The average growth in bankcard adoption from 2013 forward has been 20 percent annually. Over the last 5 years, it was 13 percent. Over the last 2 years, it was 11 percent. In 2023, it was 10 percent. Table 6 below illustrates historical adoption.

[5] Confidential Exh. TFD-4C.

[6] Confidential Exh. TFD-5C.

Table 6

Year	Payments Incurring a Fee Count	% Increase from Prior Year
2013	$ 547,742	
2014	$ 810,976	48%
2015	$ 1,075,387	33%
2016	$ 1,288,359	20%
2017	$ 1,563,339	21%
2018	$ 1,788,861	14%
2019	$ 2,033,066	14%
2020	$ 2,413,091	19%
2021	$ 2,687,553	11%
2022	$ 2,998,596	12%
2023	$ 3,294,748	10%

Average Increase	20%
Average Increase Last 5 Years	13%
Average Increase Last 2 Years	11%

NW Natural is using the most conservative of these averages, and forecasts that transactions from the Test Year through Rate Year 3 will continue at 10 percent compound annual growth rate.

Q. What is the impact to O&M for the Contracted Customer Payment Processing Fee increase?

A. The Contracted Customer Payment Processing Fee proforma expense is projected to increase as compared to the Test Year by $52 thousand. Rate Year 1 is an increase in expense of $48 thousand as compared to the proforma period. Rate Year 2 is an increase of $57 thousand as compared to Rate Year 1, and Rate Year 3 is an additional increase of $64 thousand as compared to Rate Year 2.

17. Thermal Energy Network (TEN) Adjustment (line T in Table 1)

Q. What is TEN?

A. TEN is the Thermal Energy Network pilot project in Vancouver, for which the Company is seeking recovery in this proceeding. The confidential Direct Testimony of Holly J. Braun (Exh. HJB-1CT) provides more information on the pilot project included in the case.

Q. What is the impact to O&M for the TEN project?

A. The TEN project is projected to have O&M in Rate Year 2 of $10 thousand dollars, and Rate Year 3 is an additional increase of $48 thousand as compared to Rate Year 2 expenses.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

Foreword

This document contains the Oregon economic and revenue forecasts. The Oregon economic forecast is published to provide information to planners and policy makers in state agencies and private organizations for use in their decision-making processes. The Oregon revenue forecast is published to open the revenue forecasting process to public review and is the basis for much of the Oregon state government budgeting process.

The report is published four times a year: March, May/June, September and December.

The economic model assumptions and results are reviewed by the Department of Administrative Services Economic Advisory Committee and by the Governor's Council of Economic Advisors. The Department of Administrative Services Economic Advisory Committee consists of 15 economists employed by state agencies. The Governor's Council of Economic Advisors is a group of 12 economists from academia, finance, utilities and industry.

Members of the Economic Advisory Committee and the Governor's Council of Economic Advisors provide a two-way flow of information. The Department of Administrative Services makes preliminary forecasts and receives feedback on the reasonableness of such forecasts and assumptions employed. After the discussion of the preliminary forecast, the Department of Administrative Services makes a final forecast using the suggestions and comments made by the two reviewing committees.

The results from the economic model are used to provide a preliminary forecast for state tax revenues. The preliminary results are reviewed by the Council of Revenue Forecast Advisors. The Council of Revenue Forecast Advisors consists of 15 specialists with backgrounds in accounting, financial planning and economics. Members bring specific specialties in tax issues and represent private practices, accounting firms, corporations, government (Oregon Department of Revenue and Legislative Revenue Office) and the Governor’s Council of Economic Advisors. After discussion of the preliminary revenue forecast, the Department of Administrative Services makes the final revenue forecast using the suggestions and comments made by the review committee.

Readers who have questions or wish to submit suggestions may contact the Office of Economic Analysis by email at oea.info@das.oregon.gov.

Executive Summary

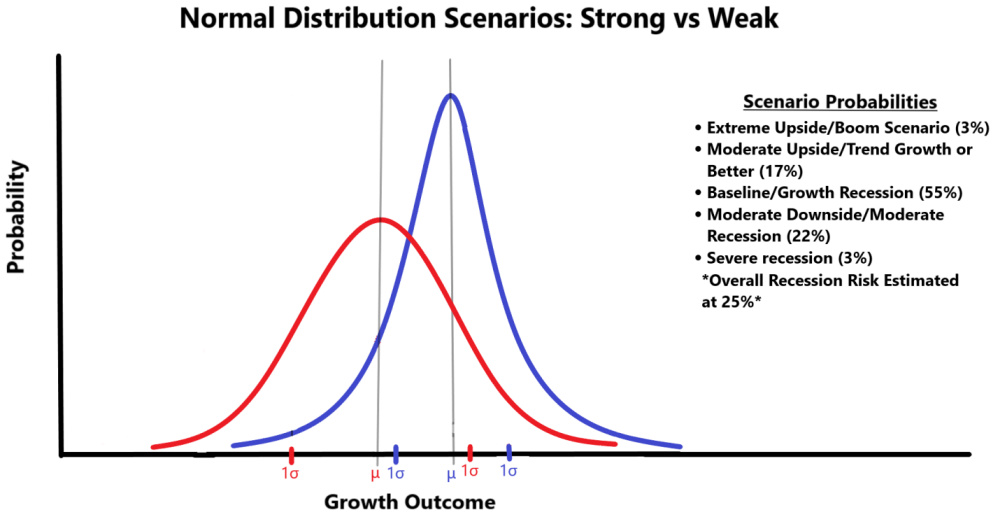
May 2025 — 'Known unknowns' foment uncertainty and wider tail risks

The national and state economies stand at a critical juncture due to a myriad of major public policy course changes and the associated uncertainties, including trade and tariff policy, restructuring of the federal government and tax reforms. The ultimate manifestation of these federal agenda priorities could have a wide range of consequences on the economic outlook—depending on the degree to which they magnify or offset one another. For example, income tax reductions for households and corporations could offset the effective levies imposed via tariffs (similar to the experience in 2018).

The timing of the 2025-27 close of session forecast comes at a time of exceptionally heightened uncertainty. Not only is it too soon to understand how the economy is responding to actions already taken—but, more broadly, the ultimate scope of critical policy decisions remains unknown. For example, even preliminary economic impacts from tariffs are unlikely to materialize in vital statistics such as employment or consumer prices for another month or two. Further, final details on tax reforms and budget reductions are only vaguely coming into view, and the eventual effective tariff rate will depend on the success of negotiations which have not yet occured.

These recognized uncertainties, or *known unknowns*, pose potentially massive risks to the economic outlook. As such, while the medium-term forecast is always subject to a distribution of potential outcomes (or risk scenarios), the elevated risks at present create unique characteristics surrounding the current projections.

Single-party control of the executive and legislative branches at the federal level create the opportunity for bold policy decisions to more forcefully push growth outcomes away from the most likely outcome based solely on economic fundamentals. As such, policy risk alone raises the probability of tail-risk scenarios, which inherently means the degree of confidence toward the baseline or central forecast is diminished.



This is worth restating—the Office of Economic Analysis has diminished confidence in the central forecast as a result of pending policy decisions which are expected to have substantial economic consequences for growth, employment, inflation and financial markets—all of which are critical variables driving the compilation of our revenue forecast.

Economic fundamentals were sound at the start of the year, and the consensus among forecasters anticipated only moderately slower growth and lower inflation relative to the prior year. Some preliminary measures of job creation even hinted at a reacceleration, both nationally and within Oregon, in the early months of 2025. After lagging the national economy for several quarters, state economic output showed compelling evidence of rebounding around yearend.

Nonetheless, Oregon is a state which is highly vulnerable to national priorities relating to tariffs, immigration, and federal expenditures. Exports and manufacturing play outsized roles in the state, so trade tensions will be borne disproportionately; particularly by key industrial pillars such as agriculture, semiconductors and sportswear/apparel. This was evident during the trade tensions of 2018-19, which were considerably smaller relative to recently enacted measures.

Growth recession, profits recession...but not an outright recession

It is admittedly too soon to comprehend the economic consequences of recent actions, although the resilience in economic data to date (and subsequent stabilization of financial markets) speaks to the broader resilience of the U.S. economy. Elevated uncertainty pertaining to the economic outlook and business climate is undoubtedly negative for capital spending and hiring plans, but the absence of more severe symptoms in the hard economic data (or forward-looking financial markets) to date is noteworthy, to be sure. As such, while the risk of recession is magnified by policy uncertainty—it is not the baseline assumption of OEA.

In the OEA forecast for 2025, growth is expected to be sufficiently slow that labor conditions soften appreciably—but not in the jarring manner of a conventional recession. Economists refer to such a scenario as a “growth recession” or near-stagnation. It is a period during which weak growth results in higher unemployment. In contrast, an outright economic recession is defined by the National Bureau of Economic Research as a significant decline in economic activity that is spread across the economy and lasts more than a few months. To be sure, a recession of some degree of severity is a plausible risk in the current environment of low growth. The economic and revenue implications of a range of scenarios, including modest and severe recessions are detailed in this document, but it is important to underscore that our central scenario is not a recession.

The revenue outlook exhibits a significant slowdown in income growth for individuals and an outright decline in business income in 2025. Normal growth conditions resume as 2026 progresses. This is a marked revision in the outlook relative to the previous forecast and results in downward changes to both the current and the next biennium’s revenue picture.

For the 2023-25 biennium—that is coming to a close—revenues are revised downward $162.3 million relative to the Q1 forecast. In addition, the 2025 legislature appropriated additional spending allowance

for the current biennium, effectively reducing the ending balance by an additional $248.9 million. All told, the ending balance in the General Fund is now projected at $2.17 billion, a change of -$414.0 million from the prior forecast.

For the 2025-27 biennium, the most significant change is to personal income taxes, which have been adjusted downward by $529.0 million. Corporate income taxes are increased slightly, up $24.6 million from the prior forecast. Total revenues have been revised down $334.2 million. Including the $414.0 decrease in the beginning balance carried forward from the prior biennium, the total change in available resources is -$755.7 million. The muted outlook also affects non-General Fund revenues such as the Corporate Activity Tax, Lottery and Marijuana Taxes. Corporate Activity Tax revenues in 2025-27 have declined $44.4 million from the previous forecast. Lottery earnings are revised downward by $36.7 million due mostly to weaker-than-expected Video Lottery sales. Marijuana tax revenues are also adjusted modestly, down $7.6 million from Q1.

Economic Outlook

Macroeconomic Setting

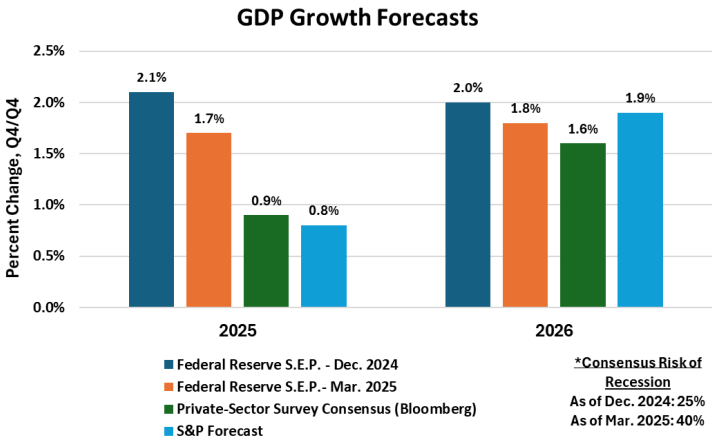
Staring into the Brink (of Recession)

Policy choices at the federal level are materially impacting the national economic outlook through both measurable actions, such as tariffs imposed, but also by sowing uncertainty among a wide range of economic entities, including households, businesses and investors. Confidence toward the economic outlook is a critical catalyst of consumption, hiring and investment, and history shows that periods of acute uncertainty can depress such activity.

International trade policy is a dominant contributor to the economic unknowns presently. The ultimate effective tariff rate, or even the direction of travel relative to current levels, is unknowable at this point in time. It is also too soon to gauge the real economic impact of measures put in place a little over a month earlier. Vital economic statistics pertaining to output, inflation and hiring are unlikely to begin showing tariff impacts until at least mid-year.

At the time of publication, the extent of progress in bilateral trade negotiations showed signs of promise, but the end result remained unclear. Similarly, the fate of the April 2 reciprocal tariffs was murky (these are currently paused through early July but also subject to various court rulings). While tariff pressures have eased in recent developments, continued progress is not assured as White House communications have hinted at upcoming tariff actions on pharmaceuticals, lumber, entertainment and other product categories.

Until the aforementioned forecasting impediments are diminished, the risk profile surrounding OEA’s forecast is distorted accordingly. Confidence toward the baseline (or central forecast) is reduced and the likelihood of alternative scenarios is elevated.



Recent developments have diminished near-term growth prospects while at the same time creating upside risks toward both inflation and unemployment. However, the magnitude of these risks is highly uncertain. The consensus among professional forecasters has trimmed growth projections accordingly while also acknowledging elevated recession risks. Some have even incorporated recession into their baseline. OEA anticipates materially slower growth relative to the prior forecast, but sees a recession narrowly avoided. Even so, growth will be sufficiently meager as to allow the unemployment rate to drift higher.

Such anemic periods of growth are described as a *growth recession*. The economy is not growing fast enough to balance labor conditions, so slack builds—embodied by rising unemployment. A growth recession is distinct from an outright recession, the latter of which is defined as a significant decline in economic activity spread across the economy, lasting more than a few months. Even so, a growth recession episode substantially increases the risk of the economy sliding into an outright recession.

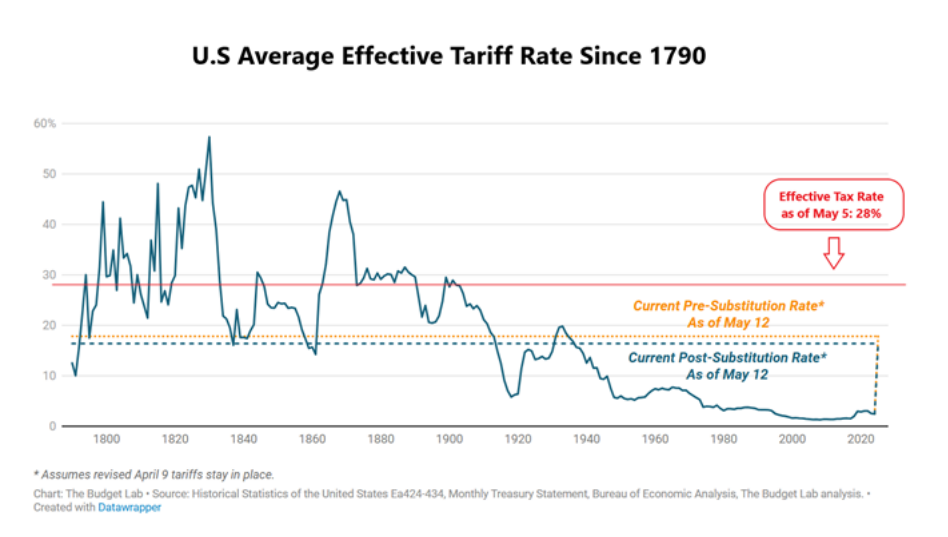
There are four main reasons why OEA thinks an outright recession could be avoided:

- **The U.S. economy has demonstrated resilience year-to-date.** In their latest assessment of economic conditions, policymakers at the Federal Reserve described economic activity as having "continued to expand at a solid pace" and labor conditions as "solid". Similarly, the pace of job creation in recent months is little changed from last year, and the unemployment rate remains stable at the national level.

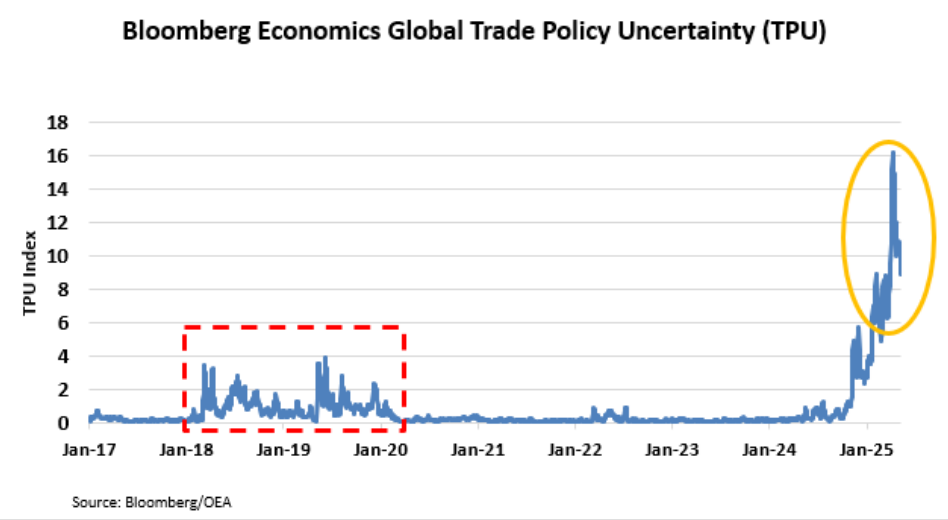
  Initial reports on Q1 2025 GDP growth showed a decline, but this occurred as households and businesses rushed to stockpile goods ahead of anticipated tariff announcements. This drove a massive surge in imports, which are subtracted from the tabulation of GDP. However, upon isolating this stockpiling effect, underlying private sector activity, known as private domestic final purchases (PDFP), showed a steady pace relative to 2024. Another factor supporting private sector resilience is robust corporate profit growth prior to the tariff announcement. The national income and product accounts show profits rising 7% in 2024 following an 11% increase in 2023.

- **Effective tariff rates appear to be at (or near) the peak.** Recent developments show the Trump administration making progress across the spectrum of trading partners in efforts to renegotiate relationships. The surprise announcement of a framework agreement with the UK on trade policy indicates a willingness from the administration to limit economic stress and also sets a template for other trade partners. Meanwhile, the fact that dialogue has begun between China and the U.S. is an encouraging sign of détente in arguably the highest-pressure point of current trade tensions. Both sides acknowledged "substantial progress" following their initial de-escalation talks in Geneva, Switzerland and subsequently agreed to reset tariffs while negotiations continue.

[It is worth noting that a number of court challenges to tariffs are also pending and could result in a rapid reduction in the effective tariff rate.]



- **Economic anxiety is starting to stabilize, maybe even subside.** Survey data shows economic sentiment souring sharply among households and businesses over the past few months. Many forecasters harbor concerns that a sustained loss of confidence will rapidly extract a toll on economic activity, including household spending, hiring and business investment. To the extent that trade tensions are driving sentiment, there are some encouraging signals of late. Financial market stress has diminished appreciably, and specific measures of trade policy uncertainty are showing tentative signs of improvement, as well. If these patterns endure, then broader measures of consumer and business confidence may soon start to thaw.



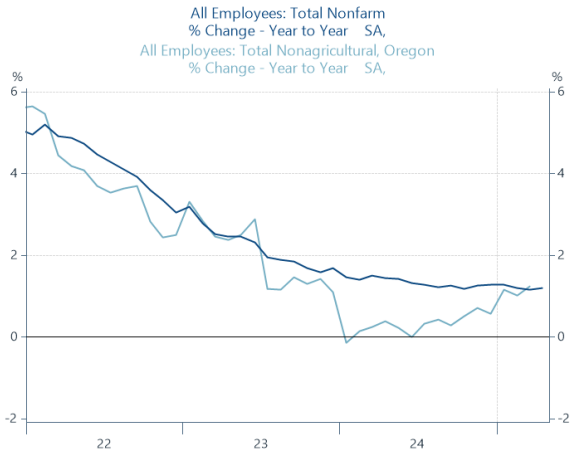
- **Policy accommodation to support the economy.** Both monetary and fiscal policy are likely to evolve toward more supportive stances later this year. Federal Reserve officials are currently signaling an unwillingness to act preemptively in cutting rates to stimulate economic activity given heightened uncertainty toward the inflation outlook. However, market expectations anticipate a series of interest rate reductions later this year.

  Fiscal policy is also likely to provide meaningful stimulus if the tax reform package working its way through Congress results in lower effective personal and corporate tax rates. Using tax cuts to offset the negative consequences of tariffs is not without precedent in the Trump administration, as a similar strategy was employed in 2018. Economic growth slowed as trade tensions amplified, but tax cuts delivered via the Tax Cuts and Jobs Act (TCJA) and interest rate reductions from the Federal Reserve ultimately stabilized activity.

To be sure, highlighting factors that may reduce the risk of recession (or its severity) should not be interpreted as downplaying the overall risk of recession. The risk of a downturn remains elevated, and has increased in recent months. The factors cited above are intended to explain why recession is an outsized downside risk—a clear and present danger—but not the OEA baseline assumption. Given the critical impact of a national recession on the economic and revenue outlook and the heighted risk at present—a robust, multi-faceted scenario analysis is included on page 30.

Oregon's Economic Outlook

Oregon's economy shows modest signs of growth in the early months of 2025, particularly in terms of job gains. The state appears to have gained growth and hiring momentum following a soft patch in late 2023/early 2024. However, its gradually increasing unemployment rate—edging higher than the national average for the past couple of months—points to a potential deviation in labor market performance.

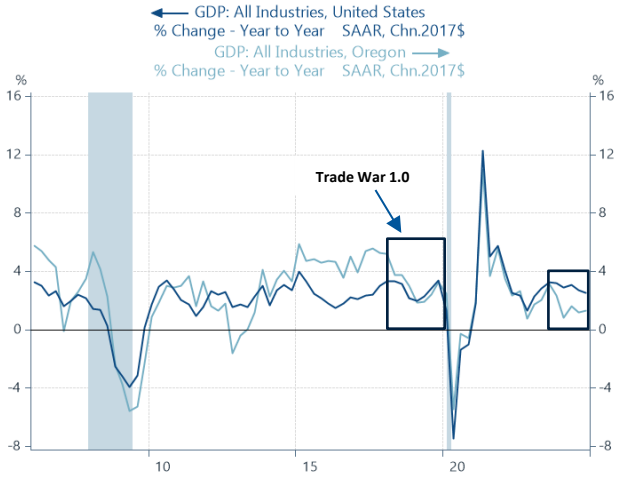


Source: Bureau of Labor Statistics/Haver Analytics

Moreover, the state is in a difficult position as headwinds related to trade wars and federal spending cutbacks threaten to further depress activity. Historically, the state has grown at an above-average rate by virtue of outsized exposure to faster growing sectors, such as tech/semiconductors, and also due to favorable demographics—namely sturdy population growth underpinned by solid in-state migration.

In the aftermath of the pandemic, the state's economic fortunes have been closely correlated with national trends. This pattern broke down at the start of 2024 as growth decelerated more sharply in Oregon due to a conflux of weak population growth and microeconomic factors among core industrial entities in the state. Over the last four quarters of reported data, Oregon GDP growth has been slower than U.S. GDP growth by about one and a half percentage points, and state job creation lagged the national average as a result. There is some tentative evidence that the state economy is bouncing back—GDP growth averaged 1.9% over Q3-Q4 2024, compared to 2.8% nationally over the same period.

The state is in a precarious position with trade tensions elevated presently, given an elevated export share of GDP. The three biggest export sectors are, respectively, computer & electronic products, transportation equipment and machinery, and the three largest export destinations are Mexico, China and Canada (comprising 45% of total exports in 2024). The economic experience of the state during the onset of tariffs and trade tensions in 2018 poses a troubling precedent.



Source: Bureau of Economic Analysis/Haver Analytics

As illustrated in the accompanying figure, the state was handily outpacing the national economy before tariffs began and then quickly downshifted the pace of growth (by about 2.5 percentage points) by mid 2019. At present, the state has less of an economic buffer: State GDP growth was averaging 4.5% in 2017 compared to about 1.3% over the last four quarters; meanwhile, job creation was substantially stronger in 2017 (+40k) compared to 2024 (+23k). The unemployment rate is comparable between the two periods. A parallel outcome in the present environment would put state economic activity close to stagnation.

Recent federal government budget cutbacks and layoffs are also likely to impact state economic activity, particularly in eastern counties where federal employment accounts for a larger share of total payrolls. At the time of publication, it is premature to discern the net impact, as the latest reported economic statistics have yet to fully capture reductions as many federal employees have been reinstated, placed on administrative leave, or await court rulings on their employment status.

Topline Forecast Changes

- *Hiring:* Anticipated job creation is revised lower relative to the previous 2025 Q1 outlook by less than one percentage point across the forecast horizon. This is in part due to the trend in payroll gains slowing more than anticipated and the expectation that growth will slow and labor conditions soften.

- *Unemployment:* The unemployment rate has been revised higher in the near term as Oregon continues to experience cooling labor conditions. With GDP growth expected to slow below trend, the unemployment rate is projected to drift higher, reaching a peak of 5.2% in 2027.

- *Income:* Personal income is now lower relative to the previous outlook. This is in large part due to a change in the outlook to a "growth recession". The impact of this can already be seen in the data as withholding and estimated payments through April are slipping below normal growth rates.

- *Population:* Population growth for Oregon has been revised lower. This forecast incorporates the 2024 mid-year population estimate and revisions released by Portland State University Population and Research Center as well as new vital statistics assumptions. The population is expected to grow by an annual average of 0.5% through the forecast horizon.

Underpinning the economic outlook is a continued rebound in migration leading to slow, but positive, population gains in the state. The labor market is expected to be sufficiently slow and labor conditions will soften. Although there is materially slower growth relative to the prior forecast, a recession is narrowly avoided.

Key forecast assumptions

The economic and revenues forecasts are developed using inputs from our national forecast vendor, Standard & Poors. Key assumptions driving the Oregon economic model are described below:

- ***Federal Fiscal Policy:*** Federal employment is lowered with an assumed 255,000 federal layoffs through August 2025. Personal tax policy includes extension beyond the scheduled expiration in 2026 of provisions in the 2017 Tax Act. Exclusion of tip and overtime pay from federal taxation.

Corporate tax rate on corporate income is lowered from 21% to 15% for corporations that produce domestically.

- ***State & local fiscal policy:*** Unspent pandemic-era funds as well as monies authorized under the Infrastructure Investment & Jobs Acts (IIJA) mitigate pressures to reduce state and local spending. States are assumed to trim Medicaid rolls through 2027.

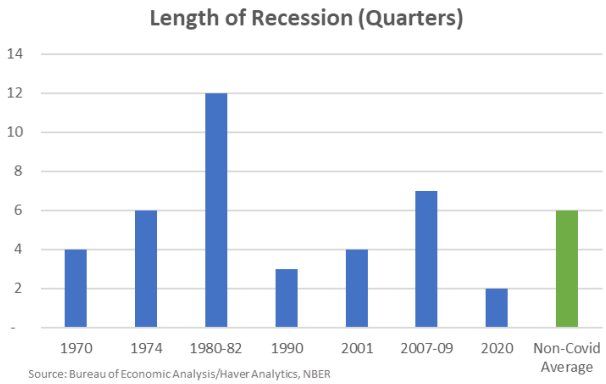
- ***Monetary Policy:*** The Federal Reserve holds the fed funds rate at current levels through much of the year, followed by three consecutive cuts spanning December 2025 through March 2026. Policymakers then slow to a pace of every other meeting over the rest of 2026, bringing the federal funds rate target to a range of 2.75%-3.00%, very close to estimates of the long-run "neutral" range.

- ***Tariffs and trade:*** Assumptions include new Section 232 tariffs on copper, lumber, semiconductors, pharmaceuticals, and critical minerals, ranging from 10% to 25%, effective in the fourth quarter of 2025. International Emergency Economic Powers Act tariffs on imports from China (20%), Canada (25%), and Mexico (25%), the latter two step down to 12% by early 2026. Reciprocal tariffs remain at a 10% universal baseline on imports from outside of North America except for China.

Oregon in Past Recessions

Given the heightened uncertainty pertaining to the economic and revenue outlook, a review of Oregon and the U.S. during prior recessions provides useful perspective on potential outcomes, particularly regarding plausible alternative scenarios for the state. It is important to underscore that our baseline scenario is not an outright recession, rather a period of anemic growth, as described in the executive summary.

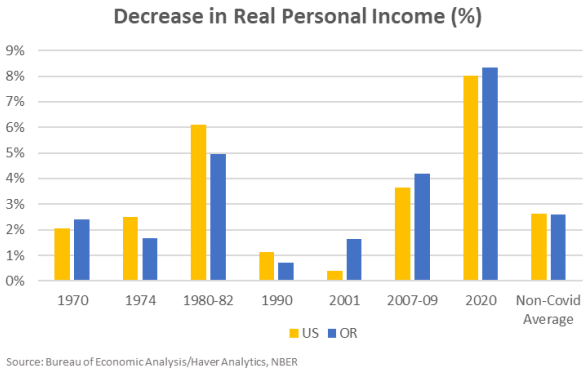
Official recessions are defined by the National Bureau of Economic Research (NBER) as a significant decline in economic activity that is spread across the economy and lasts more than a few months. Oregon's business cycle closely mirrors the U.S. cycle, so the NBER dating conventions are an appropriate benchmark for state analysis. Using these recession dates as defined by NBER, the average length of a recession dating back to 1970 is 6 quarters (excluding COVID-19). The 1980 and 2008 recessions were the longest and most severe.



With the recent emphasis on personal income less transfers and nonfarm payroll employment in NBER's decision to define a recession, our office finds it appropriate to compare Oregon vs. the U.S. in those two series, as well as the unemployment rate.

Personal Income

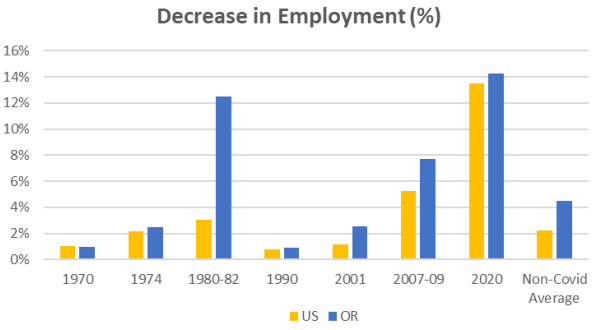
During a recession, Oregon real personal income tends to decrease in line with the national average. The non-covid average for the state is roughly the same as the national economy. However, in 1970, 2001, 2009, and 2020, Oregon experienced a greater decline in real personal income from the peak to the trough of the defined recession. For a moderate recession, Oregon typically experiences a 0.5-1.5% decline in real personal income, compared to a 4-5% decline during severe recessions.



Source: Bureau of Economic Analysis/Haver Analytics, NBER

Nonfarm Employment

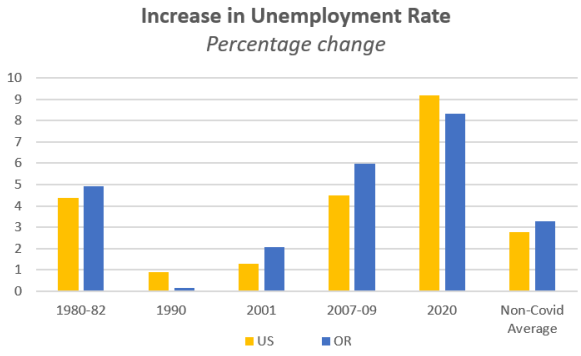
Oregon employment tends to drop more than the national average during a recession. The average decrease in employment for the U.S. is roughly 2% lower than the state's, but Oregon is also more volatile than the U.S. in terms of employment losses during recessionary periods. Much of the volatility can be attributed to the state's industrial structure. For a moderate recession, Oregon typically experiences a 1-2.5% decline in non-farm employment, compared to an 8-12% decline during severe recessions.



Source: Bureau of Economic Analysis/Haver Analytics, NBER

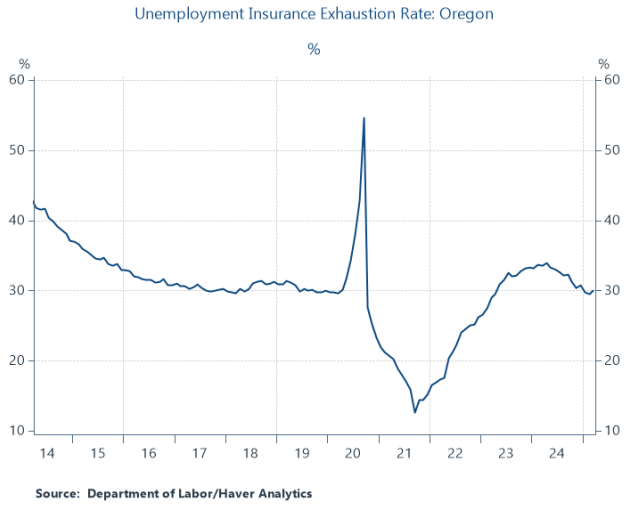
Unemployment Rate

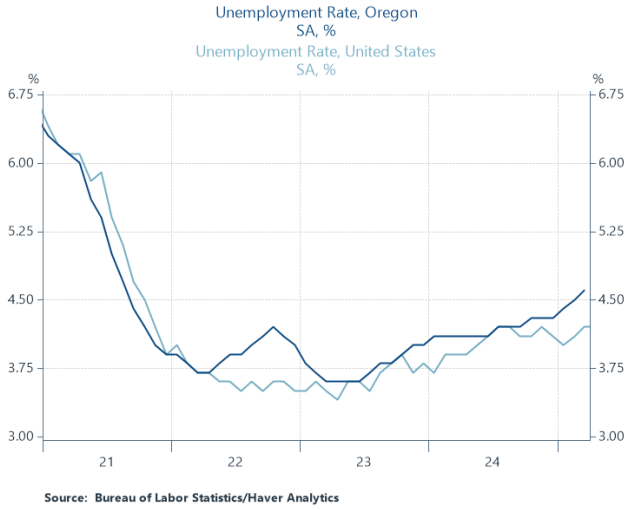
Oregon unemployment tends to increase in line with the national average during a recession. The average increase for the U.S. is roughly ¾ of a percentage point lower than the state's. For a moderate recession, Oregon typically experiences a 1-2 percentage point increase in the unemployment rate, compared to a 5-6 percentage point increase during severe recessions.



Update on Oregon Unemployment

To date, the Oregon unemployment insurance benefit exhaustion rate has been hovering around pre-pandemic levels. This measures the share of Oregonians who have received their maximum allotment of UI benefits (following 26 weeks). An elevated exhaustion rate is one symptom indicative of labor market fragility and difficulties for displaced workers to find new sources of employment. The current benefit exhaustion rate is relatively low historically, an indication that the labor market is not deteriorating further. For 2024, annual unemployment was 91,820 and the overall unemployment rate remained moderately low at 4.2%.



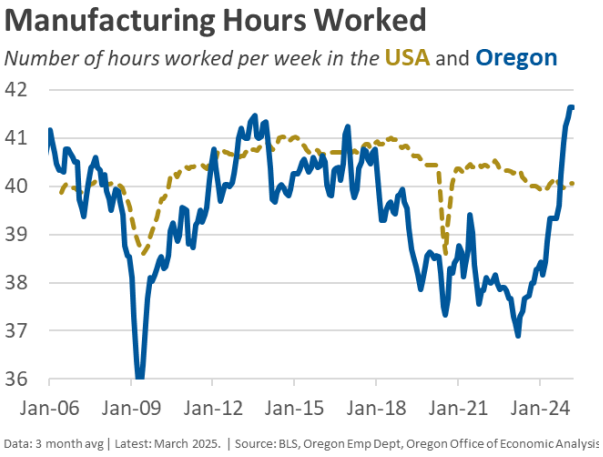


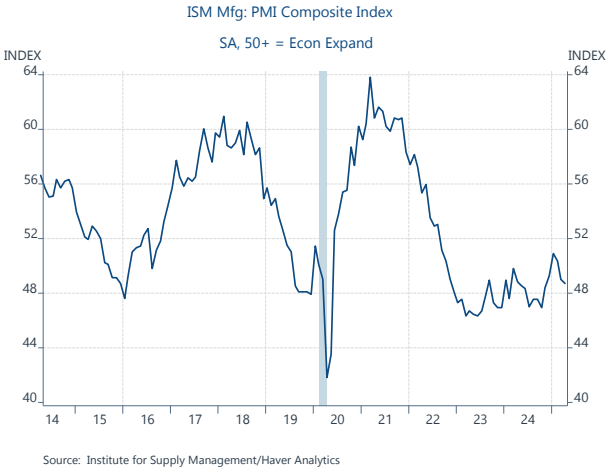
However, the unemployment situation in Oregon has soured recently. Thus far into 2025, Oregon has witnessed rising unemployment. Oregon registered a 4.6% unemployment rate in March, which is the highest rate observed since the Summer of 2021, when the rate was 4.7%.

One notable trend to emerge from these data is the divergence of Oregon and the national unemployment rate. Since August 2024, Oregon's unemployment rate has risen gradually, while the U.S. unemployment rate has remained relatively constant.

Oregon's Manufacturing Industry

Historically, manufacturing has been a key strength for the regional economy; however, over time, the industry's share of jobs has declined. As of recent, Oregon manufacturing jobs appear to have stabilized. The continuous growth in manufacturing hours worked is an encouraging signal for Oregon. It is an indication that demand for labor is rising among the remaining manufacturing employees. However, it is possible that the recent uptick in activity may have been in anticipation of changes in trade policies. The large divergence in manufacturing hours worked per week in Oregon and the U.S. warrants further watch.

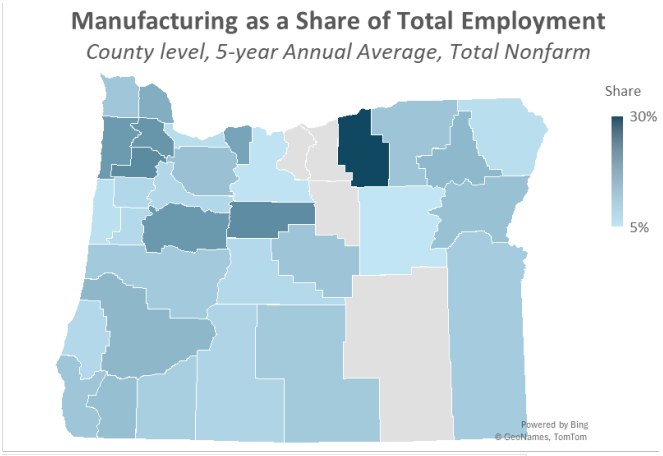




One indicator that can provide additional insights into the manufacturing sector is the Institute for Supply Management Manufacturing Purchasing Managers' Index. The ISM Manufacturing PMI® is based on survey data compiled monthly from purchasing and supply executives nationwide on new orders, production, employment, supplier deliveries and inventories.

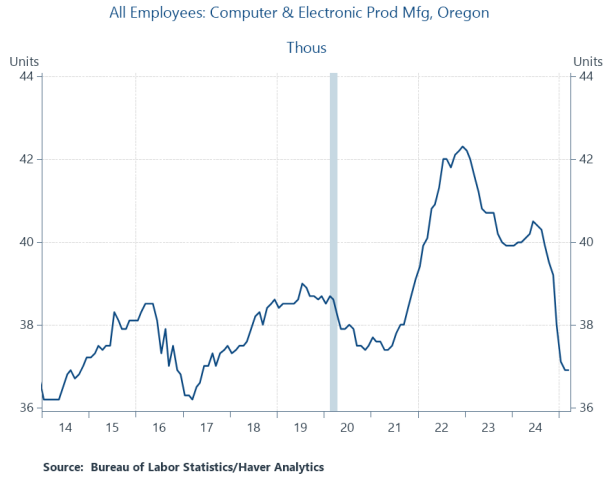
A reading above 50 indicates that the manufacturing sector is generally growing compared to the previous month, while a reading below 50 indicates that it is generally declining. The most recent Manufacturing PMI registered at 48.7. This suggests that overall U.S. manufacturing activity is marginally contracting—but it is running above levels which have historically been consistent with a broader downturn in the economy. In other words, it is not unusual for the manufacturing sector to witness a modest contraction while the overall economy continues to expand.

Oregon has a larger share of manufacturing jobs compared to the U.S. overall and is therefore more sensitive to changes in trade policy. Over the past 12 months, manufacturing accounted for 9.3% of total nonfarm employment in Oregon, compared to 8.1% nationally. The industry's importance also varies across counties as seen in the accompanying chart.



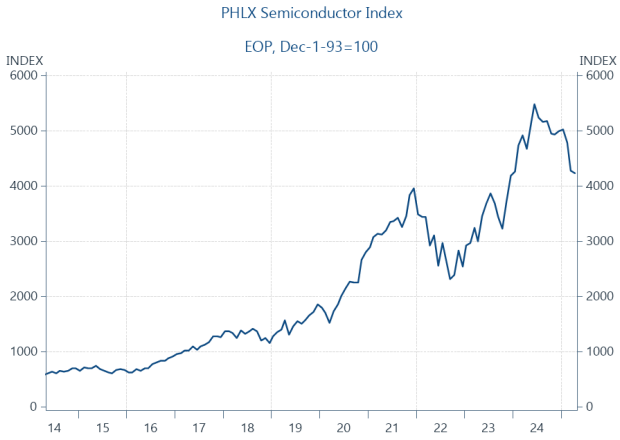
Oregon's Semiconductor Industry

Semiconductors are found in almost all modern technology and affect the operability of most Oregon industries. The semiconductor industry is one of the state's strengths, even with the continued job losses buffeting the industry.



Source: Bureau of Labor Statistics/Haver Analytics

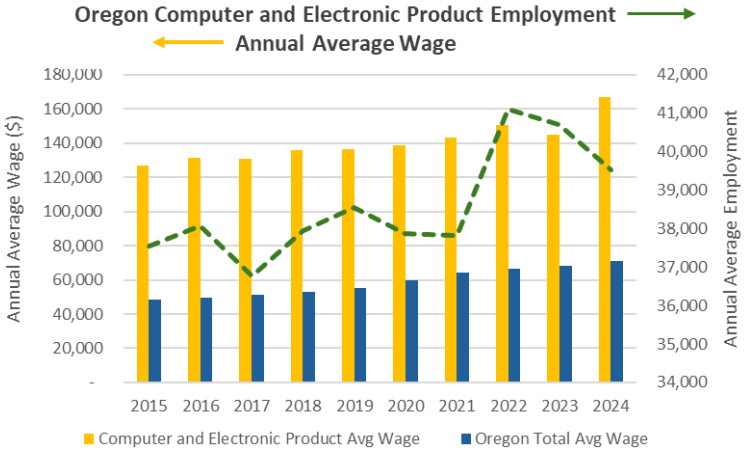
The total number of jobs in Oregon within computer and electronic manufacturing has fluctuated over the last decade, but was trending up through 2022. Over the last three years, the number of jobs has fallen from just over 42,000 to approximatley 37,000. Oregon's ability to manfucture products with semiconductors becomes even more important as the cost of importing those products increases.



Source: Wall Street Journal/Haver Analytics

A useful measure of the semiconductor industry is the Philidelphia Stock Exchange Semiconductor Sector Index (SOX), which is a market capitlization-weighted index that measures the performance of the 30 largest semiconductor and semiconductor equipment manufacturing firms. The SOX grew from 2014 to 2021, signaling a strong industry foundation and growth, after which it began to fall. The SOX rebounded in 2022 and grew to its peak in early 2024, before beginning a decline that has yet to conclude. The recent decline mirrors the decline in the number of jobs in computer and electronic manufacturing in Oregon.

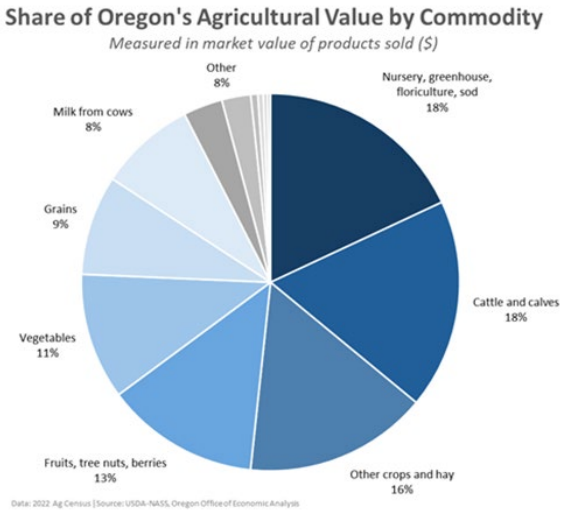
While the number of people working in this industry has been declining, wages for those employees remain strong. In 2024, the average wage for those in computer or electronic related fields was over $160,000, more than double the average wage when considering all working Oregonians. Wages in this industry continue to rise, even with job losses, suggesting the jobs remaining are those of very high skill.



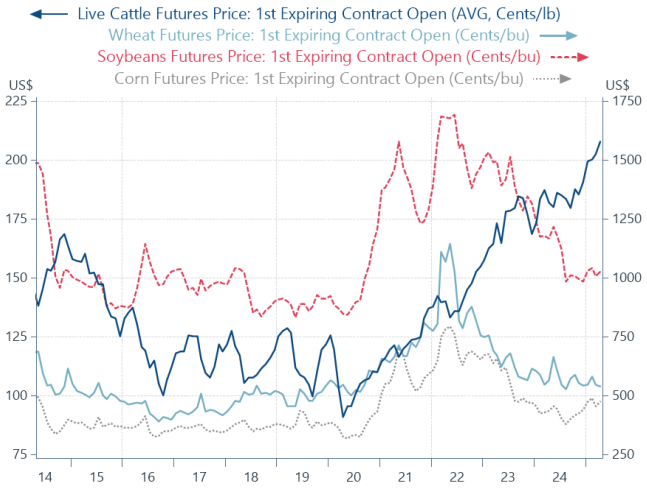
Source: Oregon Employment Department, Office of Economic Analysis

Oregon's Agricultural Economy

According to the USDA, Oregon's agricultural sales were nearly $6.8 billion, or approximately 1% of all U.S. sales in 2022. Oregon's agriculture sector has grown slower than the industry nationally, in terms of its output and job gains.



Although the agricultural industry is not large in terms of employment for the state, at about 3.1% of all private jobs in 2024, it remains a critical pillar of Oregon's economy. The state excels in the production of a diverse range of crops, including berries, wine grapes, nursery plants, and hay, as well as livestock and dairy.



Source: Chicago Mercantile Exchange/Haver Analytics

Live cattle, wheat, soybeans, and corn are Oregon's largest agricultural staple goods. The Chicago Mercantile Exchange's data show that three of those goods (wheat, soybeans, and corn), have futures prices that have been trending down after peaking in 2022. While this may be a favorable development for moderating grocery prices, it is a headwind for producers.

Decreasing prices on futures contracts can be a projection of continued hardships for those farming and selling those goods. Live cattle prices have a more optimistic outlook and have been trending upwards since 2020. These prices are likely to be inordinately sensitive.

Oregon's counties vary in terms of both agricultural value added and by specializations in the product produced. The largest contributors to statewide value are Marion and Morrow counties. The western part of the state emphasizes fruits, berries, and nursery products, while the eastern part focuses on hay, cattle, and specialty crops like grains and oilseeds. Each region's agricultural strengths underscore how farming practices are adapted to local conditions and land use.

Near- to Medium-Term Forecast Risks

Oregon faces a multitude of near- to medium-term economic risks ranging from commodity price shocks to geopolitics. Brief synopses are included below:

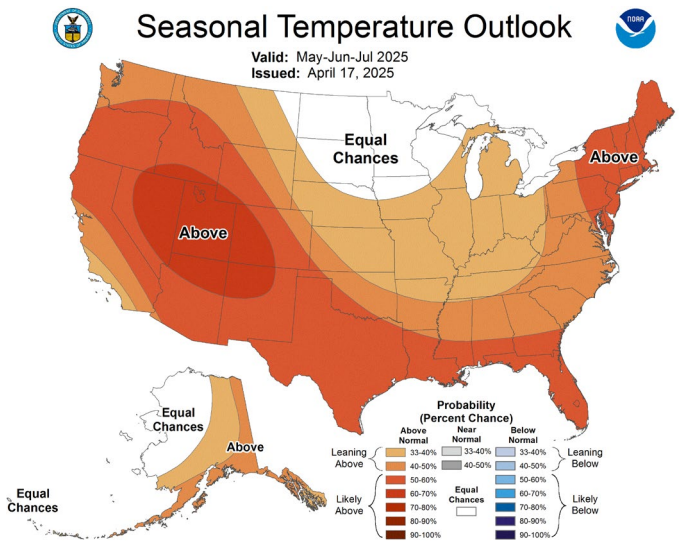
- *Trade tensions*: Ongoing trade and geopolitical disputes with major partners like China, Canada, and Mexico pose risks to Oregon's semiconductor, machinery, transportation equipment, and agricultural sectors. Given Oregon's export-reliant economy, trade restrictions or retaliatory tariffs could have an outsized impact.

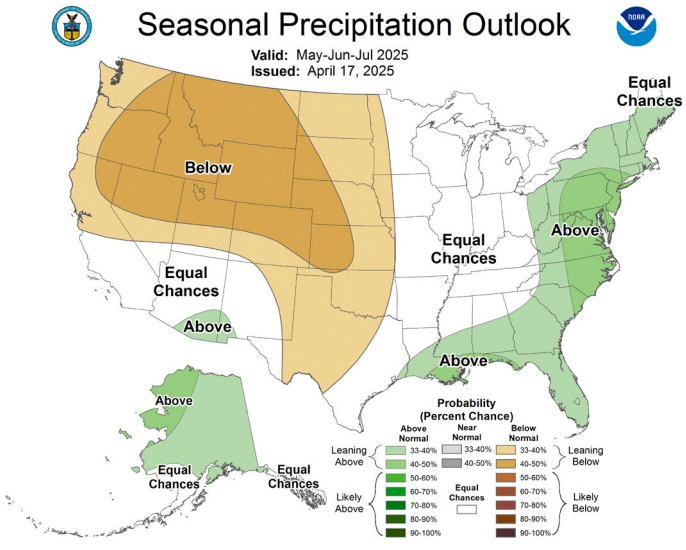
- *Oil prices*: Tensions in the Middle East and global supply uncertainties continue to create volatility in oil prices, which can affect fuel and transportation costs—particularly for rural communities and agriculture.

- *Immigration*: Large-scale deportations of undocumented immigrants would strain key industries such as agriculture, construction, hospitality, timber and food processing, which depend on immigrant labor. Removing a substantial portion of the workforce could lead to labor shortages, increased costs for businesses, and disruptions in supply chains.

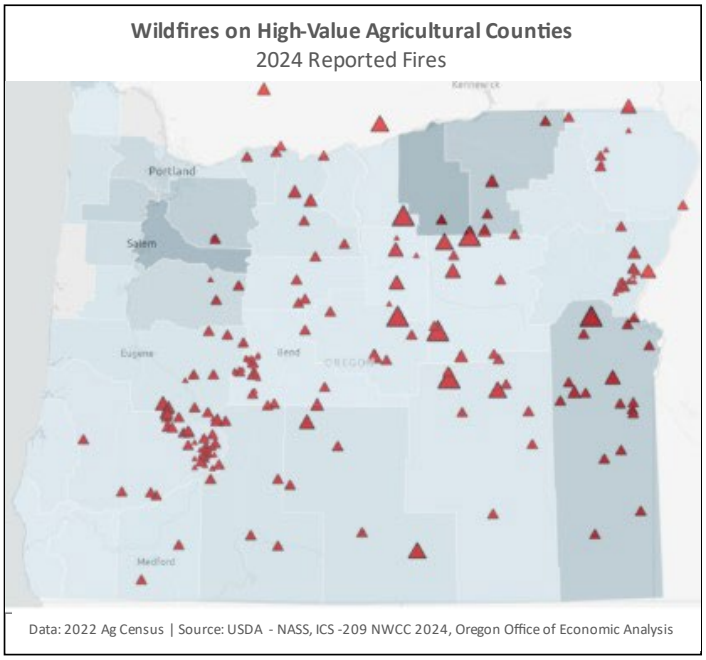
- *Bird flu/pandemic*: The spread of avian influenza to multiple species—including poultry, dairy cattle, swine, cats and humans—has raised public health concerns. While human-to-human transmission has not been observed, a wider outbreak could disrupt supply chains and consumer behavior, particularly in food and agriculture. It has already caused severe supply and price distortions for egg and poultry prices.

- *Drought*: While conditions improved in parts of southern and central Oregon due to increased snowpack and rainfall, northwestern areas saw some worsening in recent months. Water availability remains a concern for agriculture and local communities.





- *Wildfires*: Wildfire risk remains elevated, and a federal funding freeze on prevention programs heightens concerns about the 2025 season. Beyond the tangible destruction of property, wildfires worsen air quality. Prolonged exposure to wildfire smoke contributes to health issues and respiratory problems, further straining healthcare systems. The economic toll includes increased absenteeism, reduced worker productivity and higher medical costs. Sectors like tourism and agriculture are particularly vulnerable to wildfire smoke, with declines in travel and disruptions to crop production.



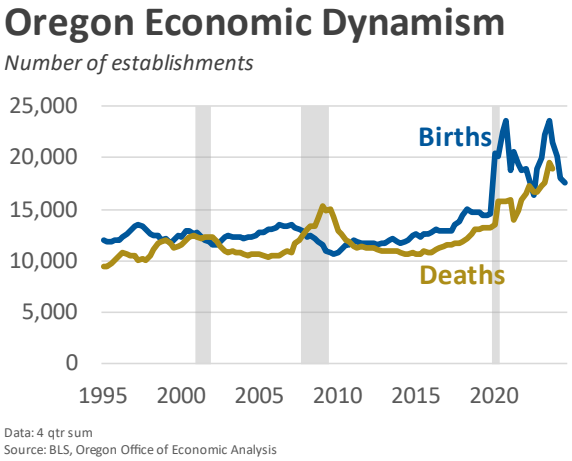
- *Flooding*: Atmospheric rivers have bolstered water supplies but increased flood risks, especially in low-lying areas like the Willamette Valley. Intense precipitation events strain infrastructure and endanger crops. Proactive flood management will be necessary to prevent significant economic losses.

- *Cascadia earthquake*: *Oregon* also faces the ever-present risk of a Cascadia Subduction Zone earthquake, an event with the potential to devastate the region's infrastructure, including transportation networks, utilities, and housing. It could displace hundreds of thousands of residents and lead to prolonged economic recovery efforts. Ongoing investments in seismic retrofitting, disaster response planning, and public awareness campaigns remain critical to mitigate the impacts of this potential catastrophe.

- *Federal fiscal policy*: Federal policy will also be a source of risk to the baseline economic forecast. The current administration has expressed a prioritization of cuts to both corporate and personal income taxes, and it has also signaled that the SALT deduction cap could be impacted. More broadly, looser fiscal policy relative to current law raises the risk of elevated interest rates (perhaps persistently) due to both supply/demand dynamics in the debt markets as well as firmer growth and inflation channels. Higher rates would be particularly harmful toward housing and residential construction—sectors which have already exhibited weakness in recent years.

- *Productivity/AI*: A recurring post-pandemic theme has been economic constraints, such as labor shortages or commodity scarcity. One factor which could mark a critical break with the recent past may come from a substantial rise in labor productivity, which would enable the existing workforce to accomplish higher levels of output, all else equal. While artificial intelligence may be among factors lifting productivity, there is a much broader increase in capital investment underway. Historically, high pressure economic periods that also coincided with increased capital investment have resulted in sustained productivity rebounds.

- *New Business Formation*: New businesses are a primary source of innovation as new ideas, products, and services help propel economic growth. Unfortunately, in the decades leading up to the pandemic, start-up activity was declining as a share of the state economy. New businesses as a share of all businesses were at or near record lows in 2019. Employment at start-ups followed a similar pattern. Since the pandemic, the number of private sector establishment births in Oregon has been volatile. In recent quarters, the number of deaths has continued to rise.



Alternative Economic Scenarios

The baseline outlook is our forecast for the most likely path for the Oregon economy. As with any forecast, however, many other scenarios are possible. The alternative scenarios below are not the upper or lower bounds to all outcomes, but rather various plausible scenarios modeled on what OEA determines to be realistic assumptions for tail risks. For the revenue implications, see page 30.

Policy risk alone raises the probability of these tail-risk scenarios, which inherently means the degree of confidence toward the baseline or central forecast is diminished. Our diminished confidence in the central forecast is a result of pending policy decisions which are expected to have substantial economic consequences for growth, employment, inflation and financial markets. As such, our baseline forecast is assigned a 55% probability. With the elevated recession risks, two additional alternative scenarios are included compared to previous editions, an extreme upside/boom scenario and a severe recession.

Alternative Scenarios				May 2025		
	2025	2026	2027	2028	2029	2030
Employment						
Opt: Boom	1.0%	1.6%	1.3%	1.3%	1.1%	1.1%
Opt: Solid Growth	0.6%	1.5%	1.5%	1.3%	1.2%	1.0%
Base: Growth Recession	0.3%	0.9%	0.8%	0.6%	0.7%	0.7%
Pes: Moderate Recession	-1.1%	-0.9%	1.0%	1.9%	2.7%	3.6%
Pes: Severe Recession	-2.1%	-1.1%	-0.9%	1.0%	1.9%	2.7%
Unemployment Rate						
Opt: Boom	4.4%	4.4%	4.3%	4.2%	4.0%	3.8%
Opt: Solid Growth	4.5%	4.6%	4.5%	4.4%	4.2%	4.0%
Base: Growth Recession	4.6%	5.0%	5.1%	5.0%	4.7%	4.5%
Pes: Moderate Recession	6.7%	6.5%	6.1%	5.2%	4.7%	4.5%
Pes: Severe Recession	6.9%	10.6%	10.8%	9.3%	6.7%	4.9%
Personal Income						
Opt: Boom	5.8%	6.4%	6.8%	5.8%	5.7%	5.2%
Opt: Solid Growth	5.2%	6.0%	6.6%	5.9%	5.5%	5.2%
Base: Growth Recession	5.1%	5.7%	6.1%	5.1%	4.9%	4.8%
Pes: Moderate Recession	3.7%	3.7%	7.2%	5.3%	5.1%	5.0%
Pes: Severe Recession	3.6%	1.6%	0.8%	6.3%	7.7%	7.9%

Pessimistic Scenario: Moderate and Severe Recession

The distribution of economic outcomes for this forecast represents a weaker scenario, with less confidence in the baseline. In contrast, the pessimistic scenarios have grown in possibility and are larger than the potential upside. For a depiction of the distribution, see page 1.

Downside economic risk accounts for 25% of the distribution. For now, the most likely pessimistic scenario is a moderate recession. This has a 22% chance of occurring or being exceeded in severity, though that includes outcomes that are roughly in the same range (not statistically different) of a moderate recession. A severe recession is associated with a probability of 3%, including outcomes similar in severity.

The moderate recession scenario is for a three-quarter decline in employment totaling 2.6%, followed by a six-quarter recovery period, more in line with the so-called jobless recoveries following the 1990 and 2001 cycles, compared to the faster recoveries in the 1950s, 1960s, and 1970s. The 2.6% decline in employment is a loss of over 52,000 jobs. The unemployment rate increases to a high of 7.6% in the second half of 2025. Nominal income does not fall outright but growth slows considerably. Next biennium, in 2025-27, total personal income in Oregon is approximately 3% below the baseline.

The severe recession scenario is for a six-quarter decline in employment totaling 8%, followed by a ten-quarter recovery period. This is similar to the contraction and recovery periods following the 2007 cycle. The 8% decline in employment is a loss of over 120,000 jobs. The unemployment rate increases to a high of 11.3% in the second half of 2026. Nominal income does not fall outright but growth stalls

relative to inflation in 2026 and 2027, resulting in a decline in real income. For a look into Oregon employment, unemployment, and real personal income during recessions, see page 9.

Optimistic Scenario: Solid Growth/Population Rebound

Some factors which could mark a critical break from the baseline forecast could come from a substantial rise in labor productivity (defined as output per hour worked) and an increasing labor force participation rate. Rising productivity enables the existing workforce to accomplish higher levels of output, all else equal. While the labor force participation rate is not particularly contingent on higher population growth and net in-migration, this is one aspect that could result in higher employment levels. Oregon has experienced periods where employment growth has exceeded population growth, necessarily driven by changes in the labor force participation rate.

Pandemic migration patterns differ from recent history substantially. There is good reason to think some of those changes will remain in the decade ahead, particularly when it comes to the combination of housing affordability and working from home resulting in lower migration to Oregon than in decades past. However, such a slow growth baseline does leave upside risks. What would happen if Oregon were to see a typical cyclical rebound in migration in the years ahead? By 2035, Oregon's employment is nearly 75,000 higher than in the baseline, and total personal income is 3.4% higher than the baseline forecast.

Revenue Outlook

Revenue Summary

The economic outlook depicted throughout this document exhibits significantly slower growth over the next year than was anticipated in the previous forecast. This translates directly through to the revenue picture. Expected income growth for individuals in 2025 is well below historical norms, driven both by lower growth in employment income and declines in capital gains. Business income is projected to turn negative in 2025 before turning positive in 2026 and 2027. After adjusting for the effects of kicker credits, the resulting General Fund revenue growth is modestly below average rates of the past four decades. This results in a mild downward revision relative to the Q1 forecast for both the current and next biennia.

General Fund revenues for 2023-25 are expected to equal $27.8 billion, down $165.2 million from the prior forecast. Personal income tax is primarily responsible for the decline, with all of the change due to weakened expectations in the outlook. The 2025 legislature passed additional appropriation allowance for current biennial spending of $460.6 million, however, an adjustment has been made for this forecast to account for the fraction of appropriations that goes unspent. The net effect of all changes is a projected ending balance of $2.17 billion, which is down $414.0 million from the prior forecast.

Table R.1

2023-25 General Fund Forecast Summary

(Millions)	2023 COS Forecast	March 2025 Forecast	May 2025 Forecast	Change from Prior Forecast	Change from COS Forecast
Structural Revenues					
Personal Income Tax	$21,019.7	$22,570.0	$22,425.2	-$144.8	$1,405.5
Corporate Income Tax	$2,228.9	$3,222.1	$3,144.8	-$77.3	$915.9
All Other Revenues	$2,011.3	$2,216.2	$2,275.9	$59.8	$264.6
Gross GF Revenues	$25,259.9	$28,008.2	$27,845.9	-$162.3	$2,586.0
Offsets, Transfers, and Actions[1]	-$437.0	-$496.8	-$502.0	-$5.1	-$64.9
Beginning Balance	$7,493.5	$8,082.5	$8,084.8	$2.3	$591.3
Net Available Resources	**$32,316.4**	**$35,593.9**	**$35,428.7**	**-$165.2**	**$3,112.3**
Expenditures	$31,873.6	$33,007.4	$33,467.9	$460.6	$1,594.4
Ending Balance	**$442.8**	**$2,586.5**	**$2,172.5**	**-$414.0**	**$1,729.7**
Confidence Intervals					
67% Confidence	+/- **1.0%**		**$271.8**	**$27.57B to $28.12B**	
95% Confidence	+/- **2.0%**		**$543.5**	**$27.30B to $28.39B**	

1 Reflects personal and corporate tax transfers, Rainy Day Fund tranfer, and Dept of Ag transfer

Changes to the revenue outlook also impact projections for the personal and corporate kicker surpluses. The personal kicker surplus is currently forecast at $1,639.1 million and will be returned to taxpayers as a credit on their 2025 tax returns. The corporate kicker now stands at $915.8 million and will be retained in the General Fund and spent on education next biennium.

Muted expectations for the economy in the coming months have a moderate impact on the 2025-27 revenue outlook. General Fund revenue has been decreased by $334.2 million due primarily to a -$529.0 million adjustment to personal income taxes. The negative headwinds are offset somewhat by a positive adjustment to anticipated Estate Taxes, as well as a smaller personal kicker credit adjustment. Including the $414.0 decrease to the projected beginning balance, total available resources are now expected to equal $37.4 billion, which is down $755.7 million from the prior forecast. It should be noted that almost $250 million of this decline is due to increased spending in the current biennium.

Non-General Fund components are also affected by the changing economic landscape. Corporate Activity Tax receipts are expected to total $3.0 billion, a $44.4 million decrease from the Q1 forecast. Lottery earnings are also revised downward $36.7 million due entirely to a weaker Video lottery sales forecast. Finally, Marijuana revenues have been adjusted down $7.6 million since the last forecast.

2023-25 General Fund Revenues

Most concurrent revenue indicators are underperforming expectations. This has played a significant role in the migration to a slower growth outlook for the coming months. As such, the 2023-25 biennium is closing on a weaker note. Revenues have been reduced by $167.5 million, primarily owing to decreases in personal and corporate income taxes.

Personal Income Tax

Tax season for the 2024 tax year is well under way. In historical terms, tax year 2024 was a very strong year with substantial growth in dividend, interest, retirement and capital gains income. Table R.2 below presents a comparison of the prior and current forecasts for the major income categories, as well as total taxable income and resulting tax liability for tax years 2024 and 2025. Note that substantial data are available to estimate tax year 2024 values while tax year 2025 is purely a forecast based on economic data.

While tax year 2024 shaped up nicely, 2025 has been revised downward significantly. This owed to the change in the outlook to a “growth recession” and a retraction in business and market performance. The impact of this is already present in the data as withholding and estimated payments through April are progressively falling below normal growth rates. This is the primary driver for the current forecast’s decline relative to the prior edition.

Table R.2: Personal Income Tax* Forecast Changes				
		Q1 Forecast	Q2 Forecast	Change
TY 2024	Wages & Salaries	6.7%	5.7%	-1.0%
	Dividends	9.0%	15.0%	6.0%
	Capital Gains	35.0%	50.0%	15.0%
	Retirement	6.8%	11.1%	4.3%
	Schedule E	10.0%	5.0%	-5.0%
	Total Income	8.5%	9.6%	1.1%
	Liability	11.6%	10.4%	-1.2%
TY 2025	Wages & Salaries	5.5%	4.5%	-1.0%
	Dividends	5.0%	-5.0%	-10.0%
	Capital Gains	3.0%	-9.0%	-12.0%
	Retirement	5.0%	8.1%	3.1%
	Schedule E	2.0%	-5.0%	-7.0%

	Liability	5.6%	4.1%	-1.5%
* Full-year filers only.				

The forecast for 2023-25 is now $22.4 billion, which is $144.8 million below the Q1 forecast. The personal income tax forecast is now $1.4 billion above the Close of Session forecast. Table B.8 presents tracking information for the third fiscal quarter of 2025. Personal income taxes finished $53.2 million below the prior forecast. Higher than expected refunds were the cause of the error.

Corporate Excise Tax

The corporate income tax forecast models tax receipts by tax year on U.S. corporate profits adjusted for the size of the Oregon economy relative to the nation. The outlook for corporate profitability has deteriorated in the past few months. This impact can even be seen in the most recent estimated payment data, which serves as a real-time gauge for economic activity. Since the beginning of 2025, payments for tax year 2025 are down approximately 13% relative to the same period for tax year 2024. It is possible that this is due to inventory accumulation ahead of the imposition of tariffs.

For the 2023-25 biennium, corporate income tax collections are projected to total $3.14 billion, down $77.3 million from the Q1 forecast. As indicated in Table B.8 in the appendix, collections during the quarter ending March 31st were $4.8 million above expectations. The full impact of recent events is expected to affect revenues in the final three months of the biennium.

Other Sources of Revenue

The two largest contributors to the “other sources” category are Estate Taxes and Interest Earnings. Since the 2023 Close of Session forecast, these two forecasts have increased almost $400 million

combined, now totaling just over $1.4 billion. Since the Q1 forecast, all other sources of revenue have been revised up $59.8 million.

General Fund Forecast Perspective

Over the past six biennia, there has been a kicker surplus in each biennium. Table R.4 presents each Close-of-Session (COS) forecast, adjusted for kicker credits, and its assumed growth rate. The adjacent column presents the actual growth rate, and the final column exhibits the total General Fund surplus. Note that this surplus includes any Corporate Income Tax surplus or deficit.

The first highlight to note is how the assumed growth rate for Close-of-Session forecasts continued to erode over time. In 2015-17, the projected growth was 14.6%, approximately equal to the 14.2% average growth in normal historical biennia since 1977-79. Beginning with the 2017-19 biennium, the Close-of-Session forecasted growth dropped far below normal and continued to decline as actual growth maintained its double-digit pace.

Table R.4

Actual vs. Projected Growth in General Fund Revenues*

	Adjusted COS Forecast	Gross Actuals	Forecasted Growth	Gross Growth	Difference
2009-11		$12,521,406,330			
2011-13		$14,155,019,600		13.0%	
2013-15	$15,642,599,000	$16,066,858,183	10.5%	13.5%	$424,259,183
2015-17	$18,411,984,050	$18,969,811,854	14.6%	18.1%	$557,827,804
2017-19	$20,016,613,279	$22,266,679,661	5.5%	17.4%	$2,250,066,382
2019-21	$22,700,925,689	$25,293,229,431	2.0%	13.6%	$2,592,303,742
2021-23	$25,233,356,312	$32,612,046,490	-0.2%	28.9%	$7,378,690,178
2023-25	$30,859,735,635	$33,445,686,972	-5.4%	2.6%	$2,585,951,337
2025-27	$37,444,987,648		12.0%		

* adjusted for kicker impacts.

The second highlight is that the current Q2 forecast for the 2025-27 biennium is the highest growth expectation for this forecast since 2015-17. While the economic outlook is muted in the first 6-9 months of the biennium, resumption of more normal growth in personal and corporate taxable incomes as well as a healthy increase in Estate Tax revenues result in a biennial growth that is just two and a half percentage points below historical norms. The 2025-27 biennium will only observe a significant kicker surplus if growth far surpasses historical norms.

Extended General Fund Outlook

Table R.3 exhibits the long-run forecast for General Fund revenues through the 2031-33 biennium. The 2025-27 biennium is the primary focus with the legislature now in session. The Legislatively Adopted Budget level will be constrained by the resources projected in this forecast, adjusted for any law changes that affect revenues. General Fund revenues in the coming biennium are now expected to total $35.6 billion, a $334.2 million decrease from the previous forecast. The primary reason for the decline is lower personal income taxes. With the inclusion of a lower beginning balance (down $414.0 million), available resources are projected to equal $37.4 billion. This is a downward revision of $755.7 million.

Table R.3 May 2025

General Fund Revenue Forecast Summary

Millions of Dollars, Current Law

Revenue Source	2023-25 Biennium	% Chg	2025-27 Biennium	% Chg	2027-29 Biennium	% Chg	2029-31 Biennium	% Chg	2031-33 Biennium	% Chg
Personal Income Taxes	22,425.2	-12.7%	30,302.8	35.1%	35,702.7	17.8%	39,780.1	11.4%	44,160.7	11.0%
Corporate Income Taxes	3,144.8	-0.4%	3,431.6	9.1%	3,666.3	6.8%	3,845.6	4.9%	4,171.1	8.5%
All Others	2,245.0	15.8%	2,043.1	-9.0%	2,173.5	6.4%	2,455.2	13.0%	2,786.6	13.5%
Gross General Fund	27,814.9	-9.6%	35,777.5	28.6%	41,542.6	16.1%	46,081.0	10.9%	51,118.4	10.9%
Offsets and Transfers	*(237.2)*		*(206.9)*		*(217.5)*		*(194.3)*		*(181.0)*	
Net Revenue	27,577.7	-9.9%	35,570.6	29.0%	41,325.1	16.2%	45,886.7	11.0%	50,937.4	11.0%

Note that the large percentage changes between biennia are due to kicker credits affecting personal income tax collections. Beyond 2025-27, when these considerations are no longer in effect, growth reflects underlying economic assumptions characterized elsewhere in this document. The potential for error in the forecast increases substantially the further ahead we look.

Corporate Activity Tax

Oregon's new corporate activity tax (CAT) went into effect January 2020. Revenues from this tax on business receipts are dedicated to education through the Fund for Student Success. The tax was designed to generate approximately $1 billion per year in new state resources, or $2 billion per biennium. These figures include both CAT revenues and the impact of the reduction in personal income tax rates which reduce state revenues, leaving a net revenue change of approximately $1 billion per year.

For the quarter ending March 31, 2025, net corporate activity tax receipts fell short of expectations by $7.0 million. The weakness was observed in estimated payments related to current economic activity, while reconciliation for prior tax years met expectations. Given the much milder outlook for economic growth in the next year, the forecast for tax receipts for 2025-27 has been revised down $44.4 million to $3.0 billion. Including a $17.3 million decline in the beginning balance, available resources for the coming biennium are now projected to equal $3.2 billion. This is $61.7 million below the Q1 forecast.

Table B.12 in Appendix B summarizes the 10-year forecast and the allocation of resources, while Table B.13 presents a more detailed quarterly breakdown of the forecast. The personal income tax reductions are built into the General Fund forecasts shown in Tables B.1 and B.2.

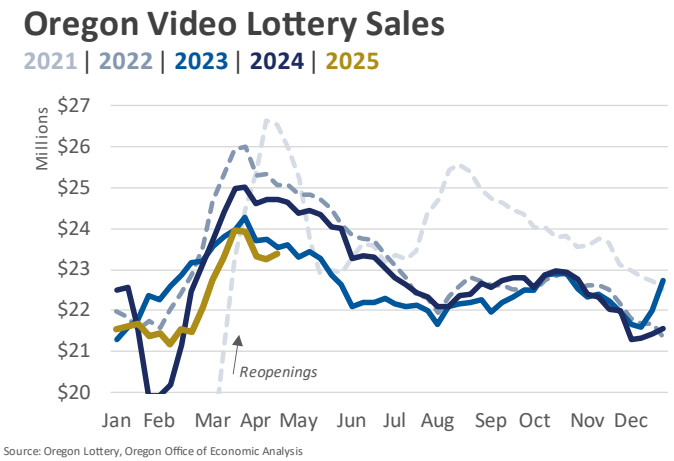
Lottery Forecast

The May lottery forecast has been revised downward from the February outlook, reflecting further reductions in overall resources. For the current 2023-25 biennium, total resources are lowered by $10.5 million, with future biennia seeing more significant decreases of $50-94 million.

Video lottery resources have seen the largest downward revision, with resources now expected to decline by $11 million (-0.7%) in 2023-25 and $50 million (-3%) in 2025-27. Future outlooks for 2027-29, 2029-31, and 2031-33 are also reduced by approximately 3.5-4.5%. Video lottery sales have continued to underperform expectations, prompting these downward adjustments to the forecast.

In contrast, traditional lottery resources show modest improvement, with projections raised by $2.3 million (1.1%) in 2023-25 and $10.0 million (5.8%) in 2025-27. The outlook for 2027-29, 2029-31, and 2031-33 biennia has also been revised upward by approximately 6.3-6.6%. Scratch-It sales have continued to increase following the introduction of a $30 ticket. Additionally, Mega Millions sales have been growing and are expected to increase further after an upcoming pricing change from $2 to $5, which is anticipated to lead to increased sales and larger jackpots.

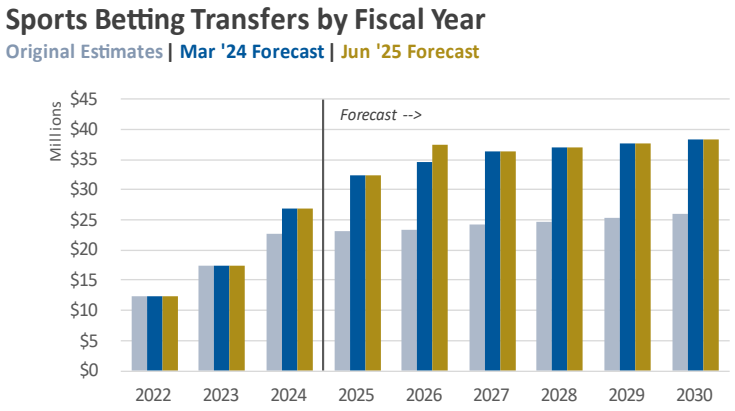
Video Lottery



Following the rapid growth during the pandemic reopening phase, video lottery sales have stabilized, with current growth rates somewhat below earlier projections. Despite the recent $5.6 billion personal income tax kicker paid out to Oregonians, no significant boost in video lottery sales was observed. Although sales in this segment continue to grow, the overall forecast is more conservative, reflecting current spending patterns and behaviors.

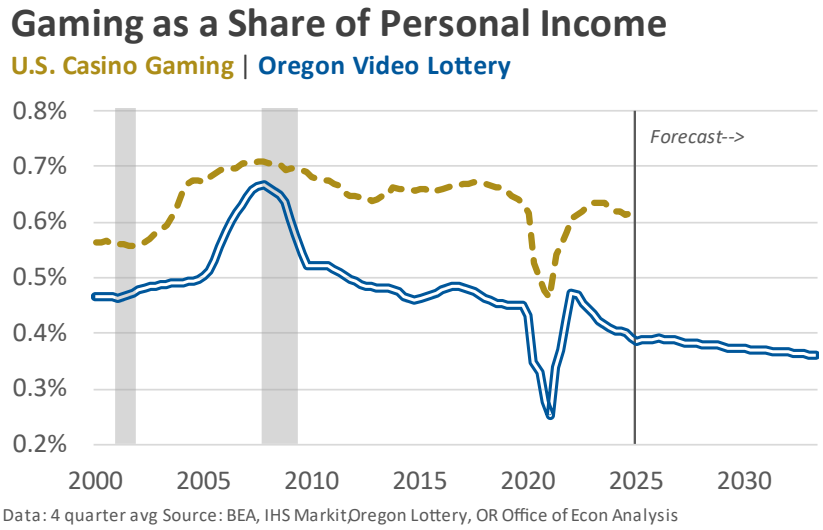
Sports Betting

The sports betting forecast remains largely in line with February's outlook, with revenues continuing to exceed early projections. While the forecast itself has not changed significantly, sports betting appears to exhibit less seasonality than previously anticipated. The steady revenue flow may be due to players engaging in a broader variety of events across staggered sports seasons, leading to more consistent betting activity throughout the year. This pattern suggests that sports betting is maturing in Oregon as player preferences diversify, contributing to stable, year-round revenue.



Longer-Term Outlook

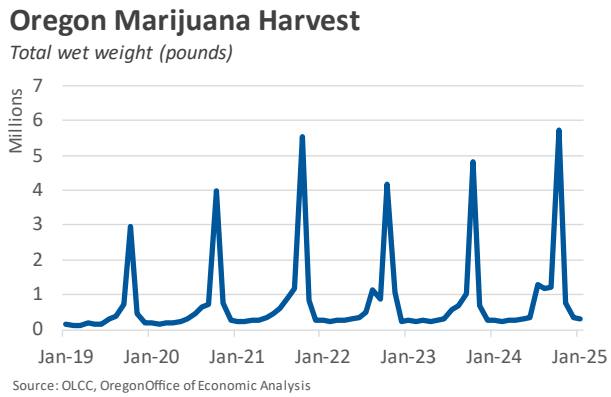
Lottery revenues continue to be closely linked to consumer behavior, household budgets and evolving entertainment preferences. Current trends point toward increased competition for entertainment dollars, shifting gaming preferences, and generational changes in gaming habits. The May forecast projects continued growth in lottery resources but at a pace slightly slower than Oregon's overall personal income growth, resulting in a marginally smaller share of the consumer spending pie over time.



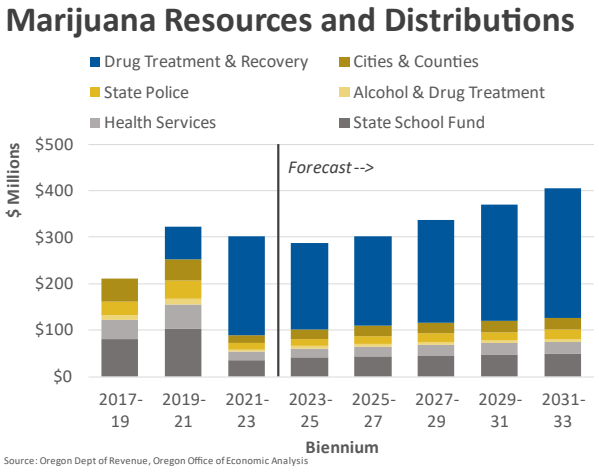
The full extended outlook for lottery earnings can be found in Table B.9 in Appendix B.

Recreational Marijuana Forecast

The May marijuana forecast has been revised downward from the March outlook. In the current 2023-25 biennium, resources are lowered by $4.8 million (-1.7%), while the 2025-27 forecast is reduced by $7.6 million (-2.5%). The outlook for outer biennia shows even larger reductions ranging from $9 million to $14 million each, which represent decreases of about 2.5-3.5%.



Last year's harvest was especially strong, with a record-breaking October yield of over 5.7 million pounds. The abundant supply continues to contribute to low prices, which are expected to remain at reduced levels. The industry faces increasing challenges, including rising input costs, particularly labor, which are squeezing profit margins. On top of that, consumption appears to have plateaued, creating difficult conditions for businesses, while intoxicating hemp-derived products are emerging as competitive substitutes.



The marijuana industry continues to face significant structural challenges at the federal level. Marijuana remains classified as a Schedule 1 drug, preventing business owners from accessing traditional banking services and disallowing common business tax deductions. These restrictions further strain financial viability in an already challenging market.

As previously noted, Oregon does not currently tax medical marijuana; however, this tax exemption is set to expire at the end of 2027, with medical marijuana taxation scheduled to begin in 2028. Although this exemption could be extended by the Legislature, the current forecast assumes medical marijuana will be taxed per current law. Overall, while marijuana tax collections are still expected to increase over time, the May forecast reflects a more challenging outlook with reduced growth projections due to persistent low prices, plateauing consumption, increased competition, and ongoing regulatory constraints.

Psilocybin Forecast

Ballot Measure 109 (2020) legalized psilocybin, including a 15% retail sales tax on the psilocybin products used. This sales tax does not apply to the overall cost of a session which can be hundreds or thousands of dollars. The vast majority of the overall cost goes to cover operational expenses for the service center and the facilitator's time and expertise.

The industry has been growing and has now been operating legally for more than a year. The current forecast remains a work in progress; however, it is now based on that first full year of data as opposed to pure assumptions. Even so, expectations are that the industry is still in its ramp-up period. The number of businesses, facilitators, and customers are all expected to grow in the years ahead. As more data becomes available, our office will adjust its outlook accordingly.

The average product price reported is approximately $40, however there is a wide range of values around that average. The average price is in line with previous conversations our office has had with multiple service centers in Oregon in recent years. And while not a low price, the cost of the product is relatively small compared to the overall cost of a session. For fiscal year 2024, which ran from July 2023 to June 2024, the sales tax revenue amounted to less than $100,000.

For now, the revenue forecast is tied to a multiyear ramp up period of stronger growth based on the patterns seen in Oregon for recreational marijuana and sports betting. After the ramp up, growth is expected to slow down to something closer to growth in the population, which is a proxy for the user base until better information is available.

Oregon Psilocybin Retail Sales Tax Revenue

May-25

	Biennium				
	2023-25	2025-27	2027-29	2029-31	2031-33
No. of Session	33,000	54,000	63,000	67,000	71,000
Avg Product Price	$40	$42	$44	$45	$47
Total Sales	$1,335,000	$2,271,000	$2,755,000	$3,049,000	$3,361,000
Taxes	$200,000	$341,000	$413,000	$457,000	$504,000

Lastly, it is important to note that the sales tax applies only to the purchase price of the psilocybin product itself. As such, service centers may charge customers the traditional retail price that includes a markup over wholesale costs which largely relates to production, testing, and distribution costs. Service centers may choose to sell the products at cost. And while they are not supposed to do this, they may charge customers a minimal product cost that is below their own cost. The potential benefit of doing so would be to increase revenues and profits for service centers and facilitators as less of the overall session price would be sent to pay taxes. To date, these data indicate this last possibility is not happening, or at least not enough to notice in industrywide information. However, as with all other sales taxes, revenue is driven by both the number of transactions and the price per transaction.

Revenue Alternative Scenarios

Given the heightened uncertainty present at the release of this forecast, the Office of Economic Analysis has engaged in extensive analysis of historical forecast outcomes and revenue performance to produce a range of scenarios that could manifest when the 2025-27 biennium is all said and done. The four alternatives to the baseline, two upside and two downside, equate to approximately one and two standard deviations in either direction. The table below presents the five scenarios along with the probabilities that each is likely to occur (e.g., the baseline outlook has a 55% chance of occurring).

General Fund Revenue* Scenarios

(millions)		2023-25	2025-27	2027-29	2029-31	2031-33
Boom (3%)	Revenues	$33,445.7	$40,815.0	$45,100.6	$50,873.5	$57,080.1
	Growth		*22.0%*	*10.5%*	*12.8%*	*12.2%*
Optimistic (17%)	Revenues	$33,445.7	$39,130.0	$43,825.6	$48,997.0	$54,680.7
	Growth		*17.0%*	*12.0%*	*11.8%*	*11.6%*
Baseline (55%)	Revenues	$33,445.7	$37,445.0	$41,542.6	$46,081.0	$51,118.4
	Growth		*12.0%*	*10.9%*	*10.9%*	*10.9%*
Pessimistic (22%)	Revenues	$33,445.7	$35,011.1	$39,912.6	$44,622.3	$49,798.5
	Growth		*4.7%*	*14.0%*	*11.8%*	*11.6%*
Severe (3%)	Revenues	$33,445.7	$32,577.1	$36,812.2	$42,886.2	$48,118.3
	Growth		*-2.6%*	*13.0%*	*16.5%*	*12.2%*

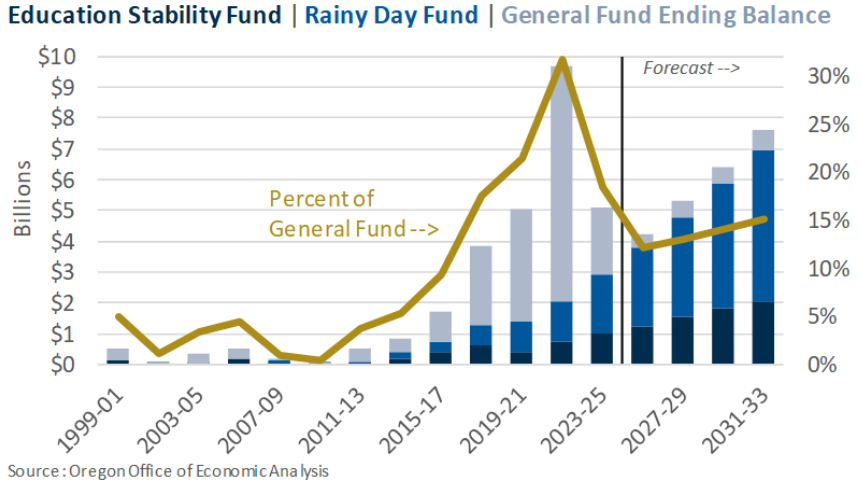
* Adjusted for kicker credits.

The first deviation is +4.5/-6.5% removed and are the traditional “optimistic” and “pessimistic” scenarios presented in past publications. It should be noted that the two scenarios are not symmetric. On the positive side, the optimistic scenario coincides with improved demographic and economic factors that are assumed to persist well into the future. The pessimistic scenario corresponds to a mild to moderate recession lasting two to three quarters followed by a healthy rebound in economic activity. The former outcome results in a boost to the General Fund of $1.7 billion while the latter produces a $2.4 billion deficit.

The second pair of scenarios (“Boom” and “Severe”) are +9.0/-13.0% removed from the baseline. The boom scenario has a few historical precedents in the last 50 years. These outlier biennia are generally followed by somewhat slower growth in the following biennium. The severe downside scenario mimics the Great Recession of 2008 in terms of both the deviation from the close-of-session forecast and the long-term impact on revenues. The boom results in a revenue gain of $3.4 billion while the severe recession costs the General Fund $4.9 billion in 2025-27.

It should be noted that the probability of recession, be it mild or more severe, is greater than the likelihood of the more optimistic outcomes. Inflation continues to pose a challenge for policy makers. In addition, many revenue indicators are showing signs of slowing or going negative. However, the slower-than-average growth exhibited by the baseline scenario does raise one upside possibility: should either optimistic outcome prevail it is almost assured that revenues will exceed the personal kicker threshold for a seventh consecutive biennium.

Budgetary Reserves



Effective Reserves ($ millions)

	End of 2023-25	*Estimated 2025-27*
ESF	$1,008	$1,237
RDF	$1,906	$2,540
Reserves	**$2,915**	**$3,777**
% of GF	10.6%	10.9%
Ending Balance	$2,184	$500
Total	**$5,099**	**$4,277**
% of GF	18.5%	12.3%

The state currently administers two general reserve accounts, the Oregon Rainy Day Fund[1] (ORDF) and the Education Stability Fund[2] (ESF). At the end of the current 2023-25 biennium, the two funds are expected to total $2.9 billion, which is equal to 10.6% of current revenues. Including the projected General Fund ending balance of $2.18 billion, the total effective reserves at the end of the current 2023-25 biennium are projected to be $5.1 billion, or 18.5% of current revenues.

As noted above, the current probability of an economic downturn is estimated at 25%. In the last 50 years, the worst decline in General Fund revenues relative to the Close-of-Session forecast was 15.3% during the 2001-03 biennium associated with the tech industry boom-bust. The final column of the table above presents the projected balances in the ORDF, ESF and a hypothetical budgetary ending balance based on historic legislatively adopted balances. Total available reserves under this scenario

[1] The ORDF is funded from ending balances each biennium, up to 1% of appropriations. The Legislature can deposit additional funds, as it did in first populating the ORDF with surplus corporate income tax revenues from the 2005-07 biennium. The ORDF also retains interest earnings. Withdrawals from the ORDF require one of three triggers, including a decline in employment, a projected budgetary shortfall, or declaration of a state of emergency, plus a simple majority vote of the Legislature. Withdrawals are capped at two-thirds of the balance as of the beginning of the biennium in question. Fund balances are capped at 7.5% of General Fund revenues in the prior biennium.

[2] [2] The ESF gained its current reserve structure and mechanics via constitutional amendment in 2002. The ESF receives 18% of lottery earnings, deposited on a quarterly basis – 10% of which are deposited in the Oregon Growth sub-account. The ESF does not retain interest earnings. The ESF has similar triggers as the ORDF but does not have the two-thirds cap on withdrawals. The ESF balance is capped at 5% of General Fund revenues collected in the prior biennium.

would amount to 12.3% of General Fund revenues. It is quite likely that Oregon's reserves are adequate to weather a potential downturn given that a mild to moderate recession is the most likely pessimistic scenario.

B.10 in Appendix B provides more details for Oregon's budgetary reserves.

Tax Law Assumptions

The revenue forecast is tied to current state law. After every legislative session, OEA incorporates adjustments to the revenue forecast produced by the Legislative Revenue Office. As each year passes and the effects of law become evident in the data, adjustments are phased out. However, many tax laws have sunsets, or end dates, built into them. These demarcations must be maintained such that the impact of extending the laws can be newly incorporated in turn.

Complication arises when considering the effects of federal law on Oregon revenues. Due to the assumptions built into these national forecasts and how national data enter the revenue models, it would be logistically difficult to maintain a current federal law revenue forecast. In addition, federal laws often have imminent sunsets and are frequently extended. Adhering to a current federal law forecast would result in large and unnecessary annual revisions. For this reason, the revenue forecast assumes the most reasonable outcomes for federal law.

For a detailed treatment of the components of the 2023 Legislatively Enacted Budget, see:

Legislative Fiscal Office's 2023-25 Budget Summary[3]

[3] https://www.oregonlegislature.gov/lfo/Documents/2023-25%20Legislatively%20Adopted%20Budget%20-%20General%20Fund%20and%20Lottery%20Funds%20Summary.pdf

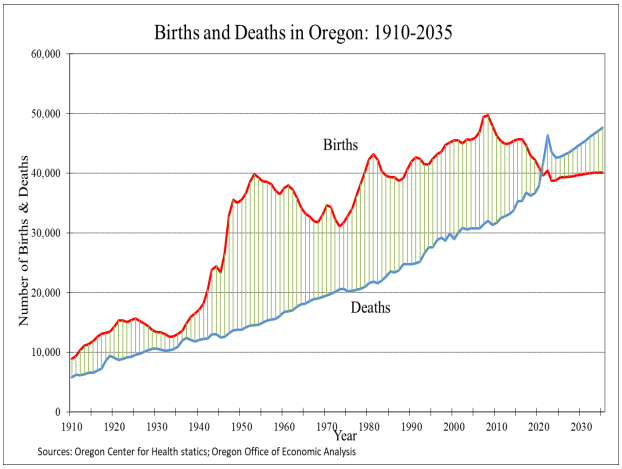
Population and Demographic Outlook

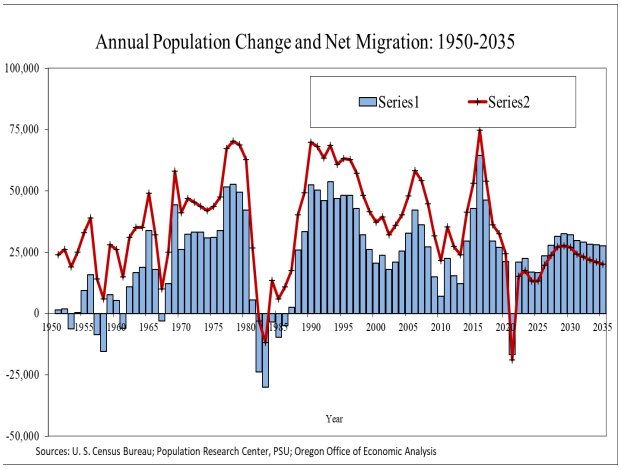
Population and Demographic Summary

Based on the most recent decennial census, Oregon's resident population on April 1, 2020, was 4,237,256. During the past decade, Oregon gained 406,182 residents or 10.6%. This decennial gain was the second lowest since the first census count in Oregon in 1860 after gaining statehood. Still, the gain was substantial enough to yield one additional congressional seat for the state. Oregon now has a total of six members in the House of Representatives. This is rare because it took 40 years for Oregon to gain one additional seat.

Oregon's population growth of 10.6% in the last decade was the 11th highest in the nation, excluding Washington D.C. The growth rate for the decade lagged all our neighboring states except California. Oregon's growth has experienced some turbulence since the 2020 census. At OEA we use the Population Research Center, PSU's recent post-censal estimate as the base for our office's population forecasts. In April 2025, the PRC released the estimate for 2024 and revised its estimates for the years 2020 through 2023. The revised estimate shows a loss of 18,962 people between 2020 and 2021. This is very unusual for Oregon since this was the first loss in population since the early 1980s.

During the early stage of the COVID-19 pandemic, according to PSU estimates, Oregon lost population. The estimates show Oregon population growth has remained low at a level not seen since the mid-1980s, indicating timid economic recovery in the post-pandemic years. The population growth is expected to show a slow positive increase in the future reaching 4.516 million in the year 2035 with an average annual rate of growth of 0.5%.



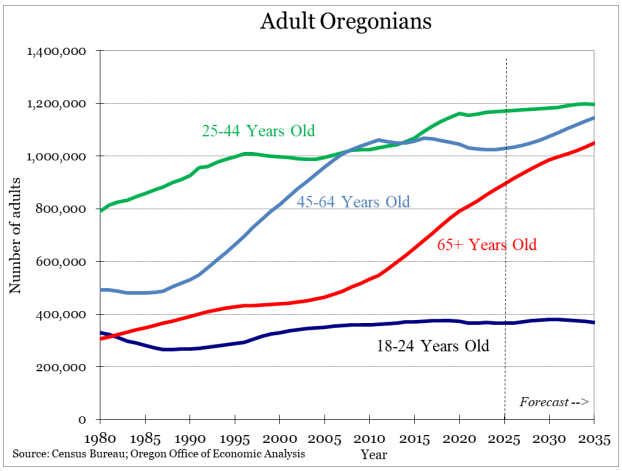


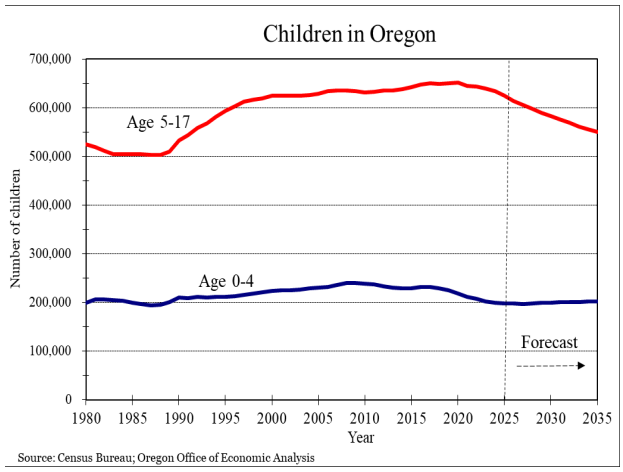
Oregon's economic environment heavily influences the state's population growth. Its economy determines the ability to retain the existing work force as well as attract job seekers from national and international labor markets. As Oregon's total fertility rate (1.4 children per woman) remains well below the replacement level (2.1 children per woman) and number of deaths continue to rise due to aging population, long-term growth relies entirely on net positive in-migration.

Working-age adults come to Oregon as long as there are favorable economic and social conditions such as: job opportunities, affordable housing and childcare, a good educational environment, and a better quality of life that projects real and perceived positivity about the state. As a result of a sudden rise in the number of deaths and a drop in the number of births coinciding with the COVID-19 pandemic,

the natural increase (number of births minus number of deaths) turned negative starting in the year 2020 and will continue through 2035 and beyond. Migration will be solely responsible for Oregon's future population growth. Without a positive net migration stream, Oregon's population will start a steady decline. Under a few scenarios, the negative natural increase may reverse itself. Such reversal can happen if women start to have more children due to behavioral or motivational factors, improved life expectancy leading to fewer deaths, or a large net in-migration contributing to an increase in the number of births.

Age structure and its change affect employment, state revenue collection, and tax expenditures. The demand for public services varies by age groups. Demographics are the major budget drivers, which are modified by policy choices on service coverage and delivery. Births, deaths, and migration histories of decades past remain impactful on the current age-sex structure. Growth in many age groups will show the effects of the depression era birth cohort, baby boom and their echo generations, and composition of migrants during the forecast period of 2025-2035.





Elderly (65+)

The overall elderly population (65+) was growing at a relatively slow pace during the late 1990s and early 2000s when the depression era birth cohort entered this age group. The elderly population picked up a faster pace of growth when the baby-boom cohort started maturing into the elderly age group. This age cohort has hit the plateau of high growth rates of above 4% annually between 2011 and 2018. The group will experience a continuously high but diminishing rate of growth in the coming years. The average annual growth of the elderly population will be 1.6% during the 2025-2035 forecast period.

As a sign of massive demographic structural change of Oregon's population, the number of elderly people has exceeded the number of children under the age of 18 since 2023. To illustrate the contrast, in 2000 the elderly population numbered a little over half of the number of children in Oregon, and now the elderly outnumber the children. Different age groups among the elderly population show quite varied and fascinating growth trends:

- The youngest elderly group (aged 65-74), which was growing at an extremely fast pace in the recent past (averaging 5.1% annually in 2010s), will taper off to negative growth after 2026 as a sign of the end of the baby boom generation transitioning to the elderly age group. This high growth period transitioning into a net loss of this youngest elderly population resulting in 0.6% annual average loss in the coming ten years.

- The next older generation of the population, aged 75-84, has been growing rapidly for a decade after several years of slow as well as negative growth. An unprecedented fast pace of growth, exceeding 6% annually in this age group, has already started as the baby boom generation is maturing and the depression era birth cohort exiting this 75-84 age group. The annual growth rate is expected to be unusually high at 3.0% during the forecast period.
- The oldest elderly population (aged 85+) will grow at a strong rate steadily gaining momentum due to the combination of cohort change, historical positive net migration, and improving longevity. The average annual rate of growth for this oldest elderly group over the forecast horizon will be 6.4%. An unprecedented annual growth exceeding 8% will commence near the end of the forecast horizon.

Working Age and Young Adults (18-64)

The oldest working age population, aged 45-64, also has seen a dramatic demographic impact as the baby boom generation matures out of this age group and is replaced by the smaller baby-bust cohort or Gen X. As the effect of this demographic transition is combined with slowing net migration, the once fast-paced growth has tapered off to negative growth. The growth rate is beginning to reverse to positive and will see gaining momentum over the forecast horizon with a 1.1% annualized rate of change. The younger working-age population of the 25-44 age group will have slow growth of 0.2% annual average over the forecast period.

The young adult population, aged 18-24, will see only a small change, averaging 0.1% annually over the forecast period. Although the slow growth of the college-age population (age 18-24) tends to ease the pressure on public spending on higher education, college enrollment typically goes up during times of a very competitive job market, high unemployment, and scarcity of well-paying jobs. The older cohort also flock back to colleges to better position themselves in a tough job market.

School Age (5-17) and pre-School Age (0-4) Children

The growth in K-12 population, aged 5-17, was very slow during the last decade, has turned negative since 2021, and is expected to decline consistently through the forecast years mainly due to the declining number of births over the years. This will translate into a decline in school enrollments. On average for the forecast period, this school-age population will decline by -1.3% annually. The growth rate for children under the age of five has remained below zero percent in the recent past and will continue negative or slow growth. The growth in pre-school age children will average 0.2% annually during the forecast period. The demand for childcare services and pre-Kindergarten programs is determined by the size of this population as well as the labor force participation and poverty rates of the parents.

Overall, the elderly population over age 65 will increase rapidly whereas the number of children will decline over the forecast horizon. The number of working-age adults in general will show slow growth. Hence, based solely on the demographics of Oregon, demand for public services geared towards children and young adults will likely decline or increase only at a slower pace, whereas demand for elderly care and services geared towards the elderly will increase rapidly.

Procedure and Assumptions

Population forecasts by age and sex are developed using the cohort-component projection procedure. The population by single year of age and sex is projected based on the specific assumptions of vital events and migrations. The projection procedure entails the model that "survives" the initial population distribution by age and sex to the next age-sex category in the following year and then applies age-sex-specific birth and migration rates to the mid-period population.

The population by single age-sex detail from the 2020 census and the most recent estimated total population for Oregon by Population Research Center of Portland State University are the base for the forecast. The numbers of births and deaths through 2023 are from Oregon's Center for Health Statistics. All other numbers and age-sex detail are generated by OEA.

Annual numbers of births are determined from the age-specific fertility rates projected based on Oregon's past trends and past and projected national trends. Oregon's total fertility rate is assumed to remain close to 1.4 per woman. This rate is well below the replacement level fertility of 2.1 children per woman during their reproductive life. Currently, all the states in the union are experiencing below replacement level fertility. Such a low fertility rate means the state will experience population decline in the long run unless fertility rate improves, along with strong net positive migration to compensate for the loss due to excess of deaths over births.

Life Table survival rates are developed for the year 2020. Male and female life expectancies for the 2020-2035 period are projected based on the past three decades of trends and national projected life expectancies. After a sudden decline during the COVID pandemic, improvements in life expectancies are expected over the forecast period. At the same time, the difference between the male and female life expectancies will continue to shrink in the long run. The male life expectancy at birth was 77.3 and the female life expectancy was 81.8 in 2010. Because of the COVID-19 pandemic, the number of deaths suddenly increased, and the actual life expectancies declined. The life expectancy at birth in 2020 was 76.9 and 81.7 years for males and females, respectively. This is expected to improve to 80.3 years for men and 84.7 years for women by 2035.

Estimates and forecasts of the number of net migrations are based on the residuals from the difference between population change and natural increase (births minus deaths) in a forecast period. Migration forecasting considers employment change, unemployment rates, income/wage of Oregon and neighboring states and the nation, and Oregon’s past population change and migration trends. Distribution of migrants by age and sex is based on detailed data from the American Community Survey. The role of net migration in Oregon’s population growth has gained prominence as the natural increase has turned negative. Between 2025 and 2035 net migration is expected to be in the range of 23,442 to 32,467, averaging 29,000 persons annually with net migration rates ranging between 5.5 to 7.4 per thousand population.

Notes: Corporate income tax figure includes Corporate Multistate taxes. Other taxes include General Fund portions of the Eastern Oregon Severance Tax, Western Oregon Severance Tax and Amusement Device Tax. Cigarette, Other Tobacco, and Liquor are the General Fund portions only, see Table B.6 and B.7 for more.

* The Anticipated Administrative Actions line includes items like Tax Anticipation Note borrowing costs. None of these costs are anticipated for the 2023-25 biennium.

** "Statutory Transfers" amounts to the Rainy Day Fund transfer.

1 "Reversions" are monies returned to the General Fund and are not new money. As such, they are not counted towards the Kicker surplus. The Kicker surplus is the sum of the latest forecast less COS for Gross Revenue less Corporate Income Tax and Reversions.

Note: Some totals may not foot due to rounding.

1. Per HB 4304 (2020 Second Special Session), the Sports Betting revenue transfer to the Employer Incentive Fund is repealed
2. Includes interest earnings on Economic Development Fund and reversions.
3. Eighteen percent of proceeds accrue to the Ed. Stability Fund, until the balance equals 5% of GF Revenues. Thereafter, 15% of proceeds accrue to the School Capital Matching Fund.
4. The Parks and Natural Resources Fund Constitutional amendment requires 15% of net proceeds be transferred to this fund.
5. Per Ballot Measure 96 (2016), 1.5% of net lottery proceeds are dedicated to the Veterans' Services Fund
6. Per Ballot Measure 99 (2016), the lesser of 4% of Lottery transfers or $22 million per year is transferred to the Outdoor Education Account. Adjusted annually for inflation.
7. Approximately one percent of net lottery proceeds are dedicated to each program. Certain limits are imposed by the Legislature.
8. Includes Debt Service Allocations, Allocations to State School Fund and Other Agency Allocations, including Business Oregon

Total Reserves

(Millions)	2021-23	2023-25	2025-27	2027-29	2029-31	2031-33
Ending Balances	**$2,063.7**	**$2,920.1**	**$3,785.8**	**$4,810.1**	**$5,916.7**	**$7,014.1**
Percent of General Fund Revenues	6.7%	10.6%	10.6%	11.6%	12.9%	13.8%

Footnotes:
1. Includes transfer of ending General Fund balances up to 1% of budgeted appropriations as well as private donations. Assumes future appropriations equal to 98.75 percent of available resources. Includes forecast for corporate income taxes above rate of 6.6% for the biennium are deposited on or before Jun 30 of each odd-numbered year.
2. Available funds in a given biennium equal 2/3rds of the beginning balance under current law.
3. Excludes funds in the Oregon Growth and the Oregon Resource and Technology Development subaccounts.
4. Interest earnings are distributed to the Oregon Education Funds (75%) and the State Scholarship Fund (25%), provided there remains debt outstanding. In the event that debt is paid off, all interest earnings distributed to the State Scholarship Fund.
5. Contributions to the ESF are capped at 5% of the prior biennium's General Fund revenue total. Quarterly contributions are made until the balance exceeds the cap.

Note: Some totals may not foot due to rounding.

1. Retailers pay taxes monthly, however taxes are not available for distribution to recepient programs until the Department of Revenue receives and processes retailers' quarterly tax returns. As such, there is a one to two quarter lag between when the initial monthly payments are made and when monies be come available to distribute.

2. Medical marijuana being exempt from tax is an explicit tax expenditure per HB 2433 (2021). Tax expenditures sunset after 6 years, although they may be renewed at that time. Current law is that medical marijuana sales will be taxed beginning January 1, 2028.

3. Administrative Costs reflect monthly collection costs for the Department of Revenue in addition to distributions to the Criminal Justice Commission and OLCC per SB 1544 (2018)

4. The first $11.25 million per quarter ($45m per year) is distributed via forumula to the initial recipient programs. These distributions are adjusted for inflation. All additional revenues go to the Drug Treatment & Recovery Fund.

Note: The State School Fund distribution equals an estimate of the lost General Fund due to the Personal and Corporate Income Tax changes enacted in HB 3427. In addition, each biennium includes an additional $40 million dedicated to the High Cost Disabilities Account. The 2021-23 distribution equals the Legislatively Adopted Budget Other Fund limitation. The 2023-25 distribution includes a $30.99 million reconciling adjustment for the prior biennium.
Some totals may not foot due to rounding.

Sources: 1980-2019 intercensal population estimates by the U.S. Census Bureau; 2020-2024 population by Population Resear Center, PSU; births and deaths 1990-2023: Oregon Center for Health Statistics. Forecaasts of population, births, deaths, and net migration are by the Oregon Office of Economic Analysis.

IMPORTANT: PRC/PSU revised the prior estimates for the years 2020 through 2024 for Oregon and its counties in April, 2025. PRC/PSU estimates are here: https://www.pdx.edu/population-research/population-estimate-reports

NOTE: The Census Bureau's 2010-2019 intercensal estimates of total population in November 2024 and.the estimates by single year of age are expected in the Fall of 2025.

I. INTRODUCTION

Q. Please state your name and address.

A. John J. Spanos. My business address is 300 Sterling Parkway, Mechanicsburg, Pennsylvania (formerly 207 Senate Avenue, Camp Hill, Pennsylvania).

Q. With what firm are you associated?

A. I am associated with the firm of Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming").

Q. How long have you been associated with Gannett Fleming?

A. I have been associated with the firm since June 1986.

Q. What is your position in the firm?

A. I am President.

Q. What is your educational background?

A. I have Bachelor of Science degrees in Industrial Management and Mathematics from Carnegie-Mellon University and a Master of Business Administration from York College of Pennsylvania.

Q. Are you a member of any professional societies?

A. Yes. I am a Past President and member of the Society of Depreciation Professionals. I am also a member of the American Gas Association/Edison Electric Institute Industry Accounting Committee.

Q. Have you taken the certification examination for depreciation professionals?

A. Yes. I passed the certification examination of the Society of Depreciation Professionals in September 1997 and was recertified in August 2003, February 2008, January 2013, February 2018 and February 2023.

Q. Will you outline your experience in the field of depreciation?

A. Yes. I have over 38 years of depreciation experience which includes giving expert testimony in more than 490 cases before 47 regulatory commissions, including this Commission. These cases have included depreciation studies in the electric, gas, water, wastewater and pipeline industries. In addition to cases where I have submitted testimony, I have also supervised over 900 other depreciation or valuation assignments. Please refer to Exh. JJS-2 for my qualifications statement, which includes further information with respect to my work history, case experience, and leadership in the Society of Depreciation Professionals.

Q. What is the purpose of your testimony?

A. My testimony is in support of the gas depreciation study conducted under my direction and supervision for Northwest Natural Gas Company (the "Company"). Based upon the study, I am recommending that new depreciation accrual rates be adopted by the Company.

II. OVERVIEW

Q. Please define the concept of depreciation.

A. Depreciation refers to the loss in service value that is not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation, against which the Company is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and the requirements of public authorities.

Q. Have you prepared an exhibit with your testimony?

A. Yes. The report titled, "2023 Depreciation Study – Calculated Annual Depreciation Accruals Related to Gas Plant as of December 31, 2023," which has been marked Exh. JJS-3, sets forth the results of my depreciation study. I will refer to this report throughout my testimony as the "Depreciation Study."

Q. Please describe the contents of the Depreciation Study.

A. The Depreciation Study is presented in nine parts. Part I, Introduction, contains statements with respect to the plan of the report and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and the methods used in the service life and net salvage studies. Part III, Service Life Considerations, presents the factors and judgment utilized in the average service life analysis. Part IV, Net Salvage Considerations, presents the judgment utilized for the net salvage study. Part V, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part VI, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VII, Service Life Statistics, presents the statistical analysis of service life estimates. Part VIII, Net Salvage Statistics, sets forth the statistical indications of net salvage percents. Part IX, Detailed Depreciation Calculations, presents the detailed tabulations of annual depreciation.

The table on Pages VI-5 through VI-8 of the Depreciation Study presents the estimated survivor curve, the net salvage percent, the original cost as of December 31, 2023, the book depreciation reserve, and the calculated annual depreciation accrual amount and rate for each account or subaccount. The section beginning on Page VII-

2 of the Depreciation Study presents the results of the retirement rate analyses prepared as the historical bases for the service life estimates. The section beginning on Page VIII-2 of the Depreciation Study presents the results of the net salvage analysis. The section beginning on Page IX-2 of the Depreciation Study presents the depreciation calculations related to surviving original cost as of December 31, 2023.

In the Depreciation Study that I performed, and which is the basis for my testimony, I used the straight line remaining life method of depreciation, with the average service life procedure to develop recommended depreciation accrual rates. The total annual depreciation is based on a system of depreciation accounting which aims to distribute the cost of fixed capital assets over the estimated useful life of the unit, or group of assets, in a systematic and rational manner.

For General Plant Accounts 391.10, 391.20, 391.21, 392.22, 393.00, 394.00, 397.00, 397.10, 397.20, 397.30, 397.40, 397.50, 398.10, 398.20, 398.30, 398.40 and 398.50 for gas assets, I used the straight line method of amortization. The annual amortization is based on amortization accounting which distributes the unrecovered cost of fixed capital assets over the remaining amortization period selected for each account and vintage.

Q. How did you determine the recommended annual depreciation accrual rates?

A. The determination of annual depreciation accrual rates consists of two phases. In the first phase, service life and net salvage characteristics are estimated for each depreciable group, that is, each plant account or subaccount identified as having similar characteristics. In the second phase, the annual depreciation accrual rates are calculated based on the service life and net salvage estimates determined in the first phase.

III. ESTIMATION OF SERVICE LIFE AND NET SALVAGE

Q. Please describe the first phase of each study, that is, the manner in which you estimated the service life and net salvage characteristics for each depreciable group.

A. The service life studies consisted of compiling historical data from records related to the Company's plant; analyzing these data to obtain historical trends of survivor characteristics; obtaining supplementary information from management and operating personnel concerning the Company's practices and plans as they relate to plant operations; and interpreting the above data and the estimates used by other gas utilities to form judgments of average service life and net salvage characteristics.

Q. What historical data did you analyze for the purpose of estimating the service life characteristics of the Company's plant?

A. The data consisted of the entries made by the Company to record plant transactions through 2023. The transactions included additions, retirements, transfers and the related balances. The Company, in accordance with my instructions, classified the data by depreciable group, type of transaction, the year in which the transaction took place, and the year in which the plant was installed.

Q. Was there any emphasis on other factors in this study?

A. Yes. First, we focused on the results from the last depreciation study in 2020, docketed as UG-210974, which was adopted by the Commission in Order No. 01, entered October 26, 2023. Second, we considered changes to certain assets to better align with the expected useful life and because NW Natural's current expected depreciable life for a service line is an industry outlier among natural gas utilities.

Q. What method did you use to analyze this service life data?

A. I used the retirement rate method. That method is the most appropriate when aged retirement data are available, because it develops the average rates of retirement actually experienced during the period of study. Other methods of life analysis infer the rates of retirement based on a selected type of survivor curve.

Q. Please describe the results of your use of the retirement rate method.

A. Each retirement rate analysis resulted in a life table which, when plotted, formed an original survivor curve. Each original survivor curve as plotted from the life table represents the average survivor pattern experienced by the several vintage groups during the experience band studied. Inasmuch as this survivor pattern does not necessarily describe the life characteristics of the property group, interpretation of the original curves is required in order to use them as valid considerations in service life estimation. Iowa-type survivor curves were used in these interpretations.

Q. What is an "Iowa-type survivor curve" and how did you use such curves to estimate the service life characteristics for each property group?

A. Iowa-type survivor curves are a widely used group of generalized survivor curves that contain the range of survivor characteristics usually experienced by utilities and other industrial companies. The Iowa survivor curves were developed at the Iowa State University College of Engineering Experiment Station through an extensive process of observing and classifying the ages at which various types of property used by utilities and other industrial companies had been retired. Iowa-type survivor curves are used to smooth and extrapolate original survivor curves determined by the retirement rate method. The Iowa survivor curves and truncated Iowa survivor curves were used in

the Depreciation Study to describe the forecasted rates of retirement based on the observed rates of retirement and the outlook for future retirements. As I will explain, the use of truncated curves is appropriate to reflect retirements of plant components that may not be fully depreciated at the time a plant is retired.

The estimated survivor curve designations for each depreciable group indicate the average service life, the family within the Iowa system and the relative height of the mode. For example, the Iowa 58-R2 indicates an average service life of fifty-eight years; a right-moded, or R, type curve (the mode occurs after average life for right-moded curves); and a low height, 2, for the mode (possible modes for R type curves range from 1 to 5).

Q. What approach did you use to estimate the lives of significant facilities such as storage facilities?

A. I used the life span technique to estimate the lives of significant facilities for which concurrent retirement of the entire facility is anticipated. In this technique, the survivor characteristics of such facilities are described by the use of interim survivor curves and estimated probable retirement dates.

The interim survivor curves describe the rate of retirement related to the replacement of elements of the facility, such as, for a building, the retirements of plumbing, heating, doors, windows, roofs, etc., that occurs during the life of the facility. The probable retirement date provides the rate of final retirement for each year of installation for the facility by truncating the interim survivor curve for each installation year at its attained age at the date of probable retirement. The use of interim survivor curves truncated at the date of probable retirement provides a consistent method for

estimating the lives of the several years of installation for a particular facility inasmuch as a single concurrent retirement for all years of installation will occur when it is retired.

Q. Has this approach been adopted in other regulatory proceedings?

A. Yes. My firm has used the life span technique in performing depreciation studies presented to and accepted by many public utility commissions across the United States and Canada, including this Commission.

Q. What are the bases for the probable retirement years that you have estimated for each facility?

A. The bases for the probable retirement years are life spans for each facility that are based on judgment and incorporate consideration of the age, use, size, nature of construction, management outlook and typical life spans experienced and used by other gas utilities for similar facilities. At the appropriate time, detailed studies of the economics of rehabilitation and continued use or retirement of the structure will be performed and the results incorporated in the estimation of the facility's life span.

Q. Have you physically observed the Company's plants and equipment as part of your depreciation work?

A. Yes. The most recent field review of the Company's property was on September 28 and 29, 2021 in order to observe representative portions of plant. Field reviews are conducted to become familiar with Company operations and obtain an understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements. This knowledge, as well as information from other discussions with management, was incorporated in the interpretation and extrapolation of the statistical analyses.

Q. How did your experience in development of other depreciation studies affect your work in this case?

A. Because I customarily conduct field reviews for my depreciation studies, I have had the opportunity to visit scores of similar plants and meet with operations personnel at other companies. The knowledge accumulated from those visits and meetings provide me useful information that I can draw on to confirm or challenge my numerical analyses concerning plant condition and remaining life estimates.

Q. Would you please explain the concept of "net salvage"?

A. Net salvage is a component of the service value of capital assets that is recovered through depreciation rates. The service value of an asset is its original cost less its net salvage. Net salvage is the salvage value received for the asset upon retirement less the cost to retire the asset. When the cost to retire exceeds the salvage value, the result is negative net salvage.

Inasmuch as depreciation expense is the loss in service value of an asset during a defined period, *e.g.,* one year, it must include a ratable portion of both the original cost and the net salvage. That is, the net salvage related to an asset should be incorporated in the cost of service during the same period as its original cost so that customers receiving service from the asset pay rates that include a portion of both elements of the asset's service value, the original cost and the net salvage value.

For example, the full recovery of the service value of a $10,000 regulator will include not only the $10,000 of original cost, but also, on average, $550 to remove the regulator at the end of its life and $50 in salvage value. In this example, the net salvage

component is negative $500 ($50 - $550), and the net salvage percent is negative 5 percent (($50 - $550)/$10,000).

Q. Please describe how you estimated net salvage percentages.

A. I estimated the net salvage percentages based on judgment. In doing so, for most accounts, I incorporated analyses of the historical data for the period 1993 through 2023 for gas plant and considered estimates for other gas companies. In the historical analyses, the net salvage, cost of removal and gross salvage amounts were expressed as percents of the original cost retired. These percents were calculated on annual and three-year moving average bases for the 1993-1995 through 2021-2023 periods.

IV. CALCULATION OF DEPRECIATION

Q. Please describe the second phase of the process that you used, that is, the calculation of annual depreciation accrual rates.

A. After I estimated the service life and net salvage characteristics for each depreciable group, I calculated annual depreciation accrual rates for each group in accordance with the straight line remaining life method, using the average service life procedure. The annual depreciation accrual rates were developed as of December 31, 2023.

Q. Please describe the straight line remaining life method of depreciation.

A. The straight line remaining life method of depreciation allocates the original cost of the property, less accumulated depreciation, less future net salvage, in equal amounts to each year of remaining service life.

Q. Please describe the average service life procedure for calculating remaining life accrual rates.

A. The average service life procedure defines the group for which the remaining life annual accrual is determined. Under this procedure, the annual accrual rate is determined for the entire group or account based on its average remaining life and this rate is applied to the surviving balance of the group's cost. The average remaining life of the group is calculated by first dividing the future book accruals (original cost less allocated book reserve less future net salvage) by the average remaining life for each vintage. The average remaining life for each vintage is derived from the area under the survivor curve between the attained age of the vintage and the maximum age. Then, the sum of the future book accruals is divided by the sum of the annual accruals to determine the average remaining life of the entire group for use in calculating the annual depreciation accrual rate.

Q. Please briefly describe the amortization of certain General Plant accounts.

A. For General Plant Accounts 391.10, 391.20, 391.21, 392.22, 393.00, 394.00, 397.00, 397.10, 397.20, 397.30, 397.40, 397.50, 398.10, 398.20, 398.30, 398.40 and 398.50 for gas assets, I used the straight line method of amortization. General Plant Accounts include a large number of units but represent slightly less than three percent of depreciable gas plant. Depreciation accounting is difficult for these assets, inasmuch as periodic inventories are required to properly reflect plant in service. In amortization accounting, units of property are capitalized in the same manner as they are in depreciation accounting. However, retirements are recorded when a vintage is fully amortized rather than as the units are removed from service. That is, there is no

dispersion of retirement. All units are retired when the age of the vintage reaches the amortization period.

V. DESCRIPTION OF REPORT

Q. Please use an example to illustrate the manner in which the studies were presented in the report.

A. I will use Account 380.00, Services, as my example because it is the largest depreciable mass account and represents 23 percent of the depreciable plant.

The retirement rate method was used to analyze the survivor characteristics of this property group. Aged plant accounting data were compiled from 1919 through 2023 and analyzed for periods that best represent the overall service life of this property. The life tables for the 1919-2023, 1976-2015 and 1981-2015 experience bands are presented on pages VII-102 through VII-110 of the report. The life table displays the retirement and surviving ratios of the aged plant data exposed to retirement by age interval. For example, page VII-102 shows $2,348,906 retired during age interval 0.5-1.5 with $1,024,432,762 exposed to retirement at the beginning of the interval. Consequently, the retirement ratio is 0.0023 ($2,348,906/$1,024,432,762) and the surviving ratio is 0.9977 (1-.00023). The percent surviving at age 0.5 of 0.9990 percent is multiplied by the survivor ratio of 99.77 to derive the percent surviving at age 1.5 of 99.67 percent. This process continues for the remaining age intervals for which plant was exposed to retirement during the period 1919-2023. The resultant life table, or original survivor curve, is plotted along with the estimated smooth survivor curve, the 60-R2.5 on page VII-101. The 60-R2.5 reflected the overall expected shorter life cycle into the future than what has been statistically experienced in the past.

The net salvage percent is presented on pages VIII-4 and VIII-5 for Account 380.00. The percentage is based on the result of annual gross salvage minus the cost to remove plant assets as compared to the original cost of plant retired during the period 1993 through 2023. The 31-year period experienced $51,864,733 (($108,345)-$51,756,388) in negative net salvage for $48,143,634 plant retired. The result is negative net salvage of 108 percent ($51,864,733/$48,143,634) on the statistics for the account for the entire 31-year period. The three-year rolling averages and the most recent five-year averages trend to more negative net salvage, however, based on the current net salvage estimate and the industry averages, the recommended net salvage for gas services is negative 108 percent.

My calculation of the annual depreciation related to the original cost of Account 380.00, Services, as of December 31, 2023, is presented on pages IX-73 through IX-75 of the report. The calculation is based on the 60-R2.5 survivor curve, 100 percent negative net salvage, the attained age, and the allocated book reserve. The tabulation sets forth the installation year, the original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual. These totals are brought forward to the table on page VI-6.

VI. RECOMMENDATION

Q. What is your recommendation regarding annual depreciation accrual rates for the Company?

A. I recommend that the Company use a composite annual depreciation accrual rate for gas accounts or subaccounts. My recommended depreciation accrual rates, based on the Depreciation Study, are set forth for each account in column 9 of Table 1 on pages

VI-5 through VI-8 of Exh. JJS-3. In my opinion, these are reasonable and appropriate depreciation accrual rates for the Company.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

JOHN SPANOS

DEPRECIATION EXPERIENCE

Q. Please state your name.

A. My name is John J. Spanos.

Q. What is your educational background?

A. I have Bachelor of Science degrees in Industrial Management and Mathematics from Carnegie-Mellon University and a Master of Business Administration from York College.

Q. Do you belong to any professional societies?

A. Yes. I am a member and past President of the Society of Depreciation Professionals and a member of the American Gas Association/Edison Electric Institute Industry Accounting Committee.

Q. Do you hold any special certification as a depreciation expert?

A. Yes. The Society of Depreciation Professionals has established national standards for depreciation professionals. The Society administers an examination to become certified in this field. I passed the certification exam in September 1997 and was recertified in August 2003, February 2008, January 2013, February 2018 and February 2023.

Q. Please outline your experience in the field of depreciation.

A. In June 1986, I was employed by Gannett Fleming Valuation and Rate Consultants, Inc. as a Depreciation Analyst. During the period from June 1986 through December 1995, I helped prepare numerous depreciation and original cost studies for utility companies in various industries. I helped perform depreciation studies for the following telephone companies: United Telephone of Pennsylvania, United Telephone of New Jersey, and Anchorage Telephone Utility. I helped perform depreciation studies for the following companies in

the railroad industry: Union Pacific Railroad, Burlington Northern Railroad, and Wisconsin Central Transportation Corporation.

I helped perform depreciation studies for the following organizations in the electric utility industry: Chugach Electric Association, The Cincinnati Gas and Electric Company (CG&E), The Union Light, Heat and Power Company (ULH&P), Northwest Territories Power Corporation, and the City of Calgary - Electric System.

I helped perform depreciation studies for the following pipeline companies: TransCanada Pipelines Limited, Trans Mountain Pipe Line Company Ltd., Interprovincial Pipe Line Inc., Nova Gas Transmission Limited and Lakehead Pipeline Company.

I helped perform depreciation studies for the following gas utility companies: Columbia Gas of Pennsylvania, Columbia Gas of Maryland, The Peoples Natural Gas Company, T. W. Phillips Gas & Oil Company, CG&E, ULH&P, Lawrenceburg Gas Company and Penn Fuel Gas, Inc.

I helped perform depreciation studies for the following water utility companies: Indiana-American Water Company, Consumers Pennsylvania Water Company and The York Water Company; and depreciation and original cost studies for Philadelphia Suburban Water Company and Pennsylvania-American Water Company.

In each of the above studies, I assembled and analyzed historical and simulated data, performed field reviews, developed preliminary estimates of service life and net salvage, calculated annual depreciation, and prepared reports for submission to state public utility commissions or federal regulatory agencies. I performed these studies under the general direction of William M. Stout, P.E.

In January 1996, I was assigned to the position of Supervisor of Depreciation Studies. In July 1999, I was promoted to the position of Manager, Depreciation and

Valuation Studies. In December 2000, I was promoted to the position as Vice-President of Gannett Fleming Valuation and Rate Consultants, Inc., in April 2012, I was promoted to the position as Senior Vice President of the Valuation and Rate Division of Gannett Fleming Inc. (now doing business as Gannett Fleming Valuation and Rate Consultants, LLC) and in January of 2019, I was promoted to my present position of President of Gannett Fleming Valuation and Rate Consultants, LLC. In my current position I am responsible for conducting all depreciation, valuation and original cost studies, including the preparation of final exhibits and responses to data requests for submission to the appropriate regulatory bodies.

Since January 1996, I have conducted depreciation studies similar to those previously listed including assignments for Pennsylvania-American Water Company; Aqua Pennsylvania; Kentucky-American Water Company; Virginia-American Water Company; Indiana-American Water Company; Iowa-American Water Company; New Jersey-American Water Company; Hampton Water Works Company; Omaha Public Power District; Enbridge Pipe Line Company; Inc.; Columbia Gas of Virginia, Inc.; Virginia Natural Gas Company National Fuel Gas Distribution Corporation - New York and Pennsylvania Divisions; The City of Bethlehem - Bureau of Water; The City of Coatesville Authority; The City of Lancaster - Bureau of Water; Peoples Energy Corporation; The York Water Company; Public Service Company of Colorado; Enbridge Pipelines; Enbridge Gas Distribution, Inc.; Reliant Energy-HLP; Massachusetts-American Water Company; St. Louis County Water Company; Missouri-American Water Company; Chugach Electric Association; Alliant Energy; Oklahoma Gas & Electric Company; Nevada Power Company; Dominion Virginia Power; NUI-Virginia Gas Companies; Pacific Gas & Electric Company; PSI Energy; NUI - Elizabethtown Gas Company; Cinergy Corporation – CG&E; Cinergy

Corporation – ULH&P; Columbia Gas of Kentucky; South Carolina Electric & Gas Company; Idaho Power Company; El Paso Electric Company; Aqua North Carolina; Aqua Ohio; Aqua Texas, Inc.; Aqua Illinois, Inc.; Ameren Missouri; Central Hudson Gas & Electric; Centennial Pipeline Company; CenterPoint Energy-Arkansas; CenterPoint Energy – Oklahoma; CenterPoint Energy – Entex; CenterPoint Energy - Louisiana; NSTAR – Boston Edison Company; Westar Energy, Inc.; United Water Pennsylvania; PPL Electric Utilities; PPL Gas Utilities; Wisconsin Power & Light Company; TransAlaska Pipeline; Avista Corporation; Northwest Natural Gas; Allegheny Energy Supply, Inc.; Public Service Company of North Carolina; South Jersey Gas Company; Duquesne Light Company; MidAmerican Energy Company; Laclede Gas; Duke Energy Company; E.ON U.S. Services Inc.; Elkton Gas Services; Anchorage Water and Wastewater Utility; Kansas City Power and Light; Duke Energy North Carolina; Duke Energy South Carolina; Monongahela Power Company; Potomac Edison Company; Duke Energy Ohio Gas; Duke Energy Kentucky; Duke Energy Indiana; Duke Energy Progress; Northern Indiana Public Service Company; Tennessee- American Water Company; Columbia Gas of Maryland; Maryland-American Water Company; Bonneville Power Administration; NSTAR Electric and Gas Company; EPCOR Distribution, Inc.; B. C. Gas; Black Hills Service Company; Black Hills Utility Holdings; Public Service Company of Oklahoma; City of Dubois; Peoples Gas Light and Coke Company; North Shore Gas Company; Connecticut Light and Power; New York State Electric and Gas Corporation; Rochester Gas and Electric Corporation; Greater Missouri Operations; Tennessee Valley Authority; Omaha Public Power District; Indianapolis Power & Light Company; Vermont Gas Systems, Inc.; Metropolitan Edison; Pennsylvania Electric; West Penn Power; Pennsylvania Power; PHI Service Company - Delmarva Power and Light; Atmos Energy Corporation; Citizens Energy Group; PSE&G Company; Berkshire Gas Company; Alabama Gas Corporation; Mid-Atlantic Interstate Transmission, LLC; SUEZ Water; WEC Energy Group; Rocky Mountain Natural Gas, LLC; Illinois-American Water Company; Northern Illinois Gas Company; Public Service of New Hampshire; FirstEnergy Service Corporation; Northeast Ohio Natural Gas Corporation; Blue Granite Water Company; Spire Missouri, Inc.; Dominion Energy South Carolina, Inc.; South FirstEnergy Operating Companies; Dayton Power and Light Company; Liberty Utilities; East Kentucky Power Cooperative; Bangor Natural Gas; Hanover Borough Municipal Water Works; West Virginia American Water Company; Evergy Metro; Evergy Missouri West; Granite State Electric; Bluegrass Water; The Borough of Ambler; Newtown Artesian Water Company and Connecticut Water Company.

My additional duties include determining final life and salvage estimates, conducting field reviews, presenting recommended depreciation rates to management for its consideration and supporting such rates before regulatory bodies.

Q. Have you submitted testimony to any state utility commission on the subject of utility plant depreciation?

A. Yes. I have submitted testimony to the Pennsylvania Public Utility Commission; the

Commonwealth of Kentucky Public Service Commission; the Public Utilities Commission of Ohio; the Nevada Public Utility Commission; the Public Utilities Board of New Jersey; the Missouri Public Service Commission; the Massachusetts Department of Telecommunications and Energy; the Alberta Energy & Utility Board; the Idaho Public Utility Commission; the Louisiana Public Service Commission; the State Corporation Commission of Kansas; the Oklahoma Corporate Commission; the Public Service Commission of South Carolina; Railroad Commission of Texas – Gas Services Division; the New York Public Service Commission; Illinois Commerce Commission; the Indiana Utility Regulatory Commission; the California Public Utilities Commission; the Federal Energy Regulatory Commission ("FERC"); the Arkansas Public Service Commission; the Public Utility Commission of Texas; Maryland Public Service Commission; Washington Utilities and Transportation Commission; The Tennessee Regulatory Commission; the Regulatory Commission of Alaska; Minnesota Public Utility Commission; Utah Public Service Commission; District of Columbia Public Service Commission; the Mississippi Public Service Commission; Delaware Public Service Commission; Virginia State Corporation Commission; Colorado Public Utility Commission; Oregon Public Utility Commission; South Dakota Public Utilities Commission; Wisconsin Public Service Commission; Wyoming Public Service Commission; the Public Service Commission of West Virginia; Maine Public Utility Commission; Iowa Utility Board; Connecticut Public Utilities Regulatory Authority; New Mexico Public Regulation Commission; Commonwealth of Massachusetts Department of Public Utilities; Rhode Island Public Utilities Commission and the North Carolina Utilities Commission.

Q. Have you had any additional education relating to utility plant depreciation?

A. Yes. I have completed the following courses conducted by Depreciation Programs, Inc.:

"Techniques of Life Analysis," "Techniques of Salvage and Depreciation Analysis," "Forecasting Life and Salvage," "Modeling and Life Analysis Using Simulation," and "Managing a Depreciation Study." I have also completed the "Introduction to Public Utility Accounting" program conducted by the American Gas Association.

Q. Does this conclude your qualification statement?

A. Yes.

LIST OF CASES IN WHICH JOHN J. SPANOS SUBMITTED TESTIMONY

	Year	Jurisdiction	Docket No.	Client Utility	Subject
01.	1998	PA PUC	R-00984375	City of Bethlehem – Bureau of Water	Original Cost and Depreciation
02.	1998	PA PUC	R-00984567	City of Lancaster	Original Cost and Depreciation
03.	1999	PA PUC	R-00994605	The York Water Company	Depreciation
04.	2000	D.T.&E.	DTE 00-105	Massachusetts-American Water Company	Depreciation

Attention: Zachary Kravitz
Rates and Regulatory Affairs

Ladies and Gentlemen:

Pursuant to your request, we have conducted a depreciation study related to the gas plant of Northwest Natural Gas Company as of December 31, 2023. The attached report presents a description of the methods used in the estimation of depreciation, the summary of annual depreciation accrual rates, the statistical support for the life and net salvage estimates and the detailed tabulations of annual depreciation.

Respectfully submitted,

GANNETT FLEMING VALUATION

NORTHWEST NATURAL GAS COMPANY

DEPRECIATION STUDY

EXECUTIVE SUMMARY

Pursuant to Northwest Natural Gas Company's ("NWNat" or "Company") request, Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming") conducted a depreciation study related to the gas plant of NWNat as of December 31, 2023. The purpose of this study was to determine the annual depreciation accrual rates and amounts for book and ratemaking purposes.

The depreciation rates are based on the straight line method using the average service life ("ASL") procedure and were applied on a remaining life basis. The calculations were based on attained ages and estimated average service life, and forecasted net salvage characteristics for each depreciable group of assets.

NWNat's accounting policy for plant assets has not changed since the last depreciation study was prepared. However, there have been changes to the plant in service due to system improvements and there are some expected changes to future life characteristics which has created new depreciation rates.

Gannett Fleming recommends the calculated annual depreciation accrual rates set forth herein apply specifically to gas plant in service as of December 31, 2023 as summarized by Table 1 of the study. Supporting analysis and calculations are provided within the study.

The study results set forth an annual depreciation expense of $154.7 million when applied to depreciable plant balances as of December 31, 2023. The results are summarized at the functional level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL RATES AND AMOUNTS

FUNCTION	ORIGINAL COST AS OF DECEMBER 31, 2023	PROPOSED RATE	PROPOSED EXPENSE
Intangible Plant	$ 294,039,083.04	8.90	$ 26,162,477
Oil Gas Facilities	21,398.00	-	0
Other Production Facilities	628,802.00	-	0
Underground Storage Plant	239,087,512.56	2.05	4,896,830
Local Storage Plant	109,378,540.95	4.31	4,718,667

Distribution Plant	2,841,263,523.03	3.16	89,708,499
General Plant	369,421,300.49	5.85	21,611,140
General Plant Reserve Amortization	-	-	(434,015)
Total	**$4,273,563,459.70**	**3.62**	**$154,747,503**

PART I. INTRODUCTION

NORTHWEST NATURAL GAS COMPANY
DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Northwest Natural Gas Company ("Company"), to determine the annual depreciation accrual rates and amounts for book purposes applicable to the original cost of gas plant as of December 31, 2023. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to gas plant in service as of December 31, 2023

The service life and net salvage estimates resulting from the study were based on informed judgment which incorporated analyses of historical plant retirement data as recorded through 2023, a review of Company practice and outlook as they relate to plant operation and retirement, and consideration of current practice in the gas industry, including knowledge of service lives and net salvage estimates used for other gas companies.

PLAN OF REPORT

Part I, Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and methods used in the service life study. Part III, Service Life Considerations, presents the results of the average service life analysis. Part IV, Net Salvage Considerations, presents the results of the net salvage study. Part V, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part VI, Results of Study, presents summaries by depreciable group

of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VII, Service Life Statistics presents the statistical analysis of service life estimates, Part VIII, Net Salvage Statistics sets forth the statistical indications of net salvage percents, and Part IX, Detailed Depreciation Calculations presents the detailed tabulations of annual depreciation.

BASIS OF THE STUDY

Depreciation

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing gas utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

For most accounts, the annual depreciation was calculated by the straight line method using the average service life procedure and the remaining life basis. For certain General Plant accounts, the annual depreciation is based on amortization accounting.

Both types of calculations were based on original cost, attained ages, and estimates of service lives and net salvage.

The straight line method, average service life procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America. Gannett Fleming recommends its continued use. Amortization accounting is used for certain General Plant accounts because of the disproportionate plant accounting effort required when compared to the minimal original cost of the large number of items in these accounts. An explanation of the calculation of annual and accrued amortization is presented beginning on page V-4 of the report.

Service Life and Net Salvage Estimates

The service life and net salvage estimates used in the depreciation and amortization calculations were based on informed judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the gas utility industry, and comparisons of the service life and net salvage estimates from our studies of other gas utilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for gas plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and the estimated future yielded estimated survivor curves from which the average service lives were derived.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

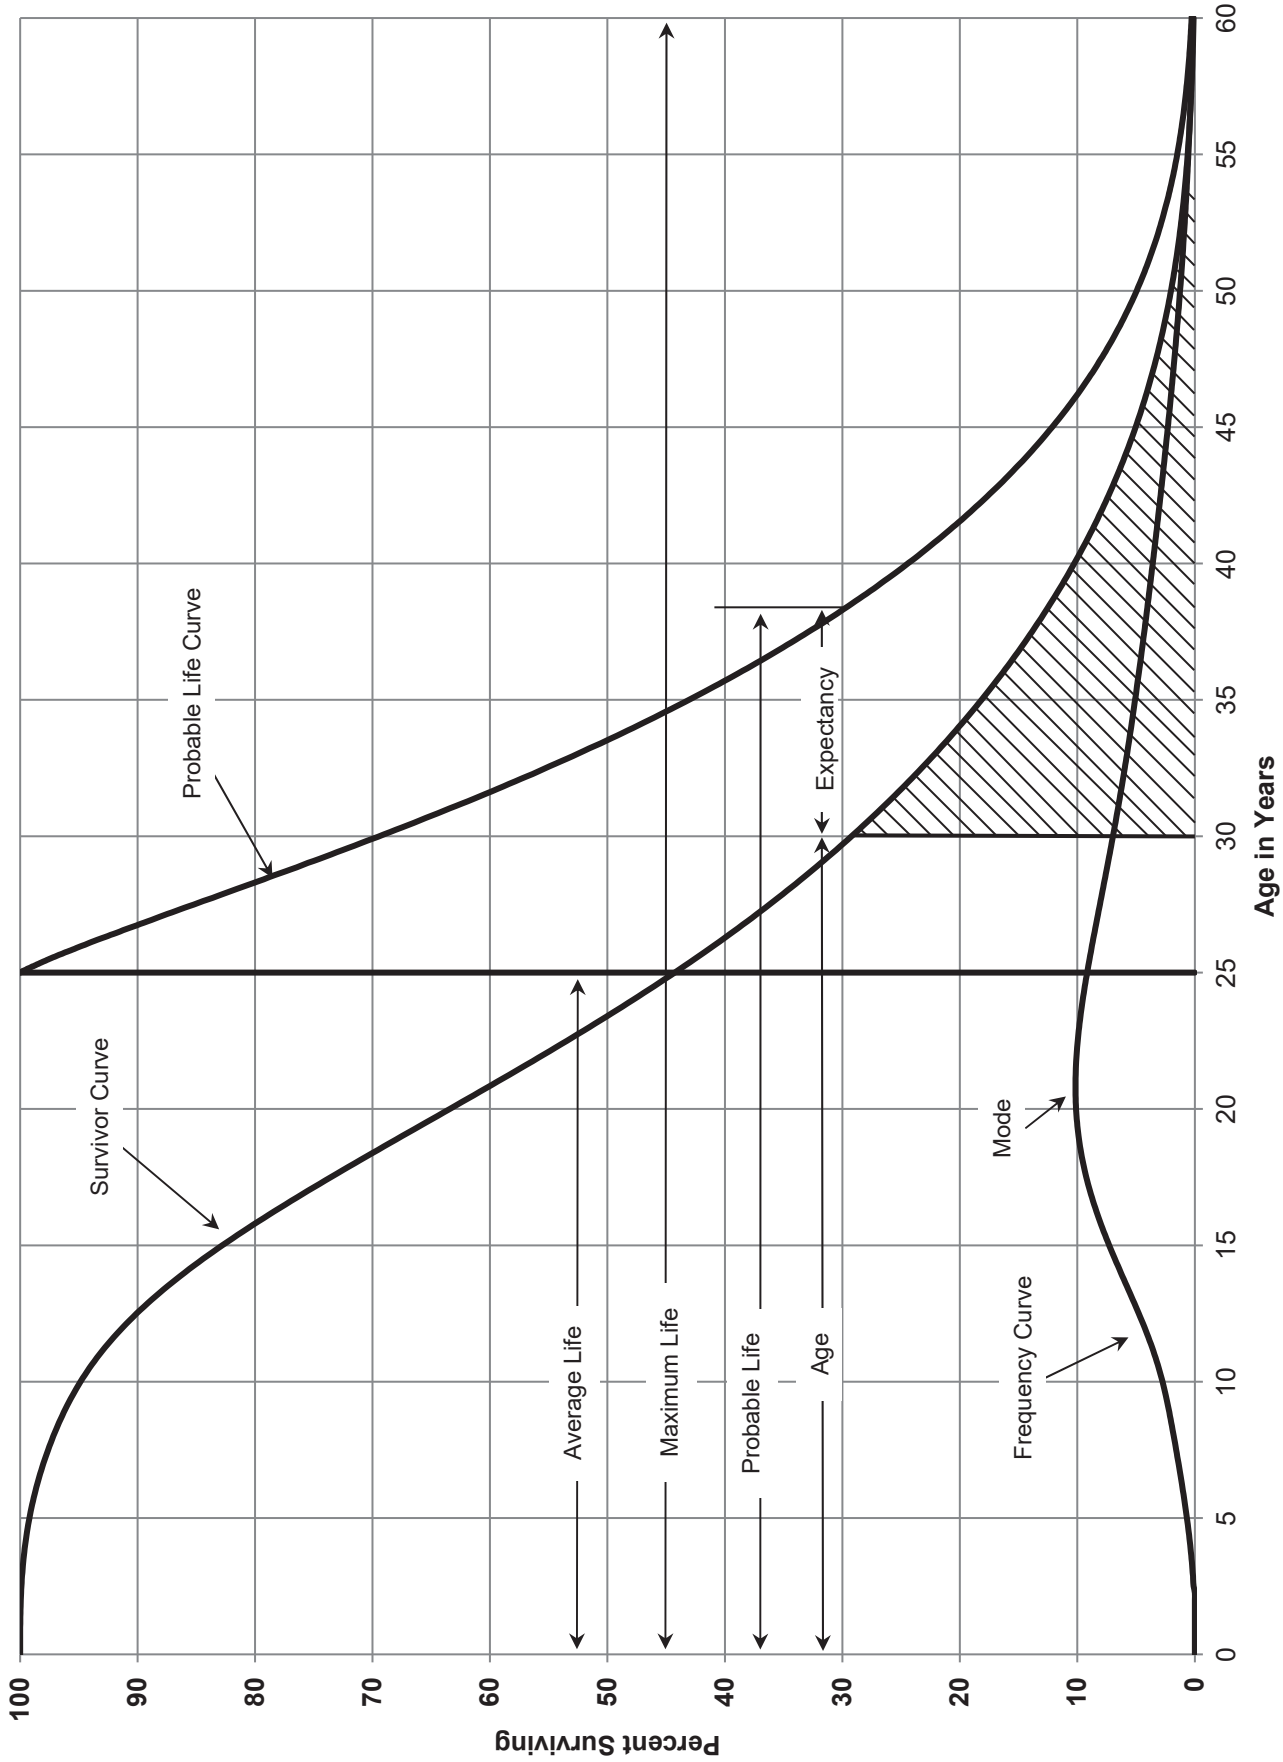

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

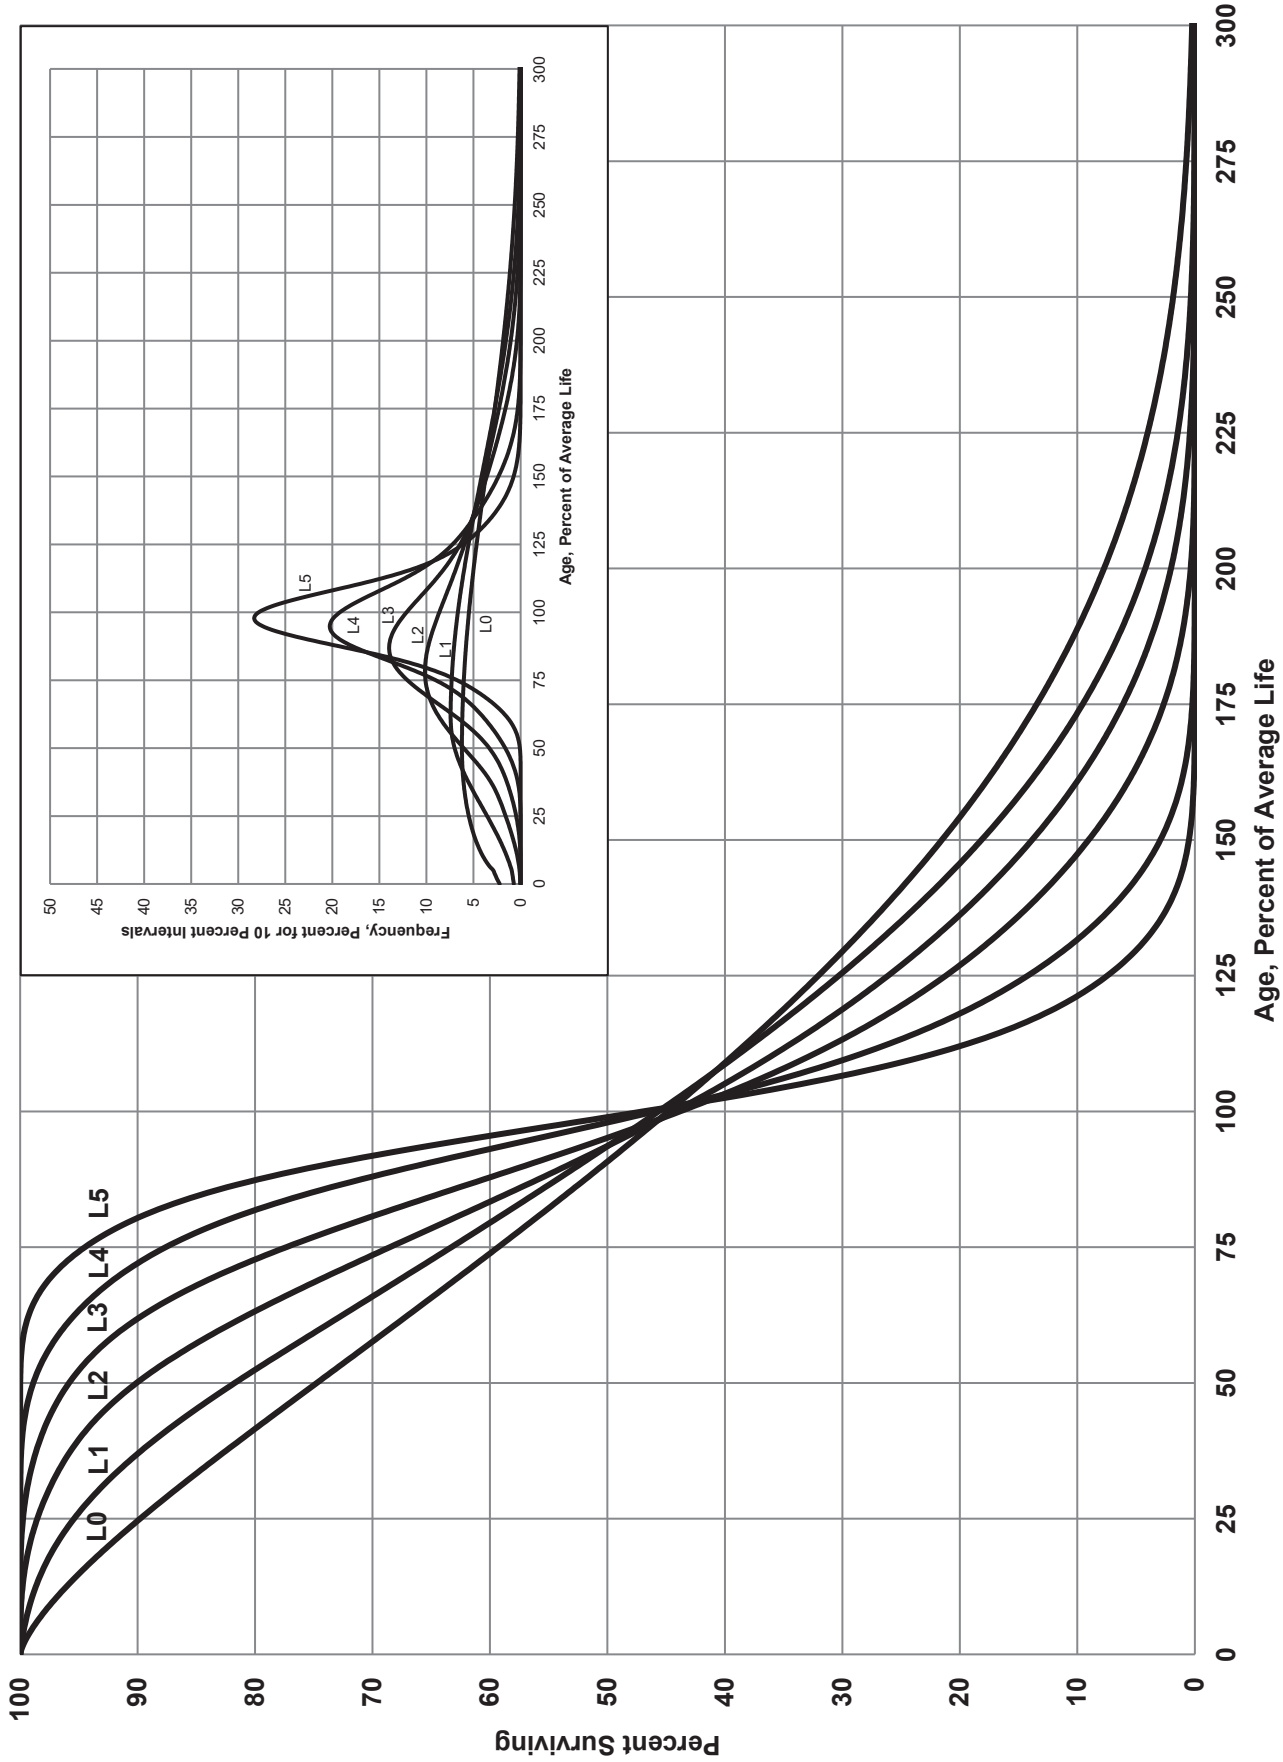

FIGURE 2. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

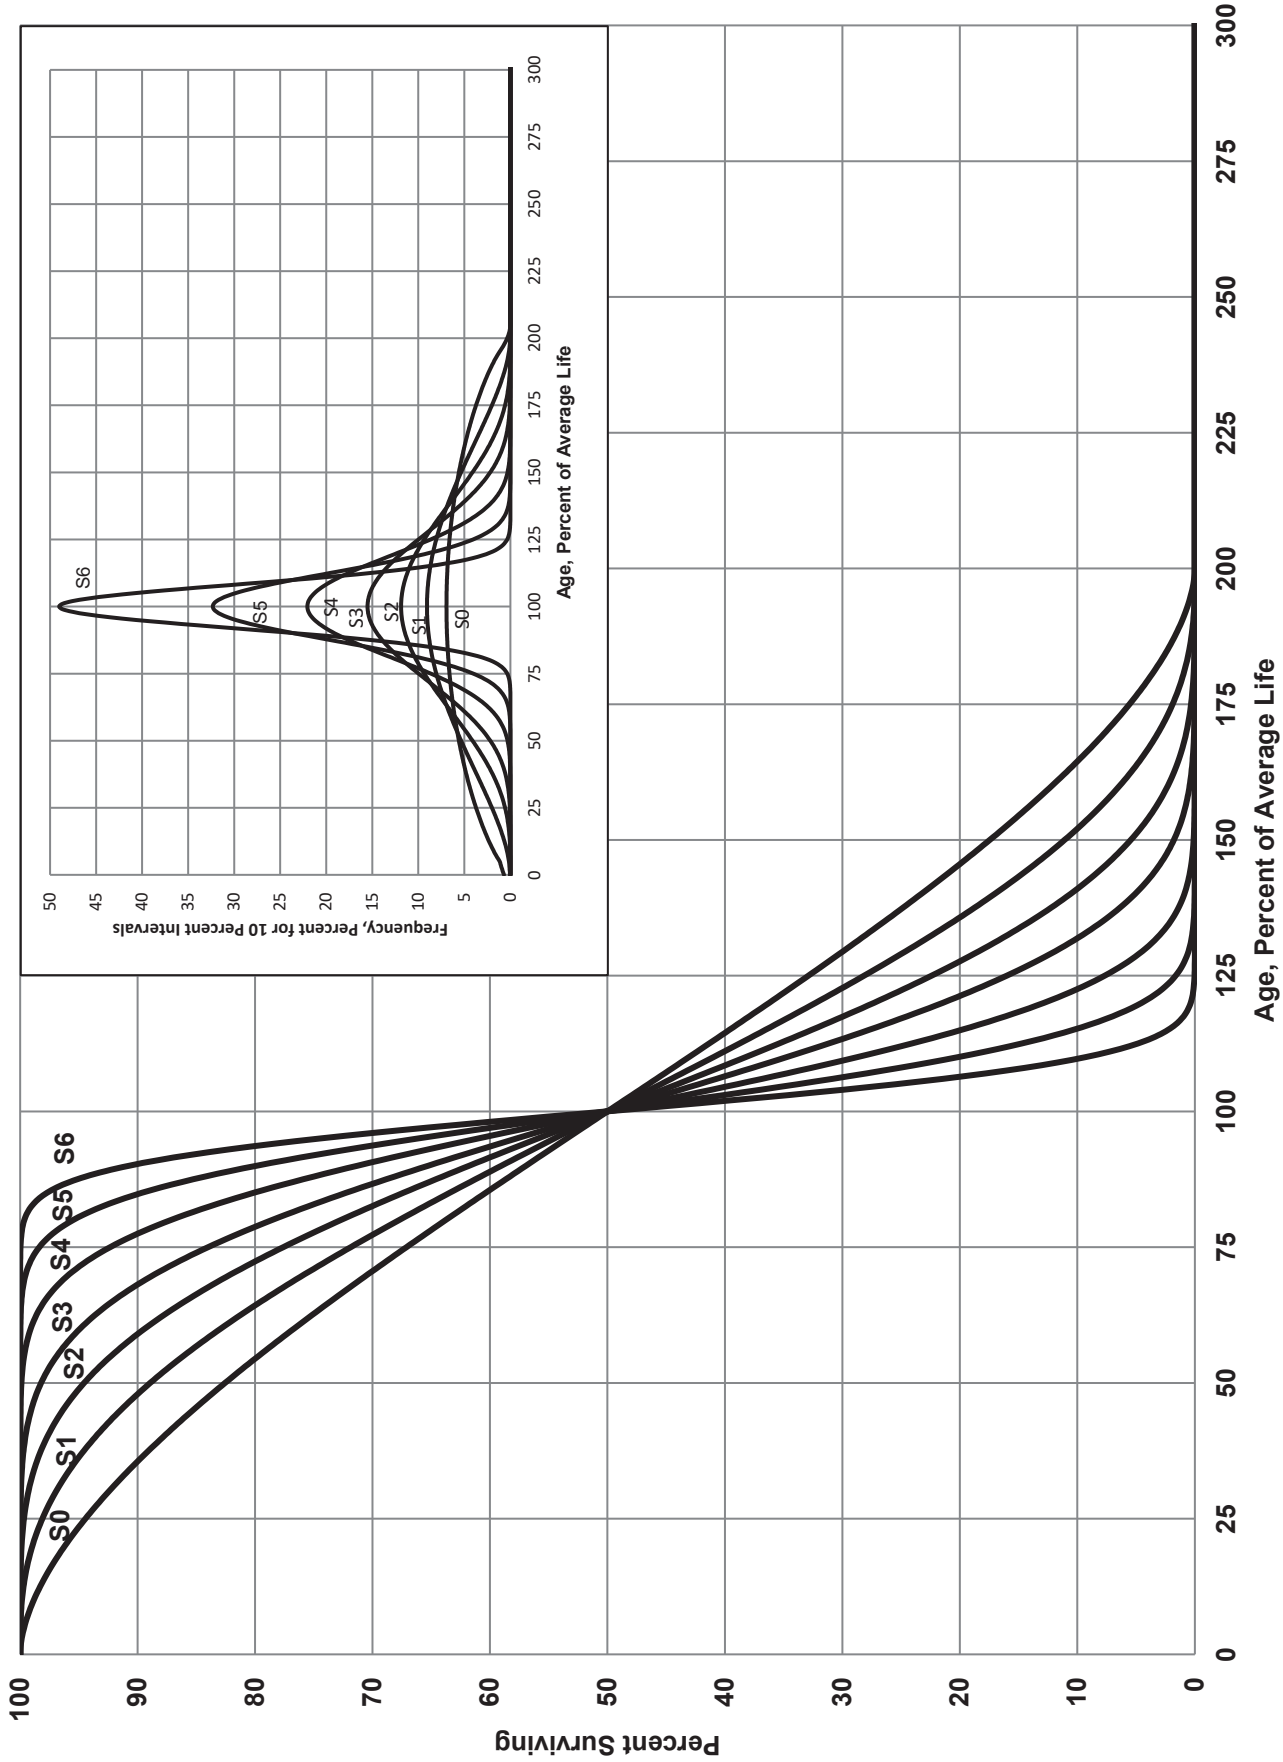

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

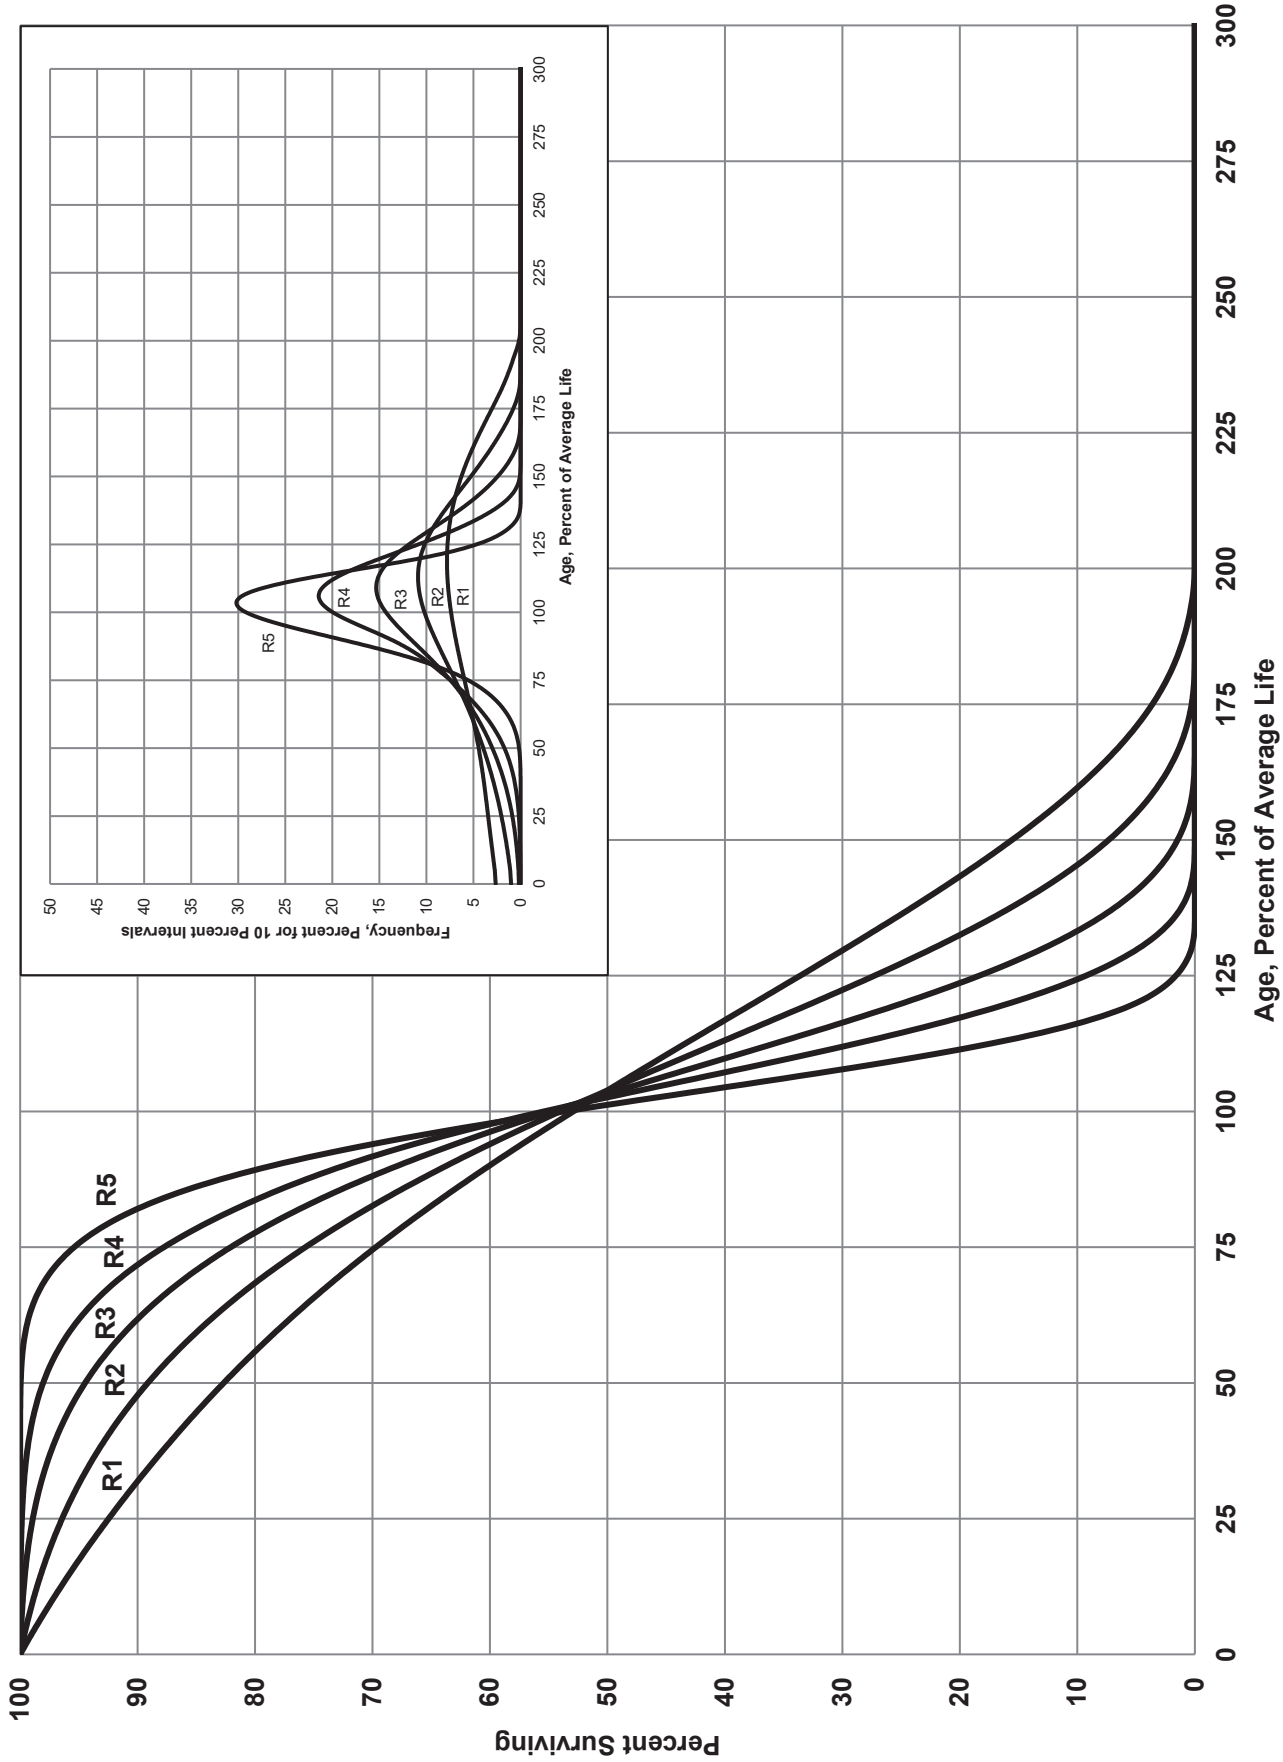

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

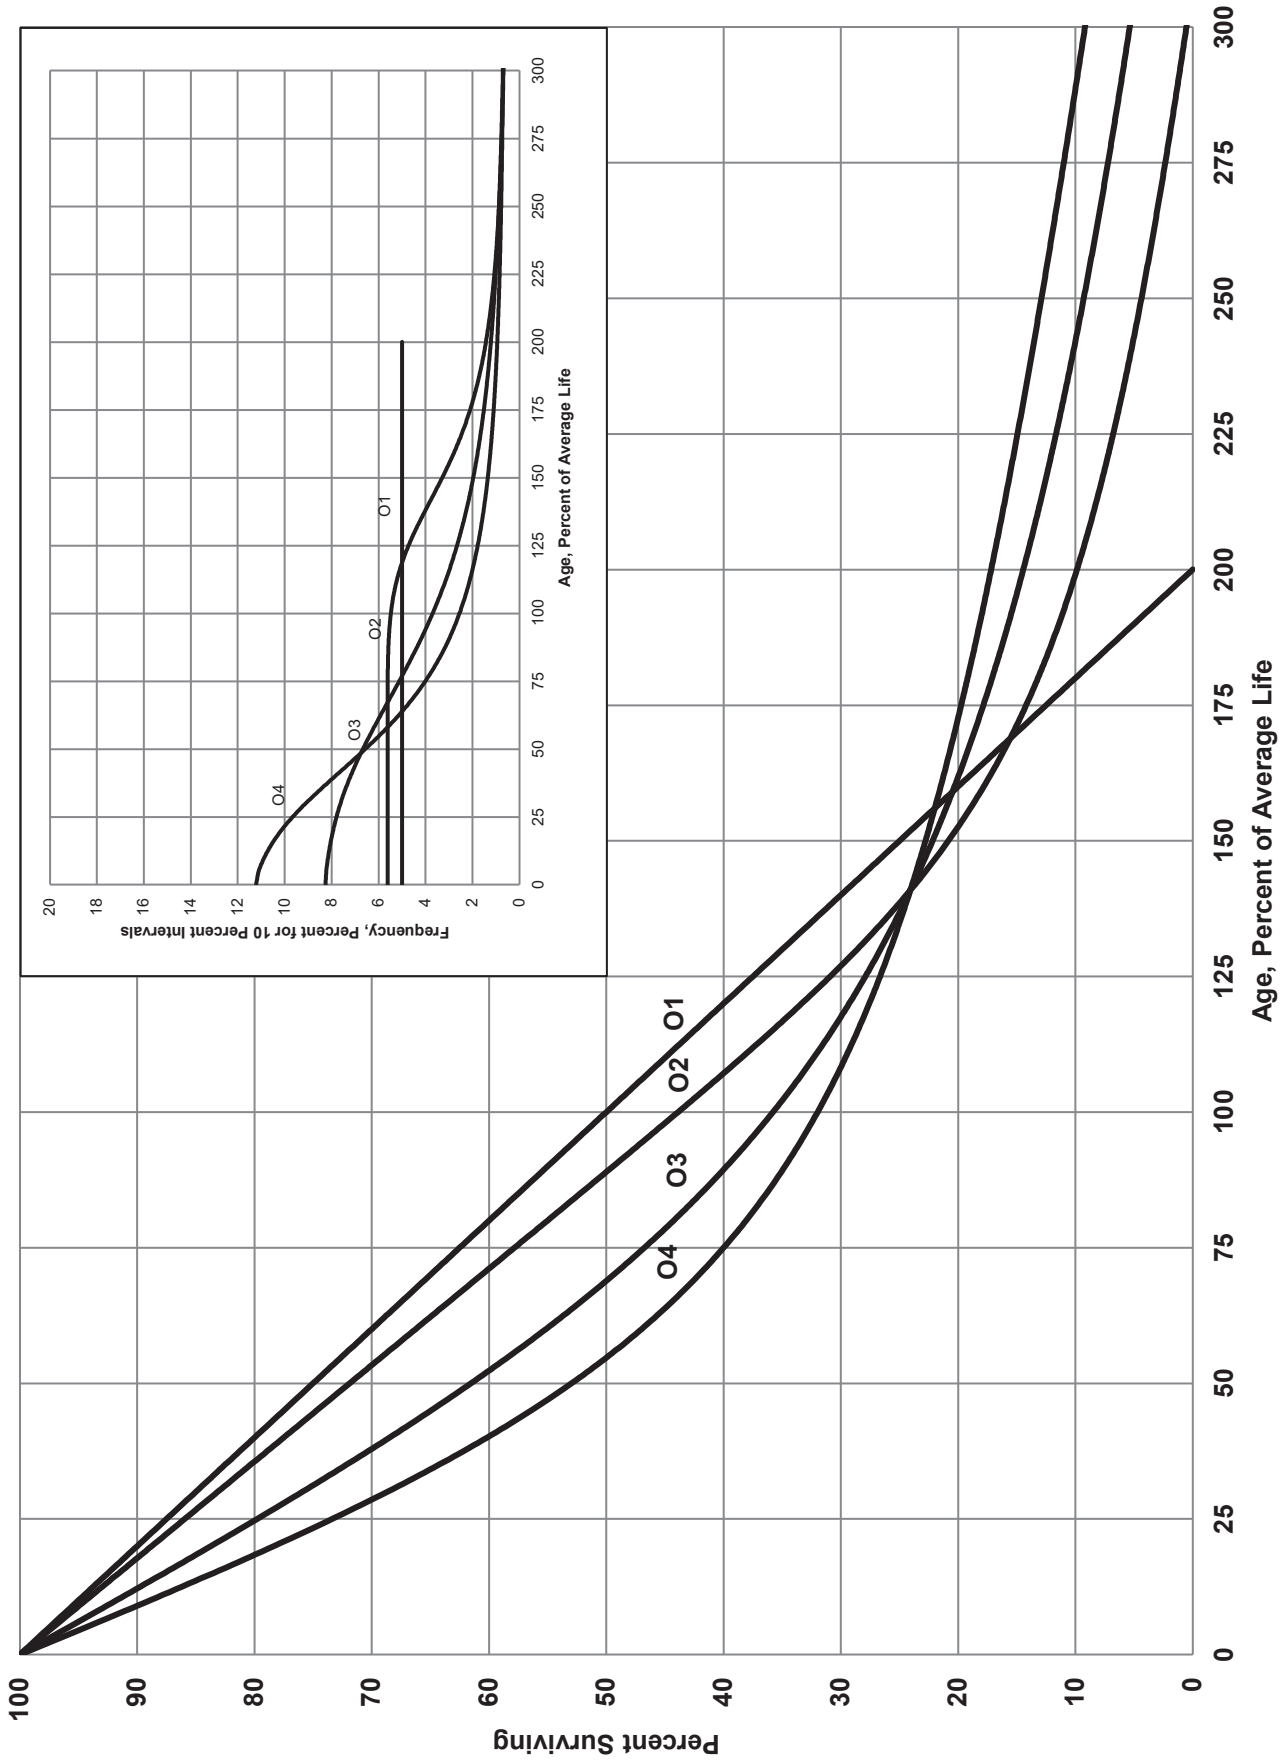

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2014-2023 for which there were placements during the years 2009-2023. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2009 were retired in 2014. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2014 retirements of 2009 installations and ending with the 2023 retirements of the 2018 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2014-2023
SUMMARIZED BY AGE INTERVAL

Experience Band 2014-2023 Placement Band 2009-2023

Year Placed	Retirements, Thousands of Dollars During Year										Total During Age Interval	Age Interval
	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
2009	10	11	12	13	14	16	23	24	25	26	26	13½-14½
2010	11	12	13	15	16	18	20	21	22	19	44	12½-13½
2011	11	12	13	14	16	17	19	21	22	18	64	11½-12½
2012	8	9	10	11	11	13	14	15	16	17	83	10½-11½
2013	9	10	11	12	13	14	16	17	19	20	93	9½-10½
2014	4	9	10	11	12	13	14	15	16	20	105	8½-9½
2015		5	11	12	13	14	15	16	18	20	113	7½-8½

[a] Transfer Affecting Exposures at Beginning of Year
[b] Transfer Affecting Exposures at End of Year
[c] Sale with Continued Use
Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2014 through 2023 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2019 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2014-2023
SUMMARIZED BY AGE INTERVAL

Experience Band 2014-2023

Placement Band 2009-2023

Year Placed	Exposures, Thousands of Dollars — Annual Survivors at the Beginning of the Year										Total at Beginning of Age Interval	Age Interval
	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
2009	255	245	234	222	209	195	239	216	192	167	167	13½-14½
2010	279	268	256	243	228	212	194	174	153	131	323	12½-13½
2011	307	296	284	271	257	241	224	205	184	162	531	11½-12½
2012	338	330	321	311	300	289	276	262	242	226	823	10½-11½
2013	376	367	357	346	334	321	307	297	280	261	1,097	9½-10½
2014	420[a]	416	407	397	386	374	361	347	332	316	1,503	8½-9½
2015		460[a]	455	444	432	419	405	390	374	356	1,952	7½-8½
2016			510[a]	504	492	479	464	448	431	412	2,463	6½-7½
2017				580[a]	574	561	546	530	501	482	3,057	5½-6½
2018					660[a]	653	639	623	628	609	3,789	4½-5½
2019						750[a]	742	724	685	663	4,332	3½-4½
2020							850[a]	841	821	799	4,955	2½-3½
2021								960[a]	949	926	5,719	1½-2½
2022									1,080[a]	1,069	6,579	½-1½
2023										1,220[a]	7,490	0-½
Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2014-2023, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2014-2023 Placement Band 2009-2023

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93
1.5	5,719	151	0.0264	0.9736	96.62
2.5	4,955	150	0.0303	0.9697	94.07
3.5	4,332	146	0.0337	0.9663	91.22
4.5	3,789	143	0.0377	0.9623	88.15
5.5	3,057	131	0.0429	0.9571	84.83
6.5	2,463	124	0.0503	0.9497	81.19
7.5	1,952	113	0.0579	0.9421	77.11
8.5	1,503	105	0.0699	0.9301	72.65
9.5	1,097	93	0.0848	0.9152	67.57
10.5	823	83	0.1009	0.8991	61.84
11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips have been conducted during past studies. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the most recent field trip.

September 28-29, 2021
North Mist Compressor Station
Injection Well 44-03-65
Mist (Miller Station) Compressor Station
Sauvie Island City Gate Station
Gasco Mixer Station (Measuring & Regulating Station)
Linnton (Portland) LNG Plant
Jean Road Regulating Station
Sherwood Service Center

SERVICE LIFE ANALYSIS

The service life estimates were based on informed judgment which considered a number of factors. The primary factors were the statistical analyses of data; current Company policies and outlook as determined during conversations with management; and the survivor curve estimates from previous studies of this company and other gas companies.

For many of the plant accounts and subaccounts for which survivor curves were estimated, the statistical analyses using the retirement rate method resulted in good to excellent indications of the survivor patterns experienced. These accounts represent 71 percent of depreciable plant. Generally, the information external to the statistics led to no

significant departure from the indicated survivor curves for the accounts listed below. The statistical support for the service life estimates is presented in the section beginning on page VII-2.

OIL GAS FACILITIES
- 305.50 Structures and Improvements - Other

OTHER PRODUCTION FACILITIES
- 305.11 Structures and Improvements – Gas Production
- 305.17 Structures and Improvements – Mixing Station

LOCAL STORAGE PLANT
- 361.00 Structures and Improvements
- 363.20 Vaporizing Equipment
- 363.50 CNG Refueling Facilities

DISTRIBUTION PLANT
- 375.00 Structures and Improvements
- 376.11 Mains – HP 4” and Less
- 376.12 Mains – HP 4” and Over
- 380.00 Services
- 381.00 Meters
- 381.10 Meters – Electric
- 381.20 Meters – ERT
- 382.00 Meter Installations
- 382.10 Meter Installations – Electric
- 382.20 Meter Installations – ERT
- 386.00 Other Property on Customers’ Premises

GENERAL PLANT
- 390.00 Structures and Improvements
- 390.10 Structures and Improvements – Source Control Plant
- 392.00 Transportation Equipment
- 396.00 Power Operated Equipment

The combined analysis of Accounts 376.11 - Mains, HP 4” and Less; and 376.12, Mains – HP 4” and Over, is used to illustrate the manner in which the study was conducted for the groups in the preceding list. The combined Accounts 376.11 and 376.12 represent 35 percent of the total depreciable plant. Aged plant accounting data have been compiled

for the years 1910 through 2023. These data have been coded in the course of the Company's normal record keeping according to account or property group, type of transaction, year in which the transaction took place, and year in which the gas plant was placed in service. The retirements, other plant transactions, and plant additions were analyzed by the retirement rate method.

The survivor curve estimate is based on the statistical indications for the period 1910 through 2023 and 1961 through 2023. The Iowa 65-R3 is an excellent fit of the original survivor curve. The 65-year service life is within the typical service life range of 55 to 70 years for mains. The 65-year life reflects the Company's plans and practices of the past and next few years. The previous estimate was the Iowa 67-R3.

The survivor curve estimate for Account 380.00, Services, is based on the statistical analyses of historical retirement experience for the periods 1919-2023, 1976-2015 and 1981-2015. The 60-R2.5 estimate for Account 380.00, Services, is a good fit of the original survivor curve developed from historical plant retirements for the period 1919 through 2023. However, the lack of recorded retirements in the last few years are not expected to continue so emphasis on the level of retirements through 2015 are expected into the future. The 60-R2.5 survivor curve sets forth the constant rates of retirement through approximately age 76. The 60-year average service life is above the upper end of the typical range of 40-55 years for services. The previous estimate was the Iowa 65-R1.5

The survivor curve estimates for the remaining accounts in the preceding list were based on similar statistical analyses and previous studies for this and other gas utilities. The remaining accounts were based primarily on judgment and estimates of other gas utilities.

Life Span Estimates

Inasmuch as production plant consists of large units, the life span technique was employed in conjunction with the use of interim survivor curves which reflect interim retirements that occur prior to the ultimate retirement of the major unit. An interim survivor curve was estimated for each plant account, inasmuch as the rate of interim retirements differs from account to account. The interim survivor curves estimated for local storage plant were based on the retirement rate method of life analysis which incorporated experienced aged retirements for the period 1961 through 2023.

The depreciable life span estimates for storage facilities were the result of considering experienced life spans of similar facilities, the age of surviving plants, general operating characteristics of the station, major refurbishing, and discussions with management personnel concerning the probable long-term outlook for the stations.

The estimated survivor curves for local storage plant reflect the life span or forecast concept of life estimation. In the life span concept, an interim survivor curve is selected to describe the rates of retirement between installation and the final concurrent retirement of all facilities at a location. The forecast life span for the Linnton and Newport plants in the local storage plant accounts, is set forth in years from the date of their initial major installation. Although the Company currently does not have plans to replace these plants in the foreseeable future, the forecast retirement dates represent the midpoint of a range of dates during which significant replacement of the facilities presently in service will be required due to their age and improvements in technology.

	Probable Retirement Date	Initial Major Installation	Life Span
Local Storage			
Linnton	2036	1969,2016	67,20
Newport	2042	1977,2017	55,25

Similar studies were performed for the remaining plant accounts. Each of the judgments represented a consideration of statistical analyses of aged plant activity, management's outlook for the future, and the typical range of lives used by other gas companies.

The selected amortization periods for other General Plant accounts are described in the section "Calculated Annual and Accrued Amortization."

PART IV. NET SALVAGE CONSIDERATIONS

PART IV. NET SALVAGE CONSIDERATIONS

NET SALVAGE ANALYSIS

The estimates of net salvage by account were based in part on historical data compiled for the years 1993 through 2023. Cost of removal and gross salvage were expressed as percents of the original cost of plant retired, both on annual and three-year moving average bases. The most recent five-year average also was calculated for consideration. The net salvage estimates by account are expressed as a percent of the original cost of plant retired.

Net Salvage Considerations

The estimates of future net salvage are expressed as percentages of surviving plant in service, i.e., all future retirements. In cases in which removal costs are expected to exceed salvage receipts, a negative net salvage percentage is estimated. The net salvage estimates were based on judgment which incorporated analyses of historical cost of removal and gross salvage data, expectations with respect to future removal requirements and markets for retired equipment and materials.

The analyses of historical cost of removal and gross salvage data are presented in the section titled “Net Salvage Statistics” for the plant accounts for which the net salvage estimate relied partially on those analyses.

Statistical analyses of historical data for the period 1993 through 2023 contributed significantly toward the net salvage estimates for 11 plant accounts, representing 70 percent of the depreciable plant, as follows:

DISTRIBUTION PLANT

376.11	Mains – HP 4” and Less
376.12	Mains – HP 4” and Over
380.00	Services
381.00	Meters
381.20	Meters – ERT
382.00	Meter Installations
382.20	Meter Installations – ERT

GENERAL PLANT

390.00	Structures and Improvements
390.10	Structures and Improvements – Source Control Plant
392.00	Transportation Equipment
396.00	Power Operated Equipment

The combined analyses of Account 376.11, Mains – HP 4” and Less and Account 376.12, Mains – HP 4” and Over, is used to illustrate the manner in which the study was conducted for the groups in the preceding list. Net salvage data for the period 1993 through 2023 were analyzed for this account. The data include cost of removal, gross salvage and net salvage amounts and each of these amounts is expressed as a percent of the original cost of regular retirements. Three-year moving averages for the 1993-1995 through 2021-2023 periods were computed to smooth the annual amounts.

Cost of removal fluctuated considerably during the 31-year period, 1993-2023. The practices for assigning labor costs to removing pipe versus installing new pipe had not changed in recent years however, there is a plan to allocate more to installation of the new asset and slightly less to cost of removal as compared to the retirement cost. Cost of removal for the most recent five years averaged 199 percent.

Gross salvage has been minimal throughout the period with a slight increase in recent years due to a few projects. The most recent five-year average of 12 percent gross salvage reflects moderate salvage value for pipe.

The net salvage percent based on the overall period 1993 through 2023 is 91 percent negative net salvage. The range of estimates made by other gas companies for mains is negative 15 to negative 75 percent. Because the overall statistical indications are above the upper end of the industry range and the most recent five-year period is well above the upper end of the range, the statistical indication of negative 65 percent was selected for the Company's mains. This also considers the expected reduction due to less cost of removal being assigned to main replacement projects.

The net salvage estimates for the remaining accounts were based on judgment incorporating estimates of previous studies of this and other gas utilities.

The net salvage estimates for the remaining plant accounts were estimated using the above-described process of historical indications, judgment and reviewing the typical range of estimates used by other gas companies. The results of the net salvage for each plant account are presented in account sequence beginning in the section titled "Net Salvage Statistics", page VIII-2.

Generally, the net salvage estimates for remaining general plant accounts were zero percent, consistent with amortization accounting.

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000\left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of December 31, 2023, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of December 31, 2023, are set forth in the Results of Study section of the report.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life}{Average\ Service\ Life}.$$

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is proposed for a number of accounts that represent numerous units of property, but a very small portion of depreciable gas plant in service. The accounts and their amortization periods are as follows:

Account		Amortization Period, Years
391.10	Office Furniture and Equipment	20
391.20	Office Furniture and Equipment – Computers	5
391.21	Office Furniture and Equipment – Computers Horizon	10
391.22	Office Furniture and Equipment – Computers TSA Security Directive	10
393.00	Stores Equipment	25
394.00	Tools, Shop and Garage Equipment - Non Specific	25
395.00	Laboratory Equipment	20
397.00	Communication Equipment	15
397.10	Communication Equipment – Mobile	10
397.20	Communication Equipment – Non Mobile and Telemeter	15
397.30	Communication Equipment – Telemeter Other	15
397.40	Communication Equipment – Telemeter Microwave	15
397.50	Communication Equipment – Telephone	10
398.10	Miscellaneous Equipment – Print Shop	15
398.20	Miscellaneous Equipment – Kitchen	15

398.30	Miscellaneous Equipment – Janitorial	20
398.40	Miscellaneous – Leased Buildings	20
398.50	Miscellaneous Equipment - Other	20

For the purpose of calculating annual amortization amounts as of December 31, 2023, the book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The book reserve assigned to vintages with an age greater than the amortization period is equal to the vintage's original cost. The remaining book reserve is allocated among vintages with an age less than the amortization period in proportion to the calculated accrued amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the future amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

PART VI. RESULTS OF STUDY

PART VI. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and net salvage and for the change of the composition of property in service. The annual accrual rates were calculated in accordance with the straight line remaining life method of depreciation, using the average service life procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

The annual depreciation accrual rates are applicable specifically to the gas plant in service as of December 31, 2023. For most plant accounts, the application of such rates to future balances that reflect additions subsequent to December 31, 2023, is reasonable for a period of three to five years.

DESCRIPTION OF STATISTICAL SUPPORT

The service life estimates were based on judgment that incorporated statistical analysis of retirement data, discussions with management and consideration of estimates made for other gas utilities. The results of the statistical analysis of service life are presented in the section beginning on page VII-2, within the supporting documents of this report.

For each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of

the original life table(s) plotted on the chart. The survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the curve type designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. The titles of the chart indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which where plotted. The experience band indicates the range of years for which retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The analyses of net salvage data are presented in the section titled, “Net Salvage Statistics”. The tabulations present annual cost of removal and gross salvage data, three-year moving averages and the most recent five-year average. Data are shown in dollars and as percentages of original costs retired.

DESCRIPTION OF DETAILED TABULATIONS

A summary of the results of the study, as applied to the original cost of gas plant as of December 31, 2023, is presented on pages VI-5 through VI-8 of this report. The schedule sets forth the original cost, the book depreciation reserve, future accruals, the calculated annual depreciation rate and amount, and the composite remaining life related to gas plant.

The tables of the calculated annual depreciation applicable to depreciable assets as of December 31, 2023 are presented in account sequence starting on page IX-2 of the supporting documents. The tables indicate the estimated survivor curve and net salvage

percent for the account and set forth, for each installation year, the original cost, the calculated accrued depreciation, the allocated book reserve, future accruals, the remaining life, and the calculated annual accrual amount.

V. List of Exhibits 33

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position at Northwest Natural Gas Company ("NW Natural" or "the Company").

A. My name is Holly J. Braun. I am a Business Development Consultant at NW Natural.

Q. Please describe your education and employment background.

A. I received a Bachelor of Business Administration from Lipscomb University with a concentration in Professional Accounting in 2001. I served as an auditor with Ernst & Young for two years; also obtaining my Certification of Public Accounting. I then developed and managed the Sarbanes-Oxley compliance program at NW Natural from 2003-2008. At this point, I moved into the Environmental Policy and Sustainability Department, shaping energy policy and managing efficiency programs until 2018 when I became an internal Innovation Consultant identifying technologies to decarbonize thermal energy delivery.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to explain NW Natural's Thermal Energy Network ("TEN") pilot project in Vancouver, including how the Company proposes to recover the costs of the project. As further explained in my testimony, NW Natural is seeking several different funding sources for this project, including an investment tax credit, an energy savings credit from the local electric utility, a grant from the Washington State Department of Commerce, as well as cost recovery through customer rates.

In this proceeding, NW Natural is seeking Commission approval to include a portion of the project's costs as provisional capital that will be recovered from natural gas customers at the beginning of the second rate year (August 1, 2027). NW Natural

is also seeking the Commission's approval of how it proposes to allocate costs between its natural gas customers and the customer that will be served by the TEN with the understanding that the Company will file the special contract for service to the TEN customer closer to project operation.

Q. Please summarize your testimony.

A. My testimony first describes TENs at a high-level, including how they work and why they are so efficient. I also describe the regulatory framework for TENs development in Washington, explaining how NW Natural is seeking to take advantage of a recently passed law—HB 2131—to build the Vancouver TEN project. Next, I explain the Vancouver TEN project, describing how it was selected and potential expansion opportunities. Finally, as referenced above, I explain how NW Natural proposes to recover the cost of the project through a combination of an investment tax credit, an energy savings credit from the local electric utility, contributions from TEN and natural gas customers, and a grant from the Washington State Department of Commerce that the Company is currently pursuing.

II. BACKGROUND

Q. What is a TEN?

A. Thermal Energy Networks (TENs) connect multiple buildings through a loop of underground pipes carrying water. This water exchanges heat with the earth through geothermal boreholes or wells. Each building connects to the TEN using a ground source heat pump, which provides heating, cooling, and hot water. The heat pump works by transferring heat from the underground loop into a building during the cold winter months and removing heat from the building into the loop during the summer.

Q. Is a TEN more efficient than air-source heat pumps?

A. Yes. Unlike the TEN, an air source heat pump uses outside air to heat and cool a building. However, in winter, for example, an air source heat pump becomes less efficient and effective at heating a building as the surface temperature drops. This decline in efficiency and effectiveness is because an air source heat pump pulls heat from outdoor air and there is less heat available in colder air. As a result, air source heat pumps are typically paired with back-up electric resistance heating for colder weather, which is very inefficient during the coldest times of the year. Likewise, in summer an air source heat pump rejects heat into hotter air, reducing its comparative efficiency.

TENs, on the other hand, use geothermal energy to heat and cool a building. Unlike air source heat pumps, TENs' efficiency and effectiveness does not depend on air temperatures that rise and fall dramatically with the seasons. Instead, TENs use the energy under the earth's surface, where the temperature remains about 55 degrees Fahrenheit year-round. This lack of temperature fluctuation, as well as water serving as the energy transfer medium (as opposed to air), makes TENs much more efficient than air source heat pumps. Water is 800 times denser than air, making it a more potent energy-transfer medium than air. The TEN system is designed to achieve a maximum coefficient of performance (COP) of approximately 6.0, which significantly outperforms conventional air source heat pumps. This higher performance translates into greater system-level energy efficiency.

Q. Why is NW Natural interested in developing a TEN pilot project?

A. NW Natural is committed to helping Washington transition to a low carbon future. The Company believes that TENs are a promising technology that may ultimately be an effective emissions reduction solution because they provide extremely efficient heating and cooling, including domestic water heating.

Q. Please briefly explain the regulatory framework for TENs in Washington.

A. In 2024, the Washington legislature passed HB 2131 (codified as RCW 80.28.450-480; RCW 43.31.033). HB 2131 permits natural gas utilities, such as NW Natural, to construct TENs to meet the heating and cooling needs of their customers. As a first step in the TENs regulatory process, NW Natural notified the Commission that it intended to develop the Vancouver TEN pilot project as required by RCW 80.28.460(2)(a) on June 5, 2025. On June 26, 2025, the Commission acknowledged that NW Natural complied with the notification requirements under that provision, giving the Company priority to develop the Vancouver TEN pilot project. See Exh. HJB-2.

The next step in the regulatory process is "submit[ting] the project for review and validation of costs assessments to the [C]ommission."[1] NW Natural submitted this project for Commission review on July 29, 2025.[2] As of the date of this testimony, this filing is pending before the Commission in docket UG-250458. HB 2131 lists the factors that the Commission must consider for approval, such as being able to fully

[1] RCW 80.28.450.

[2] *See* Exhs. HJB-3C through HJB-8C for the complete filing. These attachments are in the same order as they were presented for the July 29, 2025 filing and do not necessarily reflect the order that they are mentioned in this testimony.

meet the space heating of customers served by the TEN, as well as other policy and societal objectives.[3] HB 2131 also makes TEN pilot projects eligible for grants from the Washington State Department of Commerce to offset the cost of the TEN based on "the difference between the gas company's lowest reasonable cost resources under its current business practices and the costs of building and operating the thermal energy network pilot project," as determined by the Commission through the review and validation process outlined above.

The Commission's review and validation process in docket UG-250458, however, is not a cost recovery proceeding and does not ensure that NW Natural can recover the cost of the project from customers. Instead, per RCW 80.28.450, NW Natural is seeking to recover "the costs of building and operating the project from ratepayers in [this] rate case filing before the [C]ommission."

Q. You state that the Commission is in the process of reviewing and validating the Company's cost assessment of the Vancouver TEN project in docket UG-250458. Since this assessment is not complete, why is NW Natural seeking cost recovery in this proceeding?

A. NW Natural is seeking cost recovery in this proceeding because it expects the Vancouver TEN project to enter rates beginning in the second year of the multi-year rate plan (August 1, 2027). Although it is filing this testimony before the Commission has completed its review and validation of the Company's cost assessment of the Vancouver TEN project in docket UG-250458, NW Natural is nonetheless seeking cost

[3] *See* RCW 80.28.460 for the complete list of factors.

recovery for this project because it falls within the proposed multi-year rate plan. The Company has not filed a general rate case in Washington since 2020, and the timing of this rate case is not based on the in-service date of the Vancouver TEN project.

NW Natural is also taking this opportunity to continue the dialogue about this project with an emphasis on cost recovery and cost allocation. In the Company's July 29, 2025 filing seeking the Commission's review and validation of its cost assessments, the Company noted the importance of such a dialogue.[4] Since the time the Company began seriously pursuing this project, the amount of Washington State Department of Commerce grant funding available has been reduced from $25 million to $4.8 million for all TENs pilot projects.[5] This reduction is a material change that will affect the amount that utility customers must pay for TENs pilot projects. The Company views this proceeding as an opportunity to continue discussions on TENs development and cost recovery in the light of these funding cuts.

Q. Has NW Natural forecasted the amount of a grant that it may receive from the Washington State Department of Commerce to offset the cost of the project?

A. No. Since NW Natural is currently engaged in the review and validation process, it has not included a potential grant as an offset to the amount that must be recovered from customers. However, the Company is pursuing such a grant and will update the project's revenue requirement to reflect any grant that it subsequently receives.

[4] Exh. HJB-3, para. 3 and 76.

[5] Exh. HJB-3, para. 3 and 76.

III. VANCOUVER TEN PROJECT

Q. Please describe the Vancouver TEN project.

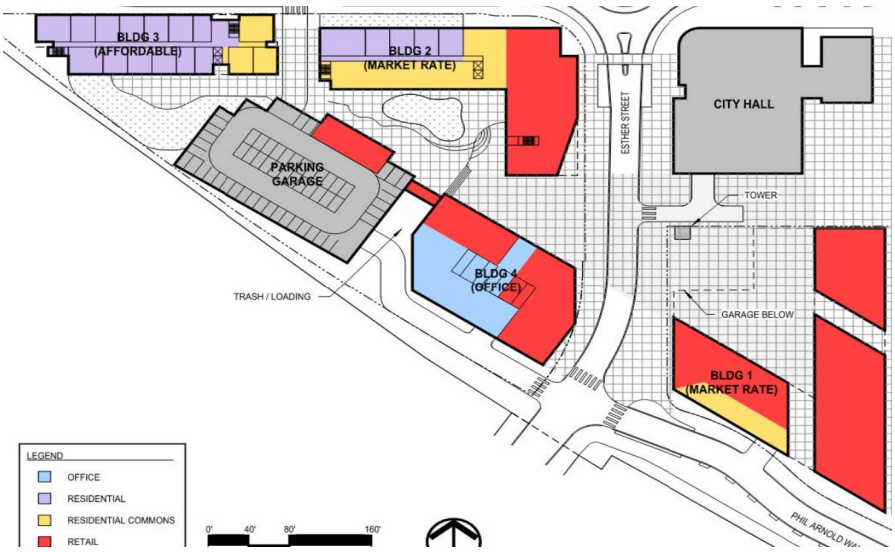
A. NW Natural selected a new construction site where the TEN will supply 100 percent of the heating and cooling plus domestic hot water to three new buildings planned for construction in Vancouver's Waterfront Gateway district, as well as the existing Vancouver City Hall. The TEN design is based on the developer site plan as of March 2025. Vancouver's existing City Hall, located across from Building 1, consists of 124,000 square feet of office space. Building 1, located on Esther Street and Phil Arnold Way, is currently planned to provide approximately 185 units of market-rate housing and 16,000 square feet of retail space. Building 2, located on the southwest corner of Esther and 6th Streets, is currently planned to provide approximately 155 units of market-rate housing and 8,800 square feet of retail space. Building 4,[6] located across the street from Building 1 and adjacent to Building 2, was originally planned as office space as depicted in Figure 1 but is currently planned as an additional 90 units of market-rate housing and 4,000 square feet of retail space. Building construction is expected to begin in late 2026. The total conditioned square footage is expected to be approximately 430,000.

Because the new buildings are still in the planning stage and have not yet been permitted, NW Natural recognizes the actual building sizes and use may change. Any such changes will be incorporated into the next stage of the Company's TEN design

[6] Building 3, to the far west side of the development, was originally in scope as affordable housing, but was on a separate track with its own developer, architect and funding and was further in development than the TEN pilot could accommodate; therefore, Building 3 is not in scope for this pilot.

work but will not fundamentally change the network. Figure 1, below, shows a map of the project area.

Figure 1



Q. Before developing the Vancouver TEN project, did NW Natural seek to learn from other utilities that have already developed these networks?

A. Yes. NW Natural has been tracking the progress of TENs since the first utility-operated TEN began development outside of Boston in 2021. By actively learning from this project, as well as other TEN projects proposed by various utilities since that time, NW Natural began development of its own pilot project that meets the swift timelines outlined in HB 2131 where TENs are scheduled to be placed in service prior to December 5, 2026.[7] Specifically, NW Natural learned that focusing on new construction for an initial pilot—as opposed to retrofitting existing buildings—is faster, more economical and easier to complete. Second, NW Natural learned the importance

[7] NW Natural also notes that HB 2131 allows utilities to petition the Commission for extensions to this deadline.

of having a local community champion that can help pull the pilot project forward. Finally, NW Natural learned that load diversity is key to optimizing thermal energy assets.

Q. How did NW Natural incorporate these lessons in selecting the downtown Vancouver site for its TENs pilot project?

A. First, based on the experience from other TENs projects across the country, NW Natural decided to focus on new construction. With new construction, there are fewer decisionmakers (i.e., a handful of developers can decide to install TENs in their new residential housing, as opposed to existing construction where that decision must be made by a multitude of individual property owners). Given the accelerated timeframe of HB 2131, where TENs are scheduled to be placed in service prior to December 5, 2026, reducing the number of decisionmakers can speed up the project and allow NW Natural to connect more customers than if the Company focused on retrofitting existing construction.

Second, new construction provides the cost and construction efficiency of utilizing trenches already open for other utilities rather than digging up paved streets.

Third, as stated above, NW Natural also learned from other utilities that have successfully completed a TEN that a community champion is critical to the success of any TENs project. In this regard, NW Natural is very appreciative to the City of Vancouver, which reached out to the Company upon passage of HB 2131, eager to partner with NW Natural to develop TENs in the city. With the City, NW Natural explored multiple sites but ultimately chose this project due to the load diversity, development timeline, and the nature of building use.

Fourth, the Vancouver TEN pilot project allows for increased efficiency as a result of thermal energy load diversity, which is another important lesson that the Company has incorporated from other TENs projects across the country. The proposed NW Natural pilot project includes multi-family residential buildings, City Hall, and commercial space. With these buildings connected to the TEN, load sharing occurs when there are simultaneous heating and cooling loads. The heat pumps in heating mode extract heat from the ambient temperature loop ("ATL") while the heat pumps in cooling mode reject heat to the ATL. The rejected heat is balanced by the extracted heat so that thermal energy sources are not needed to meet these loads.

Finally, although not directly related to what NW Natural learned from other utilities, NW Natural was also attracted to the project site due to the public nature of this development, specifically the plaza and adjacent farmers' market in downtown Vancouver. At this location, there is ample opportunity to educate and engage the public via active and passive methods regarding the TEN development and its superior energy efficiency and energy optimization compared to alternatives.

Q. Please explain the equity considerations that went into selecting the Vancouver TEN pilot project.

A. The Vancouver TEN pilot project is designed not only to deliver high-efficiency, non-combustion heating and cooling, but also to generate benefits that extend beyond individual customers to the broader community. While the initial buildings to be served are market-rate residential and commercial properties, the project is sited within census tract 042400, an area that scores among the most impacted in the state across all metrics

of the Washington Environmental Health Disparities Map.[8] This includes scores of 10 out of 10 for overall environmental health disparities and health disparities, and 9 out of 10 for diesel pollution and disproportionate impact, social vulnerability, and lead exposure risk. Locating the state's first utility-led thermal energy network in such a high-need area reflects NW Natural's commitment to equitable infrastructure investment and ensures that the pilot aligns with Washington's climate justice objectives.

Compared to all-electric air source heat pumps that these new buildings would likely use due to current Washington building codes, the project represents a replicable model for reducing system-wide emissions. Based on modeling by Salas O'Brien, the TEN configuration is expected to achieve a 36 percent reduction in greenhouse gas emissions compared to a fully electric business-as-usual scenario which already included a ground source heat pump system serving City Hall.[9]

Finally, NW Natural will leverage its existing community engagement infrastructure to guide future community benefit strategies related to the TEN pilot. This includes engagement with NW Natural's Community and Equity Advisory Group ("CEAG") and Community Affairs Manager ("CAM") team during project implementation, utilizing them as existing forums for meaningful participation by community stakeholders in future decisions about expansion, workforce development, and public benefit.

[8] Washington Environmental Health Disparities Map | Washington State Department of Health.

[9] Confidential Exh. HJB-7C.

Q. Has NW Natural received support from the local community for its Vancouver TEN pilot project?

A. Yes. The City of Vancouver has stated that the Vancouver TEN pilot project is "an innovative, sustainable infrastructure investment that aligns with the City's goals for climate action, energy resilience, equitable community development, and reducing the costs to deliver new housing," and that "[i]n addition to its environmental benefits, the thermal energy network pilot will support local economic development, create living wage jobs, and improve energy equity by delivering affordable and sustainable thermal services to a diverse set of users, including housing, municipal buildings, and small businesses."[10]

Clark Public Utilities, the electric utility for Vancouver (and all of Clark County), states that its "initial analysis indicates the NW Natural TEN project would have both an energy and capacity value for the utility and would be a benefit to the community," and that "projects like NW Natural's TEN pilot will be a key component to the successful approach needed to achieve Washington's carbon reduction goals."[11]

Finally, the developer of the new buildings that will be served by the project, Lincoln Property Company ("Lincoln"), states that the Vancouver TEN pilot "will not only provide immediate environmental and operational benefits but also set a precedent for smart energy infrastructure development in the region."[12] Specifically, Lincoln "encourages stakeholders to move forward with this transformative initiative, which

[10] Exh. HJB-4.

[11] Exh. HJB-4.

[12] Exh. HJB-4.

will serve as a model for future sustainable urban energy development and contribute to the long-term success of the Vancouver area."[13]

All three letters of support are attached to this testimony. *See* Exh. HJB-4.

Q. Did NW Natural consider alternative sites for its TENs pilot project?

A. Yes. NW Natural considered several new construction sites for its TENs pilot project. However, these sites all had limitations compared to the Vancouver TEN site that the Company ultimately selected. One site was too far along in development to pause for the development of a TENs design and exposure to regulatory uncertainty. Conversely, another site was not far enough in development, meaning that NW Natural could meet the timeline anticipated in HB 2131 for the deployment of its pilot project. Another site lacked load diversity and would primarily be used during business hours, which would sub-optimize thermal assets.

Q. Will the Vancouver pilot project be able to fully meet the heating and cooling needs of all the buildings that are connected to the project?

A. Yes. As designed, the pilot will deliver thermal service to an estimated 430 new market-rate multi-family units, 36,800 square feet of retail commercial space, and Vancouver's City Hall.[14] These buildings, located within a couple of city blocks, represent a cross-section of residential, commercial, and public-sector customers, enabling the pilot to test and refine a scalable service model across multiple customer classes.

[13] Exh. HJB-4.

[14] Confidential Exh. HJB-3C, para. 18.

Q. Please describe the design of the TEN.

A. To support both near-term delivery of heating and cooling to the buildings that will be served by the pilot project, as well as potential expansion in the future, NW Natural will implement what it has named the Street Loop system. This design was chosen after detailed evaluation of three design options due to its balanced construction profile, streamlined integration within the public right-of-way, and, critically, its positioning for future expansion.

The Street Loop will be installed in a configuration that allows new buildings to connect over time, unlocking a broader impact beyond the initial pilot footprint. Each building will be equipped with a distributed heat pump system calibrated to meet peak winter heating and summer cooling conditions as determined by energy modeling during the design phase. Year-round capacity will be achieved through geothermal resource sizing and loop flow design, without the inclusion of thermal energy storage. Thermal energy storage is not included in the design because the open-loop geothermal system, supported by a high-yield aquifer, is capable of directly meeting peak capacity demands.

The TEN pilot is designed as a distributed ATL system. Based on the preferred Street Loop design, the ATL will consist of a closed loop buried pipe system circulating water with a small amount of chemical treatment that inhibits corrosion and bacteria growth. The TEN will circulate ambient temperature fluid through a central pipe loop, driven by a primary pump station that distributes energy throughout the network to heat pumps located within each building. Each building connected to the loop will be equipped with a dedicated energy transfer station, which will include circulation pumps

and a heat exchanger that pulls geothermal fluid from the ATL to deliver energy to the building. As the heat pumps within each building extract heat from or reject heat to the ATL, the ATL will balance the needed energy flow to satisfy each heat pump's needs.

The ATL will be designed to operate within a moderate temperature range and serve as a shared thermal reservoir, allowing buildings to either extract or reject heat depending on their individual heating and cooling needs. Each building connected to the TEN is intended to use decentralized, high-efficiency ground source heat pumps, specifically:

- Ground source heat pumps will be installed at the building level, downstream of each energy transfer station.
- Each energy transfer station will transfer thermal energy from the ATL to the building's internal distribution pipe system, which will then supply thermal energy to the ground source heat pumps.
- The ATL supply water temperature differential from one energy source to the next energy source will not be more than 10°F at design conditions. This design limit ensures consistent operational efficiency for all heat pumps connected to the system while allowing sufficient margin for capacity and flow control across the network.
- This decentralized ground source heat pump architecture will ensure that the TEN system is modular and demand-responsive, allowing each building to independently control indoor temperatures without relying on centralized delivery of conditioned air or hot/chilled water.

A dedicated backup heating system is not required for the initial pilot due to the system's built-in redundancies and the reliability of the thermal resource. The design includes dual-pump redundancy (N+1), dual extraction wells and thermal load balancing across buildings and energy transfer station units. These features, coupled with the consistent production capacity of the open-loop geothermal source, will allow the system to meet heating needs without additional backup. Backup power may be considered in future system expansions, but it is not included in the scope of this pilot due to the expected reliability of the current configuration.

By maintaining ownership of the thermal energy assets, NW Natural will apply its utility-standard operations and maintenance protocols to ensure consistent year-round performance. NW Natural's experience in maintaining energy infrastructure, combined with dual-pump redundancy, Supervisory Control and Data Acquisition ("SCADA")-monitored controls, and the high-capacity geothermal resource will enable the TEN system to deliver uninterrupted space conditioning and water heating across seasonal and peak load conditions. Figure 2, below, shows the design of the Street Loop.

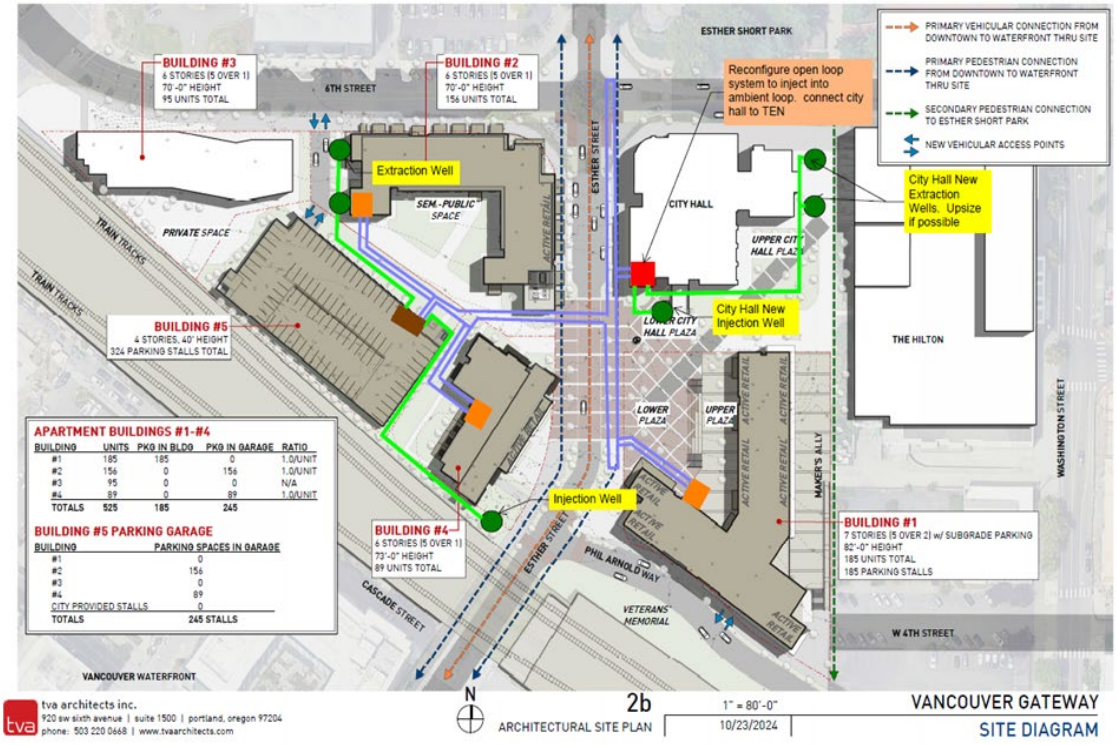
Figure 2



Q. Please explain the potential for the Vancouver TEN pilot project to be expanded in the future.

A. NW Natural's project team has identified logical future expansion targets to occur after completion of the pilot, including Esther Short Commons, a nearby affordable housing complex operated by the Vancouver Housing Authority. Built in 2004, Esther Short Commons would greatly benefit from the energy savings that a TEN connection would provide and may be able to receive government funding to retrofit the complex to be compatible with a TEN connection. Other potential future network extension connections include downtown civic buildings, condominiums, small business offices, future mixed-use development sites, and a senior housing facility that could further expand the pilot's long-term public value and benefit disadvantaged and historically

underserved community members. By concentrating service among a densely clustered customer base in downtown Vancouver and building in future growth capacity, NW Natural will establish a flexible, high-impact model that can be expanded in the future.

Q. Please explain how NW Natural will ensure the safe and reliable operation of the Vancouver TEN pilot project.

A. NW Natural will maintain high standards of infrastructure safety and reliability through engineered design features, operational oversight, and integration with existing utility-wide safety systems. The TEN pilot will be monitored and controlled through a centralized SCADA platform, enabling real-time control, monitoring, and metering of the ATL, open loop wells, and energy transfer stations. Redundant equipment will be incorporated into the system to ensure uninterrupted service in the event of equipment failure.

Each building's energy transfer station will be equipped with safety measures, including valves that can isolate the ATL from each building. System maintenance protocols will be adapted from NW Natural's utility-standard operations and maintenance procedures to ensure consistent performance and regulatory compliance. The ambient loop will be filled with water and treated with corrosion inhibitors and biocides. Air separators and automatic feed stations will maintain system pressure and prevent cavitation, which is critical for ensuring long-term reliability and system health.

Pump station enclosures are under evaluation, with above-grade, below-grade and in-building options under consideration. Regardless of final placement, the infrastructure will be subject to NW Natural's enterprise-wide physical and

cybersecurity protocols, including adherence to Transportation Security Administration ("TSA") Pipeline Security Guidelines. All buried piping will be installed with tracer wire and location tape to support long-term asset tracking and prevent excavation damage. The high-density polyethylene ("HDPE") piping selected for the system carries a 50-year warranty.

In addition, NW Natural will leverage internal safety systems and initiatives, including its Journey to Zero Safety Initiative (focused on reducing workplace injuries), the Pipeline Safety Management System (a voluntary safety framework that exceeds regulatory standards), and the Enterprise Safety Management and Reporting System (used to log field observations and track hazards in real time).

Finally, NW Natural will continue to track and learn from sibling utilities' operational protocols and experience through the Utility Networked Geothermal Collaborative – a group of 29 gas utilities in various stages of TEN development. As I have said above, learning from other utilities' experiences has been critical in developing the Company's Vancouver TEN project. NW Natural's experience in Vancouver will likewise benefit TENs operations throughout North America and beyond.

Q. How will NW Natural evaluate the success of the Vancouver pilot project?

A. As part of its July 29, 2025 filing seeking the Commission's review and validation of the project's costs, NW Natural is proposing a number of metrics intended to help NW Natural monitor the performance of the TEN pilot project and better understand how to operate and maintain future TEN projects. Proposed metrics are focused on measuring technical performance, safety and reliability performance, financial

performance, customer experience, and societal impacts. The information gathered through these metrics is expected to aid the Commission in adopting rules governing thermal energy networks. See Exh. HJB-5 for proposed metrics.

Q. When will the Vancouver pilot project enter service?

A. NW Natural currently plans to deploy this project within 30 months of June 6, 2024 (December 5, 2026) as specified in HB 2131, but will seek extensions from the Commission as appropriate, necessary, and authorized under RCW 80.28.460(2)(a). NW Natural notes that the construction of the new buildings will not be complete at this time. Therefore, the Vancouver TEN pilot project is scheduled to be finished prior to the completion of the new buildings. Given this difference in timelines, NW Natural does not anticipate the project entering rates until the second rate year (August 1, 2027). NW Natural is proposing to begin cost recovery at this time, as explained in the next section.

IV. COST RECOVERY

Q. What is your current cost estimate for the Vancouver TEN pilot project?

A. NW Natural currently estimates that the Vancouver TEN pilot project will cost approximately $12.8 million in total. The total cost that NW Natural is seeking to recover from customers, however, is lowered by an investment tax credit that NW Natural anticipates will be available for utility-scale geothermal projects,[15] as well as an energy savings credit that NW Natural anticipates it will receive from Clark Public Utilities via the Bonneville Power Administration due to the high efficiency of the TEN

[15] This investment tax credit was not impacted by recent changes to federal tax law.

as compared to other electric alternatives. Taken together, these credits reduce the overall cost of the project from $12.8 million to $9.2 million.

Importantly, however, NW Natural is unable to estimate the amount of grant funding that it may receive from the Washington Department of Commerce to offset the cost of the project. When the amount of grant funding becomes known, NW Natural will lower the project's capital investment by that amount, ensuring that customers receive the full benefit of this grant.

Q. Please describe how the cost estimate for the project was developed.

A. NW Natural contracted with Salas O'Brien to provide engineering services through schematic design of a TEN to support the Vancouver TEN pilot project. Salas O'Brien has extensive experience designing TEN projects across North America. Salas O'Brien completed the Basis of Design Report and the Energy Report that were used to develop a schematic design of the Street Loop system that is referenced in Figure 2 above.[16]

In developing this design, the team of NW Natural, City of Vancouver and the developer of the new buildings that will be served by the project—Lincoln Property Company—met at least semi-weekly from December 2024 through June 2025 to understand the site's thermal needs, limitations, feasibility of various loop options and available thermal resources. This resulted in a schematic design supported by all entities and serves as the basis for the detailed cost estimates provided by JLD Cost Consulting. NW Natural has included this cost estimate as confidential Exh. HJB-8C.

[16] Exh. HJB-6; Confidential Exh. HJB-7C.

Schematic design represents approximately 30 percent design completeness. The 30 percent design includes cost contingencies to provide a conservative estimate. The amount of these cost contingencies will be reduced over time as NW Natural moves towards 100 percent design. Figure 3 below reflects a high-level cost summary; a detailed estimate is available in confidential Exh. HJB-8C.

Figure 3

TEN Component	**Schematic Design cost estimate**
Open Loop	[redacted]
Pump house and Energy transfer stations	[redacted]
Vault	[redacted]
Heat pumps	[redacted]
SCADA Control System	[redacted]
Contingency	[redacted]
Insurance	[redacted]
Taxes/Fees	[redacted]
Other (Indirect, Misc. Electrical, , etc.)	[redacted]
Total	**$12,800,000**

NW Natural notes that the costs of the heat pumps are not included in the estimate prepared by the Company's consultant, but are necessary for the project. The Company

estimated the cost of the heat pumps based on a similar project by the building developer, Lincoln Property Company. Also, NW Natural estimates approximately $61,000 of O&M costs each year. A major driver of these costs is electrical power to operate the project.

As stated above, the cost of the project is reduced from $12.8 million to $9.2 million due to the utility-scale geothermal investment tax credit and the energy savings credit that NW Natural expects to receive from Clark Public Utilities via the Bonneville Power Administration. Any grant that NW Natural subsequently receives from the Washington State Department of Commerce would further lower the cost of the project.

Q. Why is NW Natural using schematic design to develop its revenue requirement in this proceeding?

A. NW Natural decided to use schematic design to develop its revenue requirement in this proceeding for three reasons. First, given the multi-year nature of rate cases in Washington and the fact that the project will not enter rates until the second rate year, schematic design is the best information that the Company has available.

Second, utilizing the schematic design and including the project in a multi-year rate proceeding gives NW Natural the opportunity to share the project with the Commission and parties to help inform discussions about TENs projects more generally, including rate design. By doing so, NW Natural is seeking to have open dialogue about TENs projects, especially in light of reduced funding for Washington State Department of Commerce grants to offset the cost of the project. NW Natural understands that the $25 million originally envisioned for such grants statewide is now $4.8 million.

Finally, NW Natural serves a relatively small number of customers in the state, making this pilot project a major investment in its Washington service territory, meaning that the Company must seek prompt recovery of the project's costs.

Q. How does NW Natural propose to recover the costs of the Vancouver TEN pilot project?

A. Given the current estimate of the project (currently $9.2 million after applying the investment tax credit and the energy savings credit) and its limited scope (three new buildings in downtown Vancouver in addition to City Hall), the TEN customer cannot be expected to pay the entire cost of the project. Put simply, the amount would be too great for the TEN customer to bear for heating and cooling compared to any other alternative technology (air-source heat pumps, for example).

Again, NW Natural recognizes that HB 2131 includes the opportunity to receive grants from the Washington State Department of Commerce to offset the cost of TENs pilot projects. NW Natural is vigorously pursuing such a grant. The Company also recognizes that it has not included an estimate of the grant amount that it may receive to offset the cost of the project. However, as referenced above, the amount available for these grants has been significantly reduced. This reduction is a material change that affects how we are approaching cost recovery. Specifically, NW Natural cannot rely on receiving a Washington State Department of Commerce grant that would reduce the project's capital investment to such an extent that spreading the project's remaining costs to natural gas customers would be unnecessary.

Due to these factors, NW Natural is seeking to recover the cost of the project from both the TEN customer and its natural gas customers. As such, NW Natural is

seeking to merge the rate base of its Vancouver TEN pilot project with its natural gas rate base as permitted in RCW 80.28.480. This rate base merger is solely intended as a way to allocate costs of the TENs project to the Company's natural gas customers in light of reduced state funding. The rate base merger is in the public interest because it enables the development of TENs, whose development the state is seeking to facilitate through HB 2131 as a way to help it achieve its climate goals.

Q. How much would the TEN customer pay for the pilot project?

A. Of the project's estimated annual revenue requirement of $1.4 million for the first year in service, NW Natural proposes to allocate approximately $86,000 to the new buildings that will be constructed as part of the development (i.e., excluding City Hall). This amount, in aggregate, represents what the TEN customer would have paid had air-source heat pumps been installed in lieu of TENs. In developing the amount that the TEN customer would have paid for air-source heat pumps, NW Natural relied on the energy modeling performed by its consultant, Salas O'Brien, which calculated this cost in sufficiently granular terms, as shown in Figure 13 of the Energy Report that it prepared for this project.[17]

Although NW Natural recognizes this is a relatively small amount of the project's revenue requirement, it nonetheless believes this is the maximum amount that can be spread to the TEN customer for three reasons. First, due to Washington's current building codes for new construction, air-source heat pumps represent the intended heating and cooling technology that would have been installed had TENs not been

[17] *See* confidential Exh. HJB-7C.

developed. It would be unreasonable to expect the TEN customer to pay more for heating and cooling relative to established and known alternatives, like air-source heat pumps. Second, using natural gas equipment as a baseline in lieu of air-source heat pumps, even if permissible under the Washington building codes, would lead to the TEN customer paying less than their fair share because natural gas alternatives do not provide cooling, whereas TENs do. Finally, this project is a pilot and having an established methodology to estimate the cost of other methods of heating and cooling is helpful in determining how TENs should expand.

Q. Does NW Natural plan on allocating any of the project's costs to City Hall?

A. No. City Hall already uses geothermal energy to provide heating and cooling to the building. Although this system's pumps only provide service to City Hall and is not a network connected to other buildings, they do utilize two supply wells and one injection well. To facilitate the development of the new buildings that will be served by the Vancouver TEN project, the City of Vancouver must move these wells at its own expense. These new wells, built and paid for by the City of Vancouver, will be incorporated into the TEN, helping to provide heating and cooling, not only to City Hall, but to the rest of the buildings served by the network as well.

Also, not specifically allocating costs to the City of Vancouver is consistent with the Company's approach of allocating costs based on how buildings would have been heated and cooled in the lieu of TENs. In this case, the City of Vancouver would have relied on its own supply and injection wells to heat and cool City Hall and would be responsible for these costs. NW Natural believes it would be unreasonable to request the City of Vancouver to pay more for heating and cooling relative to the status quo

alternative, especially because these supply and injection wells are being relied upon to support the TEN. NW Natural also notes that the City of Vancouver would continue to be responsible for operations and maintenance costs of these wells, including the cost of power to operate them.

Q. Excluding City Hall, how does NW Natural plan to spread costs to the TEN customer?

A. NW Natural plans to enter into a special contract with the owner of the new buildings that will be served by the TEN pursuant to WAC 480-80-143. NW Natural intends to file this contract with the Commission prior to the Vancouver TEN pilot project entering service. Although NW Natural has not fully developed the terms of the special contract, it currently plans to install a Btu meter at the energy transfer station for each building, which will measure that building's energy consumption, including heating, cooling, and hot water. NW Natural expects that the building owner would then allocate these heating and cooling costs to each building's tenants.

Q. Why does the Company believe a special contract is appropriate in this instance?

A. NW Natural believes a special contract is appropriate given the unique nature of the Vancouver TEN pilot project. Namely, it is the first TEN developed under HB 2131 in the state, it is the Company's first non-gas project, and it is relatively limited in scope. As such, a special contract is appropriate because the TEN "[p]rovide[s] for utility services not specifically addressed in the gas, electric, or water company's existing tariffs."[18] Therefore, the Company believes it is appropriate to develop a

[18] WAC 480-80-143(1)(b).

special contract that will permit it to serve these new buildings. The other alternative would be a whole new tariff that would stand alongside the Company's existing natural gas tariff. While such a TEN tariff may be warranted in the future as this network expands, NW Natural does not believe that it currently makes sense to develop such a tariff for a pilot project, especially because such a tariff would only serve a single customer (i.e., the owner of the three new buildings).

Q. Special contracts are subject to the requirements in WAC 480-80-143. WAC 480-80-143(5)(c) requires the Company to "[d]emonstrate, at a minimum, that the contract charges recover all costs resulting from providing the service during its term." How does the Company plan to address that requirement?

A. NW Natural plans to file an exemption from this requirement in accordance with WAC 480-80-015. Such an exemption is in the public interest because it is necessary to facilitate the development of TENs, especially in light of reduced state funding. NW Natural believes that TENs are a promising technology that may help the state transition to a low carbon future. The Company is seeking to maximize the opportunity presented in HB 2131 to develop these networks. The Company also does not think it is in anyone's interest to develop TENs cost recovery mechanisms, such as a standalone tariff, that are inefficient and unnecessary for a pilot project, although the Company will consider developing such a tariff in the future if TENs expand.

Q. How much would natural gas customers pay for the Vancouver TEN pilot project?

A. NW Natural currently expects its existing natural gas customers to initially pay approximately $1.3 million in the first year of service. This amount represents the

remainder of the project costs that are not paid for by the TEN customer. Importantly, this amount may be reduced as more becomes known about the project. For instance, any Washington State Department of Commerce grant that NW Natural receives would directly offset the costs that natural gas customers would pay for the project.

Natural gas customers receiving the full benefit of any Washington State Department of Commerce grant is reasonable because the amount that the customer served by the TEN will pay is already set by the estimated cost-of-service of alternative technology (air-source heat pumps) and because natural gas customers will not be directly served by the project. Also, NW Natural's current estimate includes a contingency of [redacted] because it is based on schematic design representing approximately 30 percent design completeness. As the project is further developed, these contingencies may prove unnecessary, reducing the cost of the project and, therefore, the cost allocated to natural gas customers. As with the treatment of the Washington State Department of Commerce grants, any reduction of costs would be reflected in the cost that natural gas customers would otherwise pay because the cost contribution of the TEN customer is already set.

Although NW Natural realizes that this treatment also means that natural gas customers would be responsible for any costs in excess of NW Natural's cost estimate, the Company nonetheless believes this is not likely to occur and that natural gas customers benefit from TENs development. As stated above, NW Natural's estimate is conservative. It does not take into consideration any Washington State Department of Commerce grants and includes a sizable contingency. This conservative estimate reduces the possibility that natural gas customers would bear costs in excess of what

the Company has estimated above. Also, natural gas customers will benefit from the Vancouver TEN pilot project, even though they will not be directly served by the project. As NW Natural gains experience with TENs, it can evaluate whether the technology is a decarbonization solution that can help meet the Company's obligations under the Climate Commitment Act. Finally, NW Natural does not believe that the pilot project would be viable without this level of support from its natural gas customers. Again, it would be unreasonable to ask the TEN customer to pay more for heating and cooling relative to air-sourced heat pumps or, in the case of City Hall, its existing geothermal system.

Q. How does NW Natural plan to spread costs of the pilot to its natural gas customers?

A. NW Natural plans to include the portion of costs that it is allocating to natural gas customers through base rates starting in the second rate year (August 1, 2027).

Q. Will there be an opportunity to review costs for prudency after the Vancouver TEN pilot project is in-service?

A. Yes. The Vancouver TEN pilot project will be part of the portfolio of provisional capital adjustments that are expected to go into service during the second year of the Company's proposed multi-year rate plan. As explained in the Direct Testimony of Kyle T. Walker (Exh. KTW-1T), NW Natural is proposing an annual retrospective review process for all provisional capital investments. NW Natural will file a report for utility plant, including the Vancouver TEN project, that was placed into service during the rate year, within three months following the end of that rate year. This filing gives parties the opportunity to review evidence and conduct discovery.

Q. Given this subsequent filing, what is NW Natural seeking here?

A. NW Natural is seeking to add the cost of a portion of the TEN project to rates paid by natural gas customers as provisional capital, subject to the review process above, into rates starting in the second rate year (August 1, 2027). NW Natural is also seeking Commission approval of its approach to allocating the project's costs between the customer that will be served by the TEN and its natural gas customers with the understanding that the Company will file the special contract for TEN's service closer to project operation.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

To All Interested Parties:

In 2024, Washington state passed legislation to promote thermal energy networks.[1] Part of that legislation allows existing natural gas companies to pursue thermal energy pilot projects within their service territories on the condition that those companies timely notify the Washington Utilities and Transportation Commission (Commission) in writing of their intent to do so.[2]

The Commission hereby acknowledges that Northwest Natural Gas Company d/b/a NW Natural's June 5, 2025, filing in Docket UG-250458 complies with the notification requirements in RCW 80.28.460(2)(a).

Per RCW 80.28.460(2)(a), Northwest Natural Gas Company d/b/a NW Natural currently has priority to develop a pilot project at three new building sites located in downtown Vancouver, Washington, as designated in filing UG-250458.

Sincerely,

Jeff Killip
Executive Director and Secretary

---

[1] HB 2131 (2023) later codified as RCW 80.28.450-480

[2] RCW 80.28.460(2)(a) reads, "A gas company has priority for developing thermal energy pilot projects in the gas company's service territory, but the gas company must announce in writing to the commission its intention to deploy a pilot project in a specific location within 12 months of June 6, 2024."

REDACTED VERSION

August 29, 2025

BEFORE THE

WASHINGTON UTILITIES AND TRANSPORTATION COMMISSION

In the Matter of NORTHWEST NATURAL GAS COMPANY DBA NW NATURAL Vancouver Thermal Energy Pilot Project	 DOCKET NO. UG-250458 PETITION

I. INTRODUCTION

1 Pursuant to RCW 80.28.450 and 80.28.460, Northwest Natural Gas Company ("NW Natural" or the "Company") petitions the Washington Utilities and Transportation Commission (the "Commission") for an order acknowledging the Company's proposed thermal energy network ("TEN") pilot project in Vancouver, Washington. Specifically, NW Natural is "submit[ing] the project for review and validation of costs assessments to the [C]omission per RCW 80.28.450.

2 Pursuant to RCW 80.28.470(2), NW Natural is also petitioning the Commission to use an alternative process from what is specified in RCW 80.28.470(1) to estimate the cost to deploy a thermal energy network pilot project. Specifically, NW Natural is petitioning the Commission to use its current estimate, based on schematic design, as permitted by RCW 80.28.470(2). NW Natural proposes that this estimate be used by the Department of Commerce to calculate any potential grant award under RCW 43.31.033(4). This process is an alternative to RCW 80.28.470(1), which would appear to require NW Natural to first fully design the project and complete a request-for-proposals to finalize construction costs. The RCW

80.28.470(1) process creates additional risk, expense and an elongated time horizon, making it a much more difficult pathway to pursuing and completing a TENs pilot project.

3 Finally, NW Natural is seeking to use the alternative process as specified in RCW 80.28.470(2) in order to facilitate an open dialogue about this project. NW Natural understands that Department of Commerce grant funding available for all TENs pilot projects has been reduced from $25 million to $4.8 million since the time the Company began seriously pursuing this project. This reduction is a material change that will affect the amount that utility customers must pay for TENs pilot projects. Although NW Natural is not seeking cost recovery in this proceeding, it nonetheless views this filing as a way to begin discussions of how TENs development should proceed in light of these funding cuts. The Company would like to facilitate an open dialogue between itself, the Commission, and any other interested entities about the benefits, costs, and trade-offs of the project, knowing that the all-in costs will likely be higher than originally anticipated as a result of the limited grant funding available. NW Natural understands that the Commission has previously acknowledged that the Company as complied with the notification requirements in accordance with RCW 80.28.460(2), giving NW Natural priority to develop the TEN pilot project, but this acknowledgement did not discuss or evaluate the merits of the project. NW Natural looks forward to substantive discussions regarding the project, which will fully meet the heating and cooling needs for a mix of residential, commercial, and office space in downtown Vancouver and, if successful, can be expanded to other buildings.

4 In support of this Petition, NW Natural states as follows:

II. NAME OF PETITIONER

5 NW Natural is in the business of furnishing natural gas service within the State of Washington as a public service company and is subject to the regulatory authority of the Commission as to its rates, service, facilities, and practices. Its full name and mailing address for the purposes of this proceeding are:

Northwest Natural Gas Company
c/o Zachary Kravitz
Vice President of Regulatory Affairs and Resource Planning
250 SW Taylor Street
Portland, OR 97204-3038

6 The name and address of the Company's attorney for purposes of this proceeding are:

Ryan Sigurdson
Regulatory Attorney (WSBA #39733)
250 SW Taylor Street
Portland, OR 97204-3038

III. SUPPORT FOR PETITION

A. Legal Authority

7 In 2024, the Washington legislature passed House Bill 2131 ("HB 2131") (codified as RCW 80.28.450-480; RCW 43.31.033). HB 2131 permits natural gas utilities, such as NW Natural, to construct TENs to meet the heating and cooling needs of their customers. As stated above, however, prior to constructing such a network, NW Natural must "submit the project for review and validation of costs assessments to the [C]ommission."[1] As part of its review, the Commission must consider a number of factors concerning the project, such as being able to fully meet the space heating of customers served by the TEN, as well as other policy and societal objectives, in addition to a number of factors that the Commission may consider.[2]

[1] RCW 80.28.450.
[2] RCW 80.28.460.

Importantly, as stated above, this Petition is not seeking cost recovery of NW Natural's TEN pilot project. Instead, per RCW 80.28.450, NW Natural will seek to recover "the costs of building and operating the project from ratepayers in a rate case filing before the [C]ommission" after seeking the Commission's approval in this proceeding.

8 HB 2131 also makes TEN pilot projects eligible for grants from the Department of Commerce to offset the cost of the TEN.[3] The maximum amount of this grant "the difference between the gas company's lowest reasonable cost resources under its current business practices and the costs of building and operating the thermal energy network pilot project," as determined by the Commission.[4] In deciding to award a grant, the Department of Commerce must consider the information that NW Natural provides in this Petition, as well as the Commission's "findings and conclusions . . . regarding the pilot project."[5] NW Natural has provided a copy of this Petition to the Department of Commerce.

B. Background

9 NW Natural has been tracking the progress of TENs since the first utility-operated TEN began development outside of Boston in 2021. By actively learning from this project, as well as other TEN projects proposed by various utilities since that time, NW Natural began development of its own pilot project that meets the swift timelines outlined in HB 2131. Specifically, NW Natural has learned that focusing on new construction for an initial pilot—as opposed to retrofitting existing buildings—is faster and easier to complete. Second, NW Natural learned the importance of having a local community champion that can help pull the pilot project

[3] RCW 43.31.033.
[4] *Id.*
[5] *Id.*

forward. Finally, NW Natural learned that load diversity is key to optimizing thermal energy assets.

10 Applying these learnings to the TENs development in its service territory, NW Natural selected a new construction site where the TEN will supply 100 percent of the heating and cooling plus domestic hot water to three new buildings planned for construction in Vancouver's Waterfront Gateway district, as well as the existing Vancouver City Hall. The TEN design is based on the developer site plan as of March 2025. Vancouver's existing City Hall, located across from Building 1, consists of 124,000 square feet of office space. Building 1, located on Esther Street and Phil Arnold Way, is currently planned to provide approximately 185 units of market-rate housing and 16,000 square feet of retail space. Building 2, located on the southwest corner of Esther and 6th Streets, is currently planned to provide approximately 155 units of market-rate housing and 8,800 square feet of retail space. Building 4,[6] located across the street from Building 1 and adjacent to Building 2, was originally planned as office space as depicted in Figure 1 below but is currently planned as an additional 90 units of market-rate housing and 4,000 square feet of retail space. Building construction is expected to begin in late 2026. The total conditioned square footage is expected to be approximately 430,000.

11 Because the new buildings are still in the planning stage and have not yet been permitted, NW Natural recognizes the actual building sizes and use may change. Any such changes will be incorporated into the next stage of TEN design work but will not fundamentally change the network. Figure 1, below, shows a map of the project area.

[6] Building 3, to the far west side of the development, was originally in scope as affordable housing, but was on a separate track with its own developer, architect and funding and was further in development than the TEN pilot could accommodate; therefore, Building 3 is not in scope for this pilot.

Figure 1

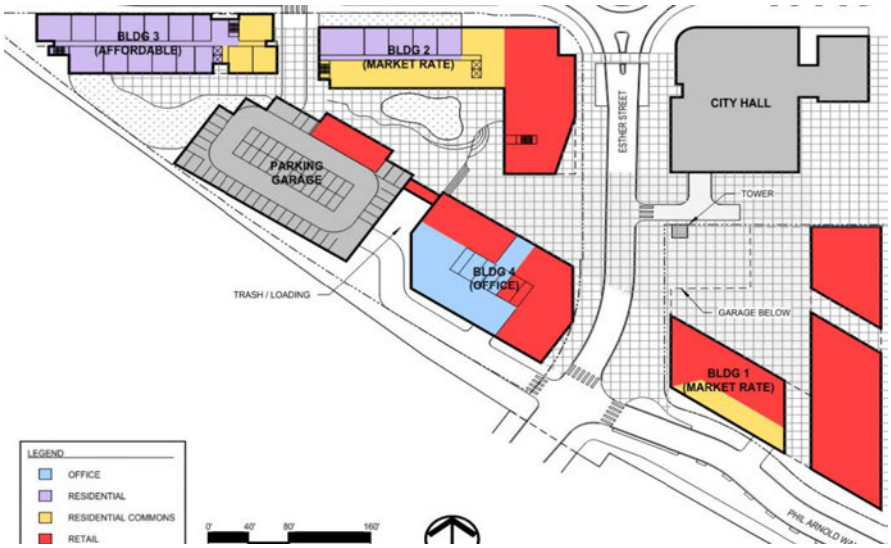

Figure 1: Waterfront Gateway site map

12 NW Natural selected this project for five reasons. First, based on its learnings from other TENs projects across the country, NW Natural decided to focus on new construction. With new construction, there are fewer decisionmakers (i.e., a handful of developers can decide to install TENs in their new residential housing, as opposed to existing construction where that decision must be made by a multitude of individual property owners). Given the accelerated timeframe of HB 2131, where TENs are scheduled to be placed in service prior to December 5, 2026, reducing the number of decisionmakers can speed up the project and allow us to connect more customers than if we focused on retrofitting existing construction.

13 Second, new construction provides the cost and construction efficiency of utilizing trenches already open for other utilities rather than digging up paved streets.

14 Third, as stated above, NW Natural also learned from other utilities that have successfully completed a TEN that a community champion is critical to the success of any TENs project. In this regard, NW Natural is very appreciative to the City of Vancouver, who reached out to

the Company upon passage of HB 2131, eager to partner with NW Natural to develop TENs in the city. With the City, NW Natural explored multiple sites but ultimately chose this project due to the load diversity, development timeline, and nature of building use.[7]

15 Fourth, the Vancouver TENs pilot project allows for increased efficiency as a result of thermal energy load diversity, which is another important learning that the Company has incorporated from other TENs projects across the country. The proposed NW Natural pilot project includes multi-family residential buildings, City Hall, and commercial space. With these buildings connected to the TEN, load sharing occurs when there are simultaneous heating and cooling loads. The heat pumps in heating mode extract heat from the ambient temperature loop ("ATL") while the heat pumps in cooling mode reject heat to the ATL. The rejected heat is balanced by the extracted heat such that the thermal energy sources do not need to meet the entire thermal energy demand.

16 Fifth, due to the public nature of this development, specifically the plaza and adjacent farmers' market in downtown Vancouver, there is ample opportunity to educate and engage the public via active and passive methods regarding the TEN development and its superior energy efficiency and energy optimization compared to alternatives.

C. Statutory Criteria that the Commission Must Consider

RCW 80.28.460(2) – Intention to Deploy a Pilot Project

17 Per RCW 80.28.460(2)(a), NW Natural has already received priority to develop a TEN pilot in downtown Vancouver. The Company plans to deploy this project within 30 months of June

[7] Other sites assessed faced the following limitations: one site was too far along in design to pause for development of a TEN design, one was not far enough along for the Company to meet the timeline dictated in HB 2131, and one site lacked load diversity and would primarily be used only during business hours and would, therefore, sub-optimize thermal assets.

6, 2024 (December 5, 2026) in order to maintain this priority, but will seek extensions as appropriate and necessary.

RCW 80.28.460(3)(a) -- The number and type of customers served, including the percent of low-income customers served.

18 While this development will target occupants seeking market-rate housing, the site was selected for its ability to connect a diverse, high-density mix of customers within a compact, infrastructure-ready footprint. The pilot will deliver thermal service to an estimated 430 new market-rate multifamily units, 36,800 square feet of retail commercial space, and Vancouver's City Hall. These buildings, located within a couple of city blocks, represent a cross-section of residential, commercial, and public-sector customers, enabling the pilot to test and refine a scalable service model across multiple customer classes.

19 To support both near-term delivery and long-term growth, NW Natural will implement what it has named the Street Loop system. This design was chosen after detailed evaluation of three total design options due to its balanced construction profile, streamlined integration within the public right-of-way, and, critically, its positioning for future customer expansion. The Street Loop will be installed in a configuration that allows new buildings to connect over time, unlocking a broader impact beyond the initial pilot footprint.

20 As explained above, Building 3, which is currently planned to be affordable housing, was originally planned to be served by the TEN pilot, it was on a separate track with its own developer and was further in development than the TEN pilot could accommodate. However, NW Natural's project team has identified logical future expansion targets to occur after completion of the pilot, including Esther Short Commons, a nearby affordable housing complex operated by the Vancouver Housing Authority. Built in 2004, Esther Short Commons

would greatly benefit from the energy savings such a TEN connection would provide and may be able to receive government funding to retrofit the complex to be compatible with a TEN connection. Other potential future network extension connections include civic buildings, condominiums, and small business office options in downtown, future mixed-use development sites, and a senior housing facility could further expand the pilot's long-term public value and benefit disadvantaged and historically underserved community members.

21 By concentrating service among a densely clustered customer base and building in future growth capacity, NW Natural will establish a flexible, high-impact model that can be expanded in the future.

22 Figure 2, below, shows the design of the Street Loop that will serve the TENs pilot project.

Figure 2

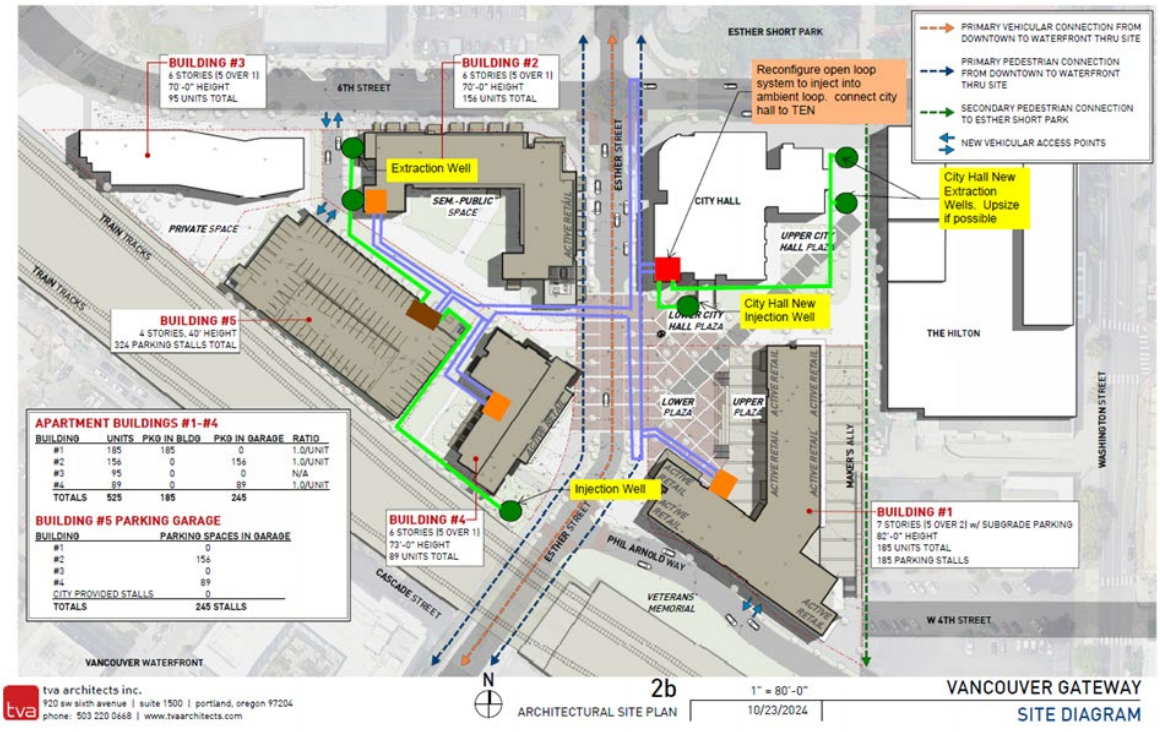

Figure 2 2: Street Loop TEN Design

RCW 80.28.460(3)(b) -- The use of the existing natural gas workforce and other labor considerations, such as efforts to transition the natural gas workforce to thermal energy work, training, recruiting, job creation and retention, payment of prevailing wages, and state-registered apprenticeship utilization.

23 NW Natural has a long-standing commitment to a collaborative and transparent relationship with its union partners. With over half of its workforce unionized for nearly a century, the Company maintains a strong partnership with its union partners, built on mutual respect and shared goals. NW Natural recognizes the union as a key stakeholder in cultivating a workplace where employees feel valued, supported, and empowered. This commitment is reflected in its collective bargaining agreement, which ensures fair wages, competitive benefits, and a safe, inclusive work environment.

24 NW Natural will use the pilot as an opportunity to evaluate how its existing utility workforce can support the delivery of thermal energy systems. As part of this effort, the Company will assess the potential to leverage internal personnel, in partnership with labor, including construction technicians, pipeline maintenance crews, and customer operations staff, to support pilot operations and maintenance.

25 To guide this evaluation, NW Natural will analyze and identify where existing capabilities align with the technical requirements of ambient loop systems and ground-source heat pump technologies. This analysis will also help pinpoint retraining and upskilling opportunities in geothermal system operation, loop maintenance, and system controls.

26 Prior to completion of the pilot project, NW Natural will assess the extent to which operations and maintenance could be delivered by internal staff or through contract services. This assessment will inform future workforce planning and labor engagement. Once the staffing

model is finalized and the broader scope of the workforce needs are defined, NW Natural may pursue formal support from workforce development partners and seek alignment on such items as prevailing wage and jurisdictional scopes of work.

27 Looking ahead, NW Natural will use the pilot to inform potential future workforce development strategies that support utility-led thermal infrastructure at scale. This may include exploring partnerships with technical colleges, trade schools, and/or workforce development organizations. The Company will evaluate outreach strategies to connect with historically underrepresented workers, such as through community-based organizations in Clark County, as it considers expansion into nearby disadvantaged census tracts, consistent with the Washington Environmental Health Disparities Map.

28 This pilot will serve as a platform for designing a replicable, equity-driven utility workforce model that honors NW Natural's workforce commitments while preparing for increasing decarbonization measures in the future.

RCW 80.28.460(3)(c) -- The ability to maintain infrastructure safety and reliability.

29 NW Natural will maintain high standards of infrastructure safety and reliability through engineered design features, operational oversight, and integration with existing utility-wide safety systems. The TEN pilot will be monitored and controlled through a centralized Supervisory Control and Data Acquisition ("SCADA") platform, enabling real-time control, monitoring, and metering of the ambient temperature loop (ATL), open loop wells, and energy transfer station ("ETS") system. Redundant assets will be incorporated into the system to ensure uninterrupted service in the event of equipment failure.

30 Each building's ETS will be equipped with safety measures, including valves that can isolate the ATL from each building. System maintenance protocols will be adapted from NW Natural's utility-standard operations and maintenance procedures to ensure consistent performance and regulatory compliance. The ambient loop will be filled with water and treated with corrosion inhibitors and biocides. Air separators and automatic feed stations will maintain system pressure and prevent cavitation, which is critical for ensuring long-term reliability and system health.

31 Pump station enclosures are under evaluation, with both above-grade and below-grade options under consideration. Regardless of final placement, the infrastructure will be subject to NW Natural's enterprise-wide physical and cybersecurity protocols, including adherence to Transportation Security Administration (TSA) Pipeline Security Guidelines. All buried piping will be installed with tracer wire and location tape to support long-term asset tracking and prevent excavation damage. The high-density polyethylene (HDPE) piping selected for the system carries a 50-year warranty.

32 In addition, NW Natural will leverage internal safety systems and initiatives, including its Journey to Zero Safety Initiative (focused on reducing workplace injuries), the Pipeline Safety Management System (a voluntary safety framework that exceeds regulatory standards), and the Enterprise Safety Management and Reporting System (used to log field observations and track hazards in real time).

33 The metrics NW Natural intends to track safety and reliability:

1. Number of workforce safety incidents
2. TENs system up-time
3. Cause of TEN shutdowns (planned/unplanned)

4. Duration of shutdowns (planned/unplanned)

RCW 80.28.460(3)(d) -- The ability to meet 100 percent of the pilot project customers' demand for space heating.

34 NW Natural has designed the TEN to meet 100 percent of the space heating demand for all connected buildings, including residential units, commercial tenants, and Vancouver City Hall. Each building will be equipped with a distributed heat pump system calibrated to meet peak winter heating conditions as defined through energy modeling during the design phase.

35 Year-round heating capacity will be achieved through geothermal resource sizing and loop flow design, without the inclusion of thermal energy storage ("TES"). TES is not included in the design because the open-loop geothermal system, supported by a high-yield aquifer, is capable of directly meeting peak capacity demands. Additionally, since the majority of electrical load in the system comes from in-unit heat pumps on the customer side, utility-side TES would not enable meaningful load shifting or generate cost or operational benefits. As a result, TES would increase capital cost without delivering corresponding value to the system.

36 By maintaining ownership of the thermal energy assets, NW Natural will apply its utility-standard operations and maintenance protocols to ensure consistent year-round performance. NW Natural's experience in maintaining such infrastructure, combined with dual-pump redundancy, SCADA-monitored controls, and the high-capacity geothermal resource will enable the TEN system to deliver uninterrupted space heating across seasonal and peak load conditions.

RCW 80.28.460(3)(e) -- Whether the pilot project creates benefits to customers, communities, and society at large including, but not limited to, public health benefits such as improved air quality in areas with disproportionate environmental or public health burdens and disadvantaged communities as identified by the environmental health disparities map described in RCW 43.70.815, and increased affordability of thermal energy options;

Equity Benefits Per the WA Environmental Health Disparities Map

37 The Vancouver TENs pilot project is designed not only to deliver high-efficiency, non-combustion heating and cooling, but also to generate benefits that extend beyond individual customers to the broader community. While the initial buildings to be served are market-rate residential and commercial properties, the project is sited within census tract 042400, an area that scores among the most impacted in the state across all metrics of the Washington Environmental Health Disparities Map. This includes scores of 10 out of 10 for overall environmental health disparities and health disparities, and 9 out of 10 for diesel pollution and disproportionate impact, social vulnerability, and lead exposure risk. Locating the state's first utility-led thermal energy network in such a high-need area reflects NW Natural's commitment to equitable infrastructure investment and ensures that the pilot aligns with Washington's climate justice objectives.

Public Health Benefits, Specifically Emissions Reductions

38 Compared to all-electric air source heat pumps that these new buildings would likely use due to current Washington building codes, the project represents a replicable model for reducing system-wide emissions. Based on modeling by Salas O'Brien, the TEN configuration is expected to achieve a 36 percent reduction in greenhouse gas emissions compared to a fully

electric business-as-usual scenario which already included a ground source heat pump system serving City Hall.[8]

Affordability Programs and Propose Customer Affordability Strategies

39 Although the initial buildings served by the pilot are market-rate, NW Natural is actively working to ensure that the TEN customers will not pay more for thermal service under the TEN model than they would under a standard business-as-usual scenario using code-compliant electric equipment for both heating and cooling.

40 While final rates and incentives will depend on several outstanding variables, including final equipment cost inputs and grant award size, NW Natural's intent is to develop a rate that is cost-competitive with baseline equipment, ensuring that early adopters of this clean thermal infrastructure do not face cost burdens relative to standard practice.

41 As part of future exploration, NW Natural may evaluate the viability of options such as:

- Partnering with local housing agencies to pre-screen public housing eligibility for future TEN nodes or rate tiers,
- Offering income-qualified bill discounts or enrollment support in partnership with community-based organizations,
- Structuring future rates to support energy-burdened customers, should subsequent phases include connections to affordable housing or community-serving facilities.

[8] NW Natural notes that calculating a specific amount of greenhouse gas reductions depends on the emissions factor used and that stakeholders can disagree about what this factor should be (i.e., the emissions intensity of the incremental electric generation to serve additional load). To hopefully avoid such disagreements in this filing, NW Natural has presented a relative reduction of 36 percent in greenhouse gas emissions that is not dependent on a certain emissions factor.

Anchoring Broader Community Benefits in NW Natural's Existing Programs and Partnerships

42 NW Natural will leverage its existing community engagement infrastructure to guide future community benefit strategies related to the TEN pilot. This includes engagement with NW Natural's Community and Equity Advisory Group ("CEAG") and Community Affairs Manager (CAM) team during project implementation, utilizing them as existing forums for meaningful participation by community stakeholders in future decisions about expansion, workforce development, and public benefit.

43 These structures provide a strong foundation for integrating equity and community perspectives into long-term thermal energy planning. As part of the broader community value proposition, NW Natural will also draw upon:

- Its track record of philanthropic support, with over 380 nonprofits served, and deep partnerships with workforce equity organizations such as Constructing Hope and the Urban League;
- Internal programs that support career pathway development for underrepresented workers, which can be adapted to support a new class of clean energy and thermal infrastructure jobs;
- The positioning of this pilot as a bridge between NW Natural's equity commitments and Washington's climate justice mandates, even if the first phase does not directly serve equity-prioritized customers.

This engagement will support NW Natural's goal of ensuring that the TEN pilot not only delivers clean energy to its initial customers, but also sets the stage for equitable, community-centered expansion in future phases.

RCW 80.28.460(3)(f) -- Coordination with any electric utility providing electrical service to areas served by the pilot project;

44 NW Natural initiated discussions with Clark Public Utilities ("CPU"), the local electric utility, to explore how the Vancouver TENs pilot project could deliver measurable electric load and capacity savings. These conversations focused on helping CPU evaluate the pilot's potential to reduce peak electricity demand and overall system usage, particularly by using highly efficient ground-source heat pumps that displace less efficient electric alternatives. The TEN design results in meaningful grid savings and NW Natural and CPU are now assessing how these energy and capacity benefits might translate into an incentive structure to support the pilot. This collaboration reflects the type of joint planning between gas and electric utilities encouraged by Washington State House Bill 1514, which promotes coordinated investment and resource optimization across utility systems. While the pilot is not designed as a grid-responsive resource in the traditional demand response sense, it is expected to provide consistent peak load reduction that aligns with CPU's broader goals of improving grid efficiency and affordability. As part of this project, NW Natural will continue to coordinate with CPU by sharing key TEN technical system, energy consumption, and power demand data that can inform CPU's grid system planning, reliability, and peak demand reduction efforts. CPU has provided a letter of support for the Vancouver TENs pilot project, included in Attachment 1.

45 In parallel, NW Natural is actively coordinating with peer natural gas utilities across Washington to support shared learning and system-wide scalability of thermal energy networks. Lessons from the Vancouver TENs pilot will be disseminated through structured engagement with our peer utilities.

RCW 80.28.460(3)(g) -- Whether the pilot project furthers the climate justice mandates of chapter 70A.02 RCW and the emissions reduction mandates of chapter 70A.45 RCW;

46 The Vancouver TEN pilot supports the climate justice mandates of RCW 70A.02 and the emissions reduction goals of RCW 70A.45 by investing in non-combustion thermal infrastructure that is located on-site in an area with high environmental health disparities. As stated above, the project site, located in census tract 042400, scores a 10 out of 10 in overall Environmental Health Disparities on the Washington Environmental Health Disparities Map. It also ranks 9 out of 10 in diesel pollution and disproportionate impact, 9 out of 10 in social vulnerability, 9 out of 10 in lead exposure risk, and 10 out of 10 in health disparities. These indicators confirm the community's disproportionate exposure to environmental burdens and health risks, positioning the pilot to deliver meaningful, place-based emissions benefits.

47 Although the pilot will initially serve market-rate buildings, the ambient loop has been designed to accommodate future expansion to nearby affordable housing and public-serving facilities as explained above. NW Natural will use equity screening tools, including the RCW 70A.02 criteria and Environmental Health Disparities Map, to inform future decisions on node siting, community partnerships, and workforce engagement.

48 NW Natural already maintains a strong foundation in equitable workforce practices and will leverage these efforts in support of the TEN pilot project. The Company partners with community-based organizations such as the Urban League, Women in Trades, Constructing Hope, and Incight to attract candidates from historically underrepresented populations. These partnerships include hosting job fairs, posting job openings on targeted hiring platforms, avoiding exclusionary language, and continuously refining hiring processes to minimize bias.

NW Natural's Communications team amplifies these efforts through social media outreach to broaden engagement.

49 NW Natural also operates two pre-apprenticeship internship programs, one for Construction and one for Customer Field Service, that provide year-long, paid on-the-job training for diverse candidates. These programs prepare participants for full-time employment with the company and include structured advancement and mentorship. Building on these initiatives, NW Natural's Organizational Effectiveness team supports a range of belonging-focused programs, including Employee Resource Groups (ERGs) and mentoring. Together, these existing initiatives will be leveraged to support inclusive workforce engagement as the TEN pilot advances.

50 To align with State requirements for procedural justice, NW Natural intends to implement community engagement strategies that center meaningful participation by overburdened and vulnerable populations. Engagement activities will be shaped by best practices described in RCW 70A.02.050, which outlines standards for equitable communication and inclusive decision-making. NW Natural will also leverage its CEAG to convene structured meetings and share project updates, ensuring transparency and accountability as the pilot progresses.

51 Regarding the emissions reduction goals of RCW 70A.45, emissions modeling conducted by Salas O'Brien estimates that the TEN pilot will achieve a 36 percent reduction in Scope 2 greenhouse gas emissions relative to a fully electric air-source heat pump ("ASHP") scenario as explained above. Even though the comparison excludes natural gas, it nonetheless demonstrates the significant emissions reduction potential of the TEN model, especially considering that City Hall already has a ground source heat pump. These findings reinforce

the pilot's role as a replicable decarbonization strategy that can contribute to the state's long-term emissions reduction targets.

RCW 80.28.460(3)(h) -- Whether the pilot project advances financial and technical approaches to equitable and affordable building electrification

52 The Vancouver TEN pilot will advance affordable building decarbonization by introducing a centralized, utility-managed thermal energy system that leverages a shared ambient loop and a centralized open-loop geothermal energy source. While each building, and each unit, will maintain its own HVAC equipment, the system design avoids reliance on less efficient, standalone ASHPs. This configuration will reduce total system energy consumption, improve overall efficiency, and enable more elegant mechanical system design compared to conventional approaches. More importantly, by offering a scalable model for efficient, decarbonized building operations in new developments, the TEN pilot provides a replicable pathway to support financially and technically viable decarbonization.

53 The TEN system is designed to achieve a maximum coefficient of performance (COP) of approximately 6.0, which significantly outperforms conventional ASHPs. This higher performance translates into greater system-level energy efficiency. By replacing distributed electric resistance or ASHP systems with centralized infrastructure, the system can also reduce total electric demand and reduce the cost of electrical infrastructure directly serving each new building. Because NW Natural will own and maintain the thermal infrastructure, building owners can reduce their investment and management of the system compared to individual HVAC systems, further reducing financial burdens. Combined with grant-funded capital costs

and a system-wide cost recovery approach, this model offers a clean, affordable solution for decarbonization that aligns with Washington's climate and equity goals.

54 As a utility-led initiative, the pilot will benefit from centralized ownership, planning, and administration, setting it apart from developer- or customer-owned systems. NW Natural's approach will enable coordinated long-term infrastructure planning, transparent rate setting, and future access to utility-administered incentives. By distributing infrastructure and operational costs across a broader customer base, the utility model further mitigates financial risks for individual property owners and tenants while ensuring professional, consistent service delivery. These advantages position the TEN as an equitable platform for future decarbonization efforts.

55 While the initial pilot will serve market-rate mixed-use buildings, NW Natural has accounted for future expansion to community-serving facilities, including affordable housing, and other civic buildings. The ambient loop layout and system capacity have been designed to accommodate these connections in later phases, helping advance broader equity goals.

56 In parallel, the pilot will generate insights to inform future cost allocation and rate design strategies. NW Natural will assess usage data and cost recovery mechanisms with an eye toward energy efficiency incentives and affordability pathways for income-qualified customers in future expansion areas. Rate development and equity considerations will be guided by pilot results and ongoing coordination with regulatory agencies.

57 Ultimately, the Vancouver TENs pilot project is slated to demonstrate how centralized thermal energy infrastructure can support efforts to overcome technical, financial, and logistical barriers to decarbonization in dense, mixed-use contexts. NW Natural intends to share lessons

learned with peer utilities, local sustainability offices, the Commission, and the Department of Commerce to support broader decarbonization efforts statewide.

RCW 80.28.460(3)(i) -- Whether the pilot project will develop information useful for the commission's adoption of rules governing thermal energy networks

58 NW Natural will publish a public-facing final report and include a dedicated Technology and Knowledge Transfer (TKT) task to document lessons learned throughout the pilot. These deliverables will be designed to generate actionable insights for Commission rulemaking process on utility-led thermal energy networks.

59 To support this, NW Natural will conduct structured consultations with key stakeholders, such as the Commission, Department of Commerce, labor representatives, technical experts, and community partners, at major project milestones. These check-ins will be used to review project activities, gather feedback, and identify rulemaking-relevant takeaways in areas such as: rate design and customer billing transparency; interconnection practices and safety protocols; labor and workforce development alignment; and community engagement strategies. This approach will allow for meaningful stakeholder input and knowledge sharing, and it will enable NW Natural to align pilot findings with future regulatory design efforts across the state.

60 Further, NW Natural is proposing a number of metrics intended to help NW Natural monitor the performance of the TEN pilot project and better understand how to operate and maintain future TEN projects. Proposed metrics are focused on measuring technical performance, safety and reliability performance, financial performance, customer experience, and societal impacts. The information gathered through these metrics is expected to aid the commission in adopting rules governing thermal energy networks. See Attachment 2 for proposed metrics.

RCW 80.28.460(3)(j) -- Enrollment in an electric utility demand response program;

61 NW Natural has been in close coordination with CPU; at this time, there is not a demand response program offered by the local utility but as that changes, NW Natural will help facilitate enrollment of the TENs customers.

RCW 80.28.460(3)(k) -- The potential to enable gas pipeline decommissioning and its potential to supplant the need for gas pipeline replacement and the need to spend on gas pipeline replacement programs.

62 Although the TEN will primarily serve new construction that will not require conventional natural gas service for space heating or domestic water heating, the project represents a meaningful opportunity to explore how utility-owned thermal energy networks can be planned and deployed as alternatives to traditional natural gas service. Through this project, NW Natural will generate lessons about utility coordination, infrastructure scoping, and long-term planning that could inform approaches to expanding TENs in the future.

RCW 80.28.460(3)(l) -- Whether the thermal energy network is a distributed system that uses ambient temperature fluid and high-efficiency heat pump equipment in each building in the network.

63 The TEN pilot is designed as a distributed ambient loop system. Based on the preferred Street Loop design, the ATL will consist of a closed loop buried pipe system circulating water with a small amount of chemical treatment that inhibits corrosion and bacteria growth.

64 The thermal energy network will circulate ambient temperature fluid through a central ambient temperature loop, driven by a primary pump station that distributes energy throughout the network to heat pumps located within each building. Each building connected to the loop will

be equipped with a dedicated energy transfer station (ETS), which includes circulation pumps and a heat exchanger that pulls geothermal fluid from the ATL to deliver energy to the building. As the heat pumps within each building extract heat from or reject heat to the ATL, the ATL will balance needed energy flow to satisfy each heat pump's needs.

65 The ATL will be designed to operate within a moderate temperature range and serve as a shared thermal reservoir, allowing buildings to either extract or reject heat depending on their individual heating and cooling needs.

66 Each building connected to the TEN is intended to use decentralized, high-efficiency GSHPs, specifically:

- GSHPs will be installed at the building level, downstream of each ETS.
- Each ETS will transfer thermal energy from the ATL to the building's internal distribution loop, which will then supply thermal energy to the GSHPs.
- The ATL supply water temperature differential from one energy source to the next energy source shall not be more than 10°F at design conditions. This design limit ensures consistent operational efficiency for all heat pumps connected to the system while allowing sufficient margin for capacity and flow control across the network.

This decentralized GSHP architecture will ensure that the TEN system is modular and demand-responsive, allowing each building to independently control indoor temperatures without relying on centralized delivery of conditioned air or hot/chilled water.

D. Statutory Criteria that the Commission May Consider

RCW 80.28.460(4)(a) -- Greenhouse gas emissions reductions;

67 As stated above, the TEN pilot is projected to achieve a 36 percent reduction in carbon emissions compared to a business-as-usual (BAU) scenario using conventional fully electric heating systems.

RCW 80.28.460(4)((b) -- The use of waste heat, ground-source heat, geothermal resources, or other nonfossil fuel and noncombustion sources, and the use of electric heat pumps;

68 The pilot project will rely primarily on an open-loop geothermal well field as its source of thermal energy. Through a centralized ambient temperature loop, geothermal energy will be circulated between connected buildings, where distributed ground-source heat pumps located in each building will extract or reject heat based on individual load conditions. The system will be fully electric. No backup will be required to meet end-use needs under the current system design.

RCW 80.28.460(4)(c) -- The ability to provide the pilot project customers' hot water demands.

69 Domestic hot water ("DHW") for all connected buildings will be supplied through building-level heat pump water heaters connected to the ambient temperature loop. The system has been sized to account for DHW demand based on occupancy type and usage estimates developed during the modeling phase. This design ensures year-round delivery of 100 percent of DHW needs without reliance on gas or electric resistance heating.

RCW 80.28.460(4)(d) -- The ability to provide the pilot project customers' cooling demand.

70 Cooling for all connected buildings will be delivered through the same systems used for heating. These systems are capable of extracting heat from indoor spaces and rejecting it to

the ambient loop. The loop is designed to maintain thermal balance and accommodate concurrent heating and cooling demands across a diverse mix of building types. System modeling has included detailed cooling load calculations based on expected summer temperatures, building envelope performance, and internal heat gains.

RCW 80.28.460(4)(e) -- The consideration of options to provide thermal energy storage.

71 TES is not included in the design because the open-loop geothermal system, supported by a high-yield aquifer, is capable of directly meeting peak capacity demands. Additionally, since the majority of electrical load in the system comes from in-unit heat pumps on the customer side, utility-side TES would not enable meaningful load shifting or generate cost or operational benefits. As a result, TES would increase capital cost without delivering corresponding value to the system.

72 A dedicated backup heating system is not required for the initial pilot due to the system's built-in redundancies and the reliability of the thermal resource. The design includes dual-pump redundancy (N+1) and thermal load balancing across buildings and ETS units. These features, coupled with the consistent production capacity of the open-loop geothermal source, will allow the system to meet heating needs without additional backup. Backup power may be considered in future system expansions, but it is not included in the scope of this pilot due to the expected reliability of the current configuration.

RCW 80.28.460(6) – Performance Metrics

73 See Attachment 2, as well as our explanation above regarding how we satisfy the requirements of RCW 80.28.460(3)(i).

RCW 80.28.470 – The Cost of the Project

74 Pursuant to RCW 80.28.470(2), NW Natural is petitioning the Commission to use an alternative process from what is specified in RCW 80.28.470(1) to estimate the cost to deploy a thermal energy network pilot project. RCW 80.28.470(1) appears to require NW Natural to first fully design the project and then submit a request-for-proposals to finalize construction costs. RCW 80.28.470(2), however, permits NW Natural to petition the Commission to use an alternative process. Specifically, NW Natural is petitioning the Commission to use its current design estimate to move forward with the project that is based on the schematic design of the Vancouver TENs pilot project provided by Salas O'Brien. As mentioned above, NW Natural contracted with Salas O'Brien to provide the schematic design of a TEN to support the Vancouver TENs pilot project. Salas O'Brien has extensive experience designing TEN projects across North America. Please see Attachment 3, Basis of Design Report and Confidential Attachment 4, the Energy Report. Both of these reports were completed by Salas O'Brien as part of our design work for the project.

75 The team of NW Natural, City of Vancouver and the developer of the new buildings that will be served by the project—Lincoln Property Company—met at least semi-weekly from December 2024 through June 2025 to understand the site's thermal needs, limitations, feasibility of various loop options and available thermal resources. This resulted in a schematic design supported by all entities and serves as the basis for the detailed cost estimates provided by JLD Cost Consulting. NW Natural has included this cost estimate as Confidential Attachment 5.

76 Schematic design represents approximately 30 percent design completeness. NW Natural decided to use 30 percent design as an alternative to the process contemplated in RCW

80.28.470(1) for four reasons. First, it gives NW Natural the opportunity to share the project with the Commission and interested entities for discussion at a much earlier stage than would otherwise be possible if the Company had waited until design was complete. By doing so, NW Natural is seeking to have open dialogue about TENs projects, especially in light of reduced funding available for Department of Commerce grants to offset the cost of the project. NW Natural understands that the $25 million originally envisioned for such grants statewide is now $4.8 million. This reduction in funding is a material change that will almost certainly increase costs to utility customers, although NW Natural notes that utility scale geothermal tax credits remain available despite recent changes to federal tax law. NW Natural currently anticipates that this tax credit will be available for this project.

77 Second, it would cost approximately $440,000 to develop the final design in addition to approximately $230,000 that NW Natural has already spent on the project. Although NW Natural is committed to the TENs project, the Company and our customers should not incur additional costs in developing the project without some assurance of Commission support, especially given the substantial reduction in state grants that are available for these pilot projects. NW Natural understands that the Commission's approval of cost recovery is not guaranteed even if the Commission grants NW Natural's petitions in this filing. However, under HB 2131 the Commission has considerable discretion to approve or reject a TENs pilot project with no clear legal standard to apply to such projects. Given this considerable uncertainty, the Company is seeking some initial discussions and feedback that it should continue to invest in this project.

78 Third, 30 percent design completeness allows NW Natural to move faster than it otherwise could in constructing the Vancouver TENs pilot project. If NW Natural had to wait until design

was complete and a request-for-proposals conducted, then the Company would have to pause the project and wait for Commission approval, even though all the necessary steps have been taken to begin construction. This delay may mean not meeting the December 2026 deadline set by the bill. On the other hand, the 30 percent design completeness is a natural point to pause and consider if the Company should continue to pursue project. In short, a company, even if it was not Commission-jurisdictional, would likely pause the project at this point and consider whether it should go forward.

79 Finally, NW Natural serves a relatively small number of customers in the state, making this pilot project a major investment in its Washington service territory. As such, the Company is seeking input from the Commission as soon as practicable on this TENs pilot project, especially due to cuts in the amount of grant finding available from the Department of Commerce, increasing the cost of the project to the Company's customers.

80 The 30 percent design includes cost contingencies to provide a conservative (worst case) estimate. The amount of these cost contingencies will be reduced over time as NW Natural moves towards 100 percent design. Figure 3 below reflects a high-level cost summary; a detailed estimate is available in Confidential Attachment 5.

///

///

///

///

///

///

Figure 3

TEN Component	**Schematic Design cost estimate**
Open Loop	[redacted]
Pump house and ETS	[redacted]
Vault	[redacted]
Heat pumps	[redacted]
SCADA Control System	[redacted]
Contingency	[redacted]
Insurance	[redacted]
Taxes/Fees	[redacted]
Other (Indirect, Misc. Electrical, , etc.)	[redacted]
Total	**$12,800,000**

NW Natural notes that the cost of the heat pumps are not included in the estimate prepared by our consultant, but are necessary for the project. The Company estimated the cost of the heat pumps based on a similar project by the building developer, Lincoln Property Company. Also, the cost, above, does not reflect the benefits of the utility-scale geothermal tax credit or any energy efficiency credits that may be available through CPU. NW Natural, however, is pursuing these avenues to lower the overall cost of the project.

81 RCW 80.28.470(1) also requires NW Natural to compare the cost of the TENs pilot project to the "lowest reasonable cost alternative resource for heating services under the gas company's

current business practices." NW Natural is not seeking an alternative process for this calculation. Instead, it estimates the cost of extending gas service to these buildings in downtown Vancouver to be approximately $38,000.

82 If the Commissions approves the alternative process to estimate the cost of the Vancouver TENs pilot project, NW Natural will complete design work and issue a Request for Proposals for TEN construction based on construction documents and the final drawings and specifications.

IV. CONCLUSION

83 NW Natural appreciates the work of the Commission, Staff, and interested parties for their work to date on TENs. In support of the project, NW Natural has secured letters of support from the City of Vancouver, Clark Public Utilities, and Lincoln Property Company. These letters of support are attached to this filing as Attachment 1. In accordance with RCW 80.28.450, RCW 80.28.460 RCW, 80.28.470(2), NW Natural respectfully requests that the Commission review and validate the costs assessments of its Vancouver TENs pilot project, including the alternative process used to develop this cost estimate.

Dated this 29th day of July 2025.

Respectfully Submitted,

Re: NW Natural's Thermal Energy Network Pilot Project

Dear Chair Rybarik and Commissioners,

Clark Public Utilities supports NW Natural's application for a proposed Thermal Energy Network (TEN) pilot project. The project team at NW Natural contacted Clark Public Utilities during the initial planning and design phase of this TEN project and we have been coordinating and researching the potential value of this project for the electric grid in Clark County for the last several months.

Our initial analysis indicates the NW Natural TEN project would have both an energy and capacity value for the utility and would be a benefit to the community. We have identified a process to measure and report energy efficiency savings this project may provide. We also concluded TEN projects have potential to provide capacity value to the electric utility; when measured against the baseline technologies that would be providing space and water conditioning, a TEN achieves much lower peak demand during both the summer and winter seasons. Clark Public Utilities does not currently have programs that provide incentives for the reduced demand TEN projects provide but the potential capacity benefit of this NW Natural pilot has been a catalyst to explore options for a future incentive program design.

Clark Public Utilities recognizes both the challenges we face as Washington decarbonizes not just the electric sector but the entire state-wide economy, and the benefits the clean energy future will bring our state. We believe projects like NW Natural's TEN pilot will be a key component to the successful approach needed to achieve Washington's carbon reduction goals. For that reason, combined with the value streams we have identified, we strongly support NW Natural's TEN grant application.

Sincerely,

Matt Babbitts
Clark Public Utilities

Subject: Letter of Support for NW Natural Thermal Energy Network Pilot in Vancouver, WA

Dear Grant Review Panel,

On behalf of the City of Vancouver, I am writing to express our strong support for NW Natural's thermal energy network pilot. This initiative represents an innovative, sustainable infrastructure investment that aligns with the City's goals for climate action, energy resilience, equitable community development, and reducing the costs to deliver new housing.

As municipalities across the country face growing challenges related to climate change, energy affordability, and aging infrastructure, the deployment of thermal energy networks offers an exciting solution that, though new to the City of Vancouver, has proven scalable and successful elsewhere in similar applications. The proposed project will utilize ground sourced heat recovery to provide low-carbon heating and cooling for the City's Waterfront Gateway mixed use redevelopment and adjacent City Hall. After completion of the thermal energy network pilot and construction of the redevelopment site, it is expected to serve over 300 residential units, 35,000 sf of retail, and 200,000 sf of office. This will significantly reduce greenhouse gas emissions with a modeled 36% energy savings compared to a conventional heating and cooling system. This significant energy savings is expected to bring down operating costs and enhance the reliability of energy services for the development while lowering the initial cost of construction for the residential development by eliminating their need to include building mechanical equipment in their scope.

The City of Vancouver recognizes the importance of innovative energy solutions in meeting our climate and sustainability targets as highlighted by the City's Climate Action Framework and ongoing Green Building Policy development. The thermal energy network pilot directly supports these efforts and demonstrates a model of public-private collaboration with the potential to be replicated regionally.

In addition to its environmental benefits, the thermal energy network pilot will support local economic development, create living wage jobs, and improve energy equity by delivering affordable and sustainable thermal services to a diverse set of users, including housing, municipal buildings, and small businesses.

We are proud to partner with NW Natural in advancing this exciting initiative, and we are committed to supporting the successful development, implementation, and long-term viability of the thermal energy network pilot.

Thank you for your consideration of this important project.

Sincerely,

Anne McEnerny-Ogle
Mayor
City of Vancouver, Washington

Re: NW Natural's Thermal Energy Network Pilot Project

Dear Chair Rybarik and Commissioners

Lincoln Property Company is pleased to offer our full support for NW Natural's proposal to develop a brand-new Thermal Energy Network (TEN) in Vancouver, Washington.

The proposed TEN aligns with Lincoln's core values and offers an innovative approach to providing reliable, low-carbon thermal energy to the growing Vancouver community. This TEN will not only provide immediate environmental and operational benefits but also set a precedent for smart energy infrastructure development in the region. We believe this project will build the State of Washington's sustainability legacy, becoming a powerful example of interdisciplinary collaboration and innovation.

As a company with a long-standing commitment to sustainable and resilient development, Lincoln has experience with carbon and energy management in new construction projects regionally and nationally. We support transitioning to thermal energy networks as an essential aspect of future-proofing our built environments—and thereby our communities—and we are eager to contribute our expertise to this forward-thinking initiative.

This project has the potential to be a landmark case study for future new construction, and we are eager to support NW Natural's leadership in advancing clean energy solutions. We encourage local stakeholders to move forward with this transformative initiative, which will serve as a model for future sustainable urban energy systems and contribute to the long-term success of the Vancouver area.

Sincerely,

Alex Aigner

THERMAL ENERGY NETWORK DESIGN

OVERVIEW

The recommended ambient thermal loop (ATL) location is a variation of the “Street Loop” option as presented in the pre-design report. The ATL will be routed in the right-of-way adjacent to the street with run-outs to each of the buildings.

Due to the significant available thermal production from an open loop geothermal system at this site, it is recommended that the City Hall open loop geothermal system be connected to the TEN system and an additional set of extraction and injection wells be installed on the west side of the site.

The ATL and the Open Loop Geothermal will need a pump station(s). The Open Loop Geothermal pump station is planned to be located in the parking garage. The 30% design shows two options for the ALT pump station. Option A is a vault located in the plaza on the East side of the site. Option B is for the ALT pump station to be located adjacent to the Open Loop pump station in the parking garage.

Each building will need an Energy Transfer Station (ETS) to separate the fluid in the TENs system from the fluid in the building system and to transfer heat between the systems. The exact location of the ETS in the new construction buildings will need to be coordinated with their building design team. They are currently shown near the planned mechanical rooms.

CIVIL

Project Design Parameters

The proposed civil/site systems will be designed in accordance with standard engineering practice and current code requirements.

Site Clearing/Demolition

- Prior to any excavation, erosion control measures will be installed to prevent the transmission of sediment laden runoff from the construction area.
- Where applicable, topsoil will be stripped and stockpiled with appropriate erosion controls applied to all disturbed areas.
- Clear and grub area within limits of the project including removal of trees, bushes, shrubs, stumps, fencing and other incidental materials not required for use on the site.
- Areas that will be left disturbed and exposed for a significant period of time shall be seeded for protection.
- Traffic control, signage, and barriers will be needed throughout the project for staging, phasing and protection of the public from construction activities.
- Conduct demolition in a manner that will prevent damage to adjacent structures, utilities, site improvements, and other facilities to remain. Surfaces to be demolished shall be clearly defined with perimeter saw cuts. All demolished materials must be properly handled and disposed of offsite.
- Remove all site improvements as required to allow installation of new utilities.
- Protect all existing site improvements and utilities that are to remain during all construction activities.

Site Earthwork

Provide excavation and backfill for utilities and surface restoration including temporary excavation and support as required per jurisdictional standards and specifications.

Site Grading, Excavation & Disposal

Prepare subgrades for walks, pavements, turf, and grasses. Provide proof-rolling of subgrades as well as any necessary dewatering systems.

Provide stockpiling of all suitable onsite materials required for reuse. The project area may contain polluted or contaminated soils. Soil testing will be conducted via geoenvironmental investigations. Monitoring of soils during excavation may be required. Polluted and contaminated soils shall be disposed of legally with all required permitting and manifests.

All hazardous waste removal shall be performed by a licensed Hazardous Waste Contractor. Include all necessary permitting and manifests required for the removal of hazardous waste.

Borrow Fill

Provide clean imported materials for sub-base and base courses for concrete and bituminous walks and pavements.

Provide clean imported material for subsurface utility trench bedding and backfill.

Site Dewatering

Provide all necessary dewatering systems to maintain a dry work area. Dewatering systems shall be designed and installed by licensed professionals in Washington State experienced with these systems.

Site Shoring

Provide all necessary temporary excavation support and protection to allow construction of proposed structures, improvements, and utilities. Temporary excavation support and protection systems shall be designed and installed by licensed professionals experienced with these systems.

Erosion and Sediment Control

The project will require a permit from US EPA for a Stormwater Permit for Construction Activity prior to the planned commencement of construction. This permit includes requirements for a Stormwater Pollution Prevention Plan (SWPPP) prior to the commencement of construction and Plan Implementation Inspections during construction performed by a qualified person. The permittee shall provide all necessary “Qualified Inspectors” and “Qualified Professionals” as defined in the permit regulations.

Erosion and sediment control measures will consist of, but shall not be limited to, inlet protection, silt fence, compost filter socks, construction entrances, sediment control ponds, etc.

The installation and maintenance of all erosion and sedimentation control measures shall be in accordance with the SWPPP provided with the Stormwater Permit mentioned above.

Utilities Trenching

Place and compact backfill in excavations on subgrades free of mud, frost, snow, or ice. Individual compacted layers shall be compacted to minimum dry densities as follows:

- Under Equipment Pads, Structures, and Pavements (Other Than Stone Base): 95 percent.
- Under and Around Utilities (Other Than Stone): 95 percent.
- Under Walkways: 95 percent.
- Under Lawn or Unpaved Areas: 90 percent.

Site Surface Improvements

- Bituminous Pavement
  - Bituminous concrete paving that is removed to allow for the installation of proposed utility shall be reinstalled to match existing conditions.

- Roadway Paving and Surfacing
  - The bituminous concrete paving section will consist of no less than 7.2” of asphalt over 8 inches of aggregate base material., specifically hot mix asphalt Class ½” PG 58H-22 constructed in accordance with Section 5-04 of the WSDOT Standard Specifications.
- Painted Lines and Markings
  - Pavement markings shall comply with the City of Vancouver. Washington standards and Specifications.
- Pedestrian Paving
  - Sidewalks removed to allow for the installation of proposed utility and surface improvements will be reinstalled to match existing conditions.
- ADA Site Elements
  - ADA ramps, signage, and striping removed to allow for the installation of proposed utility and surface improvements will be reinstalled to match existing conditions.
- Sidewalks
  - Concrete sidewalks will consist of 4-inch-thick, normal weight concrete with 3,000 psi (CL 3000) minimum, 28-day compressive strength, maximum 3-1/2” slump. Concrete sidewalks will be installed over 3” gravel base material.
- Curbing
  - Site curbing removed to allow for the installation of proposed utility will be reinstalled to match existing conditions. Site curbing will consist of precast concrete curbing or cast-in-place curbing to match existing conditions.
  - Precast concrete curbing will be 6 inches wide by 18 inches minimum depth, and curbing will extend 6 inches above adjacent roadway surfaces.
- Retaining Walls
  - Site retaining walls removed to allow for the installation of proposed geothermal system will be reinstalled to match existing conditions. Site retaining walls will consist of reinforced, cast-in-place retaining walls to match existing conditions.

Planting

Planting beds removed to allow for the installation of proposed utility and surface improvements will be replaced in kind to match existing conditions and plant species. All other disturbed softscape areas of the site will be lawn seed mixes or sod.

STRUCTURAL

Existing (City Hall)

Utility penetrations shall be cored through any existing concrete foundation walls at each building entry point. Existing walls shall be scanned prior to coring in order to locate the position of existing reinforcing steel. Avoid coring through or within 2 inches of existing reinforcing steel. Since adjustments to the location of the cores may be required after scanning, coordination with the exterior utility layout will be critical to ensure proper alignment. The coring process shall employ diamond-tipped core drills mounted on stable rigs or to the exterior face of the foundation walls. Provide a clear distance between adjacent cores and existing wall penetrations of one core diameter. Notify engineer of record if existing reinforcing steel cannot be avoided or if minimum spacing between cores cannot be maintained and allow for additional design team review and directives prior to coring. Exterior wall waterproofing shall be repaired to match the existing conditions.

New Construction

Penetration for new construction will be coordinated during design.

MECHANICAL

Operational Narrative

The Thermal Energy Network (TEN) system will likely have an open loop geothermal system. An open loop geothermal system is connected to an ambient temperature loop (ATL) pipe through a set of heat exchangers that distributes energy throughout the community to the heat pumps located within each building. Each of the open loop wells will be served by its own heat exchanger and pump station that includes (2) heat exchangers and (2) pumps. The heat exchangers are designed to provide approximately 75% of the maximum flow from the open loop wells and the pumps are sized to be fully redundant. The pumps are included to circulate the geothermal fluid through the heat exchangers to transfer heat to/from the ATL as needed. Refer to the Pump Infrastructure section in this narrative for additional information regarding equipment requirements associated with the ATL pump station.

Each of the buildings will be served by a dedicated Energy Transfer Station (ETS) which includes circulation pumps and a heat exchanger that pulls fluid from the ATL to deliver energy to the building. As the heat pumps within each building extract heat from or reject heat to the ATL, the ATL pumps speed up to provide more flow, and the thermal asset pumps speed up to transfer more heat to/from the ATL to satisfy each heat pump’s needs.

Each building will be equipped with isolation valves and a bypass line that will facilitate phasing and construction timing by allowing the isolation of each building from the ATL. Refer to flow diagrams on mechanical plans for additional information. Each building’s ETS heat exchanger will isolate the ATL from the building and provide a demarcation between Utility infrastructure and building systems. This also allows each building to connect without shutting down the ATL.

The ATL will be filled with 100% water solution with a small amount of chemical treatment that inhibits corrosion and bacteria growth. Since the ATL is a closed loop, it does not need significant fluid/water once it is filled and operational, however as any air is removed via the air elimination system or as fluid is lost due to expansion and pressure relief, a small amount of fluid will be added via automatic feed stations to maintain the pressure, thus keeping the pumps primed and operating. The system operating pressure will be confirmed during a later phase, however, is expected to be below 100 PSI.

A SCADA control system will be provided to control, monitor, and meter the ATL, open loop wells, and ETS systems.

Operational Parameters

The following presents the basis of design for the geothermal system:

- Outdoor Air Design Conditions:
  - Vancouver, WA
    - Summer: 87.7°F DB, 66.1°F MCWB (ASHRAE 1.0%)
    - Winter: 24.4°F DB (ASHRAE 99.6%)
- Delivery supply water temperatures:
  - 32°F minimum heating mode supply water temperature to the building side of the ETS.
  - 93°F maximum cooling mode supply water temperature to the building side of the ETS.
  - 3°F approach temperature on the ETS.
  - The ATL supply water temperature differential from one energy source to the next energy source shall not be more than 10°F (at design conditions). This will provide a consistent operational efficiency for all heat pumps served by the ATL system.
- Operational system pressure shall be designed to maintain minimum suction pressure at each pump to prevent pump cavitation and to limit pressure to within piping and component pressure ratings.
- ATL flow rate shall be designed to maintain the specified maximum temperature differentials between the energy source input manifolds. The heat exchanger flow rates shall be designed at 3GPM/Ton of capacity required.
- Pipe sizing Requirements:
  - The ATL pipe size will be standard pipe sizes based upon required flow. Flow rates to achieve proper temperature differences and pressure drop shall be primary design criteria for pipe sizing.

Infrastructure Piping and Materials

- Piping Materials:
  - All ATL piping shall be constructed of HDPE.
    - All pipe and heat fused materials shall be manufactured from a virgin polyethylene extrusion compound material. Pipe shall be manufactured to outside diameters, wall thicknesses and respective tolerances as specified in ASTM D-3035, D-2447, or F-714.

  - The material shall be PE4710 HDPE with minimum cell classification 445474C, with a UV stabilizer of C, D, or E as specified in ASTM D3350 and is listed by the Plastic Pipe Institute in PPI TR-4 with HDB ratings of 1600 psi at 73°F (23°C) and 1000psi at 140°F (60°C).
  - All PE4710 HDPE pipe shall have DR rating based on determined system pressures.
- High Density Polyethylene (HDPE) Pipe Fittings:
  - Pipe fittings shall be of the same material designation as detailed above and shall meet the requirements of ASTM D2683 (for socket fusion) or ASTM D3261 (for butt/saddle fusion). Each fitting shall be identified with the manufacturer's name, nominal size, pressure rating, relevant ASTM standard(s) and date of manufacture.
  - All piping shall be hydrostatically pressure tested to ASTM standards before burial and follow PPI and manufacturer pressure testing guidelines for HDPE pipe.
- A minimum 50-year limited warranty will be specified for HDPE piping.
- All pipe and fitting joining methods shall be either butt, socket, or saddle type heat fusion processes. No mechanical joints shall be allowed underground unless located within a sub-surface vault.
- Transitions from HDPE to pump volutes, valves, etc. shall be 4 or 6 bolt flanged ductile cast iron back up rings with HDPE fitting type connection for any below ground connections and flanged schedule 40 steel for any above grade connections.
- Where possible, ATL and geothermal piping will have a minimum 3’, 360° clearance around the pipe from any other infrastructure running parallel to this service. If the geothermal piping is run parallel (within 3’ distance) with either water or sewer lines for more than 3’, then the geothermal infrastructure piping shall be insulated with 1” thickness EPDM insulation for the entire length the piping is running with the other infrastructure. Buried insulation shall be protected with HDPE jacket and sealed to prevent water intrusion.
- All ATL and geothermal piping shall have a minimum 1’, 360° clearance around the pipe from any other infrastructure crossing perpendicular to this service.
- Tracer wire shall be installed on all non-metallic pipes with fiber tape placed at 10’ intervals. All tracer wire and location tape shall conform to all local and provincial regulations and standards. All tracer wire termination points will at their respective manifold or ETS. The maximum distance between termination points is not to exceed 500’. Tracer wire termination points will not be placed above ground in pedestals.

PUMP INFRASTRUCTURE

Structural

New mechanical equipment shall be placed on new concrete housekeeping pads in existing utility rooms. Housekeeping pads shall be pinned to the existing slabs with #4 dowels spaced at 18 inches on center around the perimeter edge of the housekeeping pad. Dowels shall be drilled and installed with epoxy adhesive 3 inches into the existing slab-on-grade. Pads shall be reinforced with #4 reinforcing bars spaced at 12 inches on center in each direction. Concrete for new housekeeping pads shall have a minimum 28-day compressive strength of 4,000 psi.

Mechanical

The pump stations are intended to locate all the equipment required to operate the ATL and all of the thermal resources, including ground loop heat exchanger(s). The equipment requirements for each pump station are listed below. Refer for schedules on drawings for pump sizes and operational requirements.

Pump Station Equipment

- ATL Pump Station
  - Option A – Below Grade Vault
    - Vehicle load rated precast concrete vault located near city hall. Refer to drawings for approximate location and more information.
  - Option B – Above Grade
    - Located within future parking garage in the same location as open loop pump stations. Refer to drawings for approximate location and more information.
  - 2 Pumps (N+1 redundancy) utilizing ECM/VFD control.
  - Air-Dirt Separator.
  - Expansion Tank.
  - Makeup water connection and meter.
- Open Loop Pump Stations – Located to be determined.
  - 2 Pumps (N+1 redundancy) utilizing ECM/VFD control.
  - Open Loop, stainless steel, double wall Heat Exchanger
- Energy Transfer Stations (ETS) – Located in Buildings 1, 2, 4 and City Hall.
  - Plate and Frame Heat Exchanger with a 3°F approach temperature.
  - Source / ATL Side of HX
    - 2 Pumps (N+1 redundancy) utilizing ECM/VFD control.
    - 2 Pipes entering/exiting the structure.
    - 1 Energy Monitoring Station. Includes 1 display/BTU meter, 1 flow meter, 1 supply temperature sensor, and 1 return temperature sensor.
  - Load / Building Loop Side of Heat Exchanger (All components on this side of HX shall be provided by the mechanical contractor responsible for the building side system.)
    - 2 Pumps (N+1 redundancy) utilizing ECM/VFD control.
    - 1 supply temperature sensor, and 1 return temperature sensor.
    - Air- Separator
    - Expansion Tank
    - Glycol Feed System

SCADA CONTROL SYSTEM

- Control instrumentation for the ATL, Open Loop Geothermal, and ETS systems will be provided and will include but not limited to on/off and modulating controls, actuators, water pressure switches, differential pressure transduces and transmitters, temperature and pressure sensors/transmitters, electromagnetic water flow meters, BTU energy meters, current transducers, temperature control panels, and low-voltage power supplies.

- Automatic temperature control devices and instrumentation will be provided with a complete interface to a SCADA system with overall system architecture and communications protocol to be determined upon further review and discussion. As a minimum, TEN will operate independently of the connected buildings to provide source water based on building demand feedback temperature and flow rate monitoring. All TEN equipment will be monitored, controlled, alarmed, and trended via the SCADA. The system will include a web-based operator interface. Heating and cooling energy transfer to/from the geothermal ground source heat exchangers will be monitored and trended using electromagnetic flow meters, temperature transmitters, and BTU energy meters.
- System shall include the following:
    - ATL
        - Leaving and Entering Water Temperature at every source connection
        - ATL flow rate
        - ATL pump speed
    - ETS
        - Leaving and Entering Water Temperature at the source and load side of the ETS
        - Source side pump speed
        - Source side flow rate
        - Source side BTU metering
    - Open Loop Geothermal
        - Water Temperature at each well
        - Flow rate
        - Pump speed
        - BTU metering

OPEN LOOP GEOTHERMAL

Hydrogeologic Conditions

The aquifer selected for the open loop system is the Unconsolidated Sedimentary Aquifer (USA). The USA is assumed to extend from ~30 ft to ~100 ft below ground, to be confirmed by the test drilling program.

The USA is capable of sustainable yields of more than 2000 GPM to/from a single well. A single supply and injection well completed in the USA is sufficient to satisfy 100% of the total heating and cooling requirements of the Thermal Energy Network (including the City Hall).

The groundwater is assumed to flow toward the Columbia River in a south southwest (SSW) direction.

Well Details

- Well Layout:
    - The intention is to maximize efficiency of the supply wells by limiting the effect of drawdown on an adjacent supply well (or wells). It also prevents, or limits, the effect of the injection temperature on the ambient temperature near the supply wells.

  - Generally, supply wells are located up-gradient of the groundwater flow direction and / or injection wells are located down-gradient of the supply wells.
- Well Spacing:
  - Spacing between adjacent supply wells and adjacent injection wells (if more than one is required) is based on the aquifer characteristics.
  - Spacing between a supply well and its nearest injection well are based on aquifer characteristics, the temperature of the groundwater being injected, and the flow rate going into the well. Higher temperature difference and flow will result in the need for greater spacing.
- Well Depths:
  - All wells will extend to the bottom of the USA. The grain size analysis will inform whether the depth can be decreased.
- Well Capacities:
  - The capacity of an open loop well will depend on the depth of the well, diameter of the well screen, slot size of the well screen, and requirements of the TEN.
  - Well details are to be confirmed by the test drilling program.

Operational Parameters

- The open loop geothermal system will constitute a non-consumptive use of groundwater.
- The ambient groundwater temperature is assumed to be ~52°F.
- The typical temperature drop across a HX in an open loop system for heating is ≤12°F, to ensure freeze protection of the returning water. The typical temperature rise for cooling is ≤25°F, to maintain energy efficiency of the heat pump. The resulting HX leaving water temperatures are a minimum of 40°F and maximum of 77°F.
-
- Redundancy:
  - A fully redundant well is optional, to be confirmed by the owner.

Submersible Pumps for Open Loop Wells

The supply wells will be equipped with a submersible pump. The size of the pump is based on the flow requirements for satisfying the loads of the TEN and the pressure head requirements (friction losses and pumping elevation lift).

Typically, a pump control panel with Variable Frequency Drive (VFD) will be utilized and is supplied by the manufacturer of the submersible pump.

ELECTRICAL

- All applicable national, state, local and jurisdictional codes shall be followed for the installation.
- The new Electrical Systems will be designed in accordance with the requirements of the following codes and standards.
  - 2021 Washington State Building Code.
  - 2021 International Building code

    - 2020 National Electrical Code
    - NFPA 72, National Fire Alarm code
    - Clark Public Utility material and installation specs.
    - City of Vancouver
- Power for City Hall Open Loop Pump Station and Transfer Station to be powered via a 225,3P,4W Panelboard fed via the existing building service distribution. Provide separate sub-meter as required.
- Power for Building One Transfer Station to be powered via the building service via a dedicated 225A,3P,4W panel and sub-meter.
- Power for Building Two Transfer Station to be powered via the building service via a dedicated 225A,3P,4W panel and sub-meter.
- Power for Building Four Transfer Station to be powered via the building service via a dedicated 225A,3P,4W panel and sub-meter.
- Power for Building Five Open Loop Pump Station via the building service via a dedicated 225A,3P,4W panel and sub-meter..
- Power to ATL Pump Station Vault (option A) shall be fed via an underground duct bank to a pad mounted transformer feeding a pedestal mounted meter cabinet and 225A, 3P, 4W panelboard for power to pumps. Option B 1 Pump House to be fed via an underground duct bank to a pad mounted transformer and metering feeding a 225A, 3P, 4W panelboard for power to pumps

APPENDICES

- 30% Design Drawings
- Energy Report
- Closed Loop Analysis Report
- Open Loop Geothermal Feasibility Study (for reference)
- Wastewater Energy Transfer (WET) Concept (for reference)

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position with Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company").

A. My name is Robert J. Wyman. My current position is Senior Rates and Regulatory Economist for NW Natural. I am responsible for economic analysis, short-term load forecasting of residential and commercial rate classes, cost of service, and rate spread and rate design. I have been a witness and supported witnesses and created technical work papers for multiple rate and advice proceedings filed with the Washington and Oregon utility commissions on behalf of NW Natural.

Q. Please summarize your educational background and business experience.

A. I hold a Bachelor of Science in Economics from the Robert D. Clark Honors College at the University of Oregon and a Master of Arts in Applied Economics from the University of Michigan. Prior to attending graduate school I was employed by ECONorthwest, an economics consultancy, and worked in the firm's economic development and transportation practice area. I was responsible for the technical analysis on and consultation for dozens of projects, largely in the Pacific Northwest and Western states. I joined NW Natural in 2016 as a Rates and Regulatory Analyst. I have nearly 20 years of professional experience including 8 years of consulting with a focus on public finance and policy, urban economics, and financial feasibility (benefit-cost) analysis as well as nearly 10 years as an analyst and economist in the energy industry with a focus on load forecasting, cost of service, and rate spread and rate design.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to describe the methodology for NW Natural's weather normalized use-per-customer ("UPC") forecast for the Residential and Commercial firm sales rate classes, present the Embedded Cost of Service Study ("EmCOSS") and the daily reading data sampled load study, and describe the Company's rate spread and rate design proposal for each year in the multi-year rate plan ("MYRP").[1] At the end of this testimony, I describe how the rate spread proposal will allocate incremental revenue requirement to each NW Natural Washington Tariff rate schedule ("RS"), excluding RS 4, RS 10, RS 43, and special contract schedules. Separately, I propose tariff changes for RS 10 Charges for Special Metering Equipment, Rental Meters, and Metering Services ("RS 10 Metering Services").

Q. Please summarize your testimony.

A. My testimony is made up of five distinct sections: (1) The Company's UPC weather normalizing methodology; (2) the EmCOSS methodology and a summary of results; (3) proposed changes to rate design as well as the rate spread proposal to be applied to the proposed incremental revenue requirement for this proceeding; (4) revenue and bill impacts for sales firm rate schedules; and (5) the Company's RS 10 Metering Services proposal. First, I will detail the UPC weather normalizing methodology (which creates what is referred to here as the "Normal UPCs") and explain how it is used in conjunction with the Company's customer forecast to create short-term weather

[1] The MYRP consists of the following three years: Rate Year 1, from August 1, 2026, through July 31, 2027 ("RY1"); Rate Year 2, from August 1, 2027, through July 31, 2028 ("RY2"); and Rate Year Three, from August 1, 2028, through July 31, 2029.

normalized volumes for the Residential and Commercial rate classes. The normalized values are used to support the determination of the proposed revenue requirement presented in Exh. KTW-1T. Second, I will outline NW Natural's EmCOSS methodology and will show the embedded cost inputs by capital investment and operations expense categories, on a rate schedule basis. Third, I present and discuss proposed rate design changes. Then, I will show how the Company proposes to spread the incremental revenue requirement across rate schedules. Finally, I will present the revenue and bill impacts associated with the Company's proposal.

My testimony explains how the Normal UPCs were derived using an autoregressive model specification to interpret the relationship between temperature and commodity usage to create weather normalized revenues for the Residential and Commercial firm sales service rate classes for the test year of April 1, 2024, through March 31, 2025 ("Test Year"). I will also explain how the Company derived Test Year revenues for the Industrial and Commercial interruptible sales and transportation service rate classes.

This testimony also explains how the EmCOSS is used to assign incremental revenue requirement to rate schedules based on "cost causality" (i.e., how much of the capital investment costs and operations and maintenance ("O&M") expenses required to serve the Company's customers can be attributable to each rate schedule). The EmCOSS filed with this case indicates that the Large Commercial, Industrial, and Transportation rate schedule classes are paying more than their determined cost of service under present rates, which is consistent with past rate case results. The study also indicates that RS 1 General Sales Service (Residential) ("RS 1 Residential"), RS

2 Residential Sales Service ("RS 2 Residential"), and RS 27 Residential Heating Dry-Out Service ("RS 27 Dry-Out") rate schedules are paying less than their determined cost of service, a result that is consistent with the results from the Company's last rate case, Docket UG-200994. Also consistent is the finding that RS 3 Basic Firm Sales Service Non-Residential (Commercial) ("RS 3 General Commercial") is overpaying its cost to serve, albeit to a lesser extent than indicated in Docket UG-200994. The largest difference is the finding that RS 1 Commercial General Sales Service ("RS 1 Commercial") is paying well below its cost of service (compared to the finding it was paying just above its cost of service in Docket UG-200994). In my testimony, I discuss the reasoning for these shifts in EmCOSS-indicated determined cost of service relative to parity.

I also present the Company's rate design proposal. The Company proposes to increase the monthly fixed charges for RS 1 Residential, RS 1 Commercial, and RS 2 Residential. I discuss and analyze the Company's proposal and conclude that its monthly fixed charge proposal would help to smooth customer bills across the entire year, resulting in lower winter bills at a time when a customer's bill (in addition to other energy bills) is highest, as well as promote rate equity for the residential rate class.

Then, I describe the methodology by which NW Natural proposes to spread the incremental revenue requirement presented in Exh. KTW-1T for each year in the MYRP. The Company proposes to spread incremental revenue requirement in such a manner that is responsive to the results of the EmCOSS, with small deviations for RS 2 Residential and RS 3 General Commercial which I discuss in testimony. I describe the following multi-step rate spread proposal for all rate schedules in full later in my

testimony. First, for RS 1 Residential, RS 1 Commercial, and RS 27 Dry-Out, NW Natural proposes to use a separate cap for each rate schedule that moves its relative position closer to parity with respect to the EmCOSS results, because these schedules are paying less than their cost to serve at current rates. The Company proposes a cap for RS 2 Residential that allocates slightly less than the average revenue increase (but slightly higher than the average margin increase) to minimize rate impacts even though this schedule is paying less than its cost to serve at current rates, and a cap for RS 3 General Commercial that allocates slightly more than the average margin increase to this schedule although the EmCOSS indicates this schedule is paying just above its cost to serve at present rates. Second, the Company proposes to apply an equal percent of incremental margin allocation to all rate schedules with an EmCOSS-indicated parity ratio of 1.20 and lower plus rate schedules RS 41 Non-Residential Sales and Transportation Service and RS 42 Large Volume Non-Residential Sales and Transportation Service (collectively, RS 41/RS 42 Commercial Sales Firm).[2] This step reflects the EmCOSS study results, which indicate that while these schedules are overpaying their cost to serve at present rates, they are not overpaying at the same relative level as those with parity ratios over 1.20, or those with industrial interruptible and/or transportation service. Third, the Company proposes to apply a floor based on equal percent of margin increase of the remaining incremental revenue requirement to the remaining rate schedules in the RS 41/42 Commercial Sales Firm rate classes, which is less than the overall margin increase.

[2] A ratio of 1.00 indicates rate parity, and a ratio above and below 1.00 indicates a rate schedule is overpaying and underpaying its EmCOSS-indicated cost of service, respectively.

As a result of this multi-step proposal, the RS 1 Residential, RS 1 Commercial, RS 2 Residential, RS 3 General Commercial, and RS 27 Dry-Out rate schedules will receive a revenue requirement spread slightly greater than an equal percent of margin share calculated across all rate schedules, with the greatest relative increase being applied to RS 27 Dry-Out at a percentage double that of an equal percent of margin share. The rate schedules with a parity ratio below 1.20 plus RS 41/42 Commercial Sales Firm will receive a revenue spread equal to that of an equal percent of revenue share. The remaining rate schedules (including those with industrial interruptible and/or transportation service) will receive a spread less than an equal percent of revenue share, a lower rate relative to other rate schedules in the RS 41/42 Commercial Sales Firm rate classes. The Company's proposal equitably distributes the incremental revenue requirement such that the rate classes are moved closer to or retain margin parity based on their EmCOSS-indicated cost causation, except for RS 2 Residential and RS 3 General Commercial which, respectively, are allocated amounts just below and just above the amounts meant to roughly retain their indicated parities. The proposal described above is an incremental approach; it moves most rate classes closer to (or retains) parity but does so in a manner that works to minimize rate impacts. It does this by balancing the impact on residential customers while taking incremental steps towards the EmCOSS-indicated parity for larger volume customers who are farthest from parity.

Next, I show the proposed spread of incremental revenue requirement for each sales firm service rate schedule and the corresponding average monthly bill impact.

The final section of this testimony discusses proposed tariff changes to Rate Schedule 10 – Charges for Special Metering Equipment, Rental Meters, and Metering Services, which are presented on proposed Sheets 110.1 and 110.2 filed with this proceeding.

Q. Are you introducing any exhibits with your testimony?

A. Yes. I am sponsoring Exhs. RJW-2 through RJW-19C. Exhs. RJW-2 through RJW-4 support the Company's weather normalized use per customer analysis. Exhs. RJW-5 through RJW-7 support the Company's load study in compliance with WAC 480-85 (Natural Gas Cost of Service). Exhs. RJW-8 through RJW-11 support the Company's embedded cost of service study. Exh. RJW-12 is the Company's embedded cost of service study results and revenue requirement allocation by rate schedule, including the natural gas cost of service template in compliance with WAC 480-85-040(1). Exh. RJW-13 is an alternate embedded cost of service study using the results of the load study, which is being provided to ensure compliance with WAC 480-85-060(2). Due to the Company's findings discussed in the load study in Exh. RJW-5, the Company does not adopt the results of the alternative EmCOSS presented in Exh. RJW-13 for this case and, instead, adopts the results of the EmCOSS presented in Exh. RJW-12 for this case. Exhs. RJW-14 through RJW-16 support the tables found in this testimony. Exh. RJW-17 presents the rate spread allocation proposal methodology. Exh. RJW-18 indicates the incremental revenue requirement allocation by rate schedule, the bill impact and rate increase by rate schedule, as well as the proposed billing determinants by rate schedule and rate block. Exh. RJW-19C shows the Rate Schedule 10 determination of cost of service for metering equipment and metering services.

II. WEATHER NORMALIZED LOAD

Q. What is the Test Year customer and weather normalized load?

A. The Test Year customers and normalized volumes are calculated separately. The weather normalized volumes are a short-term load adjustment with respect to the effects of weather that is built using the following steps:

1. Weather data are collected to produce a 30-year historical benchmark for normal weather.
2. Actual weather data are paired with actual load data on a billing cycle and rate schedule basis. The paired data are used in a statistical regression analysis, as described below, to produce weather normalized UPCs for the Residential and Commercial rate classes for the Test Year period (i.e., the Normal UPCs) as well as every year of the MYRP.
3. For these rate classes, the Normal UPCs are multiplied by customer forecast to derive the normalized load for the Test Year, the Pro Forma Period (i.e., April 1, 2025 through July 31, 2026), and each year of the MYRP.

The weather normalized load is used to calculate revenues at existing rates in the proposed revenue requirement presented in Exh. KTW-2. In addition to being a revenue requirement input, the Normal UPCs are also used to create the design day load factor, which is an important input to the EmCOSS.

Q. Please describe the customer forecast methodology.

A. For the Residential and Commercial firm sales service rate classes, Pro Forma Period and MYRP forecasted customer counts were developed by adding new customers to the existing customer base. Customer attrition, or loss of customers, was deducted from

the existing customer base. New customers, which are largely driven by new premises served on the system, are based on historical regional business and employment growth trends, housing starts forecasts, housing permitting activity, as well as other economic factors. The customer growth forecast used for purposes of developing additional volumes and revenues is the same forecast used for producing incremental capital expenditures that make up gross plant in the MYRP rate base.

Q. Please describe how the Normal UPCs were derived.

A. The Normal UPCs represent weather normalized usage for the Residential and Commercial firm sales service rate classes on a per customer basis. The normalizing analysis relies on the relationship between weather (including temperature, which is translated into heating degree days, or "HDDs," as well as other variables such as solar radiation and wind speed) and load demand by rate schedule and time of year (measured in daily increments),[3] as well as economic factors which I describe in greater detail below. To develop the Normal UPCs, I:

- Collected daily high and low temperature data observed in Vancouver (National Oceanic and Atmospheric Administration "NOAA" Station 94298 -- Vancouver Pearson Airport) and The Dalles (Bureau of Reclamation automated agricultural weather station network "AgriMet" station HOXO) for the period June 1, 1995,

[3] A heating degree day is a unit of measurement that is calculated by subtracting the average temperature for a day from a base set point temperature, where the average temperature is lower than the base set point temperature. Heating degree days are additive in that the sum of the daily heating degree days over the course of the month is taken to represent that month's weather. Where the average temperature is higher than the base set point temperature, zero (rather than negative) heating degree days are recorded. Heating degree days are a common unit of measurement that allows for an analysis of increasing load demand as a function of increasingly colder weather.

through May 31, 2025, for two purposes. The first purpose was to have recent actual weather data to statistically analyze against recent actual usage, and the second purpose was to produce a 30-year historical benchmark for normal weather. Where gaps in the data are present, I used NOAA Station 356751 (Portland International Airport) to estimate, using a simple linear regression, normal degree days at Station 94298 to estimate the relationship between temperature readings at like stations.

- Matched actual therm usage and actual HDDs for the period of January 2012 through May 2025. As part of this process, I used load data on a billing cycle basis and matched actual weather observations with the days between cycle meter read dates. This process ensures actual usage recorded for each billing period is appropriately matched to the observed weather for the same period. I then created a weighting of the number of days, customers, and HDDs associated with each billing cycle for each schedule in the Residential and Commercial customer classes. I used a 59-degree Fahrenheit base for residential schedules and a 58-degree Fahrenheit base for Commercial schedules as temperature set points to convert temperature observations to HDDs.[4]

[4] The set point is estimated to be the temperature at which customers begin to use energy for heating purposes. To estimate the relationship between space heating load and temperature, choosing the set point that provides an approximation as to what ambient temperature customers begin to use space heating is important. The Company used the 59-degree Fahrenheit base for Residential schedules and 58-degree Fahrenheit base for Commercial schedules as its temperature set points for HDDs because these values produce a linear relationship between therm load and HDDs within the Company's service territory (i.e., these set points achieve the an optimal linear function at approximately the point where there is a heating load response to average ambient outside temperature). I use the set points to linearize the relationship so that I can use a simplified time series model specification to derive weather normalized load by month and rate schedule.

- Aggregated the cycle-based therm usage as well as the days, customers, and HDDs weights by month. I used these monthly aggregates to regress therm use per premise per day against HDDs per day (as well as additional weather and economic variables), using a type of econometric time series model specification which I describe in greater detail below. I created a model estimation for every firm sales service schedule in the Residential and Commercial customer classes (including two models for the Residential customer class based on connection date: Premises connected prior to July 1, 2023 and premises connected on and after that date). For each model, I tested four categories of coefficients that explain usage per customer per day as a function of: (1) weather, including heating usage per HDD per day; (2) base usage by month; (3) non-weather factors that account for the shift in energy usage patterns after the COVID-19 pandemic, as well as energy efficiency from ongoing demand side management and macroeconomic indicators such as industrial production and gross domestic product; and (4) temporal effects on usage from prior periods.
- Developed normal daily HDDs using daily HDD values derived from the benchmark 30-year weather data set.
- Used the econometrically estimated coefficients to build the weather normalized Normal UPCs on a daily basis using the 30-year HDD benchmark.

The above-referenced methodology is consistent with the methodology I applied in NW Natural's most recent general rate case, Docket UG-200994.

Q. Please describe the specification for the weather normalization model.

A. I used an Autoregressive Integrated Moving Average ("ARIMA") time series model to estimate weather normalized load per customer per day as the weighted function of the number of days, customers, and HDDs associated with each billing cycle in the model period. An ARIMA model is a type of time series model specification for data observations that occur across equal intervals of time. The model is used to help forecast future values in the series by each value against a chosen number of lagged values (the autoregressive term); lags of moving averages may be chosen as well. ARIMA models are denoted as ARIMA(p,d,q) where p is the number of time lags in the autoregressive term; d indicates the number of times the independent variables are differenced; and q is the number of lags of moving averages. Together, these terms help fit the time series model by accounting for different temporal effects on usage that are associated with prior periods.

Q. Has the Company used the ARIMA model specification for its weather normalized load forecast in prior rate case filings?

A. Yes. I used an ARIMA time series model to calculate the Normal UPCs for the Company's prior Washington general rate case, Docket UG-200994.

Q. Please describe the changes in the Normal UPCs analysis methodology from NW Natural's latest rate case, Docket UG-200994.

A. I used consistent data collection, actual weather, load data alignment, and weighting methods to prepare the Normal UPCs. Similarly, I used an ARIMA time series model specification to produce the final Normal UPCs regression coefficients. I made

multiple modifications to the ARIMA model specification and indicator variable selection process for this proceeding. In summary, I:

1. Used a Stata module called "arimaauto" to recommend an algorithmically parameterized ARIMA model specification for each rate schedule in the Normal UPCs analysis. This command uses a Stata-adjusted Hyndman-Khandakar algorithm. I used the output of arimaauto as baseline model specification and note deviations from its recommendation later in this testimony.
2. Included non-linear weather terms, such as a squared HDD term for multiple rate schedules.
3. Included macroeconomic variables such as the consumer price index or an industrial production index (for large volume rate schedules) as well as a variable to control for the structural economic and social impacts related to the COVID-19 global pandemic (such as the continued prevalence of remote work).
4. Included additional weather variables beyond HDDs such as wind chill and solar radiation as a proxy for observed weather in the analysis.
5. Used, for some rate schedules, multiplicative seasonal components to the ARIMA model in the form of ARIMA(p,d,q)*(P,D,Q)s where s indicates the number of lagged multiplicative seasonal autoregressive P and moving average Q terms, seasonally differenced D times. Where applied, the seasonal differencing parameters account for the seasonal variation in rate class usage instead of the monthly indicator variables which are removed from the model specification.

Below, I describe in greater detail my selection process for each firm sales service rate schedule in the Normal UPCs analysis.

Q. Why did the Company make these changes to the Normal UPCs analysis for this proceeding?

A. Many of these changes are in response to recommendations the Company has received in Oregon general rate case proceedings and for which I concluded increased model estimation efficacy. After implementing these changes, I tested for and found improvements to model estimating performance and fit, which produce better test statistics (such as the Durbin-Watson test statistic). Further, I evaluated the changes based on ease of replicability, as well as performance against out-of-sample backcast testing conducted across varying historical data vintages, and comparison of mean absolute percentage error across forecasted model results.

Q. Please describe the weather variables included in the Normal UPCs analysis in this case.

A. I evaluated the estimation effectiveness of employing weather variables beyond HDDs which are a standard measure of weather in load forecasting analyses, including the explanatory variables: effective temperature, precipitation, solar radiation, wind speed, and wind chill. The data used to create these variables are sourced from a third-party and are employed in the Company's Integrated Resource Plan ("IRP") long-term resource planning forecast models.[5] The use of multiple variables that measure weather are meant to control for the fact that day-of ambient temperature is not the only factor that can influence heat loss. Using day-before HDDs, for instance, can help model how

[5] See, for instance, discussion of daily demand drivers in *Northwest Natural Gas Company's 2022 Integrated Resource Plan*, Docket UG-210094, at 97-100 (Sept. 23, 2022). The Company sources hourly weather data for various airports throughout its service territory to be used in its IRP models from an IBM business partner called DAI Source.

heat loss in a building from one cold weather day prior can impact natural gas consumption the following day. Using a wind chill factor can help model how wind speed can contribute to indoor cooling. I have found that including such observations can make small improvements to model estimation.

The effective temperature is an equal weighted measure of the prior day and current day temperature, converted into HDDs, which works to control for heat loss that may occur on a specific calendar day because of weather observed the prior day. The wind chill value is calculated based on a relationship between wind speed and the difference between a temperature set point and observed temperature for that day.[6] The set point in this case is the temperature cut-off where any value higher produces no wind chill effect (e.g., the temperature point at which combined wind speed and temperature does not create wind chill impacts). This set point was determined in the cited study to be 14 degrees Celsius, or about 57.2 degrees Fahrenheit.[7]

Using the effective temperature as well as historical snowfall data from NOAA, I created a "snow factor" variable for modeling the Commercial rate class schedules in this proceeding. I calculated the factor by multiplying the effective temperature by a binary indicator of whether snow was present on a given day or not so that the combination of colder weather in addition to the presence of snow is weighted heavier compared to warmer weather that precedes snow melt. I found that this factor did not improve the forecasting ability of the Residential rate class model, but it did so for the

[6] Yabsley, Warren and Shirley Coleman. *Using Data Analytics for Business Decisions in the UK Energy Sector – a Case Study Integrating Gas Demand with Weather Data.* International Journal of Oil, Gas and Coal Technology. May 2, 2019. Vol. 21, No. 1, pages 109-129.

[7] *Id*.

Commercial rate class schedules; therefore, I only included it in the models for the Commercial rate class schedules.

Q. Please describe how HDDs are included in multiple explanatory variables within the Normal UPCs analysis using interaction effects.

A. The Normal UPCs analysis includes explanatory variables that have interactive effects between the additional weather variables and effective temperature HDDs, in addition to the standard HDD variable. Variables with interactive effects recognize that demand can be different on a cold rainy day relative to a warmer rainy day, or that wind chill has a larger impact on demand as temperatures decrease. Using the effective temperature, as noted above, helps to control for temperature observed in the prior day and can help explain how, for instance, a cold rainy day yesterday could result in heat loss that impacts how long it will take a furnace to reach desired temperature on the thermostat today.

Q. Please describe how the Normal UPCs analysis controls for monthly fixed effects and weekend days.

A. For this proceeding, I use monthly fixed effects to control for seasonality for the Residential rate class while including one variable for number of weekend days per month to model how base load consumption patterns vary by month based on number of non-standard working days, especially as it relates to residential demand (e.g., number of days in a given month more likely to be spent at home using natural gas for non-heating related uses such as cooking and heating water for showers and laundry). For the Commercial rate class, I removed the monthly fixed effects from the model and instead used the ARIMA(p,d,q)*(P,D,Q)s multiplicative seasonal model specification

to account for seasonal variation in usage, but did use the weekend days variable to control for days that, depending on the business sector, commercial customers could be closed or operating for fewer hours.

Q. Please explain how the Company treats the constant term in its Normal UPCs analysis.

A. For the Residential rate class, I chose to drop the constant term so that the Normal UPCs model produces one base load coefficient associated with each of the 12 months of the year. This makes building the weather normalized UPC values on a daily and monthly basis straightforward, because each model coefficient can be matched to a specific period (month) within the year. Alternatively, if I were to retain the constant term, I would have to choose one or more months to drop, in which case the constant term coefficient would instead take on the base load attributes of the dropped variable(s). For the Commercial rate class, I retained the constant term because the ARIMA(p,d,q)*(P,D,Q)s multiplicative seasonal model specification accounts for the seasonality leaving the constant term to pick up the base load attributes.

Q. Please describe how the Normal UPCs estimates demand-side management ("DSM") savings.

A. For this Normal UPCs analysis, I have created a DSM variable and use the forecasting power of the ARIMA model specification to control for DSM savings in the Test Year rather than use a post-estimation adjustment based on anticipated programmatic savings. I used historical savings based on energy efficiency measures deployed since 2012, broken down by heating and non-heating related savings based on savings measure type, as reported by the Energy Trust of Oregon. I then converted these

savings into a savings per premise per day explanatory variable to appropriately align with the dependent variable – demand per premise per day. While the model may not anticipate all programmatic savings, it now uses historical actual savings to inform short-term forecasted savings without having to rely on post-estimation demand adjustments.

Q. Please describe how the Normal UPCs analysis estimates macroeconomic effects.

A. I have included an indicator variable that controls for behavioral changes that impact natural gas demand since the COVID-19 pandemic statewide stay-at-home order was issued for Washington in March 2020. This variable is meant to capture longer-term post-pandemic changes to consumption patterns, especially patterns that influence residential and commercial demand such as higher rates of working from home. Additionally, for the Commercial rate classes, I have added a variable from the Oregon Office of Economic Analysis ("OEA") that indexes United States industrial production as a proxy measure of the year-over-year performance of the macro economy, as well as the Consumer Price Index ("CPI") for All Urban Consumers in the Western United States also provided by the OEA as a macroeconomic signal of changes to inflation, pricing, and purchasing power.

Q. Please describe the Company's ARIMA model specification selection process.

A. I used the Stata arimaauto module to auto-parameterize, in ARIMA(p,d,q) or ARIMA(p,d,q)*(P,D,Q)s terms, every rate schedule modeled for the Normal UPCs analysis. I did not, however, select the arimaauto model parameters for all schedules but rather used the module as a starting point for model specification evaluation. I compared the auto-parameterized models against models with slightly different terms,

relying foremost on Durbin-Watson test statistics, r-squared values, and root mean squared error results to assess model efficacy and choose appropriate ARIMA *p* and *q* terms.[8] I relied on the Augmented Dickey-Fuller test to determine the appropriateness of differencing load data variables with the ARIMA *d* term to ensure model stationarity. Further, I plotted model residuals to check for non-uniformity. I consulted the Akaike Information Criterion ("AIC") and the Bayesian Information Criterion ("BIC") metrics to evaluate the performance of models under varying *p* and *q* term specifications against one another.[9] Finally, I performed "backcast" tests as I describe below, to assess the forecasting abilities of the auto-parameterized models against non-auto-parameterized models. Again, this process is consistent with the methodology applied in Docket UG-200994.

Q. Please describe the issue of non-stationarity and how it could impact the Normal UPCs model.

A. Non-stationarity in the Normal UPCs model variables can occur when their statistical properties vary over time. A utility's customer count is an example, for instance, because it generally increases over time but not at a constant rate. New customers spurred by housing construction are more likely to start service in summer months than winter months. As such, the Normal UPCs model could contain non-stationary inputs,

[8] The Durbin-Watson test statistic, which is a test for autocorrelation, takes a value from 0 to 4. A value of 2 indicates no autocorrelation. A value less than 2 indicates positive autocorrelation, and a value greater than 2 indicates negative autocorrelation.

[9] When comparing models with the same variables but different *p* or *q* terms, in general the model with the lower AIC and BIC metric is preferable.

which is why using the Augmented Dickey-Fuller test is helpful for determining whether the *d* differencing term is necessary.

Q. Please summarize the explanatory variable selection process.

A. I also relied on Durbin-Watson test statistics, r-squared values, and mean squared errors, as well as AIC/BIC metrics, to assess the choice of observed weather variables, monthly indicator variables, weekend days variable, weather-temperature interaction term variables and COVID-19, macroeconomic, and DSM variables to optimize model estimation.

Q. Did the Company perform a "backcast" test to assist in the model optimization process?

A. Yes. A backcast test evaluates how well a model can estimate actual known out-of-sample values using historical (actual) data. I performed an analysis using three backcast tests of varying data vintages to compare model forecast performance against actual load data for the Residential rate schedules. Models are evaluated against each other by calculating and comparing mean absolute percent error ("MAPE") value to test model accuracy and performance. I selected the model specifications with the lowest MAPE for the Normal UPCs analysis.

Q. Does the ARIMA model perform better at weather normalizing load compared to other types of models?

A. Yes. I found that the ARIMA model outperforms both simple linear regression and vector autoregressive models when compared against the model test statistics and metrics as well as backcast tests as discussed above.

Q. How are the results of the ARIMA model interpreted and evaluated?

A. The final output of the ARIMA models is an estimation of weather normalized use per customer per day for each evaluated rate schedule (the dependent variable). The monthly indicator variables (or, in the absence of these variables, the constant term) represent customer baseload demand. The customer heat load use coefficient is expressed as incremental demand per HDD per customer. The additional weather variables and interaction terms are similarly expressed as incremental demand per unit (e.g., inch of precipitation, degree of wind chill or effective temperature HDD) per customer. The macroeconomic and DSM variables represent structural customer baseload demand that cannot be accounted for based on weather or time of year. After running the ARIMA models to produce these coefficients, I used statistical software to evaluate the model estimation output against the 30-year daily normal HDD values to derive a normalized use per customer per day by month.[10] The additional weather variables were also evaluated against historical daily normal values. The model output incorporated the effects of the ARIMA autoregressive and moving average terms on base and heat load use into the use per customer estimation. I repeated this process for every firm sales rate schedule in the Residential and Commercial customer classes.

Q. Please describe the model specification for each firm sales rate schedule modeled in the Normal UPCs analysis.

A. Below, I describe the model specification for each rate schedule in the Normal UPCs analysis.

[10] I used the Stata statistical software package and developed use per customer estimations based on model results using the "predict" command after running the ARIMA model.

1. RS 1 General Sales Service (Residential)

For RS 1 General Sales Service (Residential) ("RS 1 Residential"), I included monthly fixed effects to control for seasonality and a squared HDD term to control for non-linear effects of weather. I used the same ARIMA model specification that I developed for RS 2 Residential, which I describe below, to maintain consistency across the Residential class models – and also because this model specification produced more optimal test statistics compared to models with different specifications.[11] The arimaauto auto-parameterization module suggested a non-differenced specification of ARIMA(2,0,2)(0,0,0)[2] or a one order differenced specification of ARIMA(1,1,0). After testing for model fit and estimating performance, I chose the non-differenced ARIMA(2,0,2)(0,0,0)[2] specification. The model is as follows, where *m* is month and *y* is year:

$$\frac{R1\ UPC}{Day}m,y = \beta_1\frac{R1\ HDD}{Day} + \beta_2\left(\frac{R1\ HDD}{Day}\right)^2 + \beta_3\frac{WindChill * EffectiveTemp}{Day} + \beta_4\frac{SolarRadiation}{Day} + \beta_5 Jan_{=1} \ldots$$
$$+ \beta_{16}Dec_{=1} + \beta_{17}SinceCovidMnths_{=1} + \beta_{18}WeekendDays + ARIMA(2,0,2)(0,0,0)_{[2]}$$

This model produces a normalized UPC value of 175.3 therms annually. This value, which is about 74 percent lower than the RS 2 Residential UPC, is expected because this sales service schedule does not allow primary space heating systems or water heating appliances and is limited to lower-usage appliances such as cooktops and fireplace inserts with a nameplate rating below 20,000 BTUs.

[11] I use the word "optimal" here and elsewhere in this testimony instead of adjectives such as "larger" or "smaller" because not every test statistic is evaluated based on magnitude. The Durbin-Watson test statistic for autocorrelation, for instance, takes a value from 0 to 4. The optimal value, which indicates no autocorrelation, is 2.

2. RS 2 Residential Sales Service

I included monthly fixed effects to control for seasonality and a squared HDD term to control for non-linear effects of weather for the RS 2 Residential model. I tested and then excluded weather terms that did not produce meaningful coefficients based on estimated p-values. I included weather variables with interaction effects (with effective HDDs) that were statistically significant. The arimaauto auto-parameterization module suggested a non-differenced specification of ARIMA(2,0,2)(0,0,0)$_{[2]}$ or a one order differenced specification of ARIMA(1,1,0). I found, however, that a specification of ARIMA(2,0,2)(0,0,0)$_{[2]}$ produces optimal test statistics and better backcast predictive fit compared to these other specifications. The model is as follows, where *m* is month and *y* is year:

$$\frac{R2\ UPC}{Day}m,y = \beta_1\frac{R2\ HDD}{Day} + \beta_2\left(\frac{R2\ HDD}{Day}\right)^2 + \beta_3\frac{WindChill * EffectiveTemp}{Day} + \beta_4\frac{SolarRadiation}{Day} + \beta_5 Jan_{=1} \ldots$$
$$+ \beta_{16}Dec_{=1} + \beta_{17}SinceCovidMnths_{=1} + \beta_{18}WeekendDays + ARIMA(2,0,2)(0,0,0)_{[2]}$$

This model produces a normalized UPC value of 662.3 therms annually. The model produces a UPC about 2.3 percent lower compared to the model specification used in UG-200994.

3. RS 1 General Sales Service (Commercial)

For RS 1 General Sales Service (Commercial) ("RS 1 Commercial"), I used a simplified model with only an explanatory variable to control for seasonality for non-winter months (with the constant term representing the remaining months). RS 1 Commercial excludes primary space and water heating equipment and has a low number of customers, which drove poorer estimation results for more complex models with more variables. The arimaauto auto-parameterization module suggested a non-

differenced specification of ARIMA(1,0,0)(0,0,0)[2] which I chose for this model. The model is as follows:

$$\frac{C1\ UPC}{Day}m,y = \beta_1\frac{C1\ HDD}{Day} + \beta_2 NonWinterMos_{=1} + \beta_3 Constant + ARIMA(1,0,0)(0,0,0)_{[2]}$$

This model produces a normalized UPC value of 654.4 therms annually. RS 1 Commercial is a low-usage rate schedule with the same service parameters and allowable equipment as RS 1 Residential. Therefore, as expected, the RS 1 Commercial UPC estimated for this proceeding is 79 percent lower than the RS 3 Commercial UPC.

4. RS 3 Basic Firm Sales Non-Residential Service - Commercial

For the RS 3 Basic Firm Sales Non-Residential Service – Commercial ("RS 3 General Commercial") model specification, I removed the monthly fixed effects and instead controlled for seasonality in the ARIMA specification, included a squared HDD term to control for non-linear effects of weather. I tested, and then excluded, weather terms that did not produce meaningful coefficients based on estimated p-values. The arimaauto auto-parameterization module suggested a non-differenced specification of ARIMA(2,0,2)(0,0,0)[2] or a one order differenced specification of ARIMA(2,1,2). I found, for this proceeding, that the differenced specification with the same order of multiplicative seasonal ARIMA periods of ARIMA(2,0,2)(2,1,2)[12] produces optimal test statistics compared to other specifications. The model is as follows:

$$\frac{C3\ UPC}{Day}m,y = \beta_1\frac{C3\ HDD}{Day} + \beta_2\left(\frac{C3\ HDD}{Day}\right)^2 + \beta_3\frac{WindChill * EffectiveTemp}{Day} + \beta_4\frac{SolarRadiation}{Day}$$
$$+ \beta_5 SinceCovidMnths_{=1} + \beta_6\frac{SnowFactor}{Day} + \beta_7 WeekendDays + \beta_8 CPIWest$$
$$+ \beta_9\frac{CommercialDSM}{Day} + \beta_{10} Constant + ARIMA(2,0,2)(2,1,2)_{[12]}$$

This model produces a normalized UPC value of 3,155.2 therms annually. The model produces a UPC about 10.9 percent higher compared to the UG-200994 model, which is attributable to both estimated increases in actual per customer demand as well as to the new model specification.

5. RS 27 Residential Heating Dry-Out Service

For the RS 27 Residential Heating Dry-Out Service ("RS 27 Dry-Out") model specification, I included monthly fixed effects and excluded weather terms because they did not have a statistically significant effect on model estimation. The arimaauto auto-parameterization module suggested a non-differenced specification of ARIMA(2,0,2)(0,0,0)[2] or a one order differenced specification of ARIMA(2,1,2). I found that the arimaauto recommended non-differenced model specification produces optimal test statistics and better backcast predictive fit compared to these other specifications. The model is as follows:

$$\frac{R27\ UPC}{Day}m,y = \beta_1 \frac{R27\ HDD}{Day} + \beta_2 NonWinterMnths_{=1} + \beta_3 Constant + ARIMA(2,0,2)$$

This model produces a normalized UPC value of 525.9 therms annually, which is 11.8 percent lower than the UPC value estimated for UG-200994.

6. RS 41 Non-Residential Firm Sales Service - Commercial

For the RS 41 Non-Residential Firm Sales Service – Commercial ("RS 41 Commercial Firm Sales") model specification, I included no monthly fixed effects and instead control for seasonality in the ARIMA specification and excluded all weather terms because they did not produce meaningful coefficients. The arimaauto auto-parameterization module suggested a non-differenced specification of ARIMA(1,0,0)(0,0,0)[2] or a one order differenced specification of

ARIMA(1,1,0)(0,0,0)[2]. For this proceeding, I chose a model specification of ARIMA(1,0,1)(1,1,1)[12], which produces more optimal test statistics. The model is as follows:

$$\frac{C41\ UPC}{Day}m, y = \beta_1 \frac{C41\ HDD}{Day} + \beta_2 WeekendDays_{=1} + \beta_3 IndustrialProductionIndex + ARIMA(1,0,1)(1,1,1)_{[12]}$$

This model produces a normalized UPC value of 41,096.8 therms annually, which is 1.4 percent lower than the UPC value estimated for UG-200994.

7. RS 42 Large Volume Non-Residential Firm Sales Service - Commercial

For RS 42 Large Volume Non-Residential Firm Sales Service – Commercial ("RS 42 Large Volume Commercial Firm Sales"), I used the same model specification as RS 41 Commercial Firm Sales. The arimaauto auto-parameterization module suggested a non-differenced specification of ARIMA(1,0,0) or a one order differenced specification of ARIMA(1,1,0). This model specification is ARIMA(1,0,1)(1,1,1)[12] and is the same specification I used for RS 41 Commercial Firm Sales. The model is as follows:

$$\frac{C42\ UPC}{Day}m, y = \beta_1 \frac{C42\ HDD}{Day} + \beta_2 WeekendDays_{=1} + \beta_3 IndustrialProductionIndex + ARIMA(1,0,1)(1,1,1)_{[12]}$$

This model produces a normalized UPC value of 246,137.6 therms annually, which is 69.5 percent higher than the UPC value estimated for UG-200994. The large change in UPC can be explained by changes to the composition of customers on this rate schedule: Compared to UG-200994, the number of customers increased from five to nine. Given the low customer count, as well as the high usage variability between large volume customers, a small number of customers can more easily drive changes of a larger magnitude to the UPC on rate schedules such as RS 42 Large Volume Commercial Firm Sales.

Q. Have you calculated UPCs for the subset of residential premises taking service on RS 2 Residential that represent new service connections ("New Premises UPC")?

A. Yes. The Company has noticed a decrease in average normalized usage for new residential premises over the past few years, and therefore the anticipated UPC for new service connections is lower than existing service connections. In response to this observation, for this proceeding I have calculated an additional UPC for new connection customers taking service on RS 2 Residential, which is used to build the Company's proposed revenues beginning at the Pro Forma Period and extending through the MYRP period. This New Premises UPC, which I estimate is about 334.0 therms annually, is meant to better estimate revenues that new customers will generate for the purpose of developing the Company's revenue requirement for this proceeding. This analysis is presented in Exh. RJW-4.

Q. Please describe the New Premises UPC data collection and estimation parameters.

A. I queried the Company's Customer Information System ("CIS") for new premises that have been connected to the Company's system beginning July 1, 2023, and associated installed equipment. Due to the short timeframe as well as the fact there is generally a delay between service initialization at new premises and observable therm load, I did not use an ARIMA model to estimate the New Premises UPC. Instead, I used assumed therm usage by equipment type for each premises to develop an expected therm load by premises. I then averaged these expected loads across the 1,799 premises in my query to calculate the estimated New Premises UPC.

Q. Why is there generally a delay between service initialization at new premises and observable therm load?

A. The initialization of service may not coincide with the installation of all appliances, and there may be a gap between when the premise is completed, is placed on the market and sold, and when a new household fully moves in; due to these reasons, there could be multiple billing periods between when a service is initialized and when it begins to produce data adequate for establishing a normalized annual use. For some new construction premises, a developer may opt for dry-out service and therefore the premise will be on RS 27 Dry-Out for several months prior to it being ready for habitation, at which point it is placed on RS 2 Residential service. Due to this gap between service initialization and full habitation, using an ARIMA model on usage of premises connected beginning July 2023 would not produce an accurate weather normalized UPC estimation. After more years of data are collected, however, it is probable that the New Premises UPC can be calculated using an ARIMA model specification.

Q. Please summarize the results of the Normal UPCs analysis.

A. The Normal UPCs analysis methodology changes, which I described earlier, result in improved test statistics and predictive capabilities, as well as interpretability. The chosen ARIMA model specifications produce a weather-normalized Test Year UPC of 653.6 therms annually for the Residential class (including RS 1 and RS 2 Residential), and 3,794.3 therms annually for the Commercial Firm Sales schedules combined.

Q. How are the customer forecast and Normal UPCs used to create Test Year volumes that generate revenues at existing rates for the proposed revenue requirement?

A. The Company calculates Residential and Commercial Firm Sales class Test Year monthly volumes by multiplying the weather normalized UPCs for each residential and commercial firm sales rate schedule by monthly end-of-period customer counts.

Q. How are normalized Test Year volumes built for the Industrial Sales as well as the Commercial and Industrial Transportation classes?

A. Normalized Test Year volumes for the Industrial Sales as well as the Commercial and Industrial Transportation classes are developed using a customer-specific methodology ("Industrial Forecast"). This customer-specific Industrial Forecast begins with a recent 12-month period of actual usage and customers and is then adjusted by the Company's large customer and major accounts subject matter experts for changes in projected load usage, and customer additions, losses, and rate schedule changes that arise from the service election period.

Q. Where are the Test Year volumes used to build the revenues for the revenue requirement presented?

A. The derivation of Test Year revenues from the customer and volume forecasts is presented in a summary by customer class in Exh. KTW-4.

Q. What are the Company's other uses for the Normal UPCs?

A. The Company uses the Normal UPCs to develop the design day load factor for the EmCOSS, as discussed below. The Normal UPCs are also used to estimate throughput volumes for the Company's annual purchased gas adjustment ("PGA"). The

methodology for calculating the Normal UPCs is consistent between the PGAs and rate case filings.

III. EMBEDDED COST OF SERVICE STUDY

A. Embedded Cost of Service Regulatory Considerations

Q. Has the Commission stated its preference for cost of service study methodology?

A. Yes. The Commission, in General Order No. R-599 (Docket UG-170003), issued on July 7, 2020, adopted WAC 480-85. These rules establish minimum filing requirements – including data inputs, methodologies, presentation of results – for any cost of service study filed with the Commission, and specifically direct utilities to calculate cost of service using an embedded cost method. The Commission states that its preference for the embedded cost methodology is based on long-standing precedent and stakeholder compromise.[12]

Q. Does the Company's EmCOSS meet the requirements of WAC 480-85?

A. Yes, the Company's cost of service study presented in this filing meets all necessary requirements. In the Company's prior rate case proceeding, Docket UG-200994, it requested and received an exemption to WAC 480-85-050(1), which specifies that the usage data employed in any cost of service study must come from advanced metering technology that provides, at a minimum, daily natural gas usage readings. If these data are not available, the utility may conduct a "load study," defined as a study of daily

[12] *See*: *In the Matter of Amending WAC 480-07-510 and Adopting Chapter 480-85 WAC Relating to Cost of Service Studies for Electric and Natural Gas Investor-Owned Utilities*, Dockets UE-170002 and UG-170003, General Order R-599, at 11 (Jul. 7, 2020); and WAC 480-85-060.

usage data to produce rate class load profiles using a subset of sampled customers.[13] At the time of the Company's last filing, the Company did not have advanced metering infrastructure ("AMI") described in WAC 480-85-050(1)(a) or other advanced metering technology such as automated meter reading ("AMR") with daily read capabilities as indicated in WAC 480-85-050(1)(c) to comply with this requirement. The Company submitted for an exemption of WAC 480-85-050(1) which was granted in UG-200925, Order 01.

Q. Does the Company have the daily meter reading capabilities deployed such that it can satisfy the requirements of WAC 480-85-050 in this filing?

A. Yes. While the Company is still in the process of installing additional new AMR encoder receiver transmitters ("ERT") that have daily read capabilities described in WAC 480-85-050(1)(b) for all customers across its Washington service territory, it does have daily read capabilities across a subset of customers with sufficient consistent daily data representative of all its customer classes for a minimum of twelve months. Therefore, the Company has developed a load study using daily data from a sampling of customers with daily read capable meters which is presented in Exh. RJW-5. Exh. RJW-6 and Exh. RJW-7 present the load study sampling and regression methodology, respectively.

[13] See WAC 480-85-030(5) (defining "load study" as "a statistical analysis of load data collected from sampled customers to estimate the load profiles of customer classes over a minimum twelve-month period.").

Q. Is the Company working to deploy daily read capabilities for all customers such that it can satisfy these requirements without the need for a load study?

A. Yes. The Company has an on-going system-wide Meter Modernization Program effort described in further detail in Exh. JSK-1T, aimed at replacing end-of-life ERTs. As part of this effort, older meter families are replaced with daily read-capable sets. While these devices are expected to be fully installed across the Company's Washington service territory by the end of 2027, the Company anticipates it would not have a minimum 12 months of daily meter read data to collect from these upgraded meter sets until the end of 2028 at the earliest.

Q. Does the EmCOSS methodology follow the same cost of service methodology presented in the Company's last rate case?

A. Yes. This is the Company's second EmCOSS that follows the cost of service study methodology adopted under General Order No. R-599 and described at WAC 480-85-060.

B. Embedded Cost of Service Study Purpose and Principles

Q. What purpose does a cost of service study serve?

A. The overall objective of a cost of service study, including an embedded cost study, is to apportion the incremental revenue requirement to rate schedules based on each schedule's specific cost to serve (this is true of other types of cost of service studies, such as those based on long run marginal costs). Whereas a long run cost of service study evaluates the marginal (incremental) costs borne by each rate schedule with the addition of one new customer, the embedded cost of service study presented below is based on historical Test Year installed costs (e.g., gross plant and the accumulated

depreciation on those capital assets) of assets in-service and expenses (e.g., for operations, maintenance, taxes) associated with the on-going provision of utility service.[14] By analyzing how the customers that make up each rate schedule contribute to these embedded capital costs and on-going expenses, the EmCOSS methodology works to apportion a utility's storage, transmission, and distribution costs, as well as operating expenses (i.e., all of the components of revenue requirement) based on cost causation.[15] As a general rule, cost causation is an influential factor in parties' discussions on how to allocate costs to specific rate schedules for rate spread; therefore, it serves the utility well to understand the engineering and economic cost differences between customer classes and/or rate schedules.

Q. Please describe the economic principles that underlie a cost of service study.

A. Embedded cost studies (and cost of service studies in general) allocate costs based on cost causation to identify how the incremental revenue requirement should be allocated to rate schedules in order to move closer to *Pareto Optimality*.[16] The reasonable allocation of costs is determined by understanding the specific customer characteristics associated with each class and rate schedule in order to equitably allocate costs.

[14] In practice, a cost of service study can and usually does apportion costs using both an embedded and incremental approach, depending on the type of cost. For instance, an embedded cost study may apportion Test Year customer service costs across all rate schedules, but allocate these costs to specific schedules based on the incremental costs of an additional customer.

[15] For gas utilities that produce energy, an embedded cost of service model can similarly apportion commodity production costs based on cost causation.

[16] *Pareto Optimality* is a state of allocation equilibrium where participants cannot be made collectively or individually better off given a change in cost or price, without also making other participants worse off. Cost of service studies generally measure the relationship between current utility rates and pareto optimal rates, on a rate class or rate schedule basis, as a "parity ratio" where a value of 1.00 indicates customers in that group are paying no more and no less than their full cost to serve. A change to the rate that results in deviation from 1.00 would signal either cost subsidization (greater than 1.00) or cost subsidy (less than 1.00).

Characteristics can include peak day demand and average usage characteristics, service type (firm vs. interruptible, sales vs. transportation), customer service needs, and average mains and service lines costs. A cost of service study works to identify not only how each characteristic of a rate class contributes to overall costs, but how these characteristics contribute to the utility's fixed and variable costs.

Economists have derived the principles of "subsidy-free prices" and "stand-alone costs" ("SAC") as a means for achieving *Pareto Optimality*. Subsidy-free pricing is achieved when the price of a good or service charged to a group of customers exceeds its marginal cost ("MC") but is less than the cost these customers otherwise would have incurred individually (e.g., the SAC). Prices set at a subsidy-free level provide customers economies of scale given that all customers are paying a portion of the fixed system costs where (Price > MC) while achieving equitable cost sharing of common costs. While the sharing of fixed and other common system costs is the most equitable outcome for customers, local distribution companies must be aware that price does not exceed the SAC to serve customers because customers would in theory be unwilling to take service (and/or would move to the next best economic alternative) if prices exceed SAC. Therefore, the level of price is key to ensuring customer equity is achieved between rate classes/schedules with common utility costs fairly identified and allocated.

Q. Please describe the specific purpose of the EmCOSS methodology presented in this testimony.

A. The EmCOSS methodology presented in this testimony is an economics exercise that evaluates how much of the Company's embedded capital investment and carrying

costs, and operations and other expenses required to serve its customers, can be directly and indirectly attributable to each rate schedule. The costs and expenses that form a basis for the EmCOSS follow the Company's Test Year for the 12 months ended March 31, 2025.

The EmCOSS follows three main steps: (1) functionalization; (2) classification, and (3) allocation. Functionalization places costs that make up the revenue requirement into categories based on broad utility functions and, following the approved methodologies prescribed in Table 3 of WAC 480-85-060(3), is based on Federal Energy Regulatory Commission ("FERC") Uniform System of Account categorization. The functionalization of embedded costs is informed by the makeup of the Company's capital investments and operating expenses in the Test Year revenue requirement of this proceeding. The second step, classification, further splits the functional costs into three characteristics related to their marginal cost characteristic: (a) demand costs are closely related to plant in-service, are generally fixed, but are influenced by design day peak demand and average throughput; (b) energy costs are variable and are directly related to therms consumed; and (c) customer costs can be fixed or variable and related to the number of customers taking service. Allocation, the final step, can assign cost items through indirect or direct assignment. Every functionalized and classified cost item is assigned to individual rate schedules through allocation methods that follow Table 4 of WAC 480-85-060(3). Some cost items are allocated based on direct assignment to specific rate schedules, however, and I describe below how these costs are directly assigned and allocated through the results of "special studies."

After allocating all revenue requirement cost elements, the EmCOSS calculates the relative ratio of revenue to incremental costs for each rate schedule at present rates. This ratio is used to understand cross-subsidies between rate schedules at current rates and can be used by the Company to inform its rate spread and rate design proposals.

Q. What costs does the EmCOSS directly assign through special studies?

A. I directly assigned costs for the following items based on studies conducted using Company data such as job orders, engineering and other Geographic Information Systems ("GIS") data, accounting data, and billing and usage data:

- Distribution mains
- Service lines
- Meter sets and regulators
- Certain customer accounts services

Note that for some costs, such as distribution mains, I directly assign only a portion of the total costs; the remainder is assigned per WAC 480-85-060(1)(d) and Table 4 of WAC 480-85-060(3). I describe each of these studies in detail below.

Q. Please explain how the EmCOSS is presented with this rate case.

A. The full Excel-based EmCOSS model is submitted in its entirety as an exhibit accompanying this rate case. Each of the special studies is similarly submitted as exhibits; the output from each study is summarized in a tab in the EmCOSS, with an index identifying the external spreadsheet file(s). The natural gas cost of service template sponsored in Exh. RJW-12, which cross-references the revenue requirement results and summarizes the EmCOSS outputs, is also located within the EmCOSS model exhibit in compliance with WAC 480-85-040(1).

C. NW Natural's EmCOSS Inputs and Methodology

Q. Have you prepared a cost of service study for this proceeding?

A. Yes. Exh. RJW-12 presents the results of NW Natural's embedded cost of service study, the EmCOSS. The exhibit includes the natural gas cost of service template and shows the indicated EmCOSS summary results and the EmCOSS-indicated spread of NW Natural's proposed revenue requirement by rate schedule. Exh. RJW-8 through RJW-11 are inputs that support the Company's EmCOSS.

Q. Does your EmCOSS methodology differ from the methodology used in the Company's last rate case filing, UG-200994?

A. No. The Company's EmCOSS methodology generally follows that of its last rate case filing, Docket UG-200994. As I describe below, I used a five-year coincident peak value to derive the load factor for the large volume rate schedules, where previously I had used non-coincident peaks for these schedules. For all other rate schedules, I used a coincident peak in UG-200994 as well as this proceeding.

Q. How is your discussion of the EmCOSS methodology organized?

A. The individual EmCOSS inputs and methodology discussion sections are organized as follows:

1. Design Day Load Factor
2. Functionalized Plant Investment Costs
3. Operations and Maintenance (O&M) Expense
4. EmCOSS Insights and Outcomes

1. Design Day Load Factor

Q. What is the design day load factor?

A. The load factor is a ratio measure of each rate schedule's contribution to the design day peak load. For purposes of the EmCOSS, I consider design day load on a Washington basis and attributable to Washington customers only. While load could potentially peak for other reasons on other systems, load peaks for NW Natural are a matter of space heating requirements and are therefore directly related to weather.

Q. How is the design day load factor value interpreted?

A. The design day load factor is the ratio of normalized average usage to the estimated design day peak usage, expressed as a percentage. A low load factor ratio indicates that a rate schedule has high peaking load relative to normalized average usage (i.e., it indicates the rate schedule has high weather sensitivity as load peaks during cold weather events). A high load factor indicates less weather sensitivity and more predicable base load usage throughout the year. Residential rate schedules, which use gas most significantly for heating purposes, are expected to have lower load factors relative to Industrial rate schedules that are more heavily comprised of processing load customers that use gas for purposes not tied directly to weather, such as the manufacturing of goods.

Q. How does the EmCOSS use the design day load factor?

A. The load factor is the basis for the design day (peak) and annual throughput (average) allocator that the EmCOSS uses to allocate (in full or in part) distribution mains and assets, system core mains, and transmission main investment to each rate schedule. The "Design Day Peak and Average Allocator" is a weighted ratio of each rate

schedule's contribution to the load factor-derived peak day deliveries and average throughput. Rate schedules with lower load factor ratios require more excess system capacity investment to meet design day load relative to higher load factor schedules, assuming equivalent annual load, and are therefore allocated more of these investment costs relative to higher load factor schedules.

Q. How is the design day load factor calculated for the EmCOSS?

A. The design day load factor for each rate schedule was estimated using the Normal UPCs for the Residential and Commercial sales customer classes, and the Company's Industrial Forecast for the remaining schedules. The design day load factor is calculated in Exh. RJW-11.

The ARIMA-based Normal UPC analysis described earlier in this testimony produced base and heat load coefficients for each rate schedule in the Residential and Commercial sales customer classes. I used statistical software that estimated these coefficients to model the normalized load numerator for the load factor ratio using the historical 30-year HDD average. As part of its resource planning processes, the Company has estimated an 11-degree Fahrenheit design day temperature, which I converted to HDDs. Using the Normal UPC-derived heating coefficients, I then estimated the design day load factor denominator.[17] For the rate schedules included in the Normal UPC analysis, this process creates a load factor based on coincident peak.

[17] For NW Natural's 2022 IRP, the Company used a probabilistic planning standard to forecast peak load as function several key drivers. This planning standard sets a daily resource capacity requirement such that the Company would be 99 percent certain it would be capable of meeting load going into any winter. Using this methodology, the Company has calculated an average system weighted temperature around this planning standard of roughly 11-degrees Fahrenheit.

Large Commercial interruptible and transportation service and Industrial schedules in rate classes RS 41 and RS 42 are not included in the Normal UPC analysis, as well as RS 3 Industrial. Customers in these classes were not included in the Normal UPC analysis because the Company maintains a separate customer-specific Industrial Forecast for these customers that is routinely updated by its subject matter experts. The Industrial Forecast volumes are the basis for the normalized load numerator for the load factor ratio. For the denominator, I queried historical load data by month and by day (where available) for all customers in these rate classes for each of the peak days on the Company's Washington system beginning January 2021 through May 2025 (resulting in five peak days). I calculated a maximum daily delivery volume ("MDDV") for each customer by peak day and aggregated these volumes by rate schedule. Then, I averaged each year's peak day MDDV value to derive a five-year coincident peak value for each large volume Commercial and Industrial service rate schedule in RS 41 and RS 42, as well as RS 3 Industrial (excluding Commercial Sales Firm service schedules, which are included in the Normal UPC analysis). This five-year coincident peak value is the basis for the design day load factor denominator; consistent with the Normal UPC analysis rate schedules, this design day load factor calculation is based on coincident peak. For the large volume Commercial and Industrial customers, coincident peak recognizes that depending on sector (such as agriculture or food processing), peak usage may not be tied to winter design day demands but rather the time of year processing or manufacturing occurs.

Q. How did you calculate the coincident peak for situations where the numerator is larger than the denominator?

A. I capped the coincident peak load factors at one hundred percent such that it at least reflects each rate schedule's annual average throughput contribution. Doing so is reasonable because for the rate schedules where this applies, their average winter sales are larger than or nearly equal to their average summer sales.

Q. What were the results of the design day load factor analysis?

A. I estimate an overall load factor for Washington rate schedules of 30.5 percent, with a firm load factor of 28.6 percent and a transportation load factor of 98.1 percent. The RS 2 Residential load factor is about 24.5 percent, meaning normal load for this schedule is a little less than one-quarter of its design day load. The RS 3 Commercial load factor is about 29.4 percent, while the Large Commercial rate schedules have estimated load factors ranging from 32.5 percent to 100.0 percent; the Industrial rate schedules have estimated load factors ranging from 55.5 percent to 100.0 percent.

Q. What were the results of the Company's load study analysis?

A. As I noted earlier, the Company also conducted a load study as defined by WAC 480-85-030(5). The load study data collection, sampling methodology, regression estimation techniques, and conclusions are presented in Exh. RJW-5, Exh. RJW-6, and Exh. RJW-7. The load study evaluates customer load profiles and calculates alternative design day load factors using sampled load data at daily granularity. The load study concludes that the design day load factors developed using the Normal UPC analysis described above produce usage estimations with better performance and fit of actual usage.

Q. Does the Company use the results of the design day load factor analysis or the results of the load study for its EmCOSS?

A. For the purposes of the EmCOSS for this proceeding, the Company uses the design day load factor analysis results developed using the Normal UPC analysis as the allocation method for distribution mains, transmission mains, and distribution assets as described in Table 4 of WAC 480-85-060(3) for the reasons discussed above and in the load study (Exh. RJW-5). The EmCOSS that the Company has used for this proceeding is presented in Exh. RJW-12. An alternative EmCOSS using the load study results is presented in Exh. RJW-13, to ensure compliance with WAC 480-85-060(2). Due to the Company's findings discussed in the load study in Exh. RJW-5, the Company does not adopt the results of the alternative EmCOSS presented in Exh. RJW-13 for this case and, instead, adopts the results of the EmCOSS presented in Exh. RJW-12 for this case.

Q. Does the Company rely solely on the peak and average methodology for allocation of capacity costs in the EmCOSS?

A. No. On its own, the Design Day Peak and Average Allocator does not fully capture the entirety of the system's cost causation among all rate schedules, which is why I also employ "average and excess" and "winter to summer average excess" allocation methodologies in my EmCOSS as is specified under the allocation method for Storage in Table 4 of WAC 480-85-060(3). While cost causation for some investments such as a portion of distribution mains and transmission mains are determined based on demand throughput based on a rate schedule's contribution to capacity needs (e.g., peak and average methodology), it also follows that cost causation for some investments, such as underground storage, are better allocated based on a rate schedule's contribution to

capacity demands at peak times (e.g., winter to summer average excess). The Company uses both methodologies to balance the assignment of cost causation among disparate investment categories from high volume to lower volume, but peakier, customer classes.

2. Functionalized Plant Investment Costs

Q. Please outline the specific components of functionalized plant investment costs evaluated in your study.

A. The functionalized incremental plant cost categories evaluated in this study include:

a) Distribution mains and assets, which are required for various purposes over time as the system grows, including mains to serve new customers and mains installed for safety and reliability purposes. The EmCOSS directly allocates a portion of these mains costs, based on an analysis of average installation cost per foot and length by rate schedule. The remainder of distribution mains costs are allocated based on the peak and average allocator. Distribution mains are designated in the Company's plant accounting records as those less than four inches in diameter, and those four inches or greater.

b) Unattributable system core mains, which are the balance of mains not attributable to distribution mains. System core mains, for the purpose of this EmCOSS, constitute the distribution pipeline that transport gas from the interstate pipeline to delivery points on the Company's system (e.g., gate stations) and interconnect with smaller diameter mains used to serve areas with customers such as neighborhoods, commercial strips, or industrial districts.

c) Transmission mains, which constitutes the pipeline that transports gas from the interstate pipeline to delivery points on the Company's system.

d) Distribution Assets, which are miscellaneous plant assets needed to support distribution functions.

e) Storage, which includes the costs associated with underground storage, is a primarily winter peaking resource.

f) Service lines, which includes costs associated with the piping and trenching from meter set to distribution main, and distribution main tie-in.

g) Meter set and regulator assemblies, which includes the cost of the meter and regulator, as well as the pipe fittings, bracket assemblies labor, and shop time required for assembly.

h) Administrative & General and Intangible Plant includes many of the assets used to serve all customers such as computers and software, as well as communications equipment.

i) Land and Structures are the physical assets the Company uses for its operations.

a. Distribution Mains and Assets

Q. Did you conduct a special study to directly assign distribution mains costs to individual rate schedules?

A. Yes, I directly assigned a portion of distribution mains costs using a special study which is presented in Exh. RJW-8. Costs not directly assigned are allocated based on the design day peak and average allocator.

Q. What were the inputs used to calculate the directly allocated distribution mains costs?

A. The main extension costs were evaluated using ten calendar years (2015 – 2024) of historical accounting data of Washington main extension job orders. The accounting data include the total cost (excluding construction overhead) and footage installed per job, pipe size and material, and are delineated by service type (conversion vs new construction), and market segment. The market segments analyzed are as follow:

- Residential-single family new construction ("Residential New")
- Residential-single family conversion ("Residential Conversion")
- Commercial / Industrial ("Com/Ind")

In addition to the ten years of job orders data, I used a main extension forecast that is produced annually by the Company's Business Analytics team, for 2024 through the Test Year. This forecast uses three categories of extensions: Commercial mains, Residential mains, and system expansion main extensions. The third category is overwhelmingly made up of new construction residential connections. The forecast is expressed in terms of mains footage and cost per foot.

Neither the main extension jobs order data nor the forecast includes a rate schedule breakout. I delineate by market segment, however, based on several factors, including location of the main extension, pipe size, and the type of customers most likely to take service on the extension.

Q. How were the directly allocated distribution mains costs calculated?

A. I used the main extension jobs order data to calculate the 10-year average cost per foot and median main length installed by market segment. Additionally, I used the same

dataset to calculate the 10-year average cost per foot and median main length installed by pipe size (less than four inches, or greater than or equal to four inches) and material (polyethylene or wrapped steel). The average cost of main extension is based on accounting data that are expressed in nominal dollars. Therefore, for purposes of the Test Year, I escalated the nominal main extension costs per foot to forecasted Test Year values using an inflation index that I equally weighted using two data sources ("Inflation Index").[18] The escalated values were used to create the median Test Year cost per foot input for the EmCOSS.

Q. How did you assign the median distribution main extension *cost per foot* for each market segment and pipe size to a rate schedule?

A. I used a weighting methodology that employs three inputs: (1) the Company's main extension forecast, weighted using a ratio of incremental customers added by way of conversion off existing main and those added through system expansion; (2) the job orders data by market segment; and (3) the job orders data by pipe size. For every rate schedule, I used a 50-50 weighting ("Segment Weight") to assign costs based on the forecast and the 10-year actual median cost per foot by market segment. For the Commercial and Industrial rate schedules, I further assigned costs by pipe size and type. I used pipe sizes and type for the large customer schedules as a method for further weighting main costs across schedules with wide variations in customer sizes, loads, and physical location off-main.

[18] I equally weighted inflation forecasts from two sources: (1) The Company's real long-term discount rate assumption used by its Strategic Planning Team for IRP development; (2) Oregon Economic and Revenue Forecast, Table Other Economic Indicators: CPI Urban Consumers. Page 45 (Exh. TFD-3, page 49), May 2025.

I assigned the Residential Conversion market segment to RS 2 Residential, the Residential New market segment to RS 27 Dry-Out, and the Com/Ind market segment to both RS 3 Commercial and RS 3 Industrial customers. Due to the large number of RS 3 Commercial customers on the system, I used Company GIS data to query a randomized sample of these customers to estimate the pipe size of the mains that customers in this rate class have been connected to historically. Using these GIS data, I calculated the ratio of customers connected to mains of less than four inches and greater than or equal to four inches and used this ratio to assign costs once the Segment Weight had been applied. The RS 3 Industrial mains costs were assigned similarly.

For the RS 41 and RS 42 rate classes, I applied the same Com/Ind Segment Weight as used for the RS 3 rate class. Mains costs were further delineated by rate schedule using the historical GIS pipe size data. For these larger schedules, I categorized mains connections by both pipe size and material due to the large variations in mains sizes and types that serve these customers.

Q. How did you assign the median distribution main extension *length* for each market segment and pipe size to a rate schedule?

A. I used a similar methodology as described above to calculate the median main extension length (in feet) for each schedule. For RS 2 Residential and RS 27 Dry-Out, I used the Company's main extension and customers forecasts. For the Commercial and Industrial schedules, I used 10-year average installed feet of mains by pipe size and material type to estimate main extension lengths for three categories: Small Com/Ind, Large Commercial, and Large Com/Ind.

Q. How were the directly allocable distribution mains costs calculated and allocated?

A. First, I estimated the feet of Washington mains on the Company's system not attributable to main extensions serving customers. I used feet of mains reported in the Company's FERC Distribution Report as a basis for total mains footage, categorized by pipe size.[19] Next, I used the historical GIS pipe size data to estimate what percentage of customers in each rate schedule are connected to distribution mains of less than four inches and equal to or greater than four inches. Using the distribution main extension median installed feet described above, I calculated the feet attributable to these customer classes by pipe diameter category. The remaining feet were classified as system core (unattributable) mains. I used an average cost of installed mains, weighted by pipe material, to get an estimated cost per foot. I then allocated these attributable mains to rate schedules based on share of overall attributable costs.

b. System Core Mains

Q. How did you calculate the share of distribution mains to classify as system core mains?

A. The remainder of the feet of mains reported on the FERC Distribution Report and not determined to be directly allocable distribution mains above (the unattributable portion) was classified as system core mains.

[19] The FERC Distribution Report is created annually by the NW Natural Engineering Department. It is used by the Plant Accounting team to validate that the feet of mains reported in the Company's asset management accounting databases is correct.

Q. How did you assign the system core mains costs to each rate schedule?

A. I used a peak and average method for distributing the system core mains costs to the rate schedules based on two allocations: Total average throughput and peak firm demand. The total throughput allocator is based on the design day load factor (i.e., the "average") and distributes costs across all schedules. The firm demand allocator is based on one minus the design day load factor (i.e., the "peak") and similarly distributes costs across all rate schedules. This cost assignment follows the allocation methodology for Distribution Mains in Table 4 of WAC 480-85-060(3).

Q. Does the system core mains allocation make an adjustment for interruptible peak day deliveries?

A. No. The system core mains allocation follows the coincident peak load factors, which assign no peak firm design day demands to the interruptible rate schedules following application of the peak and average methodology.

c. Transmission Mains

Q. How were the transmission mains costs allocated?

A. Transmission mains costs were allocated using the design day peak and average allocator based on the Washington system load factor per Table 4 of WAC 480-85-060(3).

d. Distribution Assets

Q. How were the distribution asset costs allocated?

A. Distribution asset costs were allocated using the design day peak and average allocator based on the Washington system load factor also per Table 4 of WAC 480-85-060(3).

e. Gas Storage

Q. How were underground gas storage costs allocated?

A. Underground gas storage plant costs were allocated to sales customers only, using a ratio based on Test Year average winter sales that exceed Test Year average summer sales as described in Table 4 of WAC 480-85-060(3). This measure allocates costs based on contribution to average peak loads compared to a period of average base loads.

Q. Were any underground storage costs classified as balancing and allocated to the Transportation class?

A. No. The EmCOSS does not classify any storage costs as balancing for allocation to the Transportation class. NW Natural generally will utilize the interstate pipeline for daily and/or monthly system balancing, not underground storage assets. However, it is possible that our underground storage assets could be utilized for balancing all customer classes, including Transportation. Any underground storage costs that could potentially be allocated to the Transportation class would be negligible.

f. Service Lines

Q. How were service line installation costs and average footage installed by rate schedule determined through your special study?

A. The calculation of average services cost per foot and the average footage installed was derived using ten years of historical accounting data of Washington services job orders (2015 – 2024) for customer service installations by market segment and are presented in Exh. RJW-8. These data are very similar to those of the Washington mains orders; the orders include the total cost (excluding construction overhead), footage installed

per job, and pipe size and material. The important distinction is that the services orders are associated with customers on specific rate schedules.

Services costs for RS 2 Residential, RS 3 Commercial, and RS 27 Dry-Out were calculated using a ten-year average of job costs per foot. Due to the small job sample size for the Commercial and Industrial schedules in the RS 41 and RS 42 classes, I used historical data to calculate a weighted median cost per foot. Using a GIS data query for services connection footage by rate schedule historically, I estimated services cost by customer per rate schedule by multiplying the average footage by average cost per foot. I used the Inflation Index to inflate nominal dollars to Test Year values.

Q. Did the Company update its Service Line Cost Allocator?

A. Yes. In Docket UG-200994, I applied a separate allocation for rate schedules in the RS 41 and RS 42 rate classes based on the overall embedded services plant cost in the Test Year. For this proceeding, I have applied a consistent allocation of embedded costs on a per service basis to all rate schedules that is informed by the results of my special study (through the *Line-1* allocator). Thereby, I have removed the effects of the *Line-2* allocator from the study.

g. Meter Sets and Regulators

Q. Please outline how your special study calculated costs for meter sets and regulators.

A. I ran a customer query out of NW Natural's CIS that included each actively billed customer's meter set model number and delivery pressure. A summary of this CIS data provided the counts of meter set models by rate schedule. NW Natural's Engineering Department maintains an engineering cost memo that provides the assembly and capital

cost for each assembled meter set (by meter model number) with regulator. I calculated weighted-average cost using the costs from the engineering cost guide and meter counts by rate schedule to derive the capital investment cost by customer by rate schedule. The results of this analysis are presented in Exh. RJW-9.

Q. How were meters and regulators plant investment costs allocated to rate schedules?

A. I converted the average meter cost per customer per rate schedule to share of overall meter and regulator costs using customer count as a weight.

h. General and Intangible Plant

Q. How was general plant allocated to rate schedules?

A. I used a common allocator that was built using three factors: (1) net allocated plant balances for the storage, distribution, and transmission functions; (2) total O&M expense allocation; and (3) customer count. I created the common allocator using an equal weight of each of these three factors. These factors together represent a mix of each rate schedule's share of overall utility capital investments and operating expenses, accounting for the relationship between costs and customer count.

Q. How was intangible plant allocated to rate schedules?

A. I similarly used the common allocator to allocate intangible plant, as I considered these common costs. I examined the intangible plant assets at the materiality threshold of 0.5 percent per Table 4 of WAC 480-85-060(3) and found no items directly allocable to specific rate classes or schedules.

Q. Were any of the Company's plant balances not covered in Table 3 of WAC 480-85-060(3)? How were these accounts allocated?

A. Yes, FERC Accounts 363.5 (CNG Refueling Facilities) and 363.6 (LNG Refueling Facilities) are not included in Table 3 of WAC 480-85-060(3). I used the common allocator to allocate these plant balances to the rate schedules because the benefits associated with these facilities are not limited to any customer class.

i. Land and Structures

Q. How were land and structures allocated?

A. I allocated the general land and structures plant balances (FERC Accounts 389 and 390) based on functionalized storage, transmission, and distribution plant. For land and structures attributable to certain functions, I allocated the balance based on plant associated with that function only (e.g., storage related land and structures are allocated based on storage plant).

3. Operations and Maintenance (O&M) Expenses

Q. Please describe the categories of O&M expenses evaluated in the EmCOSS.

A. Below, I describe how I allocate O&M expenses in the EmCOSS. O&M expenses are associated in EmCOSS with capital investments as well as common costs. O&M expenses associated with capital investments are the on-going O&M expenses required to keep plant assets operational and efficient. The expenses are associated with the assets: gas storage, transmission, and distribution. Common O&M expenses are associated with common cost items required to keep the entire system running, such as administrative and office expenses, wages and salaries, and customer service and billing. The two major categories of common O&M expenses that I evaluated in the

EmCOSS were: (a) Customer Service and Billing; and (b) Administrative and General. I explain how these expenses were allocated to the rate schedules below.

a. Customer Service and Billing

Q. What are the categories of customer service and billing O&M expenses that were evaluated in the EmCOSS?

A. The EmCOSS includes a special study based on the following categories of O&M customer service-related expenses for direct allocation and presented in Exh. RJW-10:

- Gas Scheduling, which includes departments that schedule underground storage injections/withdrawals, as well as control the distribution system's daily operations.
- Gas Planning, which are operations that include, short- and long-term gas acquisitions, planning, and analysis (e.g., gas purchasing and hedging activities).
- Major Accounts Services, which is the team that interacts primarily with large commercial and industrial customers through the service election process, coordinates billing and addresses billing issues, as well as coordinates new large customer acquisitions.
- Accounts Services, including billing, payment processing, metering, collections, and construction field services.

Q. How were gas planning and gas scheduling costs evaluated and assigned to each rate schedule?

A. The gas scheduling and gas planning cost centers were evaluated using the O&M budget cost center for the Gas Scheduling and Planning Department. Cost categories include total salaries, administrative costs, and FTE counts for each cost center. These

values are used to evaluate per customer costs for the EmCOSS, based on average hours spent on each customer at a calculated average labor rate.

The gas scheduling cost center was broken out into two functions: gas storage operations and gas control operations. Costs associated with gas storage operations were allocated to firm sales rate schedules only. Gas control operations costs were allocated to all schedules based on three factors: (1) service type (sales firm, sales interruptible, or transportation); (2) normalized annual throughput; and (3) the amount of time gas management staff estimate they spend working with customers of each service type.

The gas planning cost center was allocated to all service types based on the amount of time gas management staff estimate they spend working with customers of each service type. Costs are largely allocated to sales customers since little staff time is devoted to transportation customers that are responsible for procuring their own gas commodity.

Once costs were assigned to each service type, they were directly allocated to each rate schedule based on weighted customer counts within that service type.

Q. How did you evaluate Major Accounts Services costs?

A. Major Accounts Services costs were allocated only to the large RS 41 and RS 42 Commercial and Industrial rate classes, as well as RS 3 Industrial. Costs were further allocated to sales and transportation rate schedules based on reported staff time spent interfacing with each service type.

Q. How were all other Accounts Services costs evaluated?

A. For all other Accounts Services costs, NW Natural conducted a "Meter-to-Cash" study, that evaluated the incremental costs associated with providing these services to customers. The study evaluated the following cost center groups in the Company that directly serve customers:

- Accounts Services (meter reading scheduling, payment processing, collections)
- Contact Center (customer call center)
- Resource Management Center (field services scheduling/dispatch)
- Construction Field Services (field technicians and field scheduling)
- Office Services (bill printing)
- Treasury (costs that pertain only to payment processing)
- Information Technology (costs related to computer support for processes that support meter reading, payments, and Company website)

Q. What is the purpose of the Meter-to-Cash study?

A. The Meter-to-Cash study was first developed by the Company in 2015. It was developed to estimate the incremental costs of customer additions associated with the Accounts Services functions listed above. The 2015 analysis was developed over several months, through meetings with managers and subject matter experts associated with each of the Accounts Services functions. These meetings helped to determine what individual cost centers and expense items should be associated with each activity, as well as what costs and activities are associated with three categories of rate schedules: Residential, Small Commercial, and Large Commercial / Industrial. Data were collected after these informational interviews were complete. Costs that are not

directly tied to customer count were not included in the Meter-to-Cash study (e.g., software upgrade costs are not necessarily correlated to customer additions and are therefore not included).

Q. Has the Meter-to-Cash study been updated?

A. Yes. The Meter-to-Cash study was updated in 2023, and again in 2024, to reflect current operations and Accounts Services functions. Updates are developed with input from subject matter experts across the Company, using similar methodology as the initial 2015 study. The updated study is the basis for incremental Accounts Services costs for the EmCOSS.

Q. What data were collected and what criteria were used for its inclusion in the Meter-to-Cash study?

A. Incremental O&M cost estimates in the Meter-to-Cash study were based on data collected from the Company's engineering, accounting, and customer contact teams. Data were vetted with the help of supervisors and managers of these teams as well as individual cost centers. The expenses identified as part of the Meter-to-Cash process were identified by cost center and were determined to be appropriate for inclusion in this incremental cost study based on the following criteria: If it were determined an additional forecasted customer would make a direct cost change within the cost center associated with these groups, and this direct cost was measurable, the cost would be included. Costs that are not tied to functions provided by the cost centers listed above for the direct service of customers were not included in the Meter-to-Cash study.

Q. How were the incremental Meter-to-Cash costs allocated to the rate schedules for the EmCOSS?

A. After identifying the incremental costs, the EmCOSS breaks out each cost center's budget into five categories:

1. Meter Reading
2. Billing
3. Payment Processing
4. Collections (costs that pertain to payment processing)
5. Other Activities

Within each category of budget, costs are evaluated as payroll versus non-payroll. An incremental cost per customer was derived by taking the above categories and apportioning the cost into the three broad categories of rate schedules. I weighted these class-based average costs by rate schedule customer count to create an indirect allocator for customer service and billing O&M expenses.

Q. Did you directly allocate any additional customer services-related O&M expenses?

A. Yes. I examined the Company's Washington-allocated O&M expenses by type and cost center. Any costs identified as relating specifically to Residential, Residential and Commercial, or Commercial and/or Industrial classes were directly allocated to rate schedules as appropriate based on weighted customer count.

b. Administrative and General Expenses

Q. How did you allocate administrative and general O&M expenses?

A. The administrative and general O&M expenses allocation follows Table 4 of WAC 480-85-060(3) where specified. For expenses not noted in the table, I used the common allocator, except for FERC Account 921. This account represents general payroll; I allocated most of these costs based on the customer-weighted customer services cost allocator described above. I identified a portion of FERC 921 expenses as directly attributable to specific rate classes and allocated these costs as such.

4. EmCOSS Insights and Outcomes

Q. Upon what basis is revenue at current rates compared against revenue with the proposed incremental revenue requirement at the first MYRP rate effective date?

A. The EmCOSS compares the ratio of adjusted Test Year Revenues at Current Rates against the EmCOSS based Total Revenue Requirement at Unity, the difference being the proposed margin increase at the first MYRP rate effective date (i.e., August 1, 2026). This ratio is used to derive the Revenue-to-Cost Ratio at Present Rates, and then the Parity Ratio at Present Rates, which indicates each rate schedule's position relative to cost parity (i.e., the point that the schedule is neither over- nor under-paying its EmCOSS determined cost of service). Refer to the EmCOSS study results, Exh. RJW-12.

Q. What do the results of the EmCOSS indicate?

A. The EmCOSS-indicated Parity Ratio at Present Rates for each rate schedule is illustrated in Table 1 below. A parity ratio below the value of 1.00 indicates that customers on a given schedule are underpaying their EmCOSS determined cost of

service. A value over 1.00 indicates that customers on a given rate schedule are paying more than their cost of service at present rates. Per Table 1 below, the results of the EmCOSS indicate that the RS 1 Residential and RS 1 Commercial General Sales Service ("RS 1 Residential" and "RS 1 Commercial") rate schedules are paying well below their full cost of service at present rates. RS 2 Residential and RS 27 Dry-Out rate schedules are also paying less than their full cost of service at present rates while the remaining rate schedules are paying more than their cost to serve (with RS 3 General Commercial paying just slightly above the determined cost of service).

Table 1
EmCOSS Parity Ratio at Present Rates, by Rate Schedule

RATE SCHEDULE	01 R	02 R	27 C	01 C	03 C	03 I	41 CSF	42 CSF
EmCOSS Determined Parity Ratio	**0.51**	**0.95**	**0.74**	**0.50**	**1.06**	**1.02**	**1.33**	**1.35**
RATE SCHEDULE	42 CSI	41 ISF	42 ISF	42 ISI	41 CTF 41 ITF	42 CTF	42 ITF	42 CTI 42 ITI
EmCOSS Determined Parity Ratio	**1.11**	**1.39**	**1.42**	**1.81**	**1.49**	**1.25**	**1.43**	**3.12**

The class-wide EmCOSS-indicated parity ratios are as follow: 0.94 for the Residential rate schedules; 1.05 for the Small Commercial schedules; 1.31 for Large Commercial Sales schedules; and 1.58 for the Industrial and Transportation schedules.

Q. How do these results compare with the Company's last filed EmCOSS?

A. This EmCOSS and the Company's last study, filed with Docket UG-200994, both indicate that the RS 41 and RS 42 rate classes are paying more than their determined cost of service under present rates. Both studies also indicate that RS 1 Residential, RS 2 Residential, and RS 27 Dry-Out customers are paying less than their determined

cost of service. Also consistent is the finding that RS 3 Commercial is overpaying its cost to serve, albeit to a lesser extent than indicated in the prior rate case. The largest difference is the finding that RS 1 Commercial is paying well below its cost of service (compared to the finding it was paying just above its cost of service in UG-200994). The RS 2 Residential parity ratio is slightly higher than the UG-200994 indicated ratio (while still underpaying the determined cost of service, the EmCOSS indicates the gap has narrowed). Based on the data and methods used to calculate incremental cost for this EmCOSS, as described earlier in this testimony, I find that RS 1 Residential and RS 1 Commercial customers have the lowest Relative Revenue-to-Cost Ratio at the Company's current rates.

Q. What factors must be considered when comparing the results of the EmCOSS across multiple proceedings?

A. Direct comparison of parity ratios across proceedings is not straightforward due to changes in investment mix, customer makeup and service elections, and changes to overall throughput and design day demand.

Q. Why does the EmCOSS now indicate the RS 1 Residential customers are paying well below their cost to serve?

A. As noted earlier, the RS 1 Residential tariff does not allow primary space heating systems or water heating appliances and is limited to lower-usage appliances such as cooktops and fireplace inserts. Since the Company's last filed EmCOSS, the Company has realized a higher growth rate of new premises on RS 1 Residential that are lower-usage. Therefore, the customer makeup has changed (the customer count on this rate schedule has increased roughly 20 percent since just January 2023) as well as estimated

load factor. Because these customers are low using (the Normalized UPC is 74 percent lower than that of RS 2 Residential), the EmCOSS credits them with lower fixed cost recovery compared to higher using schedules with similar a load factors (such as RS 2 Residential).

Q. Was the Company required to conduct any economic feasibility studies for its Washington special contract customers since its last general rate case filing?

A. Yes. In resolution of the Company's 2019 Washington general rate case, Docket UG-181053, the Company agreed in settlement to conduct an updated economic feasibility study for its Washington special contracts within three years of November 1, 2019. As noted in final Commission Order 06 of that docket, the Company "has been unable to locate the original study, and that the relevant contract has been effective on a month-to-month basis for the past 20 years." Per the settlement, the Company agreed to conduct the study with the purpose of verifying that the special contract rates continue to be fair, just, and reasonable.[20]

Q. Did the Company conduct an economic feasibility study for its special contract customers?

A. Yes. The Company conducted an economic feasibility study prior to November 2022 for the one customer taking service under a special contract in the Company's Washington service territory as of October 2022. The purpose of the economic feasibility study was to reexamine the economics of the agreement between NW Natural and the special contract customer by estimating the cost that the customer

[20] See: *Washington Utilities and Transportation Commission, Complainant, v. Northwest Natural Gas d/b/a NW Natural, Respondent,* Docket UG-181053, Order 06, at 29-30 (Oct. 21, 2019).

would likely incur at the time of the study if it were to bypass the Company's system and directly interconnect to Northwest Pipeline.

Q. What was the result of the Company's economic feasibility study?

A. The study concluded that the cost of bypassing the Company's system would be uneconomic for the special contract customer, and the Company recommended eliminating the special contract service. The customer is no longer taking service under the special contract and is currently taking large volume industrial transportation firm service.

IV. RATE DESIGN & RATE SPREAD

Q. What is the purpose of the rate design and rate spread section of your testimony?

A. The purpose of this section of my testimony is to:

- Discuss the Company's approach to rate design for this proceeding;
- Summarize NW Natural's incremental revenue requirement request;
- Discuss the results of the EmCOSS and how it relates to rate spread;
- Describe the methodology for how the Company proposes to spread incremental revenue; and
- Show the revenue requirement spread by rate schedule and the corresponding average bill impact.

1. Rate Design

Q. Is the Company proposing any rate design changes in this proceeding?

A. Yes. The Company is proposing the following changes to fixed cost rate design in this proceeding for Rate Year 1 (RY1), Rate Year 2 (RY2), and Rate Year 3 (RY3):

- Increase the RS 1 Residential fixed monthly charge from $5.50 to $8.00 in RY1.

- Increase the RS 1 Commercial fixed monthly charge from $7.00 to $10.00 in RY1.
- Increase the RS 1 Residential fixed monthly charge from $8.00 to $10.00 in RY2.
- Increase the RS 2 Residential fixed monthly charge from $8.00 to $10.00 in RY2.

Q. Why is the Company proposing to increase the fixed monthly charge for these rate schedules?

A. The fixed monthly charge is one element the Company uses to collect a portion of the fixed cost component of its overall authorized revenue requirement for these rate schedules. These fixed costs (such as meters, services, and billing) are incurred solely because of the existence of customers connected to the system and are not related to usage demands. The other piece is the volumetric rate, which is used to collect the remainder of the fixed cost component as well as the variable component of the overall authorized revenue requirement. In fact, a significant portion of the Company's fixed costs are collected on the volumetric rate. Table 2 below shows the EmCOSS-indicated fixed monthly charge compared to the existing fixed monthly charge for each rate schedule in the Company's proposal.

Table 2
EmCOSS-Indicated Fixed Charges

Rate Schedule	EmCOSS-Indicated Fixed Charge	Existing Fixed Charge	Ratio Existing to Indicated Fixed Charge	RY1 Proposed Fixed Charge	RY2 Proposed Fixed Charge	RY3 Proposed Fixed Charge	Ratio Proposed to Indicated Fixed Charge
	$	$	%	$	$	$	%
RS 1 Residential	$ 33.85	$ 5.50	16.2%	$ 8.00	$ 10.00	$ 10.00	29.5%
RS 1 Commercial	$ 67.09	$ 7.00	10.4%	$ 10.00	$ 10.00	$ 10.00	14.9%
RS 2 Residential	$ 30.87	$ 8.00	25.9%	$ 8.00	$ 10.00	$ 10.00	32.4%

Note: The data in Table 2 is presented in Exh. RJW-14.

The existing fixed monthly charge for RS 1 Residential is under one-fifth of the EmCOSS-indicated fixed monthly charge at the proposed rates in this proceeding. For

RS 2 Residential, it is just over one-quarter of the EmCOSS-indicated fixed charge. For RS 1 Commercial, it is less than one-tenth. The Company's proposal, as shown in Table 2 above, makes meaningful – but incremental – progress towards closing the gap between current fixed cost recovery on a per customer basis and that customer's full fixed cost responsibility. At RY2, the ratio of proposed to EmCOSS-indicated fixed monthly charge would be nearly the same for RS 1 and RS 2 Residential (at just under one-third). Although the RS 1 Commercial ratio at RY2 is lower compared to the residential rate schedules, the fixed charge rate is equal to that of RS 1 Residential which has the same tariff service parameters (e.g., notably, limited to equipment that does not qualify as primary space heating systems).

Q. How does the Company's rate design proposal constitute sound rate design?

A. As shown in Table 2 above, the Company's proposal much more closely aligns fixed cost recovery across the entire residential rate class compared to existing rates (as a ratio of the proposed fixed charge monthly rate to the EmCOSS-indicated rate). It also aligns (on a dollar basis) fixed recovery for like schedules (RS 1 Residential and RS 1 Commercial) that have the same service parameters under a single tariff. As I explain further below, the Company's rate design promotes rate equity through a fair apportionment of revenue requirement between the fixed and volumetric charges that reduces subsidization flowing from higher usage customers to lower usage customers. The Company's proposal is responsive to the principle of fairness presented as "Attributes of a Sound Rate Structure" developed by James C. Bonbright ("Bonbright Principles"). The sixth principle seeks to avoid "arbitrariness and capriciousness" while attaining equity in three dimensions: "(1) Horizonal (i.e., equals treated equally);

(2) vertical (i.e., unequals treated unequally); and (3) anonymous (i.e., no ratepayer's demands can be diverted away uneconomically from an incumbent by a potential entrant)."[21] The Company's proposal avoids arbitrariness in the fixed price signal between residential customers on RS 1 Residential and RS 2 Residential, while apportioning volumetric rates that reduce the gap in cost recovery between higher usage and lower usage customers on an intra-class basis (and that are responsive to the EmCOSS-indicated results that show RS 1 Residential customers pay well below their cost of service compared to RS 2 Residential customers). The proposal also treats customers under the same service provisions (RS 1 Residential and RS 1 Commercial) more equally on an intra-class basis while still recognizing differing costs of service across premises types through the volumetric rate (residential vs commercial).

Q. How do the Company's existing fixed monthly charges for these rate schedules compare to peer utilities?

A. Table 3 below shows a comparison of the Company's existing fixed monthly charge, and its proposal compared to peer natural gas utilities in Washington for residential customers:

[21] See: Bonbright, James C., Albert L. Danielsen, David R. Kamerschen. *Principles of Public Utility Rates* (Second Edition, 1988). Public Utilities Reports, pages 383-384.

Table 3
Fixed Monthly Charges for
Residential Customers,
Comparison of Peer Utility Residential Rate Tariffs

Residential Rate Tariffs	Fixed charge Residential	
Puget Sound Energy (NG)	$14.00	
Avista (NG)	$10.50	
NW Natural (RS 1 Residential Proposed)	$10.00	*At Rate Year 2*
NW Natural (RS 2 Residential Proposed)	$10.00	*At Rate Year 2*
NW Natural (RS 2 Residential Existing)	$8.00	
Cascade Gas	$5.50	*Increasing to $6.00 March 2026*
NW Natural (RS 1 Residential Existing)	$5.50	

Note: The data in Table 3 is presented in Exh. RJW-14.

As Table 3 above indicates, the Company's RS 1 Residential fixed monthly charge will be the lowest of all peer utilities' residential fixed charge rates after March 2026, while the Company's RS 2 Residential fixed monthly charge would be the second lowest. The Company's proposed fixed charges for both RS 1 and RS 2 Residential at RY3 continue to maintain the second lowest residential fixed charge rates of peer natural gas utilities in Washington but places it nearly in line with that of the second highest (Avista).

Table 4 below shows a comparison of the Company's existing fixed monthly charge, and its proposal compared to peer natural gas utilities in Washington for general service commercial customers:

Table 4
Fixed Monthly Charges for
General Service Commercial Customers,
Comparison of Peer Utility Commercial Rate Tariffs

General Commercial Rate Tariffs	Fixed charge Commercial	
Puget Sound Energy (NG)	$50.56	*Increasing to $65.72 January 2026*
NW Natural (RS 3 Commercial Existing)	$22.00	
Cascade Gas	$20.00	*Increasing to $25.50 March 2026*
Avista (NG)	$10.50	
NW Natural (RS 1 Commercial Proposed)	$10.00	*At Rate Year 1*
NW Natural (RS 1 Commercial Existing)	$7.00	

Note: The data in Table 4 is presented in Exh. RJW-14.

Table 4 above indicates that the Company's RS 1 Commercial fixed monthly charge is currently the lowest fixed monthly charge compared to general commercial service fixed charges for peer natural gas utilities in Washington (there are no comparable low-usage commercial rate schedules). The Company's proposal will maintain this ranking, but it will more closely align with the general commercial fixed charge of Avista.

Q. In general, can increasing the monthly fixed charge be beneficial for customers?

A. Yes. When more fixed costs are collected through a higher monthly fixed charge, less of the revenue requirement is collected through the volumetric rate. This works to smooth the Company's bills across the entire year, resulting in lower winter bills at a time when customer's other energy bills may be increasing as well. Since NW Natural is a single-peaking utility, higher monthly fixed charges put a greater share of cost recovery on bills when they are the lowest: During the summer months. The outcome for customers are more predictable, and flatter, bills throughout the entire year. Finally, for residential customers enrolled in the bill discount program, the discount is applied by the same discount percentage on both the fixed monthly and volumetric charge rates.[22]

[22] The percentage of the bill that is discounted includes both the fixed and volumetric portions of the bill. For instance, a $50.00 RS 2 Residential bill discounted at the current Tier 1 level (40%) is $30.00 regardless of whether the fixed charge is $8.00 or $10.00.

Q. Does the Company have evidence that at least some residential customers prefer smoother bills throughout the entire year?

A. Yes. The Company's Equal Pay plan, which spreads bills evenly throughout the entire year, is in practicality an individualized 100 percent monthly fixed charge. As of August 2025, roughly 12 percent of the Company's Washington residential customers (taking service on both RS 1 and RS 2 Residential, totaling almost 11,000 customers) have opted into paying a fixed bill through the Equal Pay plan, including just over 1,000 customers (accounting for 9.3 percent of customers on the Equal Pay plan) that are also enrolled in the bill discount program.

Q. Can increasing the monthly fixed charge promote rate equity for residential customers?

A. Yes. As I noted above, a substantial portion of RS 1 and RS 2 Residential fixed costs are collected on the volumetric rate. The amount that is collected on the volumetric rate varies based on weather (for heating load) but also varies based on the number and type of appliances that a customer has installed, as well as housing characteristics: square footage, tightness of building envelope, and age of home which influences standards and materials used in its construction. Fewer fixed costs are collected from lower usage residential customers compared to higher usage residential customers. Lower monthly fixed charges cause greater upward pressure on the volumetric rate, thereby causing intra-class subsidization that flows from the higher usage customers to the lower usage customers.

In the absence of fixed monthly charge increases, both external and internal policies can also influence how much of the cost burden falls on higher using customers

compared to lower using customers. Establishing higher monthly fixed charges helps to equalize the contribution each customer within a class makes towards recovery of the fixed costs attributable to that rate schedule, reducing the gap between customers that are paying too much and those that are paying too little. For instance, as I discussed earlier, the anticipated UPC for new service connections is lower than existing service connections. This means that customers in newer premises will pay less of their fixed costs through the volumetric rate compared to existing customers resulting in rate inequity. Further, as the Company explores further conservation and new appliance mixes in residences like hybrid systems, such a rate design could be key to fairness between residential customers with varying usages. A higher monthly fixed charge, which produces downward pressure on the volumetric charge, mitigates a cross-subsidy that benefits lower usage customers and promotes rate equity for higher usage customers.

Q. Have you examined how the Company's RS 1 Residential monthly fixed charge proposal would impact individual customers on a monthly basis, including those customers currently enrolled in the bill discount program?

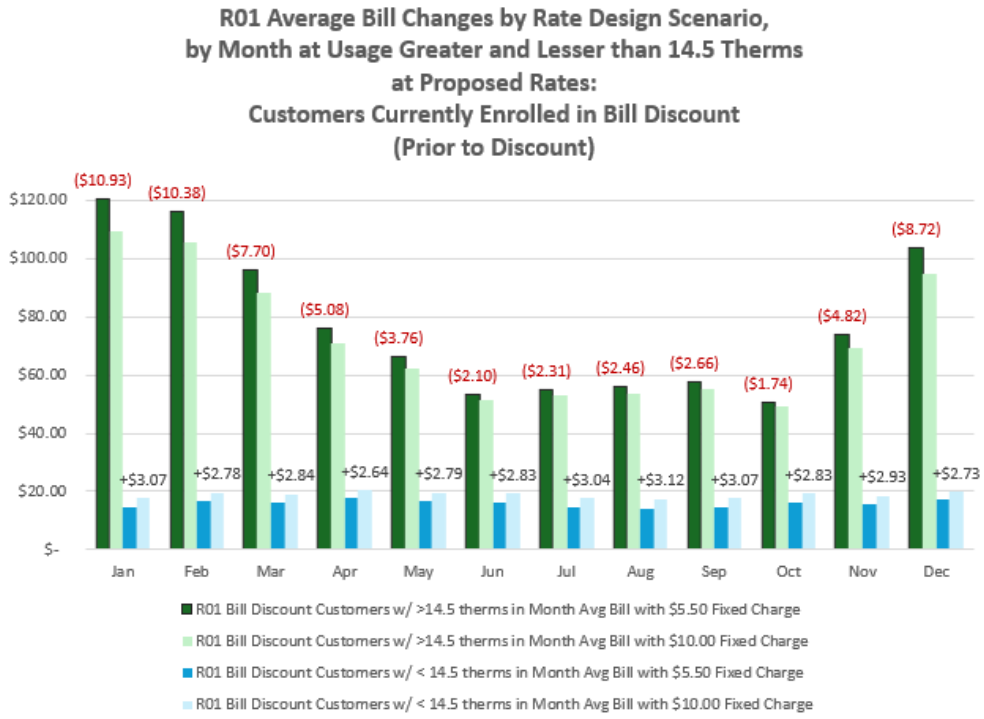
A. Yes. I examined bills issued in 2024 for RS 1 Residential premises that had a bill for every month in the year (thereby excluding premises that either moved onto or off the schedule during the year) and currently have active accounts. My analysis follows premises, so customer accounts that move into or out of a premises on RS 1 Residential service are still counted provided that premises had twelve months of bills. I made a comparison of the Company's proposed RS 1 Residential RY2 rates in this proceeding with the $10.00 fixed monthly charge against the rates the Company would have

proposed for RY2 with the current $5.50 fixed monthly charge. In the $10.00 scenario, the proposed volumetric billing rate is $2.02861 per therm; under a $5.50 scenario, the volumetric billing rate would be $2.33820 per therm. Given this difference in volumetric rate, I calculate that a customer would pay *less* under the $10.00 fixed charge scenario if they used greater than 14.5 therms in a month. Across all months for all RS 1 Residential customers, I found that the average bill would be 63 cents higher per month under the Company's proposal. The average bill would be $3.46 and $2.90 lower in the months of January and February, however, and $2.11 lower in December when bills are their highest. Across all months, the bill increase equates to less than the $4.50 fixed charge increase on 75.2 percent of bills, with the remaining 24.8 percent of bills getting a $4.50 increase due to zero reported usage (from $3.68 to $8.18 on a total bill basis after Schedule 308 credits have been applied).

Q. What did you find when you examined how the Company's RS 1 Residential monthly fixed charge proposal would impact customers currently enrolled in the bill discount program?

A. I examined the impacts of the Company's RS 1 Residential proposal on customers that are currently enrolled in Schedule L (Residential Bill Discount Program). I found that the average bill across all months would be 34 cents lower under the Company's proposal before any Schedule L discounts have been applied. Table 5 below shows average bill changes comparing the Company's $10.00 fixed charge proposal against the status quo ($5.50) for customers currently enrolled in the bill discount program using greater or lesser than 14.5 therms (the breakeven level of usage) by month prior to Schedule L discounts.

Table 5



Note: The data in Table 5 is presented in Exh. RJW-15.

Table 5 above shows that RS 1 Residential customers enrolled in the bill discount program that use greater than 14.5 therms in the months of January and February will realize bills that are on average $10.93 and $10.38 lower, respectively, under the Company's proposal compared to the status quo at proposed rates in this proceeding. Just over 60 percent of all RS 1 Residential customers enrolled in the bill discount program would realize lower bills in each of these two months under the Company's proposal. For the remainder that would receive higher bills, those amounts would average $3.07 and $2.78 in January and February, respectively. The average total bill would be $17.56 and $19.43 in January and February for these customers, compared to a total average bill of $109.31 and $105.67 in the same months for customers that use greater than 14.5 therms. Therefore, although the cohort of

customers that use less than 14.5 therms would realize higher on average bills in these months, those bills are over 80 percent lower compared to the average bills for customers that use greater than 14.5 therms. These figures are prior to the application of any Schedule L bill discounts.

Table 6 below presents the average bill comparison between the Company's $10.00 proposal and the $5.50 fixed charge status quo as shown above in Table 5, but with the Schedule L bill discounts applied across each income tier. The bill discount is applied on the entire bill (both fixed and volumetric charges), therefore, the difference in average bills under both scenarios is lower when the Schedule L bill discount is steeper for customers using both greater or lesser than 54.1 therms.

Table 6
RS 1 Residential Bill Discount Enrolled Customer
Average Bill Changes:
Proposed Fixed Charge Compared to Status Quo
at RY2 Proposed Rates
by Month by Usage Category
by Schedule L Bill Discount Tier

	Avg RY2 Bill at $5.50 Fixed Charge *Prior to Discount*	Avg RY2 Bill Difference at $10.00 Fixed Charge Based on Usage Above/Below Breakeven Amount									
		Usage Greater than 14.5 therms					Usage Less than 14.5 therms				
		Share	Tier 0	Tier 1	Tier 2	Tier 3	Share	Tier 0	Tier 1	Tier 2	Tier 3
		%	80%	40%	20%	15%	%	80%	40%	20%	15%
Jan	$ 81.79	64.2%	$ (2.19)	$ (6.56)	$ (8.75)	$ (9.29)	35.8%	$ 0.61	$ 1.84	$ 2.45	$ 2.61
Feb	$ 75.99	59.7%	$ (2.08)	$ (6.23)	$ (8.30)	$ (8.82)	40.3%	$ 0.56	$ 1.67	$ 2.23	$ 2.37
Mar	$ 57.80	52.2%	$ (1.54)	$ (4.62)	$ (6.16)	$ (6.55)	47.8%	$ 0.57	$ 1.71	$ 2.27	$ 2.42

Note: The data in Table 6 is presented in Exh. RJW-15.

The first column of Table 6 above shows the RY2 average bill at the current $5.50 monthly fixed charge for enrolled bill discount customers, prior to Schedule L bill discounts. The remaining columns show the difference in average bill for each bill

discount tier based on whether a RS 1 Residential customer uses above or below the breakeven amount (14.5 therms), and the percentage of customers in each usage category. Table 6 above indicates that for the roughly 64.2 and 59.7 percent of all RS 1 Residential customers enrolled in the bill discount program that use greater than 14.5 therms in January and February, respectively, their bills will be lower by an amount that more than offsets the higher bills for the minority of customers in those months. For Tier 0 customers that are in the 35.8 and 40.3 percent share of all customers that use less than 14.5 therms in these two months, their average bills will be just about 61 (January) and 56 (February) cents higher under the Company's proposal. In low usage months such as August where only about 4.5 percent of RS 1 Residential customers use greater than 14.5 therms, bills would similarly be just about 62 cents higher for Tier 0 customers at a time of the year usage (and total bills) are at their lowest. As indicated in Table 6 above, August average bills ($15.98) are about 80.5 percent lower than January bills ($81.79) prior to bill discounts.

Q. Have you examined how the Company's RS 2 Residential monthly fixed charge proposal would impact individual customers on a monthly basis, including those customers currently enrolled in the bill discount program?

A. Yes. Consistent with my RS 1 Residential analysis, I examined bills issued in 2024 for RS 2 Residential premises that had a bill for every month in the year (thereby excluding premises that either moved onto or off the schedule during the year) and currently have active accounts. This analysis also follows premises, so customer accounts that move into or out of a premises on RS 2 Residential service are still counted provided that premises had twelve months of bills. I made a comparison of the Company's proposed

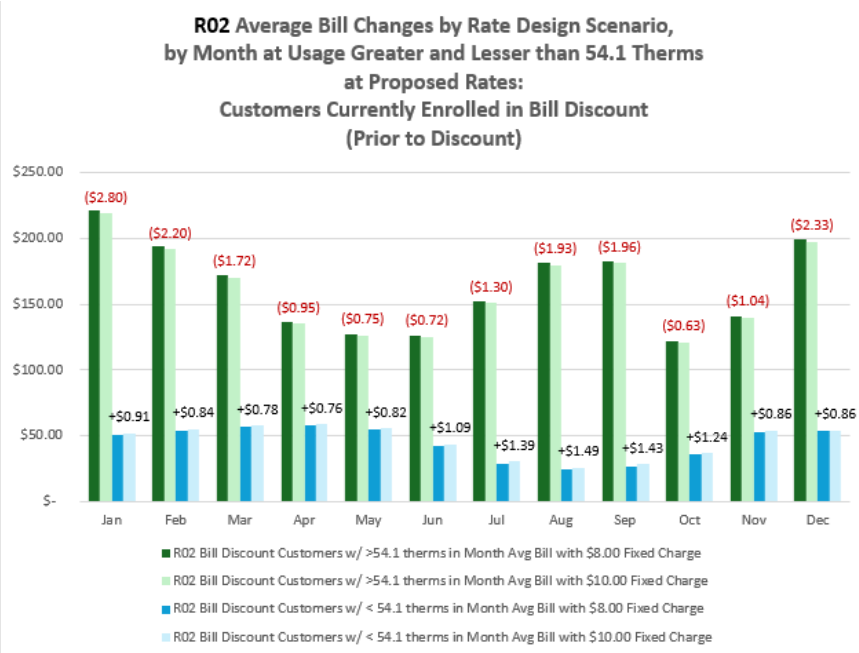
RS 2 Residential RY2 rates in this proceeding with the $10.00 fixed monthly charge against the rates the Company would have proposed for RY2 with the current $8.00 fixed monthly charge. In the $10.00 scenario, the proposed volumetric billing rate is $1.66276 per therm; under a $8.00 scenario, the volumetric billing rate would be $1.69970 per therm. Given this difference in volumetric rate, a customer would pay *less* under the $10.00 fixed charge if they used greater than 54.1 therms in a month. Across all months for all RS 2 Residential customers, I found that the average bill would be just 7 cents higher per month under the Company's proposal. The average bill would be $2.22 and $1.59 lower in the months of January and February, however, and $1.62 lower in December when bills are their highest. Across all months, the bill increase equates to less than the $2.00 fixed charge increase on 97.3 percent of bills, with the remaining 2.7 percent of bills getting a $2.00 increase due to zero reported usage (from $0.61 to $2.61 on a total bill basis after Schedule 308 credits have been applied).

Q. What did you find when you examined how the Company's RS 2 Residential monthly fixed charge proposal would impact customers currently enrolled in the bill discount program?

A. I examined the impacts of the Company's RS 2 Residential proposal on customers that are currently enrolled in Schedule L (Residential Bill Discount Program). I found that the average bill across all months would be 2 cents lower under the Company's proposal before any Schedule L discounts have been applied. Table 7 below shows average bill changes comparing the Company's $10.00 fixed charge proposal against the status quo ($8.00) for customers currently enrolled in the bill discount program

using greater or lesser than 54.1 therms by month (the breakeven level of usage) by month prior to Schedule L discounts.

Table 7



Note: The data in Table 7 is presented in Exh. RJW-16.

Table 7 above shows that RS 2 Residential customers enrolled in the bill discount program that use greater than 54.1 therms in the months of January and February will realize bills that are on average $2.80 and $2.20 lower, respectively, under the Company's proposal compared to the status quo at proposed rates in this proceeding. Of all RS 2 Residential customers enrolled in the bill discount program, roughly 85 percent would realize lower bills in each of these two months under the Company's proposal. For the remaining 15 percent that would receive higher bills, those amounts would average $0.91 and $0.84 in January and February, respectively. The average total bill would be $51.80 and $54.88 in January and February for these 15 percent of customers, compared to a total average bill of $218.81 and $191.85 in the

same months for customers that use greater than 54.1 therms. Therefore, although the cohort of customers that use less than 54.1 therms would realize higher on average bills in these months, those bills are over 70 percent lower compared to the average bills for customers that use greater than 54.1 therms. These figures are prior to the application of any Schedule L bill discounts.

Table 8 below presents the average bill comparison between the Company's $10.00 proposal and the $8.00 fixed charge status quo as shown above in Table 7 above, but with Schedule L bill discounts applied across each income tier. The bill discount is applied on the entire bill (both fixed and volumetric charges), therefore, the difference in average bills under both scenarios is lower when the Schedule L bill discount is steeper for customers using both greater or lesser than 54.1 therms.

Note: The data in Table 8 is presented in Exh. RJW-16.

The first column of Table 8 above shows the RY2 average bill at the current $8.00 monthly fixed charge for enrolled bill discount customers, prior to Schedule L bill discounts. The remaining columns show the difference in average bill for each bill discount tier based on whether a RS 2 Residential customer uses above or below the breakeven amount (54.1 therms), and the percentage of customers in each usage category. Table 8 above indicates that for the roughly 86.6 and 83.4 percent of all RS 2 Residential customers enrolled in the bill discount program that use greater than 54.1 therms in January and February, respectively, their bills will be lower by an amount that more than offsets the higher bills for the minority of customers in those months (for instance, the table shows Tier 3 bills being $2.38 lower for the higher using customers but higher by a lesser amount, $0.77, for lower using customers in January). For Tier 0 customers that are in the 13.4 and 16.6 percent share of all customers that use less than 54.1 therms in these two months, their average bills will be just about 18 (January) and 17 (February) cents higher under the Company's proposal. In low usage months such as August where only about 0.5 percent of RS 2 Residential customers use greater than 54.1 therms, bills would be just about 30 cents higher for Tier 0 customers that use less than 54.1 therms at a time of the year usage (and total bills) are at their lowest. As indicated in Table 8 above, August average bills ($25.12) are about 87.4 percent lower than January bills ($198.82) prior to bill discounts.

Q. Based on your analysis of impacts of the Company's monthly fixed charge proposal on RS 1 and RS 2 Residential customer bills, including those customers currently enrolled in the bill discount program, what do you conclude?

A. I find that the Company's RS 1 and RS 2 Residential monthly fixed charge proposals, as compared to retaining the existing monthly fixed charges, would result in lower winter bills for a majority of customers (including a majority of customers enrolled in the bill discount program) at the time of year bills are at their highest. For the minority of customers that would realize higher winter bills, (1) their overall bills are already lower than that of the majority because they are lower using customers; and (2) the amount by which the minority would realize higher bills, the majority would realize lower bills by an even greater amount. The Company's proposal would instead result in slightly higher summer bills for a majority of customers (including a majority of customers enrolled in the bill discount program) at the time of year bills are at their lowest (for instance, average bills are over 87.4 percent lower in August for RS 2 Residential). All else equal, the Company's proposal provides rate relief to those customers that have the highest bills (e.g., the highest users) at a time of year their bills are highest. This includes 86.6 percent of RS 2 Residential customers enrolled in the bill discount program in the month of January. It provides this relief by equitably shifting some fixed cost recovery to just lower using customers in the winter months and to most customers in the summer months. Yet, the higher summer bills are more than offset by the lower winter bills (for instance, as shown in Table 8 above, an average RS 2 Residential August bill would be higher by $1.49, but an average January bill would be lower by $2.80). As demonstrated by the analysis above, the Company's RS

1 and RS 2 Residential monthly fixed charge proposals would align fixed cost recovery fairly and equitably for all customers including those enrolled in the bill discount program.

Q. Do you believe that the higher monthly fixed charges proposed by the Company would minimize the conservation price signal through the volumetric charge?

A. No. The Company adds an adjustment to the volumetric billing rate of every customer's bill for recovery of costs associated with the Washington Climate Commitment Act ("CCA") for every therm of usage. Regardless of the monthly fixed charge, all customers will continue to see the same usage-based price signal on every therm, which avoids disincentivizing conservation because customers can continue to lower their bills by lowering their usage.

2. Rate Spread

Q. What is NW Natural's total incremental revenue requirement?

A. NW Natural has filed for an incremental revenue requirement of $25.6 million for RY1, $8.6 million for RY2, and $8.3 million in RY3 in this case. See Exh. KTW-1T.

Q. Is any of the incremental revenue requirement in the MYRP attributable to special contract customers?

A. No. The special contract customers are not allocated any of the incremental revenue requirement given they are under fixed cost contracts. Further, there are currently no special contract customers in the Company's Washington service territory.

Q. How does the EmCOSS relate to rate spread?

A. The EmCOSS provides the embedded capital investment and O&M costs, by functional category, and gives insights into cost causation across customer classes. In theory,

spreading the incremental revenue requirement such that all schedules have a Parity Ratio at Present Rates of 1.00 would align all customers to their indicated level of cost causation. In practice, rate spread (and rate design) tends to deviate from this strict application of cost study results, given such a change in the short-run would violate principles of acceptable rate impacts and smoothing, neither of which violations would be in the Company's or the customer's interests. It is also important to balance the interests of rate equity with rate volatility. The EmCOSS does, however, provide a baseline for incremental revenue requirement allocation by rate schedule.

Q. What are NW Natural's thoughts on using the EmCOSS results to spread revenue requirement?

A. NW Natural values the EmCOSS outputs as a baseline for understanding the basis of cost causality among the rate classes. Of course, as stated above, there are other important factors that should be considered, most importantly the idea that equitable distribution of the rate spread should be balanced with customer rate impacts. If the Company were to spread revenue requirement across rate schedules strictly in a way that results in each rate schedule paying its share of its embedded costs (i.e., if all schedules were suddenly brought to parity with their indicated cost causality), such a shift would result in substantially higher rates for many customers and perhaps inadvertently trigger rate volatility. The Company does not have a rigid standard for what constitutes unacceptable rate impacts, but rather analyzes its EmCOSS results on a case-by-case basis in conjunction with regulatory precedent, principles, and the specific nature of the rate increase in the rate case.

Table 9 below shows the amount of incremental revenue requirement that would need to be spread to each rate schedule in order to put each class in line with paying its embedded costs per the results of this EmCOSS. The sum total of the amounts in Table 9 equals the full incremental RY1 revenue requirement in this case of $25.6 million. The values in this table (Total Net Income Deficiency (Sufficiency)) are derived in Exh. RJW-12 at Row 22 of tab, "E Summary of Results."

Table 9
EmCOSS Indicated Total Incremental
Revenue Requirement Deficiency (Sufficiency),
by Rate Schedule

RATE SCHEDULE	01 R	02 R	27 R	01 C	03 C	03 I	41 CSF	42 CSF
EmCOSS Determined Target Revenue	$803,302	$22,031,975	$138,144	$50,652	$4,066,841	$43,387	($299,192)	($158,230)
RATE SCHEDULE	**42 CSI**	**41 ISF**	**42 ISF**	**42 ISI**	**41 CTF 41 ITF**	**42 CTF**	**42 ITF**	**42 CTI 42 ITI**
EmCOSS Determined Target Revenue	$69,351	($111,354)	($174,639)	($43,830)	($33,725)	($2,876)	($138,627)	($683,436)

As seen in Table 9 above, RS 2 Residential customers would bear the largest share of the incremental revenue requirement increase, followed by RS 3 Commercial customers if the Company were to adhere strictly to the indicated EmCOSS results. On a percent of total revenue basis, the indicated increase would be 29.7 percent and 16.1 percent for the RS 2 Residential and RS 3 General Commercial rate schedules, respectively. On a percentage basis, RS 1 Residential and RS 1 Commercial would see the largest increases at 139.1 percent and 144.5 percent, respectively. The customers within the RS 41 and RS 42 rate classes would all realize rate reductions under such a scenario, the one exception being RS 42 Commercial Sales Interruptible.

NW Natural believes that the factors of fairness and minimizing rate impact weigh in favor of not realigning rates completely to their indicated cost causality based on the results of the EmCOSS in this rate case, which would require higher rate increases for some schedules while others receive decreases. A strict application of the EmCOSS results across all rate schedules would not be consistent with fundamental principles of rate design and rate structure, such as the third Bonbright Principle: "Stability and predictability of the rates themselves, with a minimum of unexpected changes that are seriously adverse to utility customers and with a sense of historical continuity."[23]

The Company understands that rate design principles, such as the Bonbright Principles, taken together, can be overlapping in nature and they do not offer any rules of priority. Ratemaking consists of finding a reasonable balance between these guidelines, where strict application of economic principles of optimum pricing may yield to regulatory, historical, and social factors.

Q. Please describe the Company's rate spread proposal.

A. The Company proposes to spread incremental revenue requirement in such a manner that is responsive to the results of the EmCOSS. I describe the Company's rate spread methodology in detail below. First, for RS 1 Residential, RS 1 Commercial, and RS 27 Dry-Out, I propose to use a separate cap for each rate schedule that moves each of these schedule's relative position closer to parity with respect to the EmCOSS results, because these schedules are paying less than their cost to serve at current rates. For RS

[23] *Id*. at 383.

2 Residential, which is also paying less than its cost to serve at current rates, I propose a cap that moves the schedule closer to revenue parity but is just lower than margin parity in the interest of balancing a lower rate increase with fairness for other rate classes. I propose a cap for RS 3 General Commercial that allocates slightly more than the average margin increase to this schedule. Second, I propose to apply an increase equal to the amount to retain revenue parity to all rate schedules with an EmCOSS-indicated parity ratio at 1.20 and lower plus RS 41/42 Commercial Sales Firm to recognize that while these schedules are overpaying their cost to serve at present rates, they are not overpaying at the same relative level as the remaining rate schedules. Third, the remaining revenue requirement is allocated to all remaining rate schedules using the same revenue floor, also in recognition of the EmCOSS results. As a result of the application of the floor, the relative position to revenue parity of the applicable rate schedules with respect to the overall indicated EmCOSS results will decrease, reflecting the fact that these classes are paying more than their cost to serve at current rates. This final step essentially allocates the remaining revenue requirement on an equal percent of margin basis among the remaining rate schedules, which include all industrial sales interruptible rate schedules, as well as all commercial and industrial transportation firm and transportation interruptible rate schedules in the RS 41/42 rate classes.

The Company's proposal equitably distributes the incremental revenue requirement such that the rate classes are moved closer to or retain margin parity based on their EmCOSS-indicated cost causation, except for RS 2 Residential and RS 3 General Commercial which are allocated amounts just below and just above the

amounts meant to roughly retain their indicated parities. The proposal described above is an incremental approach; it moves most rate classes closer to (or retains) parity but does so in a manner that works to minimize rate shock. It does this by balancing the impact to residential customers while taking incremental steps towards the EmCOSS-indicated parity for larger volume customers who are farthest from parity.

Q. Please describe the methodology NW Natural proposes to use to spread the $25.6 million RY1 incremental revenue requirement.

A. NW Natural proposes a multi-step process for spreading the $25.6 million RY1 incremental revenue requirement:

1. Apply a cap equal to 1.25 times the overall incremental revenue increase of 22.8 percent to RS 1 Residential and RS 1 Commercial. This cap is equal to a 28.5 percent revenue increase.
2. Apply a cap equal to 0.99 times the overall incremental margin increase of 39.5 percent to RS 2 Residential. This cap is equal to a 23.0 percent revenue increase, just above the overall incremental revenue increase of 22.8 percent proposed for this case.
3. Apply a cap equal to 1.10 times the overall incremental margin increase of 39.5 percent to RS 3 General Commercial. This cap is equal to a 24.2 percent revenue increase.
4. Apply a cap equal to 2.00 times the overall incremental margin increase of 22.8 percent to RS 27 Dry-Out. This cap is equal to a 45.6 percent revenue increase.
5. Apply an equal percent of incremental margin allocation equal to a 39.5 margin increase to all rate schedules with an EmCOSS-indicated parity ratio at 1.20 and

lower plus RS 41/42 Commercial Sales Firm. Depending on rate schedule, this equates to revenue increases below the overall incremental revenue increase of 22.8 percent ranging from 14.5 percent to 21.2 percent.

6. Apply a floor based on equal percent of margin increase of the remaining incremental revenue requirement to the remaining rate schedules in the RS 41/42 rate classes. This step results in the same proposed margin increase for each of these schedules (27.4 percent) which is less than the overall margin increase of 39.5 percent, and revenue increases ranging from 10.6 percent to 27.4 percent. The effect of this step would be the same as applying a floor equal to 0.69 times the overall incremental margin increase in this case.

Q. Do you present this rate spread methodology in an exhibit to this testimony?

A. Yes. I present this rate spread allocation proposal methodology in Exh. RJW-17.

Q. Please describe how this rate spread proposal impacts each rate class relative to an equal percent of margin spread.

A. RS 1 Residential, RS 1 Commercial, RS 2 Residential, RS 3 General Commercial, and RS 27 Dry-Out will receive a revenue spread greater than an equal percent of margin share calculated across all rate schedules. RS 27 Dry-Out will receive the highest relative increase, at a percentage double that of an equal percent of margin share. The rate schedules with a parity ratio below 1.20 plus RS 41/42 Commercial Sales Firm will receive a revenue spread equal to that of an equal percent of revenue share. The remaining rate schedules (including those with industrial interruptible and/or transportation service), as indicated above, will receive a spread less than an equal

percent of revenue share, a lower rate relative to other rate schedules in the RS 41/42 rate classes.

Q. How does this rate spread proposal impact the EmCOSS-indicated parity ratios?

A. This rate proposal moves the parity ratio for nearly every rate schedule closer to unity (e.g., to a value of 1.0). The Parity Ratio at Proposed Rates is presented in Exh. RJW-12 at Row 36 of tab, "E Summary of Results."

Q. Are there any components of the $25.6 million revenue requirement that are already included, but are removed and spread separately?

A. Yes. We must first remove the temporary plant excess deferred income taxes ("EDIT") amortization credit of $530 thousand from the $25.6 million incremental revenue requirement in RY1 in order to calculate a billing adjustment for Schedule 305. After RY1, this amount is embedded in rates and there are no further adjustments necessary for RY2 or RY3.

Q. Please explain how NW Natural proposes to spread the plant EDIT amortization credit.

A. The Company proposes to spread the plant EDIT credit to all rate schedules using the same rate spread methodology as described above.

Q. Are there any additional proposed rates that you spread after the base revenue requirement of $25.6 million has been applied in RY1?

A. Yes. The Company proposes to spread the proposed Meter Modernization Program deferral on an equal percent of margin basis to all rate schedules after the proposed $25.6 million incremental revenue requirement has been spread for RY1 as described above. Similarly, the Company proposes to spread the COVID-19 and Transportation

Security Administration ("TSA") O&M Startup deferrals in the same manner. Each deferral is described in greater detail in Exh. KTW-1T.

Q. How does the Company propose to spread its incremental RY2 and RY3 revenue requirement?

A. The Company proposes to spread the incremental RY2 ($8.6 million) and RY3 ($8.3 million) revenue requirement in the same manner as RY1 as described above.

Q. Are there any additional proposed rates that you spread after the base revenue requirement has been applied in RY2 and RY3?

A. Yes. The Company also proposes to spread the additional rates noted above based on an equal percent of margin basis to all rate schedules after the proposed incremental revenue requirements have been spread for RY2 and RY3 as described above. Additionally, in RY3, the Company proposes the TSA Cost of Service deferral.

Q. What is the effect of the Company's fixed monthly charge proposal, as described earlier, on the rate spread methodology?

A. The Company's fixed monthly charge proposals are revenue neutral, meaning that once the incremental revenue requirement to be spread is determined the fixed charge proposal only impacts how revenues are assigned for calculation of the fixed and volumetric billing determinants.

Q. Do you present the proposed rate spread allocations in an exhibit to this testimony?

A. Yes. I present the proposed rate spread allocations and calculated billing determinants in Exh. RJW-18.

V. RESULTS AND BILL IMPACTS

Q. What is the rate impact to firm sales customers for the revenue requirement components?

A. Table 10 below shows the combined incremental revenue requirement of $25.6 million net of the $530 thousand plant EDIT credit (i.e., margin revenues only) with an average bill increase presented in this case for firm sales customers. These impacts are also presented in Exh. RJW-18, in the tab "Rate Impacts – Revenue Requirement Only."

Table 10
Incremental Revenue Requirement (Margin Revenues)
and Average Bill Increase,
Firm Sales Customers Only

	Rate Year One		Rate Year Two		Rate Year Three	
Rate Schedule	Revenue Req. Increase	Pct. Increase to Avg. Cust. Bill*	Revenue Req. Increase	Pct. Increase to Avg. Cust. Bill*	Revenue Req. Increase	Pct. Increase to Avg. Cust. Bill*

27	$ 95,340	36.9%	$ 19,088	5.4%	$ 18,804	5.0%
01 C	$ 9,999	25.6%	$ 3,169	6.4%	$ 3,122	6.0%
03 C	$ 6,131,413	22.7%	$ 1,923,010	5.8%	$ 1,894,435	5.3%
03 I	$ 45,088	21.5%	$ 15,156	6.0%	$ 14,930	4.9%
41 C Firm Sales	$ 777,441	20.9%	$ 261,344	5.8%	$ 257,440	5.4%
41 I Firm Sales	$ 119,329	14.3%	$ 53,288	5.6%	$ 52,496	4.6%
42 C Firm Sales	$ 259,563	20.9%	$ 87,249	5.8%	$ 85,950	5.4%
42 I Firm Sales	$ 138,242	18.0%	$ 61,739	6.8%	$ 60,811	5.5%
Total All Schedules**	**$ 25,557,678**		**$ 8,591,020**		**$ 8,268,228**	

* The average customer bill impact figure calculation excludes pipeline capacity charges for RS 41 and RS 42 rate classes, and thus the rate impacts for these schedules are overstated.
** The proposed margin revenue increase is based on volumetric billing rates rounded to the fifth decimal as necessitated by the Company's tariff. Therefore, there may be a small discrepancy with the indicated revenue requirement presented in Exh. KTW-1T. The total represents all rate schedules, not just the ones presented in Table 10 above.

Q. What is the rate impact to firm sales customers for all of the rate components presented in this case combined?

A. Table 11 below shows the combined incremental revenue requirement (total revenues combined) and average bill increase of all the rate components presented in this case for firm sales customers. This table includes the incremental revenue requirement shown in Table 10 above combined with the impacts of the proposed deferrals as identified earlier. These impacts are also presented in Exh. RJW-18, in the tab "Rate Impacts – Combined."

42 I Firm Sales	$ 140,540	18.3%	$ 64,161	6.3%	$ 66,895	5.9%
Total All Schedules**	**$ 25,851,105**		**$ 8,884,182**		**$ 9,232,823**	

* The average customer bill impact figure calculation excludes pipeline capacity charges for RS 41 and RS 42 rate classes, and thus the rate impacts for these schedules are overstated.
** The proposed revenue increase is based on volumetric billing rates rounded to the fifth decimal as necessitated by the Company's tariff. Therefore, there may be a small discrepancy with the indicated revenue requirement presented in Exh. KTW-1T. The total represents all rate schedules, not just the ones presented in Table 11 above.

Q. Does your testimony present the revenue and rate changes applicable to all other rate schedules as well?

A. Yes. Exh. RJW-18 shows the derivation of the revenue increases and average bill impacts by rate schedule for the revenue requirement effects and for the combined rate components shown in Table 10 and Table 11 above. Exh. RJW-18 also contains the volumetric rate increases by rate schedule and block, as well as the proposed billing determinants in the tab, "Proposed Rates - Combined."

V. SCHEDULE 10 TARIFF UPDATE

Q. What does the Company propose with regards to tariff Schedule 10?

A. Yes. The Company requests revisions to tariff Rate Schedule 10 – Charges for Special Metering Equipment, Rental Meters, and Metering Services (referred to here as RS 10 Metering Services, or "Schedule 10") to replace the existing meter rental rates for diaphragm and rotary meters with a descriptive formula that defines the calculation of the rental meter rate based on the cost of meter requested.[24]

Q. What is tariff Schedule 10?

A. Schedule 10 is an optional tariff schedule that enables customers to rent meters and metering services based on a monthly charge currently specified in the tariff for both diaphragm and rotary meters. Schedule 10 includes the terms and conditions of meter rental, as well as rates for various rotary and diaphragm meter sizes. Customers taking service under Schedule 10 enter into a rental meter agreement with the Company.

[24] This excludes diaphragm and rotary meters listed on Sheet 110.1 where monthly charges have been retained under service agreements prior to April 27, 2018, based on meter type and installation date.

Q. Why is the Company proposing revisions to Schedule 10?

A. Currently, Schedule 10 includes two tables of meters (one for diaphragm meters and one for rotary meters) delineated by size and capacity with a corresponding monthly charge rate on Sheet 110.1. The meters found on these tables, however, may not always match the Company's inventory in stock because meter inventory and their related costs can change periodically. NW Natural's Engineering department conducts research and testing on various meters and determines the meters that should be included in NW Natural's meter inventory. Instead of filing frequent tariff changes to keep up with the meters that are in inventory (especially where inventory changes do not align with general rate case proceedings), NW Natural proposes that it would be more efficient to include a cost of service formula in the tariff rather than list specific rates based on meters that may or may not be in inventory. The formula, an explanation of how to use it to calculate the monthly meter rental rate, and any necessary definitions would be included in the Schedule 10 tariff. Under the Company's proposal, customers taking service under Schedule 10 will enter into a rental meter agreement with the Company that will reflect the meter rental rate as calculated in the formula found in the tariff.

Q. How will the Company communicate the Schedule 10 monthly meter rental rates to customers?

A. The Company proposes to replace the current rates listed in the Schedule 10 tariff for diaphragm and rotary meters on Sheet 110.1 with a descriptive formula that will calculate the rate applied to rental meters regardless of size. NW Natural will continue the practice of consulting with customers choosing to rent supplementary meters

regarding available meters that meet their service requirements prior to entering into a rental agreement that will include the rental meter charge as determined by the formula. Thereafter, it is expected that rental meter charges will be updated when the Company's authorized cost of capital changes, typically with each general rate case effective date.

Q. Please describe the proposed Schedule 10 formula.

A. The Schedule 10 formula is the same as the one that is currently used to calculate the monthly meter rental rates, which in summary is the net present value of the cost of service of the meter divided by 12. The cost to serve is generally comprised of the cost of the rental meter and other costs customarily related to the revenue requirement of utility investment, including, but not limited to, depreciation expense, return on investment, income taxes, property and other taxes, operating maintenance costs, and revenue-sensitive costs. The cost of the meters available for rental is inclusive of an Encoder Receiver Transmitter (ERT), if necessary, as well as required fittings and components (e.g., swivel, gasket, flange) which can vary by meter type and size. An additional description of the components of the meter rental rate formula is found on proposed Sheets 110.1 and 110.2 filed with this proceeding.

Q. How many meters are currently being rented under Schedule 10?

A. As of November 2024, there were 28 diaphragm and rotary meters of the types listed on Sheet 110.1 being rented to customers in Washington under Schedule 10, of which 10 are meters of the types listed and installed under prior service agreements prior to the date indicated on Sheet 110.1).

Q. Is the Company proposing any other changes to Schedule 10?

A. Yes. The Company is proposing to increase the Administrative Set-Up / Consultation and Technical Assistance Fees found on Sheet 110.2 from $100.00 to $145.00. These new rates are based on updated current labor rates for customer field service ("CFS") technicians inclusive of payroll overhead and vehicle costs using an assumption that these tasks require one and a half hours to complete on average. This calculation is presented in confidential Exh. RJW-19C.

Q. What service do the CFS technicians provide associated with these fees?

A. Company technicians at the CFS 4 level, which is classified as a Major Account Services Field Technician, complete meter rental service requests for customers. For Administrative Set-up/Consultation calls, CFS 4 Technicians will work with the customer to determine appropriate meter volume, location, type and model, and will work with the Company's meter shop on design specific to the customer's premises. The technician will also help the customer, if requested, complete a rental application. This work is completed for both rotary and diaphragm rental meters.

Further, CFS 4 Technicians complete Technical Assistance calls for rental meters. Rotary meters require more technical work, including assembly and reading calibration and care for moving parts (e.g., are properly oiled), during set-up compared to diaphragm meters.

Q. Why does the Company believe its Schedule 10 fee proposal is reasonable?

A. These fees have been included in the Schedule 10 tariff since at least 2004. The Schedule 10 tariff effective July 1, 2004 (with Advice No. WUTC 04-1), did not include an Administrative Set-Up/Consultation Fee, but did include two Technical

Assistance Charges: A Technical Assistance Charge (Rotary meters only) of $200, as well as a Technical Assistance Charge (Diaphragm meters) of $100. Under the current Schedule 10 tariff, the $200 Technical Assistance Charge (Rotary meters only) is set to $100 and an additional (and complementary) Administrative Set-Up/Consultation Fee (All meters) of $100 was designated. Per the Special Provisions on Sheet 110.2 of the Schedule 10 tariff, the Administrative Set-Up/Consultation Fee is incurred for each rental meter (rotary and diaphragm), meaning that the total cost incurred for delivery of each rental rotary meter has remained $200 since 2004.

Using 2004, when Advice No. WUTC 04-1 became effective, as a comparison baseline means that the Company's proposal (a 45 percent increase) is less than the increase in average consumer prices (69.0 percent) and average nominal wages (85.7 percent) from then until now.[25]

Q. Where are the proposed changes to Schedule 10 presented?

A. The proposed changes to the Schedule 10 tariff are presented on proposed Sheets 110.1 and 110.2 filed with this proceeding.

Q. Do the Company's proposed changes to Schedule 10 impact any other rate schedules?

A. No. The purpose of these changes is to continue to align the costs borne by customers using services under Schedule 10 to those customers only.

[25] The comparison figures were derived from the Federal Reserve Economic Database, series CPIAUCSL (Consumer Price Index for All Urban Consumers: All Items in U.S. City Average) and LES1252881500Q (Employed full time: Median usual weekly nominal earnings: wage and salary workers: 16 years and over).

Q. Does this conclude your Direct Testimony?

A. Yes.

NORTHWEST NATURAL GAS COMPANY

Exhibit of Robert J. Wyman

EMBEDDED COST OF SERVICE MODEL AND RATE DESIGN/SPREAD

Exh. RJW-5

August 29, 2025

Introduction

Washington Administrative Code ("WAC") 480-85-050 requires a utility to meet certain requirements for customer usage data granularity in its embedded cost of service Study ("EmCOSS") model, which includes inputs from advanced metering technology such as automated meter reading ("AMR") or a load study. For utilities with AMR capabilities, data from these meters may be used in the EmCOSS if the granularity of the data meets or exceeds the WAC requirement for daily meter data for a natural gas utility. If a utility does not have the technology to meet this daily meter data requirement, it must conduct a load study to inform its EmCOSS inputs. NW Natural falls into the latter category and has therefore developed this load study.

Per WAC 480-85-030(5), a load study is a "statistical analysis of load data collected from sampled customers to estimate the load profiles of customer classes over a minimum twelve-month period." For natural gas utilities, the load data must be collected at a daily granularity.

This document discusses the Company's sampling methodology, regression estimation techniques, and supporting documentation it used to develop its load study for UG-250610. The purpose of this load study is to derive a design day load factor using sampling of daily meter reading data for each of the Company's Washington rate schedules. The design day load factor is the ratio of normalized average usage to the estimated design day peak usage, expressed as a percentage. A low load factor ratio indicates that a rate schedule has high peaking load relative to normalized average usage (i.e., it indicates the rate schedule has high weather sensitivity as load peaks during cold weather events). A high load factor indicates less weather sensitivity and more predicable base load usage throughout the year. The load factor is the basis for the design day (peak) and annual throughput (average) allocator that the EmCOSS uses to allocate (in full or in part) distribution mains and assets, system core mains, and transmission main investment to each rate schedule. The results of this load study, therefore, aim to assign the relative cost to serve each rate schedule or class within the EmCOSS based on their contribution to peak demand.

Finally, this document presents the results of the load study and compares those results to the Company's design day load factor analysis as presented in Exh. RJW-1T.

AMR Deployment

NW Natural does not currently have AMR daily meter reading technology with daily read capabilities deployed throughout its entire service area but is in the process of a Meter Modernization Program that includes the expansion of daily meter reading abilities through AMR throughout the Company's Washington service territory. This process includes encoder receiver transmitter ("ERT") installation required for daily usage data. As described in greater detail in the Direct Testimony of Joe S. Karney, Exh. JSK-1T, ERT deployment implementation is based on geography and age of the meter. Through this process, the Company's customers in Clark County were forecasted to have full ERT installation by June of 2025, while the Company's customers in Klickitat and Skamania Counties in the Columbia River Gorge are forecasted to have ERT changes completed by the end of 2027. Therefore, because the Company does not currently have full coverage of daily reading capable meters for all customers across all rate schedules, it must use sampled daily read data from meters that do have this capability.

Per WAC 480-85-050 requirements, this load study requires at least twelve months' worth of daily meter readings from the sampled premises. Accordingly, the daily meter read capable premises selected in the sampling methodology, described in detail below, will show fewer premises with daily metering capability than the rollout of the Meter Modernization Program would suggest at the time of this filing because newly ERT capable meters will not be eligible for the load study for at least twelve months after being set.

Tables 1 through 3 below show the percentage of meters with daily meter reading capabilities, by county and sales firm rate schedule, as of January 1, 2025. Note that this is a point-in-time status of proportion of premises with daily metering capability and does not necessarily represent the number of premises used in this load study (especially applicable for rate schedules that show one hundred percent coverage).

Service Territory and Customer Characteristics

NW Natural serves customers in the SW region of Washington covering Clark, Klickitat, and Skamania counties. The Clark and Skamania County service area is more suburban and located within the Portland-Vancouver metro area while Klickitat County is more rural and is located at the eastern end of the Columbia River Gorge.

This service territory includes two primary National Oceanic and Atmospheric Administration ("NOAA") weather zones: Vancouver station and The Dalles. Observed weather data as presented in Exh. RJW-2 shows Vancouver experiences warmer winters and cooler summers with more rainfall year-round relative to The Dalles region in the Columbia River Gorge. The weather variation experienced by NW Natural's customers across its Washington service territory is an important variable when considering how to design the load study sampling methodology.

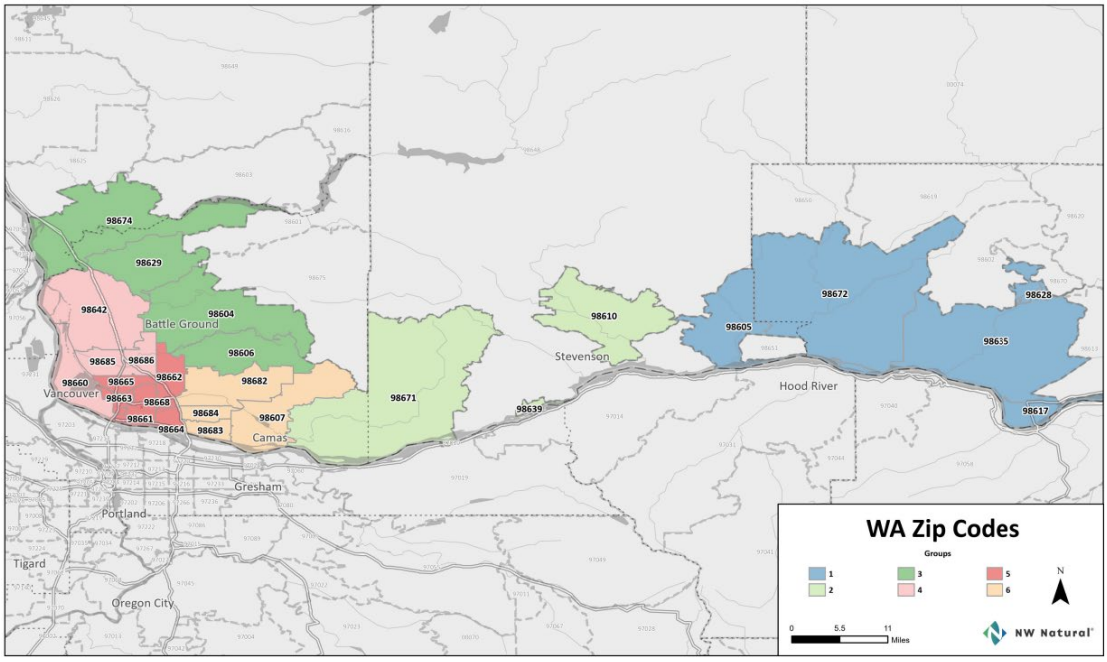
Premises Sampling Methodology

To ensure a representative sample of premises with sufficient daily read data, the Company considered how its Meter Modernization Program is being deployed as well as the temperature variability of its Washington service territory relative to where premises with twelve months of daily metering capable technology are available. Given AMR meters are being deployed in a geographically batched approach, if the Company were to simply use a sample size from the entire population of customers with daily metering capabilities, the load study sample would be biased to the premises located in areas that were in the earlier phases of the ERT replacement, such as the greater Vancouver metro area (e.g., Clark County and parts of Skamania County). In addition to recognizing and minimizing potential for geographic bias, the load study also ensures premises with daily meter reads used for sampling had three years of metering data (covering the calendar years 2022 through 2024) to best capture as much weather-related usage as possible. Due to year-over-year weather variability, customers can experience warmer or colder weather on any given calendar year; using multiple years of data ensures that the load study results are not contingent on data from just one winter heating season, as well as minimizes biasness due to short-term events such as service interruptions or economic factors that may, for instance, impact specific business sectors.

To get a geographically unbiased sample group, the Company started with a list of all active premises in the Company's Washington service territory as of March 31, 2025, and corresponding ZIP Code. The Company identified 26 unique ZIP Codes which it then organized into six groups ("strata") that were

geographically similar and would likely experience similar weather-related usage patterns. Using a stratified ratio sampling technique, the Company generated a sample of premises to achieve a balanced representation of its customer population in each ZIP Code strata. Refer to Table 4 below for map of the ZIP Codes in the Company's Washington service territory and the corresponding strata determined for this load study.

Table 4
Map of Washington Service Territory ZIP Codes by Sample Stratum



To determine the sample size by strata within each rate schedule for this load study, the Company identified which premises from the total customer count have daily metering data capabilities and matched them by ZIP Code to their geographic stratum. For each rate schedule, the Company calculated the total daily sample size required to achieve a 99 percent confidence level and confidence interval (e.g., margin of error) of 3 percent using a sample size estimator. Knowing the sample size criteria, the Company then broke out this number of customers proportionately amongst the six strata following the stratified sample formula (described below) to get the sampling amount of each of its six strata.

For example, given a total of 89,095 Rate Schedule ("RS") 2 Residential customers, the Company identified 11,066 customers as having daily metering data available every day for at least the past three years. To achieve a relevant sample of RS 2 Residential customers given the Company's sample criteria and with daily meter reads, it determined a sample size of 1,584 RS 2 Residential customers is necessary. To break this amount proportionately amongst the six strata, the Company took the proportion of its 1,584 sample from the 11,066 total customers with daily read capable meters and allocated the sample to the strata based on the size of each stratum. RS 2 Residential Stratum 1 is, for instance, comprised of 160 customers and the Company determined that a sample of 23 customers is required from Stratum 1

ZIP Codes.[1] The Company performed this calculation for each stratum until the total sample size for the rate schedule was apportioned across all strata.

This sampling technique provides the appropriate sample size needed of customers with daily read capabilities. To achieve a truly randomized sample, however, the Company then grossed up the daily read sample size to the entire population of customers. This step provides the total number of customers, regardless of whether they have daily meter reads, that will need to be sampled to get a randomized representation of just those customers with daily reads. Continuing the example for RS 2 Residential from above, there are 160 customers in Stratum1 ZIP Codes with daily reads, but out of the entire population of RS 2 Residential customers, there are 1,429 in Stratum 1. This means that the entire population of RS 2 Residential Stratum 1 customers is roughly nine times larger than just those with daily reads. Since the estimation calculated above shows the Company needed a sample size of 23 from just daily meters, grossing up sample size of 23 by a factor of nine times produces an amount customers needed to sample from the entire population. This calculation equates to 206 customers, a number that is expected to include the number of daily metered customers necessary for the Company's load study sample (23) if those 206 customers are randomly sampled.[2]

For the final step of the sampling methodology, the Company chose the load study premises using a randomized sampling approach for each stratum and the rate schedules noted below. To randomize, the Company took the entire customer population within these rate schedules as of March 31, 2025, by strata, and assigned a random number to each individual customer. Next, the Company sorted the entire group (1) by their stratum and then (2) their random number, which resulted in a fully randomized list of premises within each stratum. This process produced the number of premises required for the Company's sample set from each stratum. Continuing with the RS 2 Residential example, the sampling methodology indicated 206 premises from the total population of RS 2 Residential customers is necessary. Of those 206 premises, the Company needed at a minimum 23 of these premises to have daily metering capabilities to have a random sample at a 99 percent confidence level and a margin of error of 3 percent. The Company took a sample of 206 randomized premises from RS 2 Residential Stratum 1 and then matched this sample to its list of known daily meter capable premises. This process allowed the Company to identify total premises within the sample that have daily metering capabilities, which it could then compare to the minimum number of sampled premises required to meet the Company's standards for confidence and margin of error. If the count of daily read capable premises fell short of the Company's required amount for a given stratum, it increased the sample size for that stratum and sampled from the universe of premises (both daily read capable and incapable) to achieve the minimum daily meter read capable premises required as determined by the sampling formula.

The Company replicated the process described above for the schedules in the residential rate class (RS 1 Residential and RS 2 Residential) as well as the small commercial rate schedules (RS 1 Commercial, RS 3 Commercial). As indicated in Tables 1 through 3 above, many of the large volume rate schedules in the

[1] Stratified Sample Formula: Sample size of the strata = (size of entire sample /population size * strata size). In this example, the calculation is: 1,584/11,066*160 = 23.
[2] Daily sample size grossed up to all customers: (Count of customers with daily reads in strata/Count of all customers in strata * size of sample of strata calculated for daily reads). In this example, the calculation is: 1,429/160*23 = 206.

RS 41/42 rate classes plus RS 3 Industrial have one hundred percent daily read meter capable coverage. For those schedules in the RS 41/42 rate classes (and RS 3 Industrial) that do not have full daily read meter capable coverage, the Company found that, due to the small total customer size inherent of the its Washington large volume commercial and industrial customers, the sampling approach described above was not suitable (e.g., the number of customers needed to create a random sample at a 99 percent level with a 3 percent margin of error exceeds the total number of customers with daily read capable meters on that rate schedule). For these rate schedules, the Company examined the load profile of all customers with daily (and hourly) read capable meters and adjusted (if necessary) peak load demands based on the small number of large volume customers that still have non-AMR meters.

Daily Usage Data Collection and Aggregation Methodology

Once the Company derived a list of randomly sampled premises for each stratum for each of the residential and small commercial rate schedules identified above, it queried daily readings collected and reported by the AMR meters and stored in the Company's Customer Information System ("CIS"). Because the Company's random sample was designed to include premises with at least three years of daily readings, it pulled readings from January 1, 2022, through December 31, 2024, for a total of 1,096 days (365 days for each of the three years plus Leap Day 2024). This query resulted in 1,096 daily reading observations for every randomly sampled premises.

For each rate schedule that the Company randomly sampled, it aggregated these daily readings by day so that it had 1,096 total observations for each rate schedule. Using the number of sampled premises, the Company then derived therm usage per premises per day to be used as the dependent variable for the load study. This is consistent with the Company's weather normalized use per customer ("Normal UPC") analysis presented in Exh. RJW-1T, which uses weather normalized use per customer per day for each evaluated rate schedule as the dependent variable.

Daily Weather and Other Explanatory Variable Data Collection Methodology

The Company then matched the dependent variable usage data with normalized and design day weather using the Company's weather data model presented as Exh. RJW-2 in this proceeding and described in detail in Exh. RJW-1T. This model, which includes over thirty years of daily weather data, was the basis for the weather observations used in the Normal UPC analysis. The Company matched actual observed daily weather to usage per premises per day for the 1,096 days in the load study. It used the temperature data, translated into heating degree days ("HDDs"), to derive the HDD per day explanatory variable.

To evaluate the load study results against the Normal UPC analysis, as the Company explains in more detail below, it used the 30-year normalized weather for normalized usage prediction. As discussed in Exh. RJW-1T, the Company collects daily high and low temperature data observed in Vancouver (National Oceanic and Atmospheric Administration "NOAA" Station 94298 -- Vancouver Pearson Airport) and The Dalles (Bureau of Reclamation automated agricultural weather station network "AgriMet" station HOXO) for the period June 1, 1995, through May 31, 2025.

To derive the load study estimated design day load, the Company used its design day temperature assumption used as part of its resource planning processes. For NW Natural's 2022 Integrated Resource

Plan ("IRP"), the Company used a probabilistic planning standard to forecast peak load as function several key drivers. This planning standard sets a daily resource capacity requirement such that the Company would be 99 percent certain it would be capable of meeting load going into any winter. Using this methodology, the Company has calculated an average system weighted temperature around this planning standard of roughly 11-degrees Fahrenheit (47.9 and 46.9 HDDs for residential and commercial rate schedules using 59- and 58-degree Fahrenheit set points, respectively).

Consistent with the Normal UPC analysis, the Company included additional explanatory variables beyond standard HDDs which are a standard measure of weather in load forecasting analyses, including: Effective temperature, precipitation, solar radiation, wind speed, and wind chill. The use of multiple variables that measure weather are meant to control for the fact that day-of ambient temperature is not the only factor that can influence heat loss.

Additionally, the Company included (depending on the rate schedule model) monthly fixed effects to control for seasonality, an indicator variable for weekend and holiday days, and an indicator variable for heating months (November through April) only.

Load Study Regression Estimations

The Company developed statistical estimation models like those described in detail in Exh. RJW-1T so that it could compare the Company's current estimation techniques from the Normal UPC analysis to this load study to compare the accuracy of results estimating performance and fit. The Company used an Autoregressive Integrated Moving Average ("ARIMA") time series model to estimate weather normalized load per premises per day as the function of randomly sampled daily read capable customers and HDDs for the 1,096 days included in the load study. The results of the ARIMA model are used to help forecast both normalized and design day usage for each evaluated rate schedule.

Although the load study ARIMA models do not have model specifications that match the Normal UPC ARIMA models, the model specification selection process and model performance evaluation as described in detail in Exh. RJW-1T is consistent. For each of the models presented below, the Company evaluated the ARIMA models foremost on Durbin-Watson test statistics, r-squared values, and root mean squared error ("RMSE") results to assess model efficacy and determine model appropriateness.[3] The Company relied on root mean squared error results to evaluate the load study ARIMA models against the Company's Normal UPC ARIMA models.

The Normal UPC analysis uses billing cycle-based data that is matched to actual weather observations with the days between cycle meter read dates. Billing cycles are not necessarily tied to calendar months. For the Normal UPC analysis, this process ensures actual usage recorded for each billing period is appropriately matched to the observed weather for the same period. The daily read data used for this load study, however, is based on the calendar date the consumption occurred. Therefore, aggregating daily readings by month produces a mismatch between cycle-based months (which span calendar months) and consumption-based months (which are calendar months). The Company adjusted for this

[3] The Durbin-Watson test statistic, which is a test for autocorrelation, takes a value from 0 to 4. A value of 2 indicates no autocorrelation. A value less than 2 indicates positive autocorrelation, and a value greater than 2 indicates negative autocorrelation.

mis-match such that it could compare the Normal UPC analysis to the load study by aligning the cycle-based data to the halfway point (e.g., day 15) to the prior months' consumption data. This is because billing cycles for the following month begin halfway through the prior month. Data alignment was confirmed by examining graphs of the data which are presented below.

The load study regression estimations and evaluation against the Normal UPC is presented below by rate schedule and rate class. For each ARIMA model evaluated for this load study, the Company used fewer explanatory variables compared to the Normal UPC analysis out of necessity – the load study covers three heating seasons compared to the thirteen included in the Normal UPC analysis. It found some variables statistically insignificant in the load study that were significant in the Normal UPC analysis because more data in the time series is needed to establish a statistical trend in the data (which is especially true of macroeconomic data). The data that produces the tables below is presented in Exh. RJW-7.

RS 1 Residential

For the RS 1 Residential ARIMA model specification, the Company included an indicator variable for heating months only to control for seasonality. It found there was not enough statistical variation in RS 1 Residential customer usage between individual months to include twelve indicator variables. The Company chose a non-differenced ARIMA(2,0,2)(0,0,0)$_{[2]}$ specification for the model, which is as follows, where *m* is month and *y* is year:

$$\frac{R1\ UPC}{Day}m, y = \beta_1 \frac{R1\ HDD}{Day} + \beta_2 HeatingMonths + ARIMA(2,0,2)(0,0,0)_{[2]}$$

The RS 1 Residential load study model output is as follows:

```
ARIMA regression

Sample:  1 - 1096                               Number of obs     =       1096
                                                Wald chi2(6)      =   67493.63
Log likelihood =  1323.283                      Prob > chi2       =     0.0000

```

This model produces an estimated annual UPC of 153.4 therms, which is 12.5 percent lower than the UPC of 175.3 therms estimated by the Normal UPCs analysis. The load study model produces a design day load that is 38.0 percent lower than that of the Normal UPC analysis (1.38 therms per customer compared to 1.89 therms). Table 5 below shows a comparison of the RS 1 Residential load study model against the Normal UPCs analysis and actual usage.

Table 5

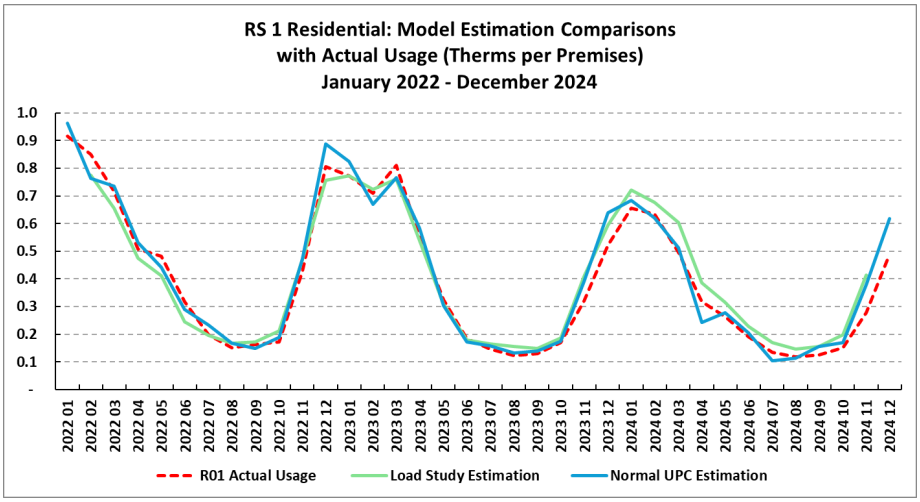

Table 5 shows that both the load study and the Normal UPC model each overpredict and underpredict the actual RS 1 Residential usage at times. The load study model under predicts in the winter and shoulder months of 2022 and overpredicts in the winter and shoulder months of 2024. The Normal UPC model overpredicts the winter peak in December 2022, but more closely predicts the winter peak in January 2024 compared to the load study model.

The Normal UPC model produces an RMSE value that is lower compared to the load study model (0.026 to 0.097, respectively). Other test statistics, such as Durbin-Watson, are similar. Based on the RMSE results, the Company concludes that the Normal UPC is the better estimator for RS 1 Residential.

RS 2 Residential

For the RS 2 Residential ARIMA model specification, the Company included an indicator variable for all months to control for seasonality. Further, it included additional weather variables (wind chill and radiation) as well as an indicator for weekends and holiday days. The Company chose a non-differenced ARIMA(2,0,2)(0,0,0)$_{[2]}$ specification for the model, which is as follows, where *m* is month and *y* is year. The variables and model specification chosen for this model align closely with the Normal UPCs RS 2 Residential model shown in Exh. RJW-1T.

$$\frac{R2\ UPC}{Day}m,y = \beta_1\frac{R2\ HDD}{Day} + \beta_2\frac{WindChill}{Day} + \beta_3\frac{SolarRadiation}{Day} + \beta_4 Jan_{=1} \ldots + \beta_{15} Dec_{=1} + \beta_{16} WeekendHolidayDays$$

$$+ ARIMA(2,0,2)(0,0,0)_{[2]}$$

The RS 2 Residential load study model output is as follows:

```
ARIMA regression

Sample:  1 - 1096                               Number of obs     =       1096
                                                Wald chi2(20)     =   92925.08
Log likelihood =  332.3048                      Prob > chi2       =     0.0000

```

This model produces an estimated annual UPC of 589.2 therms, which is 11.0 percent lower than the UPC of 662.3 therms estimated by the Normal UPC analysis. The load study model produces a design day load that is 17.6 percent lower than that of the Normal UPC analysis (6.30 therms per customer compared to 7.41 therms). Table 6 below shows a comparison of the RS 2 Residential load study model against the Normal UPCs analysis and actual usage.

Table 6

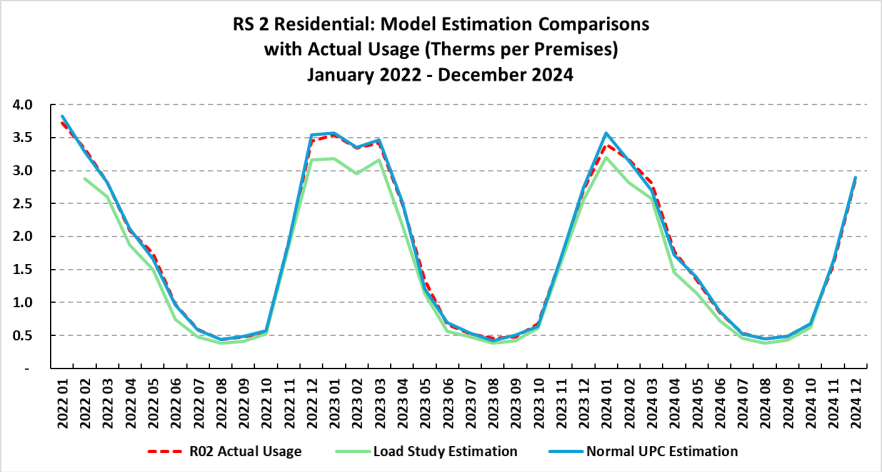

Table 6 shows that the Normal UPC model provides close estimation with actual RS 2 Residential usage over the analysis period. The load study model, however, serially underpredicts actual usage over the analysis period with the largest variances occurring during the winter heating months when usage is peaking.

As expected given the estimations shown in Table 6, the Normal UPC model produces an RMSE value that is lower compared to the load study model (0.017 to 0.066, respectively). Based on the RMSE results, the Company concludes that the Normal UPC is the better estimator for RS 2 Residential.

Small Commercial Rate Class

For the Small Commercial Rate Class (which includes RS 1 Commercial and RS 3 Commercial) ARIMA model specification, the Company used a model consistent with RS 2 Residential. It included an indicator variable for all months to control for seasonality. Further, the Company included additional weather variables (wind chill and radiation) as well as an indicator for weekends and holiday days. The Company chose a non-differenced ARIMA(2,0,2)(0,0,0)$_{[2]}$ specification for the model, which is as follows, where *m* is month and *y* is year. The variables and model specification chosen for this model align closely with the Normal UPCs RS 3 Commercial model shown in Exh. RJW-1T, but without macroeconomic variables that control for consumer price index changes or COVID-19, and without the multiplicative seasonal ARIMA specification.

$$\frac{SmlCom\ UPC}{Day}m,y = \beta_1\frac{SmlCom\ HDD}{Day} + \beta_2\frac{WindChill}{Day} + \beta_3\frac{SolarRadiation}{Day} + \beta_4 Jan_{=1} \ldots + \beta_{15} Dec_{=1} + \beta_{16} WeekendHolidayDays + ARIMA(2,0,2)(0,0,0)_{[2]}$$

The Small Commercial load study model output is as follows:

```
ARIMA regression

Sample:  1 - 1096                               Number of obs      =       1096
                                                Wald chi2(20)      =   69493.83
Log likelihood = -1645.112                      Prob > chi2        =     0.0000

```

This model produces an estimated annual UPC of 4,064.2 therms, which is 30.7 percent higher than a UPC of 3,122.1 therms estimated by using the same methods as the Normal UPC analysis. The load study model produces a design day load that is 18.8 percent higher than that of the Normal UPC analysis (35.6 therms per customer compared to 28.9 therms). Table 7 below shows a comparison of the Small Commercial load study model against the Normal UPCs analysis and actual usage.

Table 7

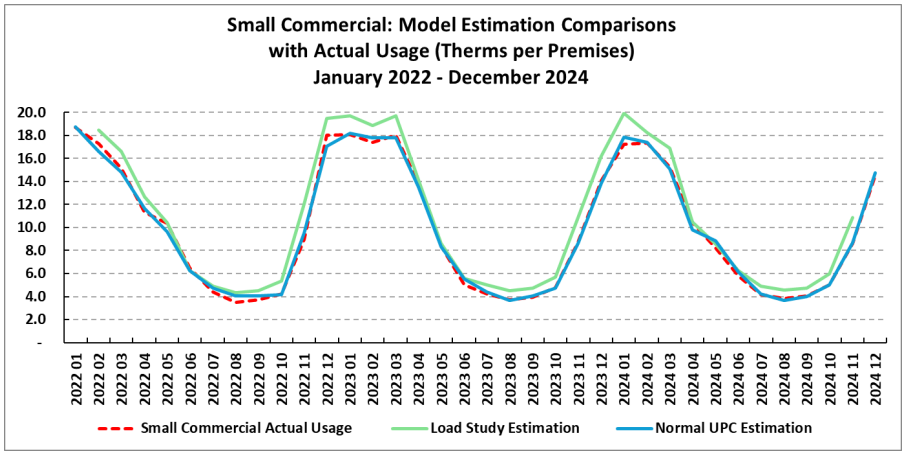

Table 7 shows that the Normal UPC model provides close estimation with actual Small Commercial usage over the analysis period. The load study model, however, serially overpredicts actual usage over the analysis period with the largest variances occurring during the winter heating months when usage is peaking.

As expected given the estimations shown in Table 7, the Normal UPC model produces an RMSE value that is lower compared to the load study model (0.026 to 0.097, respectively). Based on the RMSE results, the Company concludes that the Normal UPC is the better estimator for Small Commercial.

Large Volume Commercial and Industrial Rate Classes

Exh. RJW-1T discusses the Company's use of a five-year coincident peak value to derive the load factor for the large volume rate schedules for use in the EmCOSS model. These values, which are based on hourly, daily, and monthly data, are calculated in Exh. RJW-11. For this load study, the same load factor values are calculated in this exhibit without using the monthly data. Instead, an adjustment factor is used on the hourly and daily data to gross up the coincident peak demand to account for those large volume premises that do not have daily read meter capabilities. As shown in Tables 1 through 3 above, daily read capable meters are installed at all or nearly all premises in the RS 41 and RS 42 rate classes. Therefore, the coincident peak values are the same or nearly the same for the large volume schedules whether the monthly data is used or not.

The exceptions are RS 41 Commercial Sales Firm and RS 42 Commercial Sales Firm. As discussed in Exh. RJW-1T, the Company calculated the peak demands for these schedules using the Normal UPC analysis methodology. For this load study, the Company used the coincident peak method as shown in Exh. RJW-11 to calculate peak demands for these schedules using an adjustment for monthly usage.

Conclusion and Discussion

Based on the evaluation of the load study results compared to the Normal UPCs analysis, which concluded that the Normal UPC analysis methodology produces usage estimations with better performance and fit of actual usage, the Company decided to use the methodology presented in Exh. RJW-1T for the EmCOSS peak demand inputs. As shown above, the load study methodology both under- and over-predicts the winter heating peaks depending on the rate schedule modeled. Table 8 below

summarizes the peak demand estimates, by rate schedule, as estimated by the Normal UPC analysis and this load study.

Table 8
Load Factors
Derived for EmCOSS and Load Study

Rate Schedule	Design Day Load Factor	
	EmCOSS	Load Study
R01	25.5%	30.8%
R02	24.5%	25.6%
Small Commercial	29.6%	31.3%
C41SF	30.9%	40.6%
C42SF	42.2%	100.0%
I03	55.5%	55.6%
I41SF	69.5%	69.8%
C42SI	100.0%	100.0%
I42SF	91.0%	91.0%
I42SI	100.0%	100.0%
I42TF	100.0%	100.0%
I42TI	100.0%	100.0%
C41TF	32.5%	32.5%
C42TF	46.7%	46.7%

The Company presents two versions of the EmCOSS using peak demand inputs from the Normal UPC analysis as well as this load study. The EmCOSS using the Normal UPC analysis is presented as Exh. RJW-12, and the EmCOSS using the load study results is presented as Exh. RJW-13. The Company uses the Normal UPC EmCOSS (Exh. RJW-12) to determine its rate spread proposal as discussed in Exh. RJW-1T.

Relative to the sampled data used by the load study, the Normal UPC analysis uses all usage across all premises so any biases inadvertently introduced by sampling are avoided. Further, the Normal UPC evaluates usage across thirteen heating seasons compared to three for the load study. The Company believes that the current data constraints on the load study cause inferior usage estimations. As the Company continues to install daily read capable meters until it reaches full coverage, however, it expects that future iterations of this load study could provide useful insight for the EmCOSS.
